FOY, Maximilien Sébastien (1775–1825), French general and political orator, was born at Ham, in Picardy, February 3, 1775. He was the son of an old soldier who had fought at Fontenoy, and had become post-master of the town in which he lived. His father died in 1780, and his early instruction was given by his mother, a woman of English origin and of superior ability. He continued his education at the college of Soissons, and thence passed at the age of fourteen to the artillery school of La Fère. After eighteen months' successful study he entered the army, served his first campaign in Flanders (1791), and was present at the battle of Jemmapes. He soon attained the rank of captain, and served successively under Dampierre, Jourdan, Pichegru, and Houssard. In 1794, in consequence of having spoken freely against the violence of the extreme party at Paris, he was imprisoned by order of the commissioner of the Convention, Joseph Lebon, at Cambray, but regained his liberty soon after the fall of Robespierre. He served under Moreau in the campaigns of 1796 and 1797, distinguishing himself in many engagements. The leisure which the treaty of Campo Formio gave him he devoted to the study of public law and modern history, attending the lectures of Professor Koch at Strasburg. Recommended by Desaix to the notice of General Bonaparte, he joined the army assembled for the invasion of England, and afterwards fought, with much regret, against the Swiss. He gained the confidence of Masséna, and was promoted *chef de brigade*. After the peace of Amiens he returned to France with the rank of colonel. He was at Paris at the time of Moreau's trial, and having earnestly censured the proceedings escaped arrest only by joining the army in Holland. Foy voted against the establishment of the empire, but the only penalty for his independence was a long delay before attaining the rank of general. In 1806 he married a daughter of General Baraguay d'Hilliers. In the following year he was sent to Constantinople, and there took part in the defence of the Dardanelles against the English fleet. He was next sent to Portugal, and served in the Peninsular War from the battle of Vimeira to the battle of Orthez, at which he was severely wounded. At the first restoration of the Bourbons he was made one of the inspectors-general of infantry, and was stationed at Nantes. He joined Napoleon I. on his escape from Elba, and fought with distinction at Quatre-Bras and at Waterloo, where he was again badly wounded. After the second restoration he returned to civil life, and in 1819 was elected to the chamber of deputies. For this position his experience and his studies had especially fitted him, and by his first speech he gained a commanding place in the chamber, which he never lost, his clear, manly eloquence being always employed on the side of freedom and justice. In 1823 he made a powerful protest against French intervention in Spain, and after the dissolution of 1824 he was re-elected for three constituencies. He died at Paris, November 28, 1825, and his funeral was celebrated amidst the mourning of the city and the nation. His family were provided for by a national subscription.

---

[1] The following is the full title:—*Acts and Monuments of these latter and Perillous Dayes, touching matters of the Church, wherein are comprehended and described the great Persecutions and horrible Troubles that have been wrought and practised by the Romishe Prelates, especiallye in this Realme of England and Scotland, from the yeare of our Lorde a thousande to the time now present. Gathered and collected according to the true Copies and Wrytinges certificatorie as well of the Parties themselves that Suffered, as also out of the Bishops' Registers, which were the Doers thereof, by John Foxe.*

A collection of his speeches was published in 1826, and his unfinished *Histoire de la Guerre de la Péninsule sous Napoléon* in 1827. Several biographies of Foy have been published.

FRAAS, KARL NIKOLAS (1810–1875), a German botanist and agriculturist, was born at Stettelsdorf, near Bamberg, 8th September, 1810. After receiving his preliminary education at the gymnasium of Bamberg, he in 1830 entered the university of Munich, where he took his doctor's degree in 1834. Having devoted great attention to the study of botany, he went to Athens in 1835 as inspector of the court garden; and in April, 1836, he became professor of botany at the university. In 1842 he returned to Germany, and became teacher at the central agricultural school at Schleissheim. In 1847 he was appointed professor of agriculture at Munich, and in 1851 director of the central veterinary college. For many years he was secretary of the Agricultural Society of Bavaria, but resigned in 1861. He died at his estate of Neufreimann near Munich, 9th November, 1875. Besides his important contributions to the sciences of botany and agriculture, Fraas devoted much of his effort to improve the condition of the peasants.

His principal works are—Στοιχεῖα της Βοτανικῆς, Athens, 1835; *Synopsis floræ classicæ*, Munich, 1845; *Klima und Pflanzenwelt in der Zeit*, Landsh., 1847; *Histor-encyklopäd. Grundriss. der Landwirthschaftslehre*, Stuttgart, 1848: *Geschichte der Landwirthschaft*, Prague, 1851; *Die Schule des Landbaues*, Munich, 1852; *Baierns Rinderrassen*, Munich, 1853; *Die Künstliche Fischerzeugung*, Munich, 1854; *Die Natur der Landwirthschaft*, Munich, 1857: *Buch der Natur für Landwirthe*, Munich, 1860; *Die Ackerbaukrisen und ihre Heilmittel*, Munich, 1866; *Das Wurzelleben der Culturpflanzen*, Berlin, 1872; and *Geschichte der Landbau und Forstwissenschaft seit dem 16ten Jahr.*, Munich, 1865. He also founded and edited a weekly agricultural paper, the *Schranne*.

FRA BARTOLOMMEO. See BACCIO DE LA PORTA.

FRACASTORIO, HIERONYMO (1483–1553), a learned physician and poet, was born at Verona in 1483. It is related of him that at his birth his lips adhered so closely that a surgeon was obliged to divide them with his incision knife, and that during his infancy his mother was killed by lightning, while he, though in her arms at the moment, escaped unhurt. Fracastorio became eminently skilled, not only in medicine and belles-lettres, but in most arts and sciences. It was by his advice that Pope Paul III., on account of the prevalence of a contagious distemper, removed the council of Trent to Bologna. He was the author of many works, both poetical and medical, and was intimately acquainted with Cardinal Bembo, Julius Scaliger, and most of the great men of his time. He died of apoplexy at Casi, near Verona, on the 8th of August, 1553; and in 1559 the town of Verona erected a statue in his honor.

The principal work of Fracastorio is a kind of medical poem entitled *Syphilidis, sive Morbi Gallici, libri tres*, Verona, 1530, which has been often reprinted, and also translated into French and Italian. Among his other works (all published at Venice) are *De Vini Temperatura*, 1534; *Homocentricorum*, 1535; *De Sympatha et Antipathia Rerum*, 1546; and *De Contagionibus*, 1546. His complete works were published at Venice in 1555, and his poetical productions were collected and printed at Padua in 1728.

FRA DIAVOLO is the popular name given by his countrymen to the most notorious and dreaded of modern Italian brigands; and the name, associated during his lifetime with the political revolutions of southern Italy, has acquired a world-wide celebrity since it became the title of a favorite French opera. His real name was Michele Pezza. It would be as hopeless to fix the precise dates in his career as to determine those in the lives of Rob Roy or Jonathan Wild. He is stated, however, to have been born at Itri. His crimes became invested with a more general and political interest in 1799. At that time, from the frequency and audacity of his robberies and murders along the frontier of the Terra di Lavoro, he became known as Fra Diavolo, the popular superstition investing him with the blended attributes of a monk and a demon. When the kingdom of Naples was overrun by the troops of the French Republic, Fra Diavolo, acting in concert with the head of the Bourbon partisans, Cardinal Ruffo, waged a fierce and untiring war against the French soldiers, whenever his superior knowledge of the localities afforded the prospect of his being able to do so with effect. He continued for a considerable period in absolute possession of the line of communication from the Garigliano to Portello, falling upon and massacring the French Government couriers, and all whom he suspected of conveying information to the military or civil functionaries of the Republic. At one moment he succeeded in completely interrupting all communication between Naples and Rome. Like his fellow agents under Cardinal Ruffo—like Mammone, Pronio, Sciarpa Guarriglia—he styled himself "the faithful servant and subject of his Sicilian Majesty." As the turning point in Fra Diavolo's career must be regarded the arrival in Naples of Joseph Bonaparte, and the establishment of the extraordinary tribunals charged with the repression of this half civil, half political brigandage. Fra Diavolo was sentenced to death, and a price was set on his head. After spreading terror through Calabria by his deeds of cruelty he had passed over into Sicily, but soon returned to the mainland at the head of 300 liberated convicts placed at his disposal by the Bourbon Government. His landing at Spelonza with these ruffians was marked by unusual excesses, but the French troops were everywhere on the alert to capture him, and he was compelled to seek refuge amongst the woods and mountains of Lenola. During a period of two months he succeeded in evading his pursuers, always in the hope of making his way back to Sicily. At length, exhausted by hunger and requiring medical aid, he repaired in disguise to the village of Baronissi, but was there recognized and put to death. It is stated that on his person were found papers from Queen Caroline of Naples and Admiral Sidney Smith, those from the former recognizing his rank as colonel in the Bourbon army, and that in his last moments he cursed both his employers and his own folly which had led him to engage in such a reckless

enterprise. The most authentic source for the career of Fra Diavolo is Colletta's *History of Naples*, which the English reader may consult in the version, equally faithful and spirited, of Miss Horner.

FRÄHN, CHRISTIAN MARTIN, a numismatist and historian, was born at Rostock, 4th June, 1782, and died at St. Petersburg, 28th August, 1851. He commenced his Oriental studies under Tychsen at the university of Rostock, and afterwards prosecuted them at Göttingen and Tübingen. He became a Latin master in Pestalozzi's famous institute in 1804, returned home in 1806, and in the following year was chosen to the chair of Oriental languages in the Russian University of Kasan. Though in 1815 he was invited to succeed Tychsen at Rostock, he preferred to go to St. Petersburg, where he became director of the Asiatic museum and councillor of state. The indefatigable ardor with which he pursued his studies is shown by the number of his works, which altogether amount to more than 150, great and small.

Among the more important are—*Numophylacium orientale Pototianum*, 1813; *De numorum Bulgharicorum fonte antiquissimo*, 1816; *Das Muhammedanische Münzkabinet des Asiatischen Museum der Kaiserl. Akademie der Wissenschaften zu St. Petersburg*, 1821; *Numi cufici ex variis museis selecti*, 1823; *Notice d'une centaine d'ouvrages arabes, etc., qui manquent en grande partie aux bibliothèques de l'Europe*, 1834; and *Nova Supplementa ad recensionem Num. Muham. Acad. Imp. Sci. Petropolitanæ*, 1855 (posthumous). A description of some medals struck by the Samanid and Bouid princes (Kasan, 1804) deserves special mention, as the author composed it in Arabic because he had no Latin types at command.

FRAMLINGHAM, a market town of England in the county of Suffolk, about 4 miles north-east of Ipswich. It is the terminus of a branch railway, and has a corn exchange, a people's hall, and a newspaper office. The church is a fine old building mostly in the Perpendicular style, constructed of black flint stone, and surmounted by a tower 96 feet high. In the interior there are a number of interesting monuments, among which the most noticeable are those of Thomas Howard, third duke of Norfolk, and of Henry Howard, the famous earl of Surrey who was beheaded by Henry VIII. The castle forms a picturesque ruin, consisting of the outer walls 44 feet high and 8 feet thick, 13 towers about 58 feet high, a gateway, and some outworks. About half a mile from the town is the Albert Memorial Middle Class College, opened in 1865, and capable of accommodating 300 boys. A bronze statue of the Prince Consort by Durham adorns the front terrace. The population of the parish in 1871 was 2569. Framlingham dates, according to tradition, from the time of Redwald, king of the East Angles, but its history is of doubtful authenticity till the Norman period. The castle was successively held by the Bigods, the Mowbrays, and the Howards. On the attainder of Thomas Howard, it was seized by the king, and it thus became for a time the residence of Queen Mary of England. Though restored to the Howard family by James I., it was suffered to fall into decay, and in 1635 it was sold, along with the park and the advowson of the living, to Sir Robert Hitcham, who left the whole to the use of the masters and fellows of Pembroke Hall, Cambridge. (See *Trans. of Brit. Archæolog. Assoc.*,1865.)

FRANÇAIS, ANTOINE, Count, better known as Français of Nantes, a French politician and author, was born at Beaurepaire in the department of Isère on January 17, 1756, and died at Paris, 7th March, 1836. In 1791 he was elected to the Legislative Assembly by the department of Loire Inférieure, and soon attained a high position among his fellow representatives; but he was not re-elected to the Convention. During the Reign of Terror he was obliged to seek safety in the mountains. In 1798 he was elected to the council of the Five Hundred, and became one of its secretaries; and in the following year he voted against the Directory. He took office under the consulate as prefect of Charente Inférieure, rose to be a member of the council of state, and in 1804 obtained the important post of director-general of taxes. The value of his services was recognized by the titles of count of the empire and grand officer of the Legion of Honor. On the second restoration he retired into private life; but from 1819 to 1822 he was representative of the department of Isère, and after the July revolution he was made a peer of France.

Français wrote a number of works, but his name is more likely to be preserved by the eulogies of the literary men to whom he afforded protection and assistance. It is sufficient to mention *Le Manuscrit de feu M. Jérôme*, 1825; *Recueil de fadaises composé sur la montagne à l'usage des habitants de la plaine*, 1826; *Voyage dans la vallée des originaux*, 1828; *Tableau de la vie rurale, ou l'agriculture enseignée d'une manière dramatique*, 1829.

FRANCAVILLA, a town of Italy, in the province of Lecce, about 21 miles W.S.W. of Brindisi, sometimes called Francavilla Fontana, to distinguish it from Francavilla in Sicily and other towns of the same name. It stands in a very beautiful situation, and is regularly built, with wide streets and handsome if somewhat heavy-looking houses. There are a cathedral, a college, and several hospitals and conventual buildings. The town was founded in the 15th century and owes its name to the freedom from taxation which was granted for ten years to all who made it their place of residence. In 1734 it suffered considerably from an earthquake. The population of the town in 1871 was 16,997, and that of the commune 19,052.

Plates XII. and XIII.

Position and extent.

FRANCE. PART I.—GEOGRAPHY AND STATISTICS.—I. *Situation and Extent.—Face of the Country.—Climate and Soil.* This important part of continental Europe extends from the 43d to the 51st degree of north latitude, and from longitude 7° 35′ E. to longitude 4° 43′ W. The boundaries of France are—on the N. the English Channel (*Manche*), the Straits of Dover (*Pas-de-Calais*), Belgium, and Luxembourg; on the E. Germany (Alsace-Lorraine), Switzerland, and Italy; on the S. the Mediterranean and Spain; on the W. the Atlantic Ocean. From north to south its length is about 576 miles, measured from Dunkirk to the Col de Falguères; its breadth from east to west is about 494 miles, from Mont Donon to Cape Saint-Mathieu at the extremity of Brittany, which projects into the Atlantic like a wedge, and without which France would approach in form to a square; and its superficial extent, including Corsica and the small islands on the coasts, is 204,147 English square miles, nearly twice the total area of the British Isles.

Coast-line.

Though in point of extent of coast and ready access from the interior to the sea France is far inferior to Great Britain and Ireland, it is, on the other hand, more fortunate in these respects than the vast inland territories of Austria and Russia,—its coast-line extending 395 miles on the Mediterranean, 572 on the North Sea, the Straits of Dover, and the Channel, and 584 on the Atlantic. The country has the advantage likewise of being separated from its neighbors by natural barriers of great strength, the Pyrenees forming a powerful bulwark on the south-west, the Alps on the south-east, and the Jura and the Vosges mountains on the east. The boundary line on the side of Belgium is the only one which nature has left unprotected.

Mountains.

Orography.—The line which separates the basins of the Mediterranean and the Atlantic runs to the north from the Pyrenees through the Cevennes and Vosges, and finally joins the Alps in the south-east. The most remarkable summits in the Pyrenees are the Pic du Midi d'Ossau (9734 feet), not far from the favorite town of Pau, the Pic d'Anie (8219 feet), the cirque of Gavarnie, Mont Néthou (11,168 feet), Mont Perdu (10,995 feet), the Pic Long (10,476 feet), the Vignemale (10,820 feet), the Tour de Marboré (9861 feet). An offshoot of the Pyrenees, the Corbières, deserves mention, on account of the huge granitic mass that it contains, called the Canigou. The Cevennes are about 600 kilometres (373 miles) in length, lying between the Rhone on the east and the Garonne and Loire on the west; here, proceeding from south to north, we have Mont Naurouze, the Pic of Montaut (3412 feet), the Malpertus (5512 feet), the Hort de Dieu (5135 feet), Mont Pila (4474 feet, Vivarais), Gerbier des Joncs (5121 feet), Mézenc (5820 feet), Tarare (4757 feet), Haute-Joux (3262 feet, Charolais). Smaller chains detach themselves from the Cevennes, among which may be noticed the Montagnes d'Auvergne, the Plomb du Cantal (6095 feet), the Puy-de-Saucy (6220 feet), the Puy-de-Dôme (4806 feet), the Mount Dore (6187 feet), the mountains of Limousin, and those of Velez, Forez, and Madeleine. The Vosges, which reach no great height, trend northward between the Rhine and the Moselle. Their ramifications are the hills of Belfort, the Faucilles mountains, the Langres plateau, the Montagnes de la Côte d'Or, which are continued by the mountains of Morvan, the Orleans plateau, and the hills of Picardy, Normandy, and Brittany. The Vosges end in the north with the Argonne and the Ardennes, which separate the Seine from the Meuse. The Jura is a chain of the Alps extending between the Rhine and the Rhone from the north-east to south-west. Its principal summits are the Crêt de la Neige (5656 feet), the Reculet (5630 feet), Mont Tendre (5518 feet), and the Dôle (5514 feet). Mont Blanc (15,780 feet), the highest mountain in Europe, is in the Alps of Savoy, which project the Graian Alps, the mountains of Maurienne (Mont Cenis), the Cottian Alps, the Maritime Alps, the Alps of Dauphiné, and the Alps of Provence. As may be seen from these particulars, the surface of France exhibits, in general, an advantageous succession of high and low ground. Less level than Poland, the north of Germany, or the greater part of European Russia, it is, on the whole, less mountainous than Spain or Italy, and may with great propriety be compared to England, with this distinction that, whilst in the latter the mountainous tracts are in the north and west, in France they are in the south and east. Throughout Flanders, Picardy, Normandy, and the countries to the north and south of the Loire, we find plains, diversified occasionally by hills (either insulated or rising in succession), but having none of those massy elevations entitled to the name of mountains. The south and east of France, on the contrary, are rugged and elevated tracts, and may be said to be to that country what Wales and Scotland are to Great Britain.

Rivers.

Hydrography.—The course of the great rivers is easily connected with this view of the surface of the territory of France. With the exception of the Rhone, they all flow either from south to north or from east to west, and discharge themselves into the North Sea, the Channel, and the Atlantic. The Rhine, which not long ago formed the boundary between France and Germany, has part of its basin in France; the Moselle, one of its affluents, takes its source in the Vosges (Ballon d'Alsace), and waters Remiremont, Épinal, Toul, and Pont-à-Mousson, before entering the German territory; the Valogne, the Meurthe, and the Seille are its tributaries. The Meuse rises not far from Bourbonne-les-Bains, and becomes a Belgian river at Givet. During its course it receives on its right bank the Chiers and the Semoy, and on its left the Bar and the Sambre. The Escaut (or Scheldt) has its source near Le Catelet (Aisne), and leaves France after having watered Cambrai, Valenciennes, and Condé; the upper courses of its two affluents, the Scarpe and the Lys, also belong to France. The Somme, which receives the Avre, rises near St. Quentin, and empties itself into the Channel between St. Valery and Le Crotoy. The Seine, one of the four large rivers of France, the others being the Loire, the Garonne (Gironde), and the Rhone, descends from the Langres plateau, flows north-west down to Méry, turns to the west, resumes its north-westerly direction at Montereau, passes through Paris, and discharges itself into the Channel between Le Havre and Honfleur above Rouen and Quillebœuf. Its affluents are, on the right, the Aube, the Marne (which joins the Seine at Charenton near Paris, after having received the Ourcq and the Saulx), the Oise (which has its source in Belgium and is enlarged by the Aisne), and the Epte; on the left the Yonne, the Loing, the Essonne, the Eure, and the Rille. The Orne is a short river, which waters Argentan and Caen (Normandy), and flows into the Channel, the Vilaine, not much more considerable, passes Rennes, Redon, and La Roche-Bernard (Brittany), near which it falls into the Atlantic. The Loire rises in Mont Gerbier des Joncs, in the range of the Vivarais mountains, flows due north to Nevers, then turns to the north-west as far as Orléans, where it takes its course towards the south-west, and lastly from Saumur runs west, till it reaches the Atlantic between Paimbœuf and St. Nazaire. It passes through several large towns, as Nevers, Orléans, Tours, Angers, and Nantes. On the right the Loire receives the waters of the Furens, the Aroux, the Nièvre, the Maine (formed by the Mayenne and the Sarthe with its affluent the Loir), and the Erdre, which joins the Loire at Nantes; on the left, the Allier (which receives the Dore and the Sioule), the Loiret, the Cher, the Indre, the Vienne with its affluent, the Creuse, the Thouet, and the Sèvre-Nantaise. The Loire, the longest of French rivers, is navigable for about 512 miles of its course. It is often in many places dried up during the hot season of the year, while, on the other hand, it is subject to frequent and disastrous floods at the time when the snows melt in the upper valleys, or as a consequence of the long rains of autumn. The Charente descends from Chérounac (Haute-Vienne), traverses Angoulême, and falls into the Atlantic not far from Rochefort. The Garonne rises in the valley of Aran (Spanish Pyrenees), enters France near Bagnères-de-Luchon, has first a north-west course, then bends to the north-east, and soon resumes its first direction. It flows through Toulouse, Agen, and Bordeaux, and joins the Atlantic between Royan and the Point de Grave, opposite the tower of Cordouan. In the lower part of its course from the Bec-d'Ambez, where it receives the Dordogne, it becomes considerably wider, and takes the name of Gironde. The principal affluents are the Ariége, the Tarn with the Aveyron and the Agout, the Lot, and the Dordogne, which descends from the Mont Dore-les-Bains, and joins the Garonne at Bec-d'Ambez, to form the Gironde. All these affluents are on the right; the Gers is the only one of note which joins it on the left. The Adour rises near the Pic-du-Midi in the Pyrenees, and discharges itself into the Bay of Biscay at Bayonne; the mass of its waters is much increased in winter by several mountain streams, of which the Gave de Pau, the Bidouze, and the Nive may be mentioned. The Hérault is the first river of France which runs south and discharges itself into the Mediterranean. It comes from the Mont Laigonat in the Cevennes, and debouches into the Gulf of Lyons. The Rhone, the source of which is in Mont St. Gotthard, in Switzerland, enters France by the narrow defile of L'Écluse, and has a somewhat meandering course, first flowing south, then north-west, and then west as far as Lyons, whence it runs straight south till it reaches the Mediterranean, into which it discharges itself by two principal branches, which form the delta or island of the Camargue. Lyons, Vienne, Valence, Avignon, Beaucaire, Arles, are the chief towns passed by the impetuous waters of the Rhone. The Ain, the Saône (which passes through Mâcon, receives the Doubs, and joins the Rhone at Lyons), the Ardèche, and the Gard are the affluents on the right; on the left we may mention the Arve, the Isère, the Drôme, and the Durance. The Var, a large and rapid stream, descends from Mont Caméléon (Alpes Maritimes), and flows into the Mediterranean near Saint-Laurent-du-Var.

Lakes.

Lakes.—France has very few lakes. The Lake of Geneva, which forms 32 miles of the frontier, belongs to Switzerland. The most important French lake is that of Grand-Lieu, between Nantes and Paimbœuf (Loire-Inférieure), which presents a surface of 17,300 acres. We may also mention the lakes of Bourget and Annecy (both in Savoy), St. Point (Jura), Paladru (Isère), and Nantua (Ain). The lakes, or *étangs*, of Villers (Cher), Indre, Stock, Condrexange (Meurthe), Horre (Aube), Chaussée (Meuse), Ploërmel (Morbihan), La Pelaque (Maine-et-Loire), are artificial creations. The coasts present a number of maritime inlets, forming inland bays, which communicate with the sea by channels of greater or less width. Some of these are on the south-west coast, in Gascony, as Carcans, Lacanau, Biscarosse, Cazan, Sanguinet; but more are to be found in the south and south-east, in Languedoc and Provence, as Leucate, Sigean, Thau, Maguelonne, Berre, Courthezon, Citis, Pourra, etc. Their want of depth prevents them from serving as roadsteads for shipping, and they are useful chiefly for fishing, or for the manufacture of bay-salt.

Forests.

Forests.—The artificial or ornamental plantations of France are much fewer in number than those of England, its natural forests far more numerous, the total extent of ground covered by wood being computed at 32,250 square miles, about one-sixth of the surface of the country. There are forests in almost every department. Lower Normandy contains several of considerable extent. There is a large one at Fontainebleau, only 45 miles from Paris, and a larger to the north of the Loire, in the vicinity of Orléans. The department of Ardennes and the mountainous tract that forms the boundary of France on the side of Switzerland abound in forests. The state possesses 991,766 hectares (3830 square miles); 1,903,258 hectares (7348 square miles) belong to the *communes* or to public institutions, and are managed by the state; the rest are private property. They represent a total value of about three thousand millions of francs (£120,000,000 sterling), the annual revenue of which exceeds 38,000,000 francs.

Climate.

Climate.—The climate of France is generally temperate, but by no means uniform. The division into the north, west, south, and central regions, although it seems the most natural, does not satisfactorily correspond to the actual differences. A more convenient division is that of the following four regions or zones:—the region in which the olive-tree is cultivated, which is limited by a line from Bagnères-de-Luchon (Haute-Garonne) to Die (Isère); the region of the maize, or Indian corn, from the mouth of the Gironde to Raon-L'Étape (Vosges); the region of the vine, from the mouth of the Loire to Mézières (Ardennes); and the northern region, which is characterized by the culture of the apple-tree. These limits are, however, far from being absolute; the Indian corn, for example, is successfully cultivated in Brittany, and vineyards are to be found much farther north than the mouth of the river Loire. The north and north-west of France bear a great resemblance, both in temperature and produce, to the south of England, rain occurring frequently, and the country being consequently fit for pasture. In the interior the rains are less frequent, but, when they occur, are far more heavy, so that there is much less difference in the annual rainfall there as compared with the rest of the country than in the number of rainy days; but, on the whole, the climate of the interior is the most pleasant in France, that region being exempt equally from the oppressive heat of the south and the frequent humidity of the north. The great current of wind which prevails in France blows from west to east, from the Atlantic, over the whole surface of the country, except the lower basin of the Rhone, where the *mistral* (a cold wind coming from the north-north-west), the east wind blowing from the Alps, and the south winds do considerable damage both to the produce of the soil and to the health of the inhabitants. Pau, Cannes, Nice, etc., in the south, are much resorted to by invalids, and by English families for winter quarters.

Geology.

Geology.—In a geological point of view France may be divided into three great regions, which comprehend a nearly complete series of the different kinds of soils.

1. *Mountains.*

(*a.*) Granite and Schist.

Alpes.—Part of Isère (S.E.); Drôme; Hautes-Alpes; part of Basses-Alpes (E.); Savoie; Haute-Savoie.

Pyrénées.—Part of Aude (S.E.); Pyrénées-Orientales; part of Ariége (S.), of Haute-Garonne (S.), of Hautes-Pyrénées (S.), and of Basses-Pyrénées (S.W.).

Vosges.—Part of Vosges (E.).

Maures.—Part of Var (S.E.).

(*b.*) Limestone.

Jura.—Doubs; Jura; part of Ain (E.).

Provence.—Part of Basses-Alpes (W.) and of Var (N.W.); Vaucluse; Bouches-du-Rhône.

2. *Plateaus.*

(*a.*) Granite and Schist.

Central Plateau.—Part of Nièvre (E,) and of Saône-et-Loire (W.); Rhône; Loire; Ardèche; part of Gard (W.), of Allier, and of Puy-de-Dôme (E. and W.); Haute-Loire; part of Lozère (N.); Creuse; Haute-Vienne; Corrèze; Cantal; part of Aveyron (N.) and of Tarn (E.).

Ardennes.—Part of Ardennes (N.).

Bretagne.—Part of Orne (W.); Mayenne; part of Maine-et-Loire (W.) and of Deux-Sèvres (N.W.); Manche; Ille-et-Vilaine; Loire-Inférieure; Vendée; Côtes-du-Nord; Morbihan; Finistère.

(*b.*) Limestone.

Causses.—Part of Lozère (S.) and of Aveyron (S.).

Languedoc.—Part of Gard (E.); Hérault.

Quercy.—Lot.

Haut Poitou.—Part of Vienne (S.), of Charente (N.), and of Deux-Sèvres (N.).

Bourgogne.—Haute-Saône; Haute-Marne; Côte-d'Or; part of Yonne (S.E.) and of Nièvre (W.).

Lorraine.—Moselle; Muerthe; part of Vosges (W.); Meuse.

3. *Level Tracts.*

Champagne.—Aube; Marne; Ardennes.

Neustrie.—Nord; Aisne; Seine-et-Marne; part of Yonne (N.W.); Pas-de-Calais; Somme; Oise; Seine-et-Oise; Seine; Loiret; Cher; Seine-Inférieure; Eure; Eure-et-Loire; Loir-et-Cher; Indre; Calvados; part of Orne (E.); Sarthe; Indre-et-Loire; part of Vienne (N.) and of Maine-et-Loire (E.).

Aquitaine.—Part of Tarn (W.) and of Aude (N.W.); Tarn-et-Garonne; part of Haute-Garonne (N.), of Ariége (N.) and of Charente (S.); Dordogne; Lot-et-Garonne; part of Hautes-Pyrénées (N.); Charente-Inférieure; Landes; part of Basses-Pyrénées (N.E.).

Limagne.—Part of Allier (W.) and of Puy-de-Dôme (central part).

Bresse.—Part of Côte-d'Or (E.), of Saône-et-Loire (E.), of Ain (W.) and of Isère (N.W.).

The following table shows the same districts classified according to the nature of their soils. It will be remarked that the Tertiary rock forms nearly the third part of France, whilst the coal-fields are scarcely the two-hundredth part of it.

Primitive rock.—Vendée, part of Brittany, part of the Maures, the Vosges, and the Alps—10,416,000 hectares (40,217 square miles).

Transition rock.—Pyrenees, central part of Brittany, Cotentin, Ardenne, part of the Vosges—5,200,000 hectares (20,077 square miles).

Porphyritic and Carboniferous rocks.—North of Ardenne; north-west of the central plateau; the Maures; small portions of the surface in the Corbières, Brittany, and the Vosges—520,000 hectares (2007 square miles).

Triassic and Permian rock.—East of Lorraine, and a small part of the Vosges—3,480,000 hectares (12,436 square miles).

Jurassic rock.—The Causses, Quercy, and Haut-Poitou; Lorraine and Burgundy; part of the Alps—10,371,000 hectares (39,943 square miles).

Chalk.—Champagne, west of Neustrie, and some places in Aquitaine and the Pyrenees—6,245,700 hectares (24,115 square miles).

Tertiary rock.—The greater part of Neustrie, Limagne, Aquitaine, Bresse, part of Languedoc, Provence, and some places in Brittany and Vendée—14,853,500 hectares (57,350 square miles).

Volcanic rock.—Several masses in the central plateau, and various places in the Causses, Languedoc, Provence, the Maures, and Lorraine—520,000 hectares (2007 square miles).

Alluvial soils.—These are to be found in all valleys, but chiefly near Dunkirk and Niort, and on the Mediterranean coasts—520,000 hectares (2007 square miles).

The *Statisque générale* of France divides the soil thus:—

	Hectares.	Square miles.
Mountainous tracts	4,268,750	16,481
Heaths and moors (landes)	5,670,089	21,892
Soil of rich moulds	7,276,369	28,094
Chalk or limestone	9,788,197	37,793
Gravel	3,417,893	13,196
Stony soil	6,612,348	25,530
Sandy soil	5,921,377	22,863
Clay	2,232,885	8,611
Marshy and swampy soil	284,454	1,098
Miscellaneous	7,290,238	28,148

Or, considering the use rather than the nature of the soil, the surface of France may be divided thus:—

	Hectares.	Square miles.
Arable land	25,500,675	98,460
Forests, woods, and parks	8,800,399	33,978
Heaths and moors (landes)	7,138,282	27,551
Meadowland	5,159,179	19,920
Vineyards	2,088,048	8,062
Roads, streets, public walks, and built lands	1,361,757	5,157
Water	737,587	2,837
Orchards and gardens	627,704	2,423
Chestnut plantations	559,029	2,158
Olive, almond, and mulberry plantations	109,262	421
Miscellaneous	775,753	2,955

II. *Population.*

The population of France, which in 1801 was 27,349,003, was 36,905,788 in 1876, of whom 11,405,000 were living in towns. The following table shows the extent of each department and the population in 1861 and 1876.[1]

	Surface in Square Miles.	Population in 1861.	Population in 1876.
Ain	2,239	369,767	365,462
Aisne	2,839	564,597	560,427
Allier	2,822	356,432	405,783
Alpes (Basses-)	2,685	146,368	136,166
Alpes (Hautes-)	2,158	125,100	119,094
Alpes-Maritimes	1,512	194,578	203,604
Ardèche	2,134	388,529	384,378
Ardennes	2,020	329,111	326,782
Ariége	1,890	251,850	244,795
Aube	2,317	262,785	255,217
Aude	2,438	283,606	300,065
Aveyron	3,376	396,025	413,826
Belfort (territory of)	235	....	68,600
Bouches-du-Rhône	1,971	507,112	556,379
Calvados	2,132	480,992	450,220
Cantal	2,217	240,523	231,086
Charente	2,294	379,081	373,950
Charente-Inférieure	2,636	481,060	465,628
Cher	2,779	323,393	345,613
Corrèze	2,265	310,118	311,535
Corse	3,377	252,889	262,701
Côte-d'Or	3,383	384,140	377,663
Côtes-du-Nord	2,652	628,676	630,957
Creuse	2,150	270,055	278,423
Dordogne	3,545	501,687	489,848
Doubs	2,019	296,280	306,094
Drôme	2,518	326,684	321,756
Eure	2,300	398,661	373,629
Eure-et-Loir	2,268	290,455	283,075
Finistère	2,595	627,304	666,106
Gard	2,253	422,107	423,804
Garonne (Haute-)	2,429	484,081	477,730
Gers	2,425	298,931	283,546
Gironde	3,761	667,193	735,242

---

[1] After the cession of territory to Germany in 1871, a single department (Meurthe-et-Moselle) takes the place of two (Meurthe and Moselle), the Bas-Rhin disappears, and of the Haut-Rhin there remains only the territory of Belfort.

	Surface in Square Miles.	Population in 1861.	Population in 1876.
Hérault	2,393	409,391	445,053
Ille-et-Vilaine	2,597	584,930	602,702

Vendée	2,588	395,695	411,781
Vienne	2,691	322,028	330,916
Vienne (Haute-)	2,130	319,595	336,061
Vosges	2,259	415,485	407,082
Yonne	2,868	370,305	359,070
Total	204,147	37,472,732	36,905,788

The annual increase of population in France between 1801 and 1876 has been very small. Allowing for the alterations in extent of territory which took place in 1860 and in 1871, it amounts to about 0·43 per cent.; so that while in England the population during the same period has been doubling in about 53 years, it would require 161 years to bring about a similar result in France. The census of 1876 returned 18,373,639 males and 18,532,149 females, of whom 9,805,761 males and 8,944,386 females were single. In 1874 there were 954,652 births, 981,709 deaths, and 303,113 marriages; of the births 69,294 were illegitimate, and 44,613 were children stillborn. Population is not so dense in France as in the United Kingdom, the proportions being about 181 and 270 inhabitants respectively to the square mile.

	Men.	Women.	Total Number.
Agriculture	4,664,855	1,305,316	5,970,171
Manufactures	2,673,997	1,308,873	3,982,870
Commerce	1,181,514	308,754	1,490,268
Liberal professions	832,692	161,740	994,432
Persons living on their income	545,050	425,534	980,584
Without profession, or profession unknown	....	....	980,939

The preceding table of the population arranged according to employments (exclusive of children and servants) is taken from the census of 1872.

The first of the following tables shows the population for 1832, 1851, and 1876 of the towns in France that had upwards of 50,000 inhabitants in the last-mentioned year:—

	1832.	1851.	1876.
Paris	774,338	1,053,262	1,988,806
Lyons (*Fr.* Lyon)	133,715	156,169	322,612
Marseilles (*Fr.* Marseille)	145,115	185,082	234,690
Bordeaux	99,062	123,935	212,111
Lille	69,073	68,463	137,150
Toulouse	59,630	85,554	120,208
St. Étienne	....	53,741	117,537
Nantes	77,992	91,303	116,093
Rouen	88,086	91,512	104,893
Havre-de-Grâce	23,816	26,410	85,407
Rheims (*Fr.* Reims)	35,971	43,643	80,098

III. *Government and Administration.*

The Government.

Chamber of deputies.

Senate.

The governments and constitutions which have ruled France since 1789 have been many, and have presented wide differences. We have not, however, to consider here those frequent changes, which belong to history; we have merely to state from a geographical and statistical point of view how France is now governed and administered. The law of the 25th February, 1875, confirmed in France the republican government which had existed from the fall of the empire; but the institutions of the country still bear strong evidence of their monarchical origin and tendency. The sovereignty of the people, acknowledged and proclaimed since 1789, is now represented by three powers,—the chamber of deputies, the senate, and the president of the republic. The deputies are elected by universal suffrage; each district or "arrondissement" sends one deputy to the chamber, if its population does not exceed 100,000, and an additional deputy for every additional 100,000 inhabitants, or fraction of that number. The senate consists of 300 members, the fourth part of whom were at first elected by the national assembly, and hold office for life, each vacancy being filled up by a vote of the senate. The others are elected by special bodies formed, in each department and in the colonies, by the deputies, the general councillors, the councillors of arrondissement, and a delegate of each municipal council. They are in office for nine years,

Departments.	Capital Towns.	Arrondissements.	Ancient Provinces.
Ain	Bourg	5. Bourg; Belley; Gex; Nantua; Trévoux	Bourgogne (Bresse, Bugey, Dombes).
Aisne	Laon	5. Laon; Château-Thierry; Soissons; St. Quentin; Vervins	Ile-de-France; Picardie; Champagne (Brie).
Allier	Moulins	4. Moulins; Gannat; La Palisse; Montluçon	Bourbonnais.
Alpes (Basses-)	Digne	5. Digne; Barcelonnette; Castellane; Forcalquier; Sisteron	Haute-Provence.
Alpes (Hautes-)	Gap	3. Gap; Briançon; Embrun	Haute-Dauphiné; Provence.
Alpes-Maritimes	Nice	3. Nice; Grasse; Puget-Théniers.	
Ardèche	Privas	3. Privas; Largentière; Tournon	Languedoc (Vivarais).
Ardennes	Mézières	5. Mézières; Rethel; Rocroi; Sedan; Vouziers	Champagne (Réthelais, Rémois).
Ariége	Foix	3. Foix; Pamiers; St. Girons.	Foix; Gascogne (Conserans).
Aube	Troyes	5. Troyes; Nogent-sur-Seine; Arcis-sur-Aube; Bar-sur-Aube; Bar-sur-Seine	Champagne; Bourgogne.
Aude	Carcassonne	4. Carcassonne; Castelnaudary; Limoux; Narbonne	Bas Languedoc.
Aveyron	Rodez	5. Rodez; Espalion; Millau; St. Affrique; Villefranche	Guyenne (Rouergue).
Belfort	Belfort	1. Belfort	Alsace.
Bouches-du-Rhône	Marseille	3. Marseille; Aix; Arles	Basse-Provence.
Calvados	Caen	6. Caen; Bayeux; Falaise; Lisieux; Pont-L'Évêque; Vire	Basse-Normandie (Bessin, Bocage).
Cantal	Aurillac	4. Aurillac; Mauriac; Murat; St. Flour	Haute-Auvergne.
Charente	Angoulême	5. Angoulême; Barbezieux; Cognac; Confolens; Ruffec	Angoumois; Charente; Poitou.
Charente-Inférieure	La Rochelle	6. La Rochelle; Jonzac; Marennes; Rochefort; St.-Jean-d'Angely; Saintes	Aunis; Saintonge.
Cher	Bourges	3. Bourges; St. Amand-Mont-Rond; Sancerre	Haut-Berry; Bas-Bourbonnais.
Corrèze	Tulle	3. Tulle; Brive; Ussel	Bas-Limousin.
Côte-d'Or	Dijon	4. Dijon; Beaune; Châtillon-sur-Seine; Semur	Bourgogne (Dijonais, Auxerrois).
Côtes-du-Nord	St. Brieuc	5. St. Brieuc; Dinan; Guingamp; Lannion; Loudéac	Haute-Bretagne.
Creuse	Guéret	4. Guéret; Aubusson; Bourganeuf; Boussac	Haute-Marche.
Dordogne	Périgueux	5. Périgueux; Bergerac; Nontron; Ribérac; Sarlat	Guyenne (Périgord).
Doubs	Besançon	4. Besançon; Baume-les-Dames; Montbéliard; Pontarlier	Franche-Comté; Montbéliard.
Drôme	Valence	4. Valence; Die; Montélimart; Nyons	Bas-Dauphiné.
Eure	Evreux	5. Evreux; Les Andelys; Bernay; Louviers; Pont-Audemer	Haute-Normandie (Evreux, Vexin Normand).
Eure-et-Loir	Chartres	4. Chartres; Châteaudun; Dreux; Nogent-le-Rotrou	Orléanais (Pays chartrain); Perche.
Finistère	Quimper	5. Quimper; Brest; Châteaulin; Morlaix; Quimperlé	Basse-Bretagne.
Gard	Nîmes	4. Nîmes; Alais; Le Vigan; Uzès	Bas-Languedoc.
Garonne (Haute-)	Toulouse	4. Toulouse; Muret; St. Gaudens; Villefranche	Haute-Languedoc; Gascogne (Comminges).
Gers	Auch	5. Auch; Condom; Lectoure; Lombez; Mirande	Gascogne (Astarac, Armagnac).

Prior to 1790 France was divided into thirty-two great and eight small military governments, often called provinces, which are, however, to be distinguished from the provinces formed under the feudal system. The great governments were—Alsace, Angoumois, Anjou, Artois, Aunis and Saintonge, Auvergne, Béarn and Navarre, Berri, Bourbonnais, Bourgogne (Burgundy), Bretagne (Brittany), Champagne, Dauphiné, Flandres, Foix, Franche-Comté, Guyenne and Gascogne (Gascony), Ile-de-France, Languedoc, Limousin, Lorraine, Lyonnais, Maine, Marche, Nivernais, Normandie, Orléanais, Picardie, Poitou, Provence, Roussillon, and Touraine. The eight small governments were—Paris, Boulogne and Boulonnais, Le Havre, Sedan, Toulois, Pays Messin and Verdunois, Saumurois, and Corse. See Plate XIII.

and every third year are partly renewed.

President.

The president of the republic is chosen for seven years by the senate and chamber of deputies voting together. He promulgates the laws passed by the parliament; he has the command of the land and sea forces, but cannot declare war without the advice of the chambers; he makes treaties of peace, alliance, and commerce, nominates to all Government offices, and has power to dissolve the chamber of deputies, with the sanction of the senate. He receives a yearly salary of 600,000 francs, with an allowance of

Civil list.

162,400 francs for household expenses. Senators and deputies have an allowance of 9000 francs each per annum. It may here be interesting to compare the salary now paid to the president of the republic with the civil list or revenue of the various dynasties which have successively ruled France since the beginning of the century. Louis XVIII. had 15,510,000 francs per annum, and 4,000,000 were allowed to the royal family. Charles X. got 25,000,000 for himself and 7,000,000 for the princes. Louis Philippe was satisfied with 12,000,000 francs a year, and adequate allowances to his children. And lastly, the second empire cost 25,000,000 francs a year, not including the pensions to the members of the imperial family, the revenues of the palaces, castles, and forests, and those mysterious resources which have become known by the name of *virements.*

Council of state.

Next to these three great powers must be mentioned the council of state, presided over by the minister of justice, and composed of a vice-president, 22 councillors in ordinary service, 15 councillors in extraordinary service, representing the different ministers, 24 *maîtres des requêtes*, 20 auditors of first class, 10 auditors of second class, a general secretary having the title and rank of a *maître des requêtes*, and a *secrétaire du contentieux.* The auditors are appointed after a competitive examination; the councillors in ordinary service are elected by the chamber, and the other members of the council of state are nominated by the president of the republic. The business of the council is to give its advice on the projects of law which the parliament or the Government wish to submit to it, and on administrative regulations and by-laws. All disputes arising in matters of administration, and all claims or complaints against administrative officials, are brought before the council of state, whose decision is final. The vice-president receives a salary of 25,000 francs, the presidents of sections or committees 18,000 francs, the councillors 16,000, the *maîtres des requêtes* 8000 francs, and the auditors of first class 4000 francs; auditors of second class have no remuneration.

Ministers.

The executive department of the Government is administered by the president of the republic and his cabinet council, consisting of nine ministers, viz.:—the minister of justice and keeper of the seals; the minister of foreign affairs; the minister of the interior; the minister of finance; the minister of war; the minister of marine and colonies; the minister of public instruction, ecclesiastical affairs, and the fine arts; the minister of agriculture and commerce; and the minister of public works. They are appointed by the president of the republic, and are reponsible to the chamber. They receive a salary which has been reduced from 100,000 to 60,000 francs, and may live, if they choose, in the "hôtels" where the duties of their ministry are discharged.

Administrative divisions.

Administratively, France is divided into 87 departments cut rather arbitrarily out of the territory of the ancient provinces. These departments are subdivided into 362 "arrondissements," 2865 "cantons," and about 36,000 "communes." The table on pages 449–50 contains a list of the departments, with their capital towns and arrondissements, and also a reference to the old division into provinces.

Departmental administration.

Each department is administered by a prefect appointed by the president of the republic, and each arrondissement by a sub-prefect. The prefects are divided into three classes, the salary being 35,000 francs for the first class, 24,000 for the second class, and 18,000 for the third class. The prefect of the Seine has 50,000 francs a year. The authority of each prefect is great in his own department: he can issue local decrees; he appoints and dismisses a number of agents who depend directly on him; he is at the head of the police to maintain public order, and for this purpose can summon the military forces; he superintends the collection of taxes; he is in correspondence with all the subordinate functionaries in his department, to whom he transmits the orders and instructions of the ministers; in one word, he is the general agent of Government, and the principal instrument of centralization in the state. He is assisted in his work by two bodies, the general council (*conseil général*), which is elected by universal suffrage, and the council of prefecture, which is nominated by the head of the executive power. The business of the council of prefecture is to decide all legal questions and to advise the prefect, when asked to do so. The general councils assess the taxes, authorize the purchase, sale, or exchange of departmental property, superintend the management of the same, decide about new roads, railways, or canals, vote the budget for sanitary and charitable institutions belonging to the department, and give advice on every matter of local interest, political questions being strictly excluded. The law of the 23d February, 1872, however, has invested them with great political importance; in case of the parliament being violently dissolved by a *coup d'état*, they must immediately assemble, and form a new parliament with their delegates, in order to oppose by all means the criminal attempt.

Arrondissement.

As the prefect in the department, so the sub-prefect, with a more limited authority, is the representative of the central power in the arrondissement. He is assisted, and to a certain extent controlled, in his work by the council of arrondissement—an elective body to which each canton of the arrondissement sends one member. Except in that case, the canton is not an administrative division. It will be noticed again in connection with the judicial system of the country.

Commune.

The commune is the administrative unit in France. At its head is a mayor assisted by deputy-mayors (*adjoints*), the number of whom varies according to the population; communes of 2500 inhabitants have one deputy-mayor; up to 10,000 inhabitants they have two, from 10,000 to 30,000 three, and one additional for every 20,000. The mayor has a double part to perform, as he represents both the central power and the commune; and often it is a difficult matter to avoid a conflict of duties. He is besides *officier de l'état civil*, or official registrar of births, marriages, and deaths. The mayor and deputy-

mayor are not salaried officials. In the large towns they are nominated by Government, but they must always be chosen out of the municipal council, which is elected on the principle of universal suffrage, and has with regard to the commune much the same power and duties as the general council with regard to the department.

Every canton must have a commissary of police, who is under the direct control of the mayor. This police-officer is appointed by the prefect in towns having not more than 6000 inhabitants, and by the president of the republic in the others. He has rather complex duties, being at the same time a governmental, judicial, and municipal agent.

Paris and Lyons have in some respects a special and exceptional administration, the consideration of which belongs to the articles devoted to these cities.

IV. *Law and Administration of Justice.*

Judicial proceedings may be classed under civil, commercial, and criminal jurisdictions; there are besides some special departments, such as military and maritime tribunals, councils of discipline, and the *cour des comptes*.

Juge de paix.

In civil matters, every canton has a *juge de paix*, whose decision is final when the amount in dispute does not exceed 100 francs (£4); up to 200 francs, he only can give a sentence subject to appeal. His principal business is, however, one of conciliation; and no suit can be brought before the tribunal of first instance till he has endeavored without success to bring the parties to agreement.

Primary and appeal courts.

A tribunal of first instance, or primary court, is established in every arrondissement. Its decision may be appealed against for sums above 1500 francs. The *cours d'appel* decide the actions when the sentence of the first court has been appealed from. They are 26 in number, established in the following towns:—

Cours d'Appel.	Departments depending on them.
PARIS	Seine, Aube, Eure-et-Loir, Marne, Seine-et-Marne, Seine-et-Oise, Yonne.
AGEN	Gers, Lot, Lot-et-Garonne.
AIX	Basses-Alpes, Alpes-Maritimes, Bouches-du-Rhône, Var.
AMIENS	Aisne, Oise, Somme.
ANGERS	Maine-et-Loire, Mayenne, Sarthe.
BASTIA	Corse.
BESANÇON	Doubs, Jura, Haute-Saône, Belfort.
BORDEAUX	Charente, Dordogne, Gironde.
BOURGES	Cher, Indre, Nièvre.
CAEN	Calvados, Manche, Orne.
CHAMBÉRY	Savoie, Haute-Savoie.
DIJON	Côte-d'Or, Haute-Marne, Saône-et-Loire.
DOUAI	Nord, Pas-de-Calais.
GRENOBLE	Hautes-Alpes, Drôme, Isère.
LIMOGES	Corrèze, Creuse, Haute-Vienne.
LYONS	Ain, Loire, Rhône.
MONTPELLIER	Aude, Aveyron, Hérault, Pyrénées-Orientales.
NANCY	Meurthe-et-Moselle, Meuse, Vosges, Ardennes.
NÎMES	Ardèche, Gard, Lozère, Vaucluse.
ORLÉANS	Indre-et-Loire, Loir-et Cher, Loiret.
PAU	Landes, Basses-Pyrénées, Hautes-Pyrénées.
POITIERS	Charente-Inférieure, Deux-Sèvres, Vendée, Vienne.
RENNES	Côtes-du-Nord, Finistère, Ille-et-Vilaine, Loire-Inférieure, Morbihan.
RIOM	Allier, Cantal, Haute-Loire, Puy-de-Dôme.
ROUEN	Eure, Seine-Inférieure.
TOULOUSE	Ariége, Haute-Garonne, Tarn, Tarn-et-Garonne.

Tribunals of commerce.

Tribunals of commerce to decide disputed points arising out of business transactions are instituted in all the more important commercial towns, and consist of judges chosen from among the leading merchants, and elected by their fellows. For sums above 1500 francs there can be appeal from their decision. In small towns, the judges of the civil tribunal decide such commercial cases.

Criminal courts.

The courts of criminal jurisdiction are of three kinds. The tribunals of ordinary police (that is, the justice of the peace court in each canton) have the cognizance of small offences, which are punishable by a fine not exceeding 15 francs (12s.), or by imprisonment not exceeding 5 days. Offences of a more serious character, which French law calls *délits*, are judged by a special section of the tribunals of first instance, bearing the name of *tribunal correctionnel*. This tribunal can be appealed to from the sentences pronounced by tribunals of police; but its judgments are also subject to the revision of the *cours d'appel*. Offences which rank as crimes are judged by the *cour d'assises*, consisting of three magistrates and twelve jurors. The jury, as in England, decides only on the facts of the case, leaving the application of the law to the judges. The assizes are the only courts that are not stationary. They are held in the chief towns of the departments once in three months. In all criminal suits, the first inquiry is confided to a special magistrate attached to the tribunal, called *juge d'instruction*. He conducts the necessary investigations privately and with almost absolute power. An order of *non-lieu* issued by this magistrate at once puts an end to any prosecution. But if he finds that the case should go to trial, he hands it over to the court, before which a public prosecutor, with the title of *procureur*, or *procureur-général de la république*, maintains and endeavors to prove the accusation.

Court of cassation.

Above these various tribunals the court of cassation stands supreme. It is held at Paris, and is composed of three chambers, the *chambre des requêtes*, the *chambre civile*, and the *chambre criminelle*. Its province is to decide in all appeals from the other courts, investigating, not the facts of the case, but the forms of law, and ordering, wherever these have been infringed or deviated from, a new trial before such other tribunal as it thinks fit.

Special courts.

Among the special jurisdictions may be mentioned the military tribunals or councils of war, which sit in judgment on crimes and offences committed by soldiers, or by civilians in a town or district proclaimed by the Government as in a state of siege; the maritime tribunals, which are to the navy what the councils of war are to the land forces; and the councils of discipline for lawyers and other professional corporations. The *cour des comptes* deserves special notice. It consists of three chambers, with a president in chief over the whole court, and three presidents (one for each chamber), a general procurator, a chief *greffier*, 102 councillors, 20 auditors, and 81 clerks. This important institution, which costs 1,554,500 francs a year, was created in 1807 in order to control all the accounts of the Government officials. Certain agents who are not magistrates are, however, connected with the administration of justice. Such are the *greffiers* (clerks of the court), who keep the archives, and receive a salary from the Government; the *huissers* (sheriff-officers), who give notice of summonses and sentences; and the *avoués* (solicitors) and the public notaries (*notaires*).

Statistics of justice (1874.)

Statistics of Justice (1874).—In 1874 the *juges de paix* had before their bar, with a view to private settlement, a total of 2,160,116 cases, and brought the parties to an agreement in 856,340, a result which is hardly satisfactory. As judges they had on their rolls 391,129 cases, to which 5166 electorial disputes must be added. Their decisions were appealed from in 4460 cases. There were 125,248 cases on the rolls of the civil tribunals of first instance. The commercial courts had 255,333 cases before them, 5596 of which were cases of failure or bankruptcy. In 1850 the number was only 138,027. The decisions of the various courts above mentioned were followed by 10,555 appeals, which were brought before the *cours d'appel*. In about 67 per cent. of these the original sentences were confirmed. Of offences 168,835 were brought under the consideration of the *tribunaux correctionnels*, 171,431 males, and 31,678 females being implicated in them. Of these 7509 were under sixteen years of age, and 146,588 above twenty-one. The tribunals acquitted 13,506. Out of 7949 appeals the *cours d'appel* confirmed about three-fourths of the original sentences, and in 1206 cases increased the punishment awarded by the *tribunaux correctionnels*. The jury and judges of assize courts tried 4084 cases, affecting 5228 prisoners, 4368 being males and 860 females: 55 were under sixteen years of age, 799 under twenty-one, and 284 above sixty; 2818 were unmarried; and nearly the half of the number consisted of people living in towns; 170 only had received a good education; 1810 could not read, and 2160 could read and write but imperfectly. The jurors found 1056 prisoners not guilty; 31 were condemned to death, 151 to hard labor for life, 972 to hard labor for a limited time, 1 to transportation; 29, who were under 16 years of age, were sent to houses of correction; sentences of imprisonment for various periods were passed on the others, except two, who were fined. Four women were among the prisoners condemned to death; the sentence was carried out in the case of 13 of the convicts; the others, including one of the women, had their sentences commuted. Besides these criminal cases, the *cours d'assise* had to decide on 20 alleged infringements of the laws and regulations affecting the liberty of the press, and on 10 political offences, consisting of speeches, cries, or displaying of emblems considered as seditious. The accused were 52 in number, of whom 28 were acquitted, 4 fined, and 20 sent to prison. There were 1100 criminal cases brought before the *cour de cassation*, which has the same jurisdiction in criminal matters as in civil. In a large majority of cases it confirmed the decrees of the tribunals, only 103 having been sent back for a new trial.

Prisons.

Prisons.—Although the prisons are attached to the ministry of the interior, it is impossible to treat of the administration of justice without saying a word about them. The convicts who have to serve more than one year are distributed into 24 central prisons (*maisons centrales*). Departmental prisons receive those whose sentence does not exceed one year. Political convicts are kept in custody in the two *maisons de détention* of Doullens (Somme) and Belle-Ile (Morbihan). Two places of transportation, Cayenne and New Caledonia, receive those who were formerly confined in *bagnes*, or convict prisons. The population of these penal colonies is considerably increased by the victims of internal discord; for in France it seems as if the victorious party thought that by banishing its opponents from their native land it could eradicate the ideas for which they unsuccessfully fought. The expenses of these different penitentiary establishments amount to about 18,500,000 francs. On the other hand, the produce of prison labor has a value of 2,800,000 francs.

Police.

Police.—The public peace is maintained by an armed police or *gendarmerie*, partly on foot and partly mounted; and in all emergencies, when this force is found insufficient for the preservation or execution of the laws, the troops may be called in to assist, subject, however, to the orders of the police. About 7000 *gardiens de la paix*, formerly *sergents de ville* (policemen), under the orders of the prefect of police, form in Paris an additional police force; and similar organizations exist in all the larger towns.

V. *Religion.*

Three churches are recognized and supported by the state in France,—the Roman Catholic, the Protestant (subdivided into Calvinist and Lutheran), and the Hebrew. In Algeria the Mussulman creed is equally recognized.

Roman Catholics.

Roman Catholic.—The Roman Catholic Church is much stronger than the others. It may perhaps be said that France is the country where this church is the most powerful; at any rate, it has there its most perfect organization, and raises the largest sums of money; and it is to France that, directly or indirectly, the Holy See appeals in all its difficulties. Most of the provisions of the "concordat" concluded in 1801 between the first consul Bonaparte and Pope Pius VII. are still in force. France is divided into dioceses, each governed by an archbishop or a bishop, and the dioceses into parishes, each of which has at its head a *curé*, or parish priest. Archbishops and bishops are appointed by the head of the Government and confirmed by the pope; the archbishop of Paris receives a salary of 50,000 francs, and the others are paid 20,000 francs a year. The stipend of the bishops is 15,000 francs per annum. In 1789 France contained 135 dioceses, 18 of which were archbishoprics. The Constituent Assembly made the dioceses correspond exactly with the departments; but this was changed by the concordat of 1815. The archbishoprics and bishoprics now existing in France are as follows:—

Archbishoprics.	Bishoprics.
Paris	Chartres, Meaux, Orléans, Blois, Versailles.
Aix, Arles, and Embrun	Marseilles, Fréjus and Toulon, Digne, Gap, Nice, Ajaccio.
Albi	Rodez, Cahors, Mende, Perpignan.
Auch	Aire and Dax, Tarbes, Bayonne.
Avignon	Nîmes, Valence, Viviers, Montpellier.
Besançon	Verdun, Belley, St. Dié, Nancy.
Bordeaux	Agen, Angoulême, Poitiers, Périgueux, La Rochelle, Luçon.
Bourges	Clermont, Limoges, Le Puy, Tulle, St. Flour.
Cambrai	Arras.
Chambéry	Annecy, Tarentaise, Maurienne.
Lyons and Vienne	Autun, Langres, Dijon, St. Claude, Grenoble.
Rheims	Soissons, Châlons-sur-Marne, Beauvais, Amiens.
Rennes	Quimper, Vannes, St. Brieuc.
Rouen	Bayeux, Evreux, Sées, Coutances.
Sens and Auxerre	Troyes, Nevers, Moulins.
Toulouse and Narbonne	Montauban, Pamiers, Carcassonne.
Tours	Le Mans, Angers, Nantes, Laval.

Every archbishop has three vicars-general, and every bishop two, making a total of 190. They are assisted by a chapter attached to each cathedral church, and presided over by the bishop. The *curés* have a minimum salary which varies from 1500 to 1200 francs, but additional money may be allowed by the municipal councils. They also receive the fees charged for baptisms, marriages, funerals, and extra masses, and have the benefit of a free house called a *presbytère*. The *curés* are about 3500 in number, and are assisted by curates (*vicaires*), and by *desservants*, the latter being priests attached to *succursales* or chapels-of-ease in large parishes. In 1873 the sums paid to the prelates and priests of France by the Government amounted to 39,382,495 francs—about two and a half millions more than in 1859.

The Roman Catholic Church possesses in France 89 *grands séminaires*, in which special instruction is given to young men who intend to enter the church, and 150 *petits séminaires*, or establishments of secondary education, by which the clergy endeavor to rival the *lycées* of Government. There are besides a number of schools and colleges kept by the Jesuits and other religious bodies. A recent law has even allowed the clergy to found independent universities, which will be noticed in the chapter on education. Convents are very numerous in France, especially for females. They are inhabited by about 140,000 persons (including 120,000 women), whose property is worth more than a thousand millions of francs.

Protestants.

Protestants.—The *Église Réformée* (Calvinist Church) has about one million of members in France, distributed into parishes, which form 103 consistories, and 21 synodal districts, including Algeria. The Lutheran Church (*Église de la Confession d'Augsbourg*) is far inferior in number. It is ruled by a directory, now sitting in Paris, instead of Strasburg as formerly. Sixty-one pastors compose the staff of this Church, whilst the Calvinist Church has 600. The seminary of the latter is at Montauban, and that of the former at Paris since the loss of Strasburg.

Jews.

Jews.—The Hebrew Church is administered by a central consistory presided over by the chief rabbi. It is subdivided into eight provincial consistories, sitting respectively at Paris, Lyons, Bordeaux, Nancy, Marseilles, Bayonne, Lille, and Vesoul. Their seminary used to be at Metz, but has been transferred to Paris.

VI. *Education.*

Ministry of instruction.

The National Convention laid the foundation of the system of public instruction that is still in force in France; the Government of the first Napoleon developed and completed it. At the head of public instruction is a minister, who has the title of grand-master of the university, this term describing not an institution for liberal education as in Great Britain and Germany, but the branch of administration under which public instruction in its universality is placed. The minister appoints all the officers of university administration, and fills up all the vacancies in colleges and schools. He is assisted by the superior council of public instruction, which has to examine the books adopted in schools and colleges, to judge and remove incompetent teachers,—in short, to watch over the concerns and interests of public instruction in all its branches. Attached to this council are 19 inspectors-general, who visit the principal establishments in the country for the purpose of inquiring into their management and the way in which instruction is conducted.

Academies.

Académies.—The whole territory of France is divided into 16 *académies*, or districts of educational jurisdiction, a list of which is appended.

Académies.	Departments included in them.
Paris	Seine, Cher, Eure-et-Loir, Loir-et-Cher, Loiret, Marne, Oise, Seine-et-Marne, Seine-et-Oise.
Aix.	Bouches-du-Rhône, Basses-Alpes, Alpes-Maritimes, Corse, Var, Vaucluse.
Besançon	Doubs, Jura, Haute-Saône.
Bordeaux	Gironde, Dordogne, Landes, Lot-et-Garonne, Basses-Pyrénées.
Caen	Calvados, Eure, Manche, Orne, Sarthe, Seine-Inférieure.

CHAMBÉRY	Savoie, Haute-Savoie.
CLERMONT-FERRAND	Puy-de-Dôme, Allier, Cantal, Corrèze, Creuse, Haute-Loire.
DIJON	Côte-d'Or, Aube, Haute-Marne, Nièvre, Yonne.
DOUAI	Nord, Aisne, Ardennes, Pas-de-Calais, Somme.
GRENOBLE	Isère, Hautes-Alpes, Ardèche, Drôme.
LYONS	Rhône, Ain, Loire, Saône-et-Loire.
MONTPELLIER	Hérault,, Aude, Gard, Lozère, Pyrénées-Orientales.
NANCY	Meurthe-et-Moselle, Meuse, Vosges.
POITIERS	Vienne, Charente, Charente-Inférieure, Indre, Indre-et-Loire, Deux-Sèvres, Vendée, Haute-Vienne.
RENNES	Ille-et-Vilaine, Côtes-du-Nord, Finistère, Loire-Inférieure, Maine-et-Loire, Mayenne, Morbihan.
TOULOUSE	Haute-Garonne, Ariége, Aveyron, Gers, Lot, Hautes-Pyrénées, Tarn, Tarn-et-Garonne.

At the head of each *académie* is a rector, assisted by an academical council, and by the inspectors of the district. His business is to superintend all the schools, colleges, and faculties within the bounds of his educational province, and to serve as the organ of communication between the inferior officials and the minister of public instruction. In the *académie* of Paris the rector is the minister himself, who is represented by a vice-rector. The rectors have not, however, the entire management of all educational matters, for primary schools are mostly under the superintendence of the perfect and of a departmental council.

Higher education.

Superior education is given by faculties of theology, law, medicine, sciences, and literature. The faculties of theology are established at Paris, Aix, Bordeaux, Lyons, Rouen, Montauban; those of law at Paris, Toulouse, Aix, Caen, Dijon, Poitiers, Rheims, Bordeaux, Grenoble, Douai, Nancy; those of medicine at Paris, Montpellier, Nancy; those of sciences at Paris, Besançon, Rennes, Caen, Bordeaux, Clermont, Poitiers, Dijon, Grenoble, Lille, Nancy, Lyons, Marseilles, Montpellier, Toulouse; and those of literature at Paris, Aix, Besançon, Bordeaux, Caen, Clermont, Dijon, Douai, Grenoble, Lyons, Montpellier, Poitiers, Rennes, Toulouse, Nancy. The faculties not only impart superior teaching, but are also examining bodies, which confer the degrees of bachelor, licentiate, and doctor.

Secondary education.

Primary schools.

The teaching work of the faculties is in some measure shared by 3 superior schools of pharmacy established in the same towns as the faculties of medicine, 22 preparatory schools of medicine and pharmacy, 5 preparatory schools of science and literature (at Angers, Lyons, Nantes, Chambéry, Rouen), and by the *École pratique des Hautes Études*, founded in 1868 at Paris. Secondary education is given in 80 *lycées*, attended by about 37,000 pupils, and 244 *collèges communaux*, with an attendance which is not much inferior in number to that of the *lycées*; but the organization of many of them is still in an imperfect state. The third and lowest stage of national instruction is that of the *écoles primaires* or primary schools. Every commune of 500 inhabitants has to maintain a boys' and a girls' school. The law is not yet very strictly observed; in 1871 the total number of schools was 51,881, of which 20,374 were boys' schools, 14,837 schools for girls, and 16,670 schools attended by girls and boys together. Primary instruction steadily gains ground in France, although it is neither gratuitous—except when parents cannot pay for it—nor obligatory by law. In 1827 only 420 out of 1000 could read; in 1857 this average had risen to 675, and in 1867 to 775. The following table was published in 1873 by the general bureau of statistics:—

Age.	Can neither write nor read.	Can read.	Can read and write.	Instruction not ascertained.	Total.
Under 6 years	3,540,101	292,348	151,595	38,042	4,022,086
From 6 to 20 years	2,082,338	1,175,125	5,458,097	70,721	8,786,281
Above 20 years	7,702,362	2,305,130	13,073,057	214,005	23,294,554
	13,324,801	3,772,603	18,682,749	322,768	36,102,921

Training schools.

To provide the staff of teachers necessary for these educational establishments, training schools (*écoles normales*) have been instituted. The *écoles normales primaires* are now 90 in number,—79 for the training of male and 11 for the training of female teachers. The *école normale supérieure*, founded by the decree of the 9th Brumaire, year III. (30th October, 1794), provides for the education of professors for the *lycées* or *facultés*; it maintains 100 students, who, during a course of three years, not only attain considerable proficiency in literature and science, but are trained to the art of communicating their knowledge to others in an attractive and interesting form. It is not, however, necessary to have gone through the course of study of the *école normale* to become a secondary teacher or a faculty professor; the condition required of students of the *école normale*, as of others, is to pass a series of examinations, and to acquire the degrees of *bachelier*, *licencié*, and *agrégé*, the last being the only one conferring rights of membership in the university.

The law of the 21st June, 1865, has laid down in the lycées and communal colleges a special course of teaching, more especially intended to prepare pupils for commercial and industrial pursuits; it is called *enseignement secondaire spécial*. A normal school, for the training of teachers who choose this line, was founded at Cluny (Saône-et-Loire) in 1868.

Private and special schools.

Private Educational Establishments.—The systematic provision thus made by the state for public instruction in France is supplemented in various ways. Not only may any one who possesses the diploma of bachelor engage in the work of primary and secondary education on his own account, but recently by a special law sanction has been given to the existence of institutions for superior instruction distinct from those of the state. The Roman Catholic clergy have not been slow to take advantage of this new state of things, and have established universities in which students may get their degrees, as in the old university of France. In 1872 there were, besides the governmental schools, 657 establishments for secondary education directed by laymen, and 278 by priests, the latter giving instruction to 34,000 pupils, whilst the 657 others were only attended by 43,000. There are other high class schools devoted to various special purposes, and not in all cases depending on the minister of public instruction. Such are the *École des chartes*, in which twenty students are trained during a three years' course to study the documents and historical remains of the Middle Ages; the *École des langues orientales*; the *École des beaux-arts*, which every year sends to Rome its best pupil in each of the departments of painting, sculpture, and architecture; the *École de Rome et Athènes*, where young *savants* find the opportunity of studying antiquities in the two great capitals of the ancient world; several special schools for the teaching of drawing and mathematics applied to the industrial arts at Paris, Lyons, and Dijon; the *École polytechnique*, in which the highest scientific education is imparted to young men who have passed a very difficult preliminary examination, and who wish to prepare themselves for the ordnance office, for engineering, or for high positions in the different branches of administration; the *École spéciale militaire*, established at St. Cyr for officers; the *École de cavalerie*, at Saumur; the *Prytanée militaire*, at La Flèche, in which gratuitious instruction is given to sons of officers, and non-commissioned officers; the *École d'application d'état-major*, for the training of staff officers; the *École d'application de l'artillerie et du génie*, at Fontainebleau, formerly at Metz, where old students of the polytechnic school receive a more special and developed instruction; the naval school at Brest; the *École d'application du génie maritime*, for students of the polytechnic school who are intended for maritime engineering; the *École d'hydrographie*, for sea-captains; the *École des ponts et chaussées*, which is under the minister of public works and prepares the old students of the polytechnic school for civil engineering; the *École des mines*, towards which a stage in the polytechnic school is also a first and necessary step; the *Conservatoire des arts et métiers*, under the control of the minister of agriculture and commerce; the *École centrale des arts et manufactures*, for the training of private engineers and manufacturers; the schools of *arts et métiers*, established at Châlons-sur-Marne, Angers, and Aix; the *École forestière*, at Nancy, which trains the administrators of the forests belonging to the state and to the communes; the agricultural schools of Grignon (Seine-et-Oise), Grandjouan (Loire-Inférieure), and Montpellier (Hérault); the veterinary schools of Alfort (Seine), Toulouse, and Lyons; the *Maisons d'éducation de la légion d'honneur* at St. Denis, Ecouen, and Les Loges, for daughters of knights of the Legion of Honor in straitened circumstances.

Notice must also be taken of the *Collége de France*, in which 34 professors deliver lectures to the public on almost every branch of human knowledge; the *Muséum d'histoire naturelle*, with 16 lecturers; and the chair of archæology attached to the national library of Paris. Government supports three great establishments devoted to astronomical study—the *Bureau des Longitudes* and the observatories of Paris and Marseilles.

The Institute.

The highest institution founded and kept up by the French Government on behalf of science and literature is the *Institut de France*, composed of five Academies as follows:—

Academies.	Sec-tions.	Members.	Honorary Members.	Foreign Members.
Académie Française	...	40	...	...
Académie des Inscriptions et Belles-lettres	11	40	10	8
Académie des Sciences	11	63	10	8
Académie des Beaux-Arts	5	40	10	10
Académie des Sciences morales et politiques	6	40	5	5

The *Académie de Médecine* is a separate body, divided into 11 sections; it is composed of 100 resident members, and a number of fellows and correspondents, chosen from among the medical celebrities of the world.

VII. *Charitable Institutions.*

Although there is no poor law in France, charitable establishments, either private or created and managed by the state, are very numerous, and, on the whole, efficient. *Orphelinats* (orphans' houses) receive infants which have neither parents nor friends to care for them; *crèches* and *salles d'asile* (infant schools) gratuitously give shelter and the first elements of education to poor children whose mothers must earn their daily bread by out-door work; young girls of the destitute class may learn a trade in the *ouvroirs* or workshops freely open to them in many towns; whilst lads find employment and agricultural training in such establishments as the *colonies agricoles* of Mesnil-St.-Firmin (Oise), St. Jean, Petit-Mettray (Somme), Lesparre (Gironde), Montmorillon (Vienne), etc. There are also other charitable institutions, analogous to those which exist in other countries. Besides these private charities, more or less supported by Government grants, there is a special department, called *assistance publique*, a branch of the minister of the interior, established to superintend, and in some cases organize, the *bureaux de bienfaisance* and hospitals. The *bureaux de bienfaisance* give out-door relief to the poor when it is deemed necessary. They are 12,989 in number, or about 36 *bureaux* for every 100 communes, a proportion quite inadequate—there should be one for each commune. In 1873 these bureaux assisted 1,312,847 people, or an average of 3·61 per cent.; but this help is still very unequally distributed, the average being 18 per 100 in the department of the North, and under 0·35 per 100 in the departments of Corsica, Ardèche, and Pyrénées-Orientales. The total amount of their disbursements, covered by foundations, grants, a tax on the theatres, and private gifts, is about 12,500,000 francs, which gives an average of less than 17 francs (13s. 8d.) for each pauper assisted. The same inequality appears here; for, whilst in the department of the Seine the average is 26·95 francs (£1, 1s. 7d.) per head, it falls as low as 6·45 francs (5s. 2d.) in less favored districts.

Hospitals.

The number of hospitals, in addition to the *Maison Municipale de Santé* and the seven great establishments of Paris, is 1481, furnished with 161,520 beds, and employing 2673 physicians and surgeons, 3212 officials, 11,032 nuns, and 11,534 servants. In 1873 the number of patients received was 410,441,—that is, 1 patient for 88 inhabitants. Out of 100 patients, 79 were discharged cured, at least for a time, and the death average was not above 9 per cent. Besides the patients who only pass through the wards (37 days is the average duration of their stay), 69,786 infirm, incurable, or old people live as inmates in some of the hospitals, which are specially designated by the name *hospice;* this number is divided into 27,256 men, 31,037 women, and 11,493 children. This population of invalids, both in *hôpitals* and *hospices*, was maintained at a cost of 93,269,886 francs.

It must be confessed that all these means of relief, good as they are, provide but very insufficiently for the wants of the million of poor which France reckons among her 36 millions of inhabitants. Pauperism is, there as elsewhere, a sore which civilization has been as yet quite unable to heal.

Lunatic asylums.

The census of 1872 shows that there were at that time 87,968 lunatics in France, an average of 2·44 for 1000 inhabitants. Of these 51,004 were kept at home, and 36,964 in asylums, public or private. In 1873 the number of asylums in France was 102, of which 61 were public; of the 41 private asylums 17 received the poor gratuitously. These asylums, at the end of the year, contained 41,064 inmates, of whom only about 8000 were able to pay for board and attendance; the rest were paupers. The average number of cures was 6 per cent., and of these part only would be permanent.

VIII. *Finance.*

Ministry of finance.

All the agents who have the charge of collecting taxes are under the minister of finance, who, besides, distributes to the other departments the sums necessary for their expenses. In each department a *trésorier payeur général* receives the taxes raised in his district, and is accountable for them to the central office of the treasury at Paris. These *trésoriers payeurs généraux* have a salary of 6000 francs a year, but they also get a percentage on the amount of taxes collected, and are allowed to transact private banking business with the funds of the state, as well as with their own. As security they have, before entering on their duties, to deposit with the treasury a sum which varies with the importance of their situation, but on an average amounts to 800,000 francs. A part of their business is to pay the creditors of the state in their respective departments. They are assisted in their work by *receveurs particuliers* in each arrondissement, except that in which the *trésorier payeur général* resides. These officials have a salary of 2400 francs a year, and a percentage on the amount that they collect. The security which they are bound to give is five times their total income.

Direct taxes.

The taxes that pass through the hands first of the *receveurs particuliers*, then of the *trésoriers payeurs généraux*, and finally into the treasury, are of two kinds, direct and indirect. The land tax, the poll and rent-tax, the tax on doors and windows, the license tax, and the tax on money invested in public funds or in bonds of private companies (*valeurs mobilières*) are now the chief sources of the direct revenue of the French treasury. The land-tax or *contribution foncière* is assessed on the net revenue of landed property. In order to obtain as correct a valuation as possible, a land register book was commenced in 1821, in which every piece of ground has to be described, with its extent and value, and the name of the owner. This work is not yet quite completed, and the continual changes which occur in the ownership of holdings, as well as in value or size, will always prevent it from being perfect. As it is, this gives the average net revenue of assessed land in France as amounting to 1,053,907,113 francs 56 centimes. In 1874 this yielded to the treasury a revenue of 169,905,814 francs. Each citizen owes to the state the value of three days' work; this is the *contribution personnelle* (poll tax). The value of a day's work varies with the districts; but it cannot exceed 1 franc 50 centimes (1s. 2½d.) or be less than 50 centimes (5d.). Every proprietor or tenant, except paupers, soldiers in service, and foreign diplomatic or consular agents, is assessed in proportion to the rent of the house he lives in. This tax, which is collected along with the preceding one, is distinctively called *contribution mobilière*. In 1875 the *contribution personnelle mobilière* gave a return of about 56 millions of francs.

The tax on doors and windows rises in proportion to the population of the communes or towns, the average being 30 centimes (3d.) for one aperture in communes having under 5000 inhabitants, and 1 franc (10d.) in those of 100,000 inhabitants and upwards. In 1871 the 8,467,483 houses in France were divided thus:

Houses with one aperture	276,384
" two apertures	1,883,924
" three apertures	1,601,050
" four apertures	1,112,024
" five apertures	793,551
" six and upwards	2,800,550

The value of the assessment was 43,275,000 francs in 1875; but the enormous number of houses having only one door, and of those having two doors without a window, or one door and one window, tells strongly against the wisdom of such a tax.

The license tax is imposed on every person carrying on any business whatever; physicians, bankers, and manufacturers are subject to this tax, as well as the humblest shopkeeper. On the 1st January, 1873, 1,529,363 names were on the rolls as *patentés*, and the amount produced by the tax was for the same year 73,726,331 francs.

A law of the 29th June, 1872, has established a tax of 3 per cent. on the income derived from money invested in the public funds and from bonds and shares in commercial or industrial companies. This tax, added to other duties previously established, as the stamp and the duty of *transmission*, raises to 7½ per cent. the charges that this kind of property has to bear.

Tax collectors.

These various taxes are collected by agents called *percepteurs*, under the orders of the *receveurs particuliers* or *trésoriers payeurs généraux.* Their number is 7000,—hardly enough for the amount and intricacy of the work they have to do. They are paid, not by a salary, but by a percentage on the money they raise. The collecting of other less important taxes, as the tax on mortmain, on mines, on weights and measures, on houses and carriages, on billiards and clubs, is also entrusted to them.

Excise.

The excise revenue, or *contributions indirectes*, is managed by a central office at Paris, with a *directeur général*, three *administrateurs*, and 94 other officials and clerks of various ranks. Each department has a *directeur*, assisted by *inspecteurs, sous-directeurs*, and *contrôleurs.* Under this head are comprised the taxes on intoxicating drinks, salt, tobacco, gunpowder, on public coaches and railways, on gold and silver work, on sugar, paper, matches, soap, stearine, salad oil, receipt stamps; also the navigation dues, bridge tolls, and a few other special taxes of little importance. The excise appears on the budget of 1877 for a sum of 1,039,293,800 francs. The taxes on paper, soap, stearine, oil, matches, etc., have been established in consequence of the war of 1870–71. A numerous staff is employed to collect these duties. Besides the high functionaries mentioned above and their clerks, there are 1795 *receveurs ambulants*, with 4637 *commis;* alcohol, matches, paper, salt, etc., require 218 officials; 200 are employed to collect the navigation tax; 2038 are attached to the manufactures of sugar, etc. The total number is above 19,000.

Customs.

For a long time the customs (*douane*) were only a branch of the administration of the *contributions indirectes*, but since 1869 they have formed a special office, at the head of which is a *directeur général*, with a salary of 25,000 francs, assisted by two *administrateurs* and 93 clerks. As far as this office is concerned, France is divided into 26 districts, administered by 26 *directeurs*, residing at Dunkirk, Lille, Valenciennes, Charleville, Nancy, Épinal, Besançon, Bourg, Lyons, Chambéry, Nice, Marseilles, Montpellier, Perpignan, Bayonne, Bordeaux, La Rochelle, Nantes, Vannes, Brest, St. Brieuc, Caen, Rouen, Le Havre, Boulogne, and Bastia. These directors have under them 81 inspectors, 71 sub-inspectors, and 130 clerks of all ranks. An armed force, composed of 245 captains, 469 lieutenants, 4056 non-commissioned officers, and 14,207 privates (*préposés*), is distributed along the frontiers to prevent smuggling; for the same purpose 1257 sailors, commanded by 371 *patrons* and *sous-patrons*, keep guard along the coasts. The customs contributed to the budget of 1877 a sum of 268,355,800 francs, and their collection cost 30,362,105 francs.

Other sources of revenue.

There are still other sources from which money flows into the treasury. The administration of the *enregistrement, timbre, et domaines* yielded 634,605,451 francs in 1877. This sum is made up—(1) by the fees charged for the registration of all legal documents and deeds; (2) by shooting and hunting licenses; (3) by the sale of stamps; (4) by the revenues and sales of state property; and (5) by fines of various sorts and the cost to the public of legal proceedings. From this amount 19,038,400 francs must be deducted, being the expenditure required to pay the expense of collection. The public forests and those managed by the state gave a return of 38,548,680 francs, and cost 12,995,732 francs. For all purposes connected with these taxes the country is divided into 32 districts, administered by as many *conservateurs*, whose residences are Paris, Rouen, Dijon, Nancy, Amiens, Troyes, Épinal, Châlons-sur-Marne, Besançon, Lons-le-Saulnier, Grenoble, Alençon, Bar-le-Duc, Macon, Toulouse, Tours, Bourges, Moulins, Pau, Rennes, Niort, Carcassonne, Aix, Nîmes, Aurillac, Bordeaux, Ajaccio, Chaumont, Vesoul, Chambéry, Nice, and Valence. The post-office department employs about 32,000 officials, at a cost of about 71,500,000 francs, and yielded 116,126,000 francs in 1877. The telegraph service is under the minister of the interior. In 1872, 123,000 kilometres (76,430 miles) of wires were laid along distances of 44,965 kilometres (27,940 miles). In 1877 the total income from this source amounted to 16,600,000 francs. The income from other less important resources, which cannot here be noticed in detail, may be estimated at not much less than 2 millions of francs.

National debt.

The total income of the public treasury in France, including the revenues of the departments and communes, is above 3,000,000,000 francs (£120,000,000), which is more than any other nation has to pay for the expenses of its government; and yet this enormous sum has not been sufficient to meet the wants of the state, for repeated loans have constantly increased the public debt. Not taking into account the petty payments of all sorts that Government has always to make, the public debt is divided into funded (*dette consolidée*) and floating debt (*dette flottante*). The funded debt is not subject to reimbursement, but only to the payment of a certain interest fixed by law. This debt, which was arranged by the law of the 9th of Vendémiaire, year VI. (27th September, 1797), to liquidate the old debts of the monarchy, then amounted to 40,216,000 francs of interest to be paid yearly to the creditors. From 1800 to 1814 it increased by 23,091,635 francs; and the Government of the Restoration added 101,260,463 francs, making a total of 164,568,100 francs in interest. Louis Philippe carried it to 176,845,367 francs, and at the time of the *coup d'état* it amounted to 230,768,863 francs. The second empire, during a period of eighteen years, created 168,187,663 francs of consols, thus charging France with an annual payment of 398,956,526 francs. As an unavoidable consequence of the Prussian war, the funded debt has been still further increased, so that the interest was 748,593,642 francs in 1874, and 747,571,030 francs in 1877, which gives an average of about 21 francs per head of the population.

The floating debt, which the Government contracts either by receiving private deposits and using them for its needs or by issuing bills of exchange called *bons du trésor*, amounted in 1872 to 761,000,000 francs. This part of the public debt, including some other items under the name of *capitaux remboursables à divers titres*, appears in the budget of 1877 for the much lower figure of 300,226,686 francs.

Budget for 1877.

The following table gives a summary of the budget proposed for 1877:—

Expenditure.	Francs.
Ministry of justice and religion	87,960,485
" foreign affairs	12,720,500
" interior	81,528,386
" finance	1,497,042,632
" war	531,148,836
" marine and colonies	186,622,116
" public instruction and the fine arts	56,628,762
" agriculture and commerce	19,762,388
" public works	238,246,535
Government of Algeria	24,587,322
	2,736,247,962

Receipts.	
Direct taxes	412,470,600
Indirect taxes (excise)	1,039,293,800
Enregistrement, timbre, et domaines	634,605,451
Forests	38,548,680
Customs	268,355,800
Post-office	116,126,000
Miscellaneous revenues	227,600,481
	2,737,003,812

IX. *Army and Navy.*

Army.

The principle that every citizen is a soldier is the foundation of the military system of France; but it has received a new force and a more complete application from the law of the 27th July, 1872. According to this law, every young man of twenty years of age, free from bodily defects, owes to the country five years of active service, five years in the territorial army, and six years in the reserve of the territorial army. The chief causes of exemption are physical infirmities and diminutive stature (the standard of height being 1 metre 54 centimetres or 60·631 inches). In a family of orphans, or of a widow, or

Compulsory service.

of a septuagenarian, or of blind parents, the eldest son is also exempt. If the eldest son is himself blind or invalid, the next one enjoys the privilege. Exemptions are likewise granted to brothers of soldiers on active service, or that have died when so engaged, or that have been pensioned, and to the elder of two brothers who should, on account of their age, be included in the same levy. Men serving in the navy, students of the Polytechnic school, of the *École forestière École des Langues orientales vivantes*, and *École des Chartes*, public teachers, and ministers of any of the religions recognized by the state are not called upon, but must serve the public in their respective capacities during a period which varies from five to ten years. In 1875, out of a total number of 283,768, 72,065 were exempted, 29,797 of them because of unfitness to serve, and 30,073 were deducted from the contingent as serving the state in some of the ways mentioned above. The law authorizes young men who hold the diploma of *bachelier*, or a certificate bearing that their studies have been carried on at a public school to a certain fixed standard (*certificat d'études*), and those who pass a special examination held for the purpose, to engage for one year as voluntary recruits, at the end of which they are sent home, provided they can give evidence of having received a good military training; but they are always, as long as they have not served for the time fixed by law, subject to be called out again in case of need. In 1875, 9804 men took advantage of this partial exemption. Voluntary enlistments are also permitted in the French army, which are binding for a period of not less than two years and not more than five. Many soldiers who have completed their legal time of service contract a re-engagement. Such *engagés volontaires* receive extra pay, but no bounty as formerly. They numbered 24,091 in 1875.

Military organization.

The minister of war is assisted at Paris by 2 general directors, a brigade major (*chef d'état major*), a historiographer, a law agent, and 434 other functionaries of various ranks, attended by 108 servants; the whole costs 1,895,350 francs a year.

Under the control of this central office, the army is divided into 19 corps, quartered in 19 territorial districts, Algeria being one of them. The infantry is composed of 144 regiments (three battalions of six companies each forming a regiment), numbering in all 225,111 men; 30 battalions of *chasseurs à pied* (light infantry), with 8 companies in each battalion, giving a total of 18,889 men; 4 regiments of *zouaves*, 12,000 men; 3 African battalions of light infantry, 3000 men; 5 *compagnies de discipline*, 1000 men; 1 foreign regiment, 3000 men; and 3 regiments of natives (Algerians), 9000 men. The cavalry consists of 75 regiments, viz., 12 cuirassiers, 26 dragoons, 19 *chasseurs* and 11 hussars,—numbering 47,498 men; 4 regiments of *chasseurs d'Afrique*, 3812 men; and 3 regiments of spahis, 2134 men. The ordnance comprises 38 regiments, each of them having 3 batteries served by foot soldiers, and 6 mounted batteries,—in all 42,500 men; 1 regiment of pontoon soldiers, 1877 men; 15 companies of workmen (*ouvriers*) and pyrotechnists (*artificiers*), in all 2215 men; 50 *compagnies du train*, 3870 men. There are 3 regiments of engineers, numbering 9000 men. Finally, 8000 men, distributed into 64 companies, are specially charged with the *équipages militaires*. The *gendarmerie* and the republican guard of Paris (mounted police) are also, for all military duties, under the orders of the minister of war, and now form a corps of about 40,000 men. France has thus in time of peace an effective force of about 440,000 men.

The French army is commanded by a staff of 5 marshals, 121 generals of division, and 200 generals of brigade. There are besides 81 generals of division and 197 generals of brigade on the rolls of the reserve.

The following table shows the division of France into 19 military districts:—

ALGERIA.	
AMIENS	Aisne, Oise, Somme, part of Seine-et-Oise, and Seine.
BESANÇON	Ain, Doubs, Jura, Haute-Marne, Belfort, Haute-Saône, part of Rhône.
BORDEAUX	Charente-Inférieure, Gironde, Landes, Basses-Pyrénées, Hautes-Pyrénées.
BOURGES	Cher, Côte-d'Or, Nièvre, Saône-et-Loire, part of Rhône.
CHÂLONS-SUR-MARNE	Ardennes, Aube, Marne, Meuse, Vosges, Meurthe-et-Moselle.
CLERMONT-FERRAND	Allier, Loire, Puy-de-Dôme, Haute-Loire, Cantal, part of Rhône.
GRENOBLE	Hautes-Alpes, Drôme, Isère, Savoie, Haute-Savoie, part of Rhône.
LE MANS	Eure-et-Loir, Mayenne, Orne, Sarthe, part of Seine-et-Oise, and Seine.
LILLE	Nord, Pas-de-Calais.
LIMOGES	Charente, Corrèze, Creuse, Dordogne, Haute-Vienne.
MARSEILLES	Basses-Alpes, Alpes-Maritimes, Corse, Bouches-du-Rhône, Gard, Ardèche, Var, Vaucluse.
MONTPELLIER	Aude, Aveyron, Hérault, Lozère, Tarn, Pyrénées-Orientales.
NANTES	Finistère, Loire-Inférieure, Morbihan, Vendée.
ORLÉANS	Loiret, Loir-et-Cher, Seine-et-Marne, Yonne, part of Seine-et-Oise and of Seine.
RENNES	Côtes-du-Nord, Manche, Ille-et-Vilaine.
ROUEN	Calvados, Eure, Seine-Inférieure, part of Seine-et-Oise and of Seine.
TOULOUSE	Ariége, Haute-Garonne, Gers, Lot, Lot-et-Garonne, Tarn-et-Garonne.
TOURS	Maine-et-Loire, Indre-et-Loire, Deux-Sèvres, Vienne.

National guard.

The national guard no longer exists; one of the first measures of the Government of M. Thiers, after crushing the Parisian insurrection of 1871, was to suppress it.

Hôtel des Invalides.

Some institutions must be mentioned here as attached to the war department, and completing the military organization of France. The Hôtel des Invalides was founded by Louis XIV. as a house of refuge for old infirm soldiers of all grades; but the number of the inmates is always decreasing, as old soldiers now generally prefer to live at home on their pensions and private resources, rather than to live in common apart from their families and under military discipline. In 1875 the *Invalides* numbered only 642; but the same year the maintenance of the Hôtel cost the state 1,123,053 francs. The order of the Legion of Honor, founded by Bonaparte in 1802, embraces both soldiers and civilians among its members. It is composed of knights (*chevaliers*), officers, commanders, grand-officers, and grand-crosses. The chief of the government of France has the title of grand master, and is the head of the order, which is managed by a grand chancellor and a council, the members of which are appointed by the president of the republic, as well as all the *légionnaires*, whose number is now about 38,500. A military medal, with a yearly pension of 100 francs, has been awarded, since 1852, to private soldiers and non-commissioned officers who have distinguished themselves in the service or on the field.

Legion of Honor.

Navy.

Under the minister of the navy and the control office at Paris, which employs 260 officials, there are five maritime prefects, one in each of the maritime arrondissements of France. These are—Cherbourg, with the subdivisions of Dunkirk and Le Havre; Brest, with St. Servan; Lorient, with Nantes; Rochefort, with Bordeaux; and Toulon, with Marseilles, Nice, and Bastia.

The naval officers in active service are—2 admirals, 18 vice-admirals, 30 rear-admirals, 343 captains of ships or frigates, and about 1377 lieutenants and officers of inferior rank. There are besides 14 vice-admirals and 20 rear-admirals on the rolls of the reserve.

The recruiting of sailors for the navy is secured by the *inscription maritime*, established by Colbert in 1681, and regulated since by various decrees and laws. According to the law as it now stands, all fishermen and men employed on board merchant ships must have their names inscribed in a special register, and are bound to give, whenever required, a minimum of three years' service in the navy. In 1873 this register contained 151,830 names. A special body of ordnance, called *artillerie de marine*, is composed of 243 officers and 4216 soldiers, part of whom are in garrison in the colonies. The general staff of the naval ordnance at Paris is composed of a general of division, 2 generals of brigade in active service and 2 in the reserve, 1 colonel, 2 lieutenant-colonels, and a few subaltern officers. The administration is divided into 6 directions, the seats of which are Cherbourg, Brest, Rochefort, Toulon, Lorient, and La Villeneuve.

The marines in the fleet number about 15,000, divided into 4 regiments with 780 officers, and a staff consisting of

2 generals of division, 4 generals of brigade, 1 chief of battalion, and 3 aides-de-camp.

The fleet consisted in 1876 of 110 vessels of all sizes (10 of them iron-clads of first and second rank), armed with 529 guns, and of a reserve comprising 18 iron-clads and 60 other vessels.

X. *Roads.—Railways.—Navigable Rivers and Canals.—Harbors.*

Before referring to the state of agriculture, manufactures, and commerce in France, it is important to have an idea of the means of communication by which the different productive districts are connected with one another. The minister of public works has the superintendence of all roads and ways, natural or artificial, by land or by water. A special department, called *Administration des Ponts et Chaussées*, assisted by a council with the minister as its president, is charged with the management of that important branch of public business; 569 engineers and inspectors, and 2153 inferior officials form the administrative staff.

Roads.

Roads are either national, departmental, military, or *vicinal* (cross roads). National roads are kept up entirely at the expense of the public treasury. The departments have to provide for departmental roads and a portion of the military roads, the rest being charged on the state. As to cross roads, or *chemins vicinaux,* they depend, by an awkward anomaly, on the ministry of the interior, and are kept up by the communes, or, when of a higher importance, by the departments. At the end of 1811, 229 roads were classified as imperial roads. They extended over a length of 46,500 kilometres (28,894 miles). In 1815, after the territory of France had been brought back to its ancient limits, the length was only 27,200 kilometres (16,901 miles); in 1873 there were 223 national roads, giving a total of 37,304 kilometres (23,180 miles), 2627 kilometres (1632 miles) of which are still paved like a street. The average breadth of that class of road is 16 metres (52 feet 6 inches), 6 metres for the causeway, 6 for the sideways, and 4 for the ditches and embankment. Although the great extension of railways has somewhat reduced the importance of high roads, it has been calculated that the traffic has changed very little during the last twenty years. The departmental roads are not quite so wide as the national ones, their average breadth being 12 metres (39 feet). In 1872 their length was 46,939 kilometres (29,167 miles). Military roads were made in the west of France, after the last insurrection of Vendée. They are 28 in number, distributed in the departments of Charente-Inférieure, Ille-et-Vilaine, Loire-Inférieure, Maine-et-Loire, Mayenne, Sarthe, Deux-Sèvres, and Vendée, and extend to a length of about 1500 kilometres (932 miles).

A sum of nearly 34 millions of francs is spent yearly for the purpose of making new roads or repairing old ones. The *chemins vicinaux,* or cross roads establishing a communication between rural places not far distant from each other, are managed by a special branch of the department of the minister of the interior; about 3000 *agents-voyers* and 42,000 *cantonniers* or workmen are specially charged with the duty of keeping them in repair. In 1872 these roads, divided into three classes according to their importance, were 544,390 kilometres (338,273 miles) in length, and covered a surface of about 370,000 hectares (915,000 acres). To the very considerable resources which the communes must apply to the extension and repair of their rural roads the Government used to add a yearly grant of 11,500,000 francs; but this sum has been reduced to 5,750,000 francs since 1873. The *Annales* of the administration of the *Ponts et Chaussées* mention 1982 large bridges, of which 79 are cast iron. The chief are the bridge over the Gironde at Bordeaux, which has 17 arches, is 501 metres (1643 feet) in length, and cost 6,850,000 francs; the bridge of Cubzac, over the river Dordogne; the turning bridge of Penfeld at Brest; the bridge St. Esprit, over the Rhone, with 18 arches on a length of 730 metres (2395 feet); those of Toulouse, Libourne, Tours, and Rouen; the new bridge (*Pont-Neuf*) and the bridge of Iéna at Paris; and the bridge of La Guillotière at Lyons.

Railways.

Although the system of railways in France is far from being so complete as in England and Belgium, the country is now traversed by great lines which connect together all the principal towns; and lines of less importance have been made, or will ere long be established, in every district. The chief lines, which are worked by powerful companies under the superintendence of the state, are—(1) the *Chemins de fer du Nord,* which run between Paris and Soissons, Boulogne, Calais, Rouen, Amiens, etc., traverse the coal districts of Picardy, and reach the Belgian territory at Quiévrain and at Tournay; (2) the *Chemins de fer de l'Est,* from Paris to Strasburg, Mulhouse, and Basel in Switzerland, through Alsace, with branch lines to Sedan, Metz, Luxembourg, Rheims, Sarreguemines, etc., joining Belgian and Prussian railways at several points of the frontier; (3) the *Chemins de fer de l'Ouest,* which traverse Normandy in every direction, and connect Paris with the towns of Brittany; (4) the *Chemins de fer d'Orléans,* which go to Nantes, Bordeaux, Limoges, Bourges, and Toulouse; (5) the *Chemins de fer de Paris à Lyon et à la Méditerranée,* which connect the valley of the Seine with that of the Rhone, and have branch lines to St. Étienne, Clermont-Ferrand, Grenoble, Toulon, Cette, etc., establishing regular and direct communication between France and Switzerland —the railways of Savoy being also worked by the same company. Paris is the starting point and the administrative centre of all these lines. Another great line worked by the *Compagnie du Midi,* starts from Bordeaux, which it connects with Cette and Bayonne, with branches between Bayonne, Toulouse, and Foix, Agen and Tarbes, Toulouse and Auch, Montpellier and Milhau, etc. Through this line Spain is brought into communication with France.

The other lines worthy of mention are—the railways of the Charentes, connecting La Roche-sur-Yon, La Rochelle, Rochefort, Coutras, Angoulême, Saintes, Limoges, and St. Jean d'Angély; the line from Chauny to St. Gobain; the railway of the docks of St. Ouen, Paris; the line from Dunkirk to Fumay (Belgian frontier); those from Épinay to Velars, from Béthune to Lille, from Somain to Anzin and the Belgian territory, from Vitré to Fougères, and from Perpignan to Prades; the Médoc railway; the Vendée railways; and the *Chemin de fer de ceinture,* which encircles Paris.

The capital required for the making of these railways has been calculated at not less than 10,000,000,000 francs—which gives, for a total length of 21,987 kilometres (13,662 miles), an average of 297,000 francs per kilometre, or £19,118 per English mile. The state has granted and still grants large sums to the companies; but in return they are subject to a tax in proportion to their traffic, as well as to other dues, which are a considerable source of revenue to the public treasury, the profit realized by it having been 55,912,330 francs in 1873. The yearly returns of the companies show an average income of 840 millions of francs.

Navigable rivers and canals.

All navigable rivers are state property. A table is subjoined of the navigable rivers arranged by basins, with the length of their navigable course, and also of the canals and the small rivers which have been converted into canals. Owing to the cheap rate of transport by water, canal traffic has been but little injured by the extension of railways, this inexpensive way of conveyance being used for heavy goods

whenever practicable. In 1875, 1,721,070,943 kilometric tons (about 1,748,500,000 tons avoirdupois) were carried by river and canal navigation, besides 176,551,434 cubic metres (230,933,000 cubic yards) of wood or *bois flotté*. The duties levied on these goods amounted to more than 4,177,940 francs.

Harbors.

France is but very inadequately provided with harbors; her long tract of coast washed by the Atlantic and the Bay of Biscay has scarcely three or four good seaports, and those on the southern shore of the channel form a striking contrast to the spacious maritime inlets on the English side. To begin from the north-east, Dunkirk has a small harbor, enlarged, however, by docks, and approached in the Dutch manner by a canal leading from the sea. Calais, one of the best ports on the coast, is not to be compared with Dover. Boulogne has a roadstead, which has been of late greatly deepened and improved. The port of Dieppe is exposed, and of course unsuitable for winter. The best mercantile harbor in the north of France, Le Havre-de-Grâce, at the mouth of the Seine, has large basins and docks, formed at a very great expense. Cherbourg is now a port and arsenal of great utility and importance to the navy; its roadstead, extensive but open, has a sea-wall, affording protection from the swell of the sea; and its spacious dock, excavated since the beginning of this century, at an expense of £3,000,000 sterling, is capable of containing fifty sail of the line. St. Malo, on the north coast of Brittany, possesses a good and large harbor, with quays extending to a length of 2955 metres (3231 yards); its entrance is protected by fortified islets. Brittany also possesses Brest, the great maritime port of the Atlantic for the navy, and, in the south-west, Lorient. Proceeding further to the south, we find Nantes, with its two ports at the mouth of the Loire, Paimbœuf and St. Nazaire; Les Sables d'Olonne, now connected with Liverpool by a regular service of steamers; Rochefort, on the Charente, one of the great dockyards and naval stations; La Rochelle, a small but secure harbor; and Bordeaux, where the Gironde is nearly equal in width to the Thames at London. From this there is no seaport worthy of mention until we reach Bayonne, a place of difficult access. On the Mediterranean, France has the ports of Cette, Marseilles (the most spacious and secure on the coast), Nice, and the great maritime port, arsenal, and dockyard of Toulon.

XI. *Agriculture.*

Agricultural population.

The rural population of France is equal to about a half of the total number of the inhabitants. The census of 1872 gave a return of 18,513,325, or 52·71 per cent. of the whole population. That number was divided thus:—

Landowners living on their estates	9,097,758
Farmers and tenants	4,570,068
Gardeners and nurserymen	378,827
Woodcutters and charcoal burners	270,743
Servants	940,311
Day laborers	3,255,618

Progress in agriculture.

In the general description of the country, some information has been given as to the nature of the soil and its various kinds of produce, which must be supplemented here. The extent of agricultural improvement in France since the first Revolution has certainly been less than in England and Scotland, and it has been repeatedly said that this inferiority had its chief cause in the insignificant size of the occupancies, a feature of French agriculture which Arthur Young observed in his time, but which has been much increased by the law obliging a father to make an almost equal division of his property amongst his children. It would be perhaps nearer the truth to say that generally the more fertile a country is the less care the inhabitants take to cultivate it; if we add to this the influence of the climate, which makes country people more frugal, and at the same time more indolent, we shall be able to account for the difference in the state of agriculture as between the northern and the southern provinces of France. It does not appear, however, that land thus divided produces less in proportion than large estates, and, notwithstanding the great progress that France has still to make, it is in an agricultural point of view as rich as any other country.

Average land value and rent.

The *Statistique Officielle* gives a statement of the average value of land per hectare, and the average rent paid for it, distinguishing in each case three classes of land, thus:—(1) Lands under tillage: value, 3066, 2175, 1355 francs; rent, 96, 69, 45 francs; (2) meadows: value, 4151, 3958, 2022 francs; rent, 152, 104, 72 francs; (3) vineyards: value, 3564, 2638, 1783 francs; rent, 139, 98, 68 francs.

The value of wood varies from 2877 to 1435 francs for the forests, and from 1081 to 569 francs for copsewoods.

Grain crops.

The cultivation of grain has always been the chief business of French agriculturists. In 1873 about 13,000,000 hectares were under this crop, and in 1875 this had increased to about 15,000,000, distributed thus:—

	Hectares.	Average Crop per Hectare.	Total Produce.
		Hectolitres.	Hectolitres.
Wheat	6,961,419	12·04	83,861,193
Meslin	503,178	12·50	6,287,301
Rye	1,912,601	10·86	20,779,367
Barley	1,118,071	16·75	18,732,827
Oats	3,182,456	21·33	67,891,995
Buckwheat	677,626	14·35	9,722,257
Maize	505,993	14·72	8,918,352
Millet	49,984	12·24	612,031

Wheat sells at prices varying from 20 to 26 francs a hectolitre (46s. 6d. to 60s. 5d. a quarter), and costs the agriculturist about 17 francs 50 centimes (40s. 8d. a quarter). The quantity which is produced in France, large as it is, does not meet the wants of the population, and several millions of hectolitres are every year imported from Russia, Prussia, Roumania, Spain, Italy, Egypt, and America.

The cultivation of meslin and rye is on the decline; wherever the progress of agricultural science had succeeded in making a poor soil more rich and fertile, wheat takes their place, as being better and more profitable.

The area allotted to barley has been much the same for a long period, and is likely to remain so. The same may be said of maize, which is especially cultivated in the east and south-west, and of buckwheat, which in Auvergne and Brittany forms no small part of the food of the inhabitants. Oats are extensively cultivated and yield a good return; this crop was on the increase from 1815 to 1862, but has since been almost stationary.

Other crops.

Potatoes form a very important article, occupying in 1873 1,176,496 hectares (2,907,290 acres), and yielding 120,410,929 hectolitres (331,274,554 bushels).

The other crops are tabulated here with the results they yielded for 1873:—

	Hectares.	Average Crop.	Total.
		Hectolitres.	Hectolitres.
Pease, beans, etc.	322,681	13·74	4,434,107
Chestnuts	482,247	13·68	6,567,381
Colza and other oleaginous plants	214,808	13·34	2,963,441
Olive trees	148,626	...	4,594,010
		Quintals.	Quintals.[1]
Beet	253,335	306	77,435,100
Hops	3,528	14	50,244
Tobacco	14,858	12	172,522
Hemp	95,521	5·28	503,941
Flax	87,671	5·75	503,917
Miscellaneous	10,900	20	319,898

[1] The *quintal mètrique* is 3½ ℔ less than 2 cwt.

Meadows.

Meadows, both natural and artificial, are very numerous in France, and give a higher return than any other kind of land. Artificial meadows, sown with clover or lucerne, have considerably increased in extent, as will be seen from the following comparative table:—

	1842.	1852.	1862.
	Hectares.	Hectares.	Hectares.

Vineyards.

The vineyards cover 4·27 per cent of the surface of France, and are one of the chief sources of its agricultural wealth. They are to be found, more or less, in every district, except in ten northern departments, viz., Calvados, Côtes-du-Nord, Creuse, Finistère, Manche, Nord, Orne, Pas-de-Calais, Seine-Inférieure, and Somme. In 1862, according to statistical documents then published by the Government, the departments in which the vine was most extensively cultivated were—Hérault (162,172 hectares), Charente-Inférieure (157,753), Gironde, (126,220), Charente (100,008), Gers (94,790), Gard (94,200), Dordogne (87,252), Aude (81,869), Var (79,040), Lot-et-Garonne (69,166). The vintage of 1876 gave a total of about 41,846,748 hectolitres (921,033,017 gallons).

Live stock.

The census taken in 1872 gave 2,882,851 as the total number of horses, comprising 400,454 colts, 351,654 stallions of 4 years and upwards, 872,911 geldings, and 1,257,832 mares. The number of mules was 299,129, and of asses 450,625. The returns for the same year gave 10,023,746 head of cattle and 24,707,496 sheep. The goats, particularly numerous in Corsica and some mountainous parts, were 1,791,725. The addition of 2,500,000 beehives, of a total value of about 32,800,000 francs, 58,300,000 poultry of all kinds, and 2,300,000 dogs completes the enumeration in its principal divisions of the live stock of agricultural France.

Ministry of agriculture.

In France the interests of agriculture are entrusted to a special minister. Under him are general inspectors, whose duty it is to visit the different parts of the country, and to report on their respective position and wants. These reports serve to determine the distribution of grants and rewards which the state dispenses every year. In 1869 the sum of money given as relief in cases of fires, cattle disease, and damage caused by storms, frost, or excessive drought, floods, and other accidents, amounted to 2,171,340 francs. As rewards, the state gives premiums to the owners of the best stallions and brood-mares (826,000 francs in 1873); it supports by grants riding schools and establishments for training horses (160,500 francs), gives prizes for racehorses (404,500 francs), and distributes about 1,400,000 francs a year for the creation and maintenance of agricultural societies. The principal object of these societies is the organization of provincial shows of cattle, implements, and agricultural produce, under the name of *comices agricoles.* The Government has, besides, founded institutions that are entirely under its management and belong to the state. Such are the sheep-folds of Haut-Tingry (Pas-de-Calais) and Rambouillet (Seine-et-Oise), the cow-house of Corbon (Calvados) for the breeding of Durham cows only, and the *haras* or stallion stables. These stables, containing together about 1085 horses, and kept at an expense of 1,844,000 francs, are established in 22 central towns, and send stallions every year to 340 stations. Two great banking establishments have been founded in order to help those who are engaged in agricultural business. The one, the *crédit foncier*, grants loans on land securities; these loans amounted for the year 1872 to 45,482,242 francs 60 centimes, divided among 1156 borrowers. The other, the *crédit agricole,* which dates from 1860, discounts bills and lends on personal or other security, but always with the object of promoting the progress of agricultural pursuits. In 1872 this company negotiated bills to the value of 248 millions of francs. It paid the same year a dividend of 15 francs for each 500 francs share. The *crédit foncier*, which is an older institution (1852), paid 35 francs for each share of the same value.

XII. *Manufactures, Mines, and Quarries.*

Textile manufactures.

One of the foremost branches of manufacture in France is that which has for its object the working up of textile materials. The gross amount of its produce is not less than 3,500,000,000 francs a year, and statistics published in 1873 return it as employing 308,481 men, 306,898 women, 69,948 children, 2777 steam-engines, and about 9,500,000 spindles. These figures relate to the period between 1861 and 1865, and are certainly very much less than if the enumeration had been taken more recently.

Linen.

The flax gathered in 1873 weighed 54,874,740 kilogrammes (1,081,276 cwt.), and represented a minimum value of 84 millions of francs; to which must be added 10,188,721 kilogrammes (200,766 cwt.) of hemp, at an average price of one franc a kilogramme. About 800,000 spindles are kept busy with this material. In this branch of trade the department of Nord ranks first; it manufactures more than one-third of the total amount of linen produced. Seine, Sarthe, Maine-et-Loire, Seine Inférieure, Calvados, Ille-et-Vilaine, Lot-et-Garonne, Indre-et-Loire, and Seine-et-Oise are, next to the department of Nord, the chief seats of this industry.

Cotton.

The cotton manufacture has its centre in Normandy. More than a third of the total produce of the French cotton looms comes from the department of Seine-Inférieure; Nord, Vosges, Calvados, Aisne, Aube, Orne, Meuse, and Eure have also a large share in the production of cotton yarn and cotton cloth. The department of Rhône is famous for its cotton muslins, the value of which is not less than 28 millions of francs. Meurthe produces a special kind of trimming, valued at about 3 millions of francs a year. French cotton goods cannot cope in cheapness with the English, but they are of fine quality, and on this account command a sale in the markets. In the absence of authentic documents, we may safely estimate the produce of cotton manufacture for 1872 at 500 millions of francs, and the plant engaged in the trade at 6 millions of spindles and 260 millions of looms of various kinds. The loss of Alsace has been a heavy blow to the cotton trade of France.

Woollen.

In the woollen factories 3,200,000 spindles are employed, giving work to more than 172,000 people. Wool fabrics amount in value to 1,200,000,000 francs, figures which present a striking contrast to the valuation of Count Chaptal in 1812, which was not above 250 millions of francs. Large manufacturing houses are to be found especially in the departments of Ardennes (Sedan), Nord (Lille, Cambrai, etc.), Marne, Eure (Louviers), Hérault; while Rhône is noted for shawls, Bouches-du-Rhône for washing and combing, Calvados for wool yarns, Aisne for both yarns and tissues, Aude for drapery, etc. The special manufacture of Paris is that of shawls, damasks for furniture, merinos, and lighter fabrics as gauzes, muslins, bareges, etc.

Silk.

The rearing of silk-worms and the production of silk can be traced far back in the industrial history of France. The first Avignon pope, Clement V., is said to have introduced the first silk-worms and the first mulberry trees (1305). This branch of industry soon assumed a national character, and all kings who, like Louis XI. and Henry IV., cared for the progress of commerce and manufactures, gave it encouragement and privileges. In 1780 France produced 6,600,000 kilogrammes of cocoons (14,549,194℔), having a value of 15,500,000 francs. The following table shows the progress made in the rearing of silk-worms from that date:—

Years.	Weight of Cocoons.		Value.
	Kilogrammes.	Cwt.	Francs.
1781–88	6,200,000	122,167	18,600,000
1789–1800	3,000,000	59,113	9,800,000
1801–1807	4,200,000	82,761	13,600,000
1808–12	5,147,800	101,436	17,502,550
1813–20	5,200,000	102,463	21,520,000
1821–30	10,800,000	212,808	44,080,000
1831–40	11,537,000	227,132	42,840,000
1841–45	17,500,000	344,631	66,500,000
1846–52	24,254,000	477,911	91,816,000
1853	26,000,000	512,335	117,000,000
1863	9,578,804	188,745	51,916,837
1867	14,082,942	277,496	98,580,515
1869	8,076,545	159,144	60,170,260
1872	9,871,116	194,505	60,707,363

These 9,871,116 kilogrammes of cocoons gave 636,800 kilogrammes (12,547 cwt.) of raw silk. Twenty-one departments are engaged in the rearing of silk-worms,—those which yield the largest produce being Gard, Drôme, Ardèche, Vaucluse, Bouches-du Rhône, Var, Isère, Hérault, Basses-Alpes, etc. After having undergone the various operations which transform the cocoon into regular yarn, the silk goes to the weaver. Nine-tenths of the silk is woven at Lyons, by 120,000 looms, belonging to 400 firms, with nearly 800,000 workers, who every year produce silk goods to a value of about 460 millions of francs.

Lace and embroidery.

The manufacture of lace gives employment to 240,000 women at Alençon, Bailleul (Valenciennes), Lille, Chantilly, Caen and Bayeux, Mirecourt, Le Puy, and Paris; and there are 150,000 embroiderers spread over Paris, Lyons, Nancy, Épinal, Tours, Mirecourt, Lunéville, Plombières, St. Mihiel, St. Dié, Alençon, Tarare, Caen, Le Puy, Lille, Cambrai, St. Quentin, etc. The two industries contribute to the public wealth about 90 millions of francs every year.

Hosiery.

Cotton hosiery has its central point in the department of the Aube, wool in Picardy, and silk at Nîmes, Lyons, and Paris; the last also manufactures nearly the whole produce of France in linen hosiery. The annual value of this branch of industry may be stated approximately at 200 millions of francs.

Shoemaking.

The number of shoemakers is above 83,000, and they employ about 120,000 workmen and assistants. Shoes of cloth (*chaussons*) are made by 819 firms, employing 5200 workmen and assistants; and wooden shoes, an important branch of the business, are made chiefly in the departments of Cantal, Orne, Sarthe, Vosges, Vaucluse, and Puy-de-Dôme, and in Brittany, by 34,700 makers, assisted by 77,500 workmen. It has been calculated that this article has a value of about 530 millions of francs. Paris, Grenoble, Lunéville, Vendôme, Blois, Béziers, Annonay, and Niort are the chief seats of the manufacture of gloves, which represents a sum of about 70 millions of francs.

Gloves.

Other clothing.

Hats and caps are made every year to the value of 50 millions, by 6200 houses, employing about 24,000 workmen. Millinery, chiefly made in Paris, gives work to about 4000 persons, most of whom are women. It may be valued at 25 millions of francs. Tailors, and outfitters of all kinds number about 74,000, and give work to 82,000 workmen, seamstresses, and shop-assistants.

Beet sugar.

Beet sugar is extensively made in the north of France. The manufacture of this sugar in a raw state was thus distributed for the year 1876:—

	Kilogrammès.	Cwt.
Aisne	92,721,965	1,827,034
Nord	111,114,778	2,189,454
Oise	41,367,892	815,131
Pas-de-Calais	60,102,110	1,184,278
Somme	67,747,541	1,334,927
Other departments	75,817,002	1,493,931

These quantities are produced by about 510 manufactories. Ninety establishments are especially engaged in refining the first produce extracted from beetroot, or from the sugar cane; about 180,000 tons of raw sugar are received annually from the colonies, French and foreign, by these refining establishments, which employ 3400 workers. The yearly value of the manufacture amounts to 140 millions of francs.

Liquors.

Wine, treacle, and the juice of the beetroot are the substances from which the largest quantity of the alcohol produced in France is extracted. About 3500 firms are engaged in distillation; the produce for the year 1875–76 was divided thus:—

			Hectolitres.	Gallons.
Alcohol distilled from		wine	415,967	9,155,295
"	"	corn and potatoes	97,467	2,145,217
"	"	beetroot	315,024	6,933,572
"	"	treacle	681,734	15,004,739
"	"	other substances	48,017	1,056,838
			1,558,209	34,295,661

To this 429,648 hectolitres (9,456,409 gallons) are to be added, distilled by small proprietors who do not manufacture much more than for their own consumption, and are known by the name of *bouilleurs de cru.* Normandy and Brittany are the chief centres for the production of cider. In 1876 about 7,035,669 hectolitres (154,845,539 gallons) were manufactured. There are about 3200 brewers, who send out not less than 7,400,000 hectolitres of beer (162,871,543 gallons), worth about 200 millions of francs; but, as hops are but little cultivated in France, 3 millions of francs are spent yearly in importing them. The largest manufactories of vinegar are in the departments of Loiret and Loire-Inférieure; it is made almost exclusively from wine, but malt and some other substances are now beginning to be used. The total value is about 3 millions of francs.

Tanning.

The dressing and tanning of hides and skins have greatly increased of late years; they now represent a sum of 400 millions of francs, or about a million of francs more than in 1852.

Soap.

The principal soap manufactories are at Marseilles, its production being 800,000 quintals (1,576,354 cwt.); Nantes and Paris hold the second rank. It has been calculated that France produces annually 2 millions of quintals (3,940,886 cwt.) of soap. Candles are chiefly made at Paris. This branch of manufacture has a total value of 300 millions of francs, whilst the production of soap amounts to 450 millions. French perfumery is appreciated through the world, and gives a yearly return of more than 50 millions of francs.

Candles.

Perfumery.

Pottery and glass.

The departments of Vienne, Seine, Sarthe, and Puy-de-Dôme are the centres of the fabrication of earthenware and bricks; in Haute-Vienne, Var, and Gironde the special manufacture is china. In 1847 official statistics valued at 85,964,000 francs the total produce of that industry; but this value has certainly more than doubled since. A great manufactory kept up by the state at Sèvres forms a school in which artistic workmen are trained, so that the art is maintained in a high degree of perfection. Crystal wares are made in eight works, established in the departments of the Meurthe-et-Moselle, Seine, and Orne, among which special mention must be made of Baccarat, which is to this branch of industry what Sèvres is to the ceramic. Looking-glasses are a very important article of manufacture in France,—that country possessing no fewer than 6 out of the 15 or 16 establishments in Europe. The principal manufactory is at St. Gobain (Aisne), and the value of the produce of the whole is above 14 millions of francs. Glass of a more common kind is made in about 250 establishments, and is valued at 80 millions of francs. The departments of Nord, Haute-Saône, Haute-Loire, Allier, Seine-Inférieure, Seine, Aveyron, and Loire are famed for common window and plate glass; bottles are chiefly manufactured in the department of Nord, and in the basins of the Loire and Rhône; the most ancient works established for this manufacture are at Quiquengrogne (Aisne), and date as far back as 1291.

Paper.

The most important paper-mills are situated in Charente, Pas-de-Calais, Seine-et-Oise, Isère, Vosges, Seine-Inférieure, Seine, Eure, and Seine-et-Marne. Paris is celebrated for its paper-hangings and stained papers. In 1856 Moreau de Jonnès valued the produce of this manufacture at 55 millions of francs. Notwithstanding the special taxes now levied on it, this amount has undoubtedly increased by a large sum.

Books and prints.

In the period between the 1st November, 1811, and the 31st December, 1872, 603,849 works have been published in France, subdivided thus:—

Books and pamphlets in all languages	463,617
Engravings, maps, and plans	85,787
Musical publications	54,445

In 1872 the number of publications of all kinds was 15,744, 3614 of which were musical works, and 1571 engravings, maps, or plans. Proprietors of political newspapers must deposit with the treasury a guarantee that they will pay the fines to which the press law often renders them liable; security to the amount of 24,000 francs is required in the department of Seine, and 12,000 francs in the others. If the paper appears only once or twice a week, the security required is only 18,000 francs in the department of Seine and 6000 in the rest of France. The paper on which political newspapers are printed is charged besides with a tax of 20 francs per 100 kilogrammes (about 8s. 1½d. per cwt.). Notwithstanding this 854 political newspapers, 210 of which were daily, were published in France (54 of them in Paris) in 1873. Non-political periodicals were not fewer than 1220, to which number Paris contributed 718, divided thus:—religious, 81; educational, 21; legal, 42; administration, 18; political economy, insurance, and commerce, 40; stock-exchange interests, 39; medical, 54; natural philosophy, 45; agricultural, 37; military and naval, 23; history and geography, 17; fine arts and architecture, 49; literary and critical, 56; fashion and the amusement of the young, 84; archæological, 14; public works, 26; technology and popular science, 50.

The printing and bookselling trades are carried on by about 7000 persons, who may be classed as follows:—

	Paris.	Departments.	Total.
Printers	88	944	1032
Printers and lithographers	549	911	1460
Copper-plate printers	67	61	128
Booksellers	1034	3354	4388
	1738	5270	7008

Coal.

The principal mines which France possesses are coal and iron mines. Coal-pits are almost exclusively confined to the east, south-east, and north of the country. The richest departments are Nord (239 square miles), Pas-de-Calais (201), Gard (187), Saône-et-Loire (165), Hérault (113), Loire (110), and Bouches-du-Rhône (107). The whole area is about 2200 square miles, and comprises 623 separate *concessions*, which, however, are not all being worked. The yield of coal mines in 1876 was 170,477,613 quintals (16,795,824 tons), the following being the most productive districts:—

Names of the Basins.	Departments.	Quintals.
Valenciennes	Nord, Pas de Calais	65,332,909
Loire	Loire, Rhône	34,717,183
Alais	Ardèche, Gard	16,448,387
Creuzot; Blanzy	Saône-et-Loire	9,905,876
Commentry	Allier	9,219,227
Aubin	Aveyron	7,046,129
Aix	Bouches-du-Rhône, Var	3,545,100
Graissessac	Hérault	2,757,831
Carmaux	Tarn	2,571,700
Ahun	Creuse	2,150,828
Brassac	Haute-Loire, Puy-de-Dôme	2,020,896
Ronchamp	Haute-Saône	1,998,332
St. Eloy	Puy-de-Dôme	1,772,765
Decize	Nièvre	1,626,430
Epinac	Saône-et-Loire	1,490,170
Le Maine	Mayenne, Sarthe	1,190,680
Le Drac	Isère	1,086,520
Hardinghem	Pas-de-Calais	942,734
Basse-Loire	Loire-Inférieure, Maine-et-Loire	680,293
Vouvant, Chantonnay	Deux-Sèvres, Vendée	445,819
Buxière-la-Grue	Allier	437,282
Manosque	Basses-Alpes, Vaucluse	388,054
Bert	Allier	358,145
Sainte-Foy-l'Argentière	Rhône	332,103
Maurienne - Tarentaise, Briançon	Hautes-Alpes, Savoie	299,690

Peat.

Peat is to be found in 40 departments, but especially in Somme, Pas-de-Calais, Loire-Inférieure, Isère, Oise, Seine-et-Oise, Aisne, Nord, Doubs, Marne, Vosges, and Aube. The cutting of this fuel, so useful to the poorer classes, gives work to from 30,000 to 40,000 men, whose wages amount to a total of about 4 millions of francs. The mines of mineral tar yield about 3 millions of quintals (295,566 tons) annually. Saône-et-Loire, Allier, and Ardèche are the principal centres of its production.

Iron.

France is very rich in iron mines; but as these are generally far from the districts which produce coal, the working expenses are considerably increased, and sometimes to such an extent that the metal extracted cannot repay the outlay required for its extraction, and the mines have to be abandoned. The production of iron, however, is on the increase, and reaches 7½ millions of quintals (738,915 tons), which represent about 14,500,000 quintals (1,428,571 tons) of pig-iron. The details in quintals of this production for 1876 are appended:—

Departments.	Pig-Iron.	Iron.	Departments.	Pig-Iron.	Iron.
Allier	947,730	247,990	Marne	29,226	
Ardèche	808,597		Haute-Marne	841,193	822,026

Landes	152,135	25,566	Somme	....	8,300
Loir-et-Cher	......	2,350	Tarn	....	7,264
Loire	467,895	569,901	Tarn-et-Garonne	53,500	49,750
Loire-Inférieure	85,660	66,500	Vienne	....	1,600
Lot-et-Garonne	128,000		Vosges	......	17,075
			Yonne	....	96,806
				14,495,377	7,332,716

In some iron-works, especially those which are established in the chain of the Pyrenees, wood is still used as fuel; 185,024 quintals (18,266 tons) of iron were made by this process in 1876. The production of steel was for the same year 2,618,767 quintals (258,006 tons), the largest part of which came from the departments of Loire, Saône-et-Loire, Gard, Allier, Nord, and Rhône.

Other metals.

In 1864 there were 64 mines from which other metals than iron were extracted, viz., 39 of silver ore (*galène argentifère* and *alquifoux*) in the departments of Hautes-Alpes, Finistère, Gard, Haute-Garonne, Ille-et-Vilaine, Isère, Loire, Haute-Loire, Lozère, and Puy-de-Dôme; 12 of copper (Rhône and Vosges); 8 of antimony (Cantal, Haute-Loire, Lozère, Puy-de-Dôme); 4 of manganese, and 1 of nickel. There were 5066 men employed in working these mines, which gave a return of 4,955,515 francs. But these statistics cannot be relied on, except for the year of their publication, as old mines are constantly closed and new ones opened. In 1869, for example, there is no mention of silver mines, and the mines of manganese are 9 in number instead of 4 as given above.

Quarries.

The quarries of France are about 24,000 in number, giving employment to more than 88,000 men. The last valuation of the produce was made in 1846, and amounted to 41,047,519 francs, but it must be much higher now. Marble is abundant, especially in the departments of Pyrénées, Bouches-du-Rhône, Puy-de-Dôme, Hérault, Hautes-Alpes, Corse, Ariége, etc. Alabaster is found in the departments of the Yonne, in the valley of Aspe (Pyrénées), at Lagny (Seine-et-Marne), and at Montmartre (Paris). Lithographic stones are common in the departments of Ain, Indre, and Côte-d'Or. Slates are principally extracted from the quarries of Cherbourg and St. Lô (Manche), Angers (Maine-et-Loire), and Fumay (Ardennes). Limestone is abundant in 50 departments, and 38 yield plaster.

Gold and silver work.

Paris is the chief centre of the manufacture of artistic objects in gold or silver; in 1860 the workmen were 18,731 in number, distributed among 3199 establishments, and the business was transacted to the value of not far from 184 millions of francs. Lyons holds the second place, and then Bordeaux, Marseilles, Nîmes, Besançon, Clermont-Ferrand, and Toulouse. The gross value of the various metals used by the trade at the same period was calculated at 52,625,000 francs, silver forming about a third of the whole.

Watches and clocks. The manufacture of watches and clocks yields a revenue of 30 millions of francs. Large iron clocks are made at Morez (Jura); time-pieces are constructed in part at St. Nicolas d'Aliermont (Seine-Inférieure) and at Montbéliard, and finished at Paris; watches are begun at Montbéliard and Cluses (Haute-Savoie), and finished at Paris and Besançon. This last town is the central place of the trade, and represents 99½ per cent. of the total manufacture; 15,000 persons, men, women, and children, are employed in this trade, and in 1872 they turned out 135,276 gold and 259,626 silver watches.

XIII. *Commerce and Banking Establishments.*

Inland trade. Commerce is naturally divided into home and foreign trade, the former being greatly more important than the latter. It is impossible to give a strict and correct valuation of the inland traffic, but, judging of the whole from the few accessible details, we may, without exaggeration estimate its amount at about 35 or 40 thousand millions of francs. The gross weight of goods conveyed through the canals and navigable rivers has been given above (p. 458); these goods principally consist of coals, wood, stones, metals, wines, corn, and other heavy materials. This mode of conveyance is slow, but cheap, the duty levied varying from 1 to 5 centimes per 1000 kilogrammes per kilometre, *i. e.*, the maximum rate is about $\frac{3}{4}$d. a ton per mile.

The administration of public works published in 1867 a table of the traffic on French railways by goods trains, from which the following is an extract:—

	Metric Tons.		Metric Tons.
Flour and corn	3,233,369	Manures	521,932
Wine, spirits, and vinegar	2,670,424	Coals	11,638,662
Grocery and provisions	1,836,678	Carriages	11,724
Metals	3,298,317	Horses	218,504
Building materials	5,242,354	Cattle	5,929,667
		Miscellaneous	10,124,766

In 1869 the total weight of goods conveyed by *petite vitesse* (goods trains) was 44,013,433 metric tons.[1] Since that time a considerable increase has evidently taken place, the consequence at once of the general progress of commerce and of the great extension of railways.

Coasting trade. The coasting trade has always been of great importance in France, though it is far inferior to that of England. In 1875 the total weight of goods transported by coasters was 2,022,559 tons, an increase of nearly 7000 tons on the preceding year. These goods were of various kinds,—building materials (258,174 tons), wines (225,595 tons), salt (213,185 tons), wood (207,211 tons), corn and flour (199,461 tons), coals (125,243 tons), being the chief articles in the general traffic. 62,396 vessels, the tonnage of which amounted to 3,207,933 tons, were engaged in this trade, while in 1874 there were only 57,888, of 2,952,414 tons. The harbors most frequented by coasters are Marseilles, Le Havre, Bordeaux, Dunkirk, Rouen, Cettes, Dieppe, Nantes, St. Nazaire, and Boulogne.

Fisheries. The annual produce of river and pond fishing in the interior of France may be valued at about 10 millions of francs. Coast fishing was carried on in 1871 by 8995 boats, manned by 38,150 men, with a tonnage of 68,517 tons, giving a return of 51,609,200 francs. In 1875 the increase was considerable, the number of the boats being 20,159, the tonnage 101,852 tons, the crews 68,651 hands, and the revenue 61,780,160 francs. The same year 178 vessels, with a tonnage of 30,295 tons, and manned by 7800 men, sailed from French ports to fish for cod on the coasts of Newfoundland; the year before the number of the boats engaged in cod fishing was 188. The average value of the Newfoundland fisheries is estimated at about 17 millions of francs. The rearing of oysters has of late made very great progress in France. Large beds are established on almost every suitable point of the coast, as at Cancale, Auray, Marennes, Oléron, and Arcachon. The last-named place is the most important of all, the beds being not fewer than 2427, which gave for 1876 a return of 3,941,309 francs, represented by 196,885,450 oysters, 4,700,000 of which were shipped to England.

Octroi. In 1510 towns a duty is levied on goods, especially upon provisions and liquors, brought to market for public sale, or disposed of privately. In 1871 the total revenue yielded by this tax, which is known by the name of "*octroi,*" was 156,490,935 francs, divided as follows:—

	Francs.		Francs.
Wines	48,427,924	Fuel	17,704,919
Cider	2,771,743	Fodder	7,906,196
Spirits	8,997,298	Building materials	7,891,322
Other drinks	15,624,090	Miscellaneous	5,319,968
Provisions	41,847,475		

The following table shows the returns of the octroi tax, in the towns where it yielded more than 1 million of francs for the years 1874 and 1876:—

	1874. Francs.	1876. Francs.
Paris	98,896,890	124,238,118
Lyons	8,570,618	11,138,497
Marseilles	6,228,699	9,782,279
Bordeaux	3,670,979	4,267,331
Lille	2,971,308	1,317,053
Nantes	2,041,361	2,309,377
Toulouse	2,471,514	2,904,121
Rouen	2,883,526	3,499,820
Le Havre	2,309,623	2,484,347
St. Étienne	2,269,951	2,847,545
Rheims	1,002,037	1,072,340
Roubaix	1,138,525	1,350,249
Nîmes	996,914	1,095,857
Amiens	957,925	1,107,082
Angers	870,540	1,096,869
Nancy	1,095,856	1,363,654
Limoges	958,555	1,140,029
Toulon	1,076,139	1,207,100
Nice	1,087,901	1,277,581
Rennes	1,004,110	1,148,469
Tours	778,876	1,023,582
Versailles	1,089,532	1,146,738
Grenoble	896,999	1,049,734

This tax is far from being uniform, the percentage in some places, as Paris, being as low as 4·76 francs for every 100 inhabitants, and in some others, as high as 13·55 (Amiens), 14·15 (Rouen), 14·98 (Bordeaux), and 15·56 (Versailles). It is fixed by a decision of the municipal council, subject to the sanction of the legislative chambers. If the average of the tax be reckoned at 10 per cent. of the value of the goods liable to it, the returns would show that such goods have a value of about 16 millions of francs, not including, of course, the considerable trade which is carried on in places where no octroi has been yet established.

Foreign trade. Although the principles of free trade are now better understood in France than they were formerly, and are generally considered by French economists and statesmen as most conducive to the interests of a nation, their application is still far from complete, owing to the enormous charges brought upon the country by the late war, but chiefly to the personal influence of M. Thiers, the first president of the republic, who was a determined upholder of protection. This is not the place to enter on any discussion of the merits of the two opposite doctrines; but the fact does not admit of question, that notwithstanding the tax on raw materials and other duties which hamper the commercial intercourse of France with other nations, her foreign trade has been constantly increasing. The imports amounted in 1875 to 3,537,000,000 francs, and the exports to 3,872,000,000 francs (goods in transit not being included in these numbers), which is an increase of 24 millions for imported and 171 millions for exported goods over the year 1874. In 1869 the value of the imports was 3,153,100 francs, and that of the exports 3,074,900 francs. Foreign goods weighing 1,988,770 quintals (195,938 tons) entered and left France in transit during the course of 1875, showing a decrease of 318,745 quintals as compared with 1874. The principal articles of this class are silk goods (value 137 millions of francs), cottons, woollens, jewelry, gold and silver plate, mats, manufactured leather, corn, coffee, etc. The commercial transactions of France with foreign countries and her own colonies are shown in the following table, the returns being those of 1875:—

---

[1] The ton here and in what follows (as well as in the table) is the French metric ton of 10 quintals, which is about 33 ℔ less than the English ton,—the latter in commerce being held equivalent to 1015 kilogrammes.

	3,872,600,000

The whole export and import trade, along with the salt tax, brought in the same year to the custom house a return of 267,907,791 francs, divided thus:—

	Francs.
Import duties	228,457,837
Export duties	353,013
Droits de statisque	5,844,999
Navigation duties	4,717,688
Accessory duties	3,985,645
Salt tax	24,907,791

The foreign trade is for a great part carried on by sea. France, however, has a very limited number of trading vessels; and foreign ships, chiefly English, convey about two-thirds of her goods, both imports and exports.

With regard to the nature of the goods, the values of the imports and exports (1875) were as follows:—

IMPORTS.

	Francs.
Silk and floss-silk	330,100,000
Wool	326,500,000
Raw cotton	321,300,000
Hides, skins, and furs	203,300,000

Banks.

Besides the two banking companies especially founded with a view to assist agriculture, of which notice has been taken under that heading (*crédit foncier, crédit mobilier*), there are other establishments of credit which partake of the nature of public institutions, and must not be passed over in silence when speaking of French trade. The first of them is the *Banque de France*, founded in the year VII. (1799), and definitely organized by the law of the 26th April, 1806, which gives the management of the bank to a governor and two deputy governors appointed by the chief of the state, and assisted by a council of fifteen *régents* and three *censeurs* elected by the shareholders. The capital of the Bank of France is 182,500,000 francs. Besides issuing bank notes, which circulate as freely as gold, the bank has the power to discount bills and letters of exchange at three months, when endorsed by three signatures; to collect bills payable given to it by private persons or commercial houses for that purpose; to receive deposits and open current accounts; and to keep in trust the coupons, deeds, silver and gold bars, bullion, and jewels which may be entrusted to it, at the rate of one per cent. per annum. The Bank of France has now a branch in each department. In the following towns, Bourg, Cahors, Tarbes, Aurillac, Mende, Tulle, Digne, Belfort, Foix, Gap, Mont-de-Marsan, La Roche-sur-Yon, and Meaux, these branches are not yet open; but the law has been passed, and their being opened is only a question of time. This establishment is the great instrument of credit in the country. It has more than once supported the Government by loans in difficult circumstances. The Government, which holds a great number of its shares, is therefore interested in its preservation, and, when money is unusually scarce, gives to its notes the value and privileges of coin, by decreeing what is called the *cours forcé*. This measure was resorted to during the late war, and confidence in the bank remained unshaken. During the year 1876 the quotation of the shares of the Bank of France fluctuated between 3875 and 3470 francs. Of other banks the *Comptoir d'Escompte*, which dates from 1848 and was reorganized in 1854, the *Société générale de Crédit industriel et commerciel*, founded in 1859 after the model of the London joint stock banks, the *Société générale pour favoriser le développement du Commerce et de l'Industrie en France*, established in 1864, whose special feature is to endeavor to make the use of cheques popular in France, and the *Caisse des Dépôts et Comptes courants*, are also worth mentioning. Among the local banks, the *Crédit Lyonnais*, the Colonial Banks, and the Bank of Algeria may be named, as the most important.

Coinage.

The coining of money is carried on by private contractors under the strict superintendence of the state. There are now in France six *hôtels des monnaies* (mints), in Marseilles, Bordeaux, Lille, Lyons, Paris, and Rouen respectively. Paris is the chief centre, and the other mints hardly now issue anything except copper coins. From 1795 till the 1st January, 1874, the quantity of gold and silver moneys coined in France was as stated below:—

GOLD.[1]

	Value, francs.
Coins of 100 francs	44,346,400
" 50 "	46,568,700
" 40 "	204,432,360
" 20 "	6,273,174,360
" 10 "	965,051,690
" 5 "	210,947,190
	7,744,520,700

SILVER.

" 0·50 centimes.	40,480,856	2,943,258	545,862
" 0·20 "	2,504,728		
	4,886,137,296	26,838,369	156,270,160
	Total, 5,069,245,825 francs.		

This amount (with 307,232,889 francs value re-coined) is apportioned thus among the different governments which have ruled France during the period specified:—

	Gold.	Silver.	Total.
	Value, francs.	Value, francs.	Value, francs.
First Republic	......	106,237,255	106,237,255
Bonaparte and Napoleon I	528,024,440	887,830,055	1,415,854,495
Louis XVIII	389,333,060	614,830,110	1,004,163,170
Charles X	52,918,920	632,511,320	685,430,240
Louis Philippe	215,912,800	1,756,938,333	1,972,851,133
Second Republic	427,282,860	459,248,282	886,531,142
Louis Bonaparte and Napoleon III	6,151,961,600	626,294,792	6,778,256,392
Third Republic	50,169,880	221,505,707	271,675,587
	7,815,603,560	5,305,395,854	13,120,999,414

Measures and weights.

Measures, Weights, and Money.—The basis of all French measurements is the *mètre*, the length of which is the ten-millionth part of the arc from the pole to the equator. Multiples of this, increasing by tens, are expressed by Greek prefixes (the decametre, hectometre, and kilometre being 10, 100, and 1000 metres respectively), while the subdivisions have Latin prefixes (the decimetre, centimetre, and millimetre being $\frac{1}{10}$, $\frac{1}{100}$, and $\frac{1}{1000}$ of a metre). Similar decimal systems are formed from the other units of measure. The *are* is 100 square metres, and the *litre* the thousandth part of a cubic metre. The *gramme* is the weight of a cubic centimetre of distilled water at 4° C. (its maximum density). The measures in common use are here given, with their English equivalents:—

Lineal Measure	Metre	= 39·3707904 inches.
	Kilometre	= ·6213824 mile.
Square Measure	Hectare	= 2·471143 acres.
	Kilometre carré (100 hectares)	= ·386116 sq. mile.
Capacity	Litre	= 1·7607734 imp. pints.
	Hectolitre	= 22·0096677 gallons.
Weight	Gramme	= 15·43234 grains troy.
	Kilogramme (or kilo).	= 2·20462 ℔ avoird.

In commerce 10 kilos = 22 ℔, but 1015 kilos = 1 ton.

Money.

Money is reckoned by the franc of 100 centimes, in value a little over 9½d. £1 sterling = 25 francs.

XIV. *Colonies.*

Algeria.

Algeria is the most important colonial possession of France. Its extent, between the Mediterranean in the north, Tunis in the east, Morocco in the west, and the Sahara in the south, is about 47,000,000 hectares (181,474 square miles), 4,597,000 hectares of which are peopled by 1,132,414 inhabitants, ruled by the ordinary laws of the mother country. A part of the rest is divided into *douars*, dependent on regularly administered *communes*, 166 in number. This portion extends to 1,511,000 hectares (5834 square miles), with 555,807 inhabitants, 127,321 of whom are French, 32,660 Jews, 113,018 foreigners, and 282,808 Mussulmans. Another portion of the *douars* is administered by French functionaries, either civil or military, assisted by native and European councillors; the territory under civil authorities measures 3,086,000 hectares (11,915 sq. miles), and contains 576,007 inhabitants; 9888 are French or naturalized Jews, 1683 foreigners, and 567,036 Mussulmans. Finally, 32 communes are still directly managed by native chiefs, although their authority is subordinate to that of French officials; the number of inhabitants is 1,219,285, 1747 of whom are French, 93 Jews, 649 foreigners, and 1,216,796 Mussulmans.

The European colonists who have settled in Algeria number about 117,175. They have received from the state (1875) 565,000 hectares (2181 square miles); they have bought from the natives 260,000 hectares (1004 sq. m.), and 130,000 hectares (502 sq. m.) have been conceded to the *Société générale Algérienne* and to the *Société génévoise*. The budget of Algeria in 1876 amounted to about 27 millions of francs, of which two-thirds was devoted to public works or works of general interest. In 1869 the surface of ground under tillage was 1,684,000 hectares (6502 sq. m.), which produced 10,676,500 quintals (1,051,871 tons) of grain. In 1874, 2,950,000 hectares (11,390 sq. m.) gave a harvest of 16,676,290 quintals (1,642,984 tons), more than two millions of which were exported, representing a value of about 40 millions of francs. Vineyards occupied a surface of 11,360 hectares (28,072 acres), without taking into account the plantations made by the natives, and yielded 230,000 hectolitres (5,062,236 gallons) of wine; in 1866 this crop did not give more than 99,000 hectolitres (2,178,957 gallons). The importance of the cultivation of flax has doubled during the last five years, this plant covering now about 9000 hectares (22,240 acres) of ground. The same progress is to be noticed everywhere; thus the last census (1874) showed that there were in Algeria about 4,500,000 head of cattle and 10 millions of sheep, double the numbers returned in 1869. Algeria contains mines of iron, copper, lead, and zinc, which give a produce of about 600,000 metric tons, of a value of 7 millions of francs at least,—that is, a fifth part of the production of those metals in France. Alfa (a plant which gives excellent material for the manufacture of paper) and tobacco are the other products of importance. Alfa was exported in 1874 to the extent of 45,000 metric tons, 72 per cent. of this being sent to England. About 9000 planters are engaged in the cultivation of tobacco, which gave in 1875 a crop of more than 4,300,000 kilogrammes (84,629 cwt.), representing a value of about 3,300,000 francs. See ALGERIA.

---

[1] It is to be remarked that no gold money was coined in 1872 or 1873.

Other colonies.

The other colonies of France are—in Asia, Pondichéry, Karikal, Mahé, Yanaon, Chandernagor and Surate, and the French Cochin-China; in Africa, Senegal, with the island of Gorée, the island of Réunion or Bourbon, the islands of Sainte-Marie de Madagascar, Mayotte, and Nossi-Bé; in America, Martinique, Guadeloupe, St. Barthélemy, French Guiana, and the islands of St. Pierre and Miquelon; in Oceania, the Marquesas Islands, Tahiti, and New Caledonia. Among these settlements, Martinique, Guadeloupe, La Réunion, and Guiana are, properly speaking, the only colonies, the rest being rather mercantile stations, except perhaps the French possessions near Madagascar and in the Pacific Ocean, which have better prospects, and one of which, New Caledonia, now contains the principal penitentiary establishments maintained abroad by France.

All these colonies submitted, till 1861, to what was called the colonial pact, which bound them to France so closely and jealously that they could trade with no other nation than the mother country. This state of affairs has been greatly changed, chiefly for Martinique, Guadaloupe, and La Réunion; and but for some privileges of navigation and some special taxes, trade with the colonies is almost as free as trade with France itself.

Produce and trade of colonies.

An account of the colonies of France will be found under the particular headings. It is only necessary here to give some statistical information about their produce and trade, so far as it concerns the general state and interests of French commerce.

The island of Martinique specially produces sugar canes; they were cultivated in 1874 on a surface of 19,314 hectares (47,727 acres), more than a third of the entire area of the island, and yielded a return of 38,653,000 francs. Cocoa trees came next, covering 262,000 hectares of ground (647,539 acres), and giving a crop of 284,000 francs; then coffee, planted on 210,000 hectares (518,940 acres), representing a yearly income of 203,000 francs; and lastly, cotton, which occupies only 42,000 hectares (103,788 acres) and does not bring more than 34,000 francs. The foreign trade amounts (1874) to 61,810,481 francs, 28,398,309 francs for imports, and 33,412,172 francs for exports. In these totals the trade with France amounts to 36,700,560 francs.

The large island of Guadeloupe, with its dependencies La Désirade, Les Saintes, and the French part of St. Martin, imported in 1874 goods to the value of 24,526,212 francs, and exported 22,470,302 francs value, making a total of 46,996,414 francs, to which trade with France contributed 27,825,183 francs. The value of the natural produce is as follows:—sugar canes (20,686 hectares or 51,100 acres), 40,775,732 francs; coffee, 676,846 francs; cotton, 35,470 francs; cocoa trees, 120,300 francs.

Cod fishing is the principal industry of the islands of St. Pierre and Miquelon. The imports amount to 8,285,416 francs, the exports to 10,825,336 francs, and the trade with France to 9,913,532 francs.

French Guiana (Cayenne), which also contains penitentiary establishments, produces the same articles of trade as Guadeloupe, as follows:—coffee to the value of 48,028 francs; sugar canes, 243,984 francs; cocoa trees 52,430 francs; cotton, 1750. Its trade with France amounts to 4,914,002 francs; its imports to 6,571,067 francs, and its exports to 681,211 francs.

La Réunion or the island of Bourbon produces sugar canes to the value of 34,474,825 francs; coffee, 294,850 francs; tobacco, 494,100 francs; cocoa trees, 43,959 francs. The imports amount to 24,819,421 francs, and the exports to 30,219,829 francs. The trade with France is 34,869,267 francs.

The imports of Senegal (St. Louis and Gorée) amount to 12,134,631 francs, the exports to 16,628,069 francs, and the trade with France to 16,346,032 francs. The chief articles of trade are gum, gold powder, wax, ivory, a kind of vegetable oil, and valuable woods.

For Mayotte, Nossi-Bé, and Sainte-Marie de Madagascar the value of the imports is 4,080,229 francs, and of the exports, 3,773,280 francs. The trade with France amounts to 2,973,941 francs. The principal productions are sugar (5,088,750 francs), rice (1,799,008 francs), rum (334,480 francs), and coffee 11,275 francs).

For the French establishments in India (Pondichéry, Karikal, Yanaon, Mahé, Chandernagor, Surate) the imports are 6,675,583 francs; the exports, 17,671,100 francs; and the trade with France, 7,600,116 francs. Pondichéry and Karikal are the most important centres of cultivation, the former having 19,835 hectares under culture, which produce 1,494,714 francs, and the latter 9114 hectares yielding 1,122,525 francs.

The imports of French Cochin-China amount to the value of 67,044,022 francs, and the exports to 88,011,123 francs. This settlement comprises extensive cultivated grounds, distributed thus: rice, 279,703 hectares; fruit trees, 32,989; vegetables, 30,938; sugar canes, 8052; water palm trees, 5640.

In Oceania, the returns for the Society Islands, Tahiti and Mouréa, are—imports, 3,458,735 francs; exports, 3,112,989 francs; and trade with France, 562,369 francs.

For New Caledonia the returns are—imports, 12,561,577 francs; and exports, 880,970 francs. This large island might afford an extensive and profitable field to the enterprise of colonists, but it has hitherto been too much neglected by the Government, which considers it almost exclusively as a penal settlement, and has not even taken the necssary steps to secure the few plantations around the town of Nouméa against the inroads of the native tribes, who still possess the greatest part of the country.

France has lately acquired from Sweden the island of St. Barthélemy, in the Antilles. It is an islet of 25 kilometres (16 miles) in circumference, without drinkable water. This acqusition was made, it is reported, with the view of founding there a new penal settlement less distant from the mother country.

PART II.—HISTORY.

I. INTRODUCTORY.

Early inhabitants of Gaul.

The extinct tribes which once thinly peopled the soil of France have left but scanty traces of their existence in the weapons and ornaments dug out of gravel-beds and river-courses. However interesting they may be to the student of ethnology and of the origin of man, they find no place in history; for neither in blood, nor manners, nor speech have they left any mark on the land they inhabited. Very different are those tribes whom Cæsar met when he first entered Gaul. The history of France may well begin with the words which open his famous chronicle—"Gaul is all divided into three parts."

Iberians.

Of the inhabitants of these divisions, the Belgians, Gauls, and Iberians, the third were in all ways different from the others; for the Iberians were a race of other origin, shorter, darker of complexion, less sociable, less bright, of more tenacity, possessed of that power of resistance which those whom stronger races drive out of the plains into the mountains quickly learn. On the northward and southward slopes of the Pyrenees, amid the fastnesses of that great chain, and in the Basque provinces of Spain, this race still dwells, easily discerned by characteristics of speech and appearance, which mark them off alike from Spaniards and Frenchmen.

Belgians and Gauls.

The Belgians and the Gauls were blood-relations. The former, dwelling chiefly in the northern districts of France, were later comers than their kinsmen the Gauls, stronger men and of a finer development. The Gauls, the men of central France, were a bright intelligent people, full of vivacity, frank and open of disposition, brave and scornful of tactics, as though all strategy were a lie and a disgrace. The Belgians seem to have been more staid, less active, less easily cast down, more thoughtful; they were not without a physical and moral resemblance to their neighbors and distant cousins the Germans. From these two tribes has sprung the modern Frenchman, who to this day, according to his part of France, bears the mark and sign of one or other origin.

When Julius Cæsar entered Gaul (58 B.C.), he found these natives in a half-barbarous state, split up into clans, each with its elected chieftain, its Druids or priests, and its body of warriors or horsemen; while below these was an undistinguished company of servile men, women, and children, who did all works of peace for their idle fighting aristocracy. Each clan lived to itself, with little or no power of combining even with its nearest neighbors. Its home was usually an open village of circular wattled huts, with one family dwelling in each hut. Sometimes, in places of strength and importance, the Gaul built himself a fortified town enclosed by earthworks, perched sometimes, like Alesia, on a strong hill-top, or entrenched in dark recesses of wood and marsh. The more close the tightening of the Celtic clanship, the more completely did each little community live to itself, apart from other clans; so that in spite of the great difficulties of the country, Cæsar found the reduction of it a tolerably easy task.

Before Cæsar's days Gaul had already known something of foreign invasion. On her northern and eastern frontiers were the Germans; in the south stood the Greek city of Massilia, the ancient rival of Carthage; and in 122 B.C. Caius Sextius had founded the town which bore his name, Aquæ Sextiæ, now Aix in Provence, whence, as from a centre, the Roman occupation spread through the district watered by the Rhone and its tributaries, until it received the name of Gallia Braccata, and became a province of the republic. Narbonne (Narbo Martius, founded 118 B.C.) was the new capital of the district, the first Roman municipium on the soil of Gaul. But invasion took an entirely new character when Cæsar was made proconsul (59 B.C.). He entered on his great conquest in the following year, and the reduction of the whole country was complete by 50 B.C. In the course of those years the great Roman penetrated to the utmost limits of Gaul, beat down all opposition, crushed the Helvetians back into their Swiss home; he defeated the Germans who had made secure lodgment in the Sequanian lands, and drove them into the Rhine; broke the resistance of the Nervii, all but exterminating that gallant tribe; severed the connection between Gaul and Britain, on which the Armoricans especially relied, by two expeditions across the Channel, in which he gained a great addition of glory, if little fresh power; the conquest of far-off Britain fired the imaginations of men: finally he brought the long wars to a close by the submission of Vercingetorix under the walls of Alesia.

Cæsar in Gaul.

Thenceforward Cæsar, having conquered the Gauls, became their emperor. He saw what boundless supplies of force, of enthusiasm and intelligence, were now at his disposal; with Gallic support and his own devoted legions, he was now able to give law to Rome herself. Meanwhile, he did all in his power for Gaul,—lightened her tribute, mitigated slavery, forbade human sacrifices, repressed the Druids. The country lost its independence, and became the docile pupil and follower of Roman civilized life.

For more than four hundred years the Roman domination influenced Gaul. At the beginning of the time the natives were savages, dwelling in a wild land of forests and wastes, a thinly scattered company of unsociable clans, without towns or roads or industries; at the end they had fine cities, and much cultivated land, wore the Roman dress, had adopted the Roman law, and had exchanged their own tongue for a new form of the common Latin language.

Augustus.

After the murder of Julius Cæsar, the administrative genius of Augustus found wide scope for its activity in Gaul. Lyons was the new capital, whence his four great roadways and his civilization radiated out in every direction. Several of the later emperors vied with him in their interest in Gallic affairs: Caligula spent much time at Lyons, and, in his grotesque way, encouraged letters there; Claudius was a native of that city, and threw open the senate to the Gallic chiefs; he established schools, emancipated slaves, and taught the Gauls the equality of all men under the law; Nero, with his Greek sympathies, delighted in Provence, though he cared little for the rest of the country—then called "Imperial" Gaul. All through this period new ideas, new pleasures and efforts, characterize the life of Gaul; and after the fall of Civilis in 70 A.D., no one in all the country dreams of any further struggle in behalf of the independence she had finally lost.

Christianity in Gaul.

All things were now preparing for the next great influence which should affect the Gallic race. For nearly a century, though Gaul and Rome seemed together to tread the downward path towards ruin, the Roman ideas as to justice, law, and order, were fitting the Gallic mind for the reception of Christianity. And Christianity soon came. In 160 or 161 A.D. we find a bishop of Lyons, Pothinus, and with him the well-known name of Irenæus. These men ministered at first to Greek and other settlers, for the early church of Lyons long bore marks of a Greek not a Latin origin. Gradually, however, the life-giving ideas and doctrines of Christianity spread abroad among the Gauls, and churches sprang up at Autun, Dijon, Besançon, and other towns within comparatively easy reach of Lyons. Roman Christendom, however, did little for Gaul till the middle of the 3d century (244 A.D.), when seven Latin bishops were sent thither, and formed new centres of Christian life in the land at Limoges, Tours, and even Paris, whither came Dionysius with a little company of brethren in 251. Henceforward Christianity spread swiftly; and though in the next century St. Martin of Tours still found heathen temples to overthrow and multitudes of country pagans to convert, still we may say generally that in three generations from the time of the Roman mission of 244 A.D. all Gaul had embraced the Christian faith.

These were also the days of what is called "the Gallo-Roman empire;" of the provincial emperors who strove to sever the Eastern from the Western world. Along her northern frontier also Gaul saw the establishment of the two Germanies, districts on the left bank of the Rhine, where German warriors held their lands by feudal tenure of the sword. Thus as Gaul herself languished under the loss of her independence and the influence of the moral corruption of Rome, she began to become aware of the two powers which were destined to mould her character—the Christian Church, and the fierce Germans. They advance upon her from south and north; when they meet, the Gaul bows the head before them, and in new union the feudalism of the Teuton and the Christianity of the Latins begin their task of education. The combination of the institutions of Germany with those of the church forms the basis on which the history of France is reared.

The Germans.

The Germans, who now began to overrun the soil of Gaul, were a very different race from those with whom they came into contact. Stronger and larger in frame, they were also more stable and enduring than the Gauls. Far back they claimed the same ancestry; in language and in personal characteristics alike we can trace the connection. Yet, thanks to climate and circumstances, the two races were by this time completely severed, alien in speech, ideas, institutions, and tastes. The German was a hunter, a man of independence of character; the Gaul lived in his clan, and shrank from personal freedom; slaves were unknown in Germany, while they swarmed in Gaul; the Gaul had an organized faith, a regular hierarchy between him and the supernatural; the German worshipped, independent and alone, without human mediator, in the depths of his forests. The fighting-men who grouped themselves round a German chief were his free comrades, connected with him only by a personal tie, each prepared to act independently if his time came, and to build up for himself a lordship of his own. On many sides these men now began to press into Gaul. The Goths, after wandering apparently from Scandinavia to the Black Sea and thence into western Europe, settled down,—the Ostrogoths in Italy, the Visigoths in Spain and southern France. The Burgundian Vandals, from Low Germany about the Elbe and Vistula, now began to stream over into eastern Gaul, giving their name to a large district of the country; the Franks, an aggregate of northern tribes, Low Germans of the centre and the west, were destined to be the chief conquerors of the land, the authors of her modern name.

Church organization.

But before the German had become master of Gaul, the Christian Church had already firmly established itself. Thanks to the support he received from Christianized Gaul, Constantine was enabled (312 A.D.) to enter Rome in triumph, and to assure the victory to the church in her struggle against paganism. Henceforth the church, which had always endeavored in her organization to copy the civil power, was officially modelled on the lay institutions of the later empire; her dioceses corresponded in position and extent to those of the civil administration; the chief clergy became important magistrates. The bishop of each city with his clergy took the place of the older curials, the members of the civil municipality; the old relations of church and state were profoundly modified by the rise of the bishop of Rome to the position of supreme pontiff, a title given up by the emperor. In the downfall of Roman society in the fourth century, the clergy alone retained some power, and showed promise of the future. The lay power struggled hard for a while against the German invasion, specially against the Franks; the church stayed in the cities, secure and growing stronger against the day when she too would have to face the invader, and to convert him from a heathen foe into a firm ally and friend.

The Visigoths.

The Franks.

In the 5th century the Germans ceased to plunder and ravage, and began to settle; it is the age in which Gaul exchanges her Latin for her Teutonic masters. Early in the century a vast horde crossed the Rhine on the ice in mid-winter, and streamed over northern, central, even southern Gaul, passing thence a little later into Spain. In 412 Ataulf the Visigoth settled down in the valley of the Rhone, and allied himself with Rome; the Burgundians also occupied the Sequanian lands. These two tribes were friendly towards the older inhabitants, and were recognized as peaceable settlers by the imperial power; they showed that they deserved well of the falling empire by the gallant and successful resistance with which in 450 the Visigoths and Gallo-Romans defeated the terrible hordes of Attila at Chalons-sur-Marne. Yet the empire thus saved for a time could not be saved from internal decay; confusion reigned throughout Gaul, the Germans and the Gallo-Romans struggling as it were in the dark for possession; and when in 476 the empire of the West finally went under, Ewarik (or Euric), the prudent Visigoth, was left as master of all that had belonged to Rome beyond the Alps towards the west. The Arian Goths, with Toulouse as their capital, might have secured their authority over all France if the church had accepted the views of Ewarik, and if that vigorous prince had lived. He died, however, in 485, leaving behind him only a weak boy as his successor; and far to the north the fierce Frankish warriors had already taken as their chief the youthful Hlodowig (Clovis). The Franks, a loose confederation of Germanic tribes, were in existence in the third century on the right bank of the Rhine, and for a long time showed no wish to migrate into Gaul. By degrees one of these tribes, the Salians, headed by a family called the Merewings or Merwings (the Merovingians), began to take the lead; they soon made themselves formidable by their incursions on northern Gaul, and established themselves masters of the left bank of the lower Rhine. As the Roman power declined along that district, their authority increased; early in the 5th century they had spread from the Rhine to the Somme. Another leading tribe of Franks, the Ripuarians, whose home lay on the Rhine about Cologne, less tempted towards Gaul, seemed to hold themselves in reserve for the future.

Hlodowig or Clovis.

In 481 Hilderic, chief of the Salian Franks died, leaving behind him a boy of fifteen, Hlodowig or Clovis. This youth, endowed with unusual vigor and fierceness, soon won a great reputation among the Franks, and in 486 broke in on the only Roman power now left in northern Gaul, the degenerate legions commanded by the patrician Syagrius of Soissons. These were swept away like the autumn leaves before the wind, and Hlodowig settled down in the lands which he had won. Here he at once came into contact with Christianity; Remigius bishop of Rheims becoming his friend and adviser long before he adopted the Christian faith. It was probably through his influence that the young king married Hlotehild, niece of the Burgundian king, a Christian maiden. In the quiet years which followed Hlodowig doubtless became more and more inclined towards his wife's belief; and when, in repelling the invasion of the Allemans in 496, he believed that the "god of Hlotehild" had heard his vow, he at once declared his gratitude and his conversion. Some thousands of his wild warriors followed him to the font, as willingly and with as little thought as they would have followed him to death or victory. From this moment the firm alliance between the church and the Frank began, an alliance which affected both; the church became more warlike and aggressive, the Frank grew more civilized, and learnt the art of ruling.

With their headquarters fixed in northern Gaul, the Franks, under Hlodowig's command, reduced first their cousins, the Burgundians (500 A.D.) and then (507) the Visigoths under Alaric. All France, with exception of a rich strip of land between the mountains and the Gulf of Lyons, afterwards called Septimania, was overrun and plundered. This done, Hlodowig spent the rest of his days securing his dominion by the destruction of all powerful neighbors or competitors; for the grim Frank, vigorous and ambitious, knew neither scruple nor pity, and the clergy round his throne passed over crimes which they were powerless to prevent. When he died in 511 the settlement of the German on the soil of Gaul had been accomplished, and Hlodowig, who has no claim to honor as a man of constructive power, still stands out in history as the founder of a new world in France. To him France owes that feudal relation which has so deeply marked her story; in him the church first made that connection with feudalism which lowered her character, while it strengthened her power and influence. Not without reason does France inscribe on the first page of her history this German conqueror, a robber, a liar, a murderer,—for it is from him that modern France rightly dates her beginning.

Feudalism.

The origins of feudalism are simple enough. When the Franks came in under Hlodowig, they were a host of free and equal Germans under the king of their choice. The belief that he brought with him a graduated hierarchy of chieftains, who at once established a complete "feudal system" on the conquered soil, is no longer tenable. No doubt the most influential and vigorous of Hlodowig's followers got most in the distribution of lands and spoils; still, in theory at least, all free Franks were equal, and in the new settlement of the country each man according to his strength took what he could get. The older conditions of the Germanic peoples had died out of the Salian's life; the institutions which appear in an indistinct form in the *Germania* of Tacitus had already undergone great change; the family of tribes, with common rule of usage and very slight bonds of political union, is, as Professor Stubbs remarks (*Constitutional History*, i. p. 36), "singularly capable of entering into new combinations; singularly liable to be united and dissolved in short-lived confederations." It was one of their late-formed confederacies over which Hlodowig, with the vigor of barbarous youth, had now come to rule. The Salian law, a collection of the customs of Frankish law in the 5th century, gives us a fairly clear view of the condition of those who streamed over into Gaul at this great chieftain's back. We learn from it that among the Franks the kingly office was fully recognized, and though the form of election by the nation is preserved, the choice is limited to the members of a single family, so that hereditary succession partly prevails. The king, once chosen, is the real head of the nation; he has not as yet run any risk of becoming a *fainéant*; he appoints the rulers of provinces, if we may use this Roman term,—that is, the grafs who are set over certain aggregations of hundreds; and the graf or reeve, to take the English form of the word, is an administrative officer, who carries out the sentences of the courts of justice. The king also appoints the officers who collect the royal dues in the "vills" which had succeeded in the place of the primitive "marks" of the Germanic peoples. Round the king's person is his "comitatus," his aggregate of immediate followers, who form his guard, and are the germ of the later feudal nobility. The nation in arms forms the equal council, in which all men give voice and vote alike; justice is administered by a hundred-court or mall, composed of qualified landowners; if any one is aggrieved by their decision, he can appeal directly to the king. It is round this "hundred" that the Frankish system really moves, for it is out of a group of hundreds that a district with its graf is formed; and there seems to be no court of law superior to that of the hundred. All political questions are of course the affair of the national council. There is in the Salian law no trace of a primitive nobility; though the old system of common land has disappeared, giving place to separate ownership, the land does not carry with it any special honor; the Franks are still very far from any ideas as to a territorial nobility.

These were the institutions which Hlodowig transplanted out of the districts of the lower Rhine into Gaul. They came into contact with the tenacious Gallic temper, and the masterful organization of the Romans. The Franks, with singular energy and success, adapted themselves to their new place as conquerors; and, giving and taking, laid the foundations of modern French life. Their settlement was slow and unsystematic; the king, receiving a large portion

511-558.

of the soil as his domain, granted out of it benefices for his immediate friends and followers. These gifts were at first held on pleasure, and were liable to be resumed at any time; after a while this precarious tenure suited neither party; these fiefs became first life-holdings, and finally hereditary possessions, held on tenure of service of some kind. The greater chiefs, with the king, took their share of conquered lands, asserting their rights to an alodial holding, and, if they chose to do so, granting out benefices from these districts to their followers. The common sort of Franks, who were neither king's friends nor independent chiefs and their friends, took what they could get, their share of the spoil as it fell to them; and as their strong arms were useful and marketable possessions, we may be sure that many of them grouped themselves round the king, and, if they were fortunate, were rewarded with small benefices. A considerable part of the land was left in the hands of the Gallo-Romans undisturbed, and became tributary—the tribute being a kind of rent paid by the old owners to their new masters.

Thus the Franks were spread over the whole surface of the soil; they were at home in the country, and shunned the cities; civic life was distasteful to them; the air of the streets too confined for those who loved the forest and the chase as all Germans did. Consequently, in the towns the Gallo-Roman bishops retained sole authority, ruling by the Roman law, and preserving the last remains of the civilization of the past. The church, however, was far from confining herself within these civic limits; though she stood aloof from feudalism at first, deeming her own ways better, she soon showed a consciousness that the centre of power no longer lay in the cities, and that her influence must be felt at the king's court. Consequently, we soon find the bishops grouping themselves round the king, acting as his advisers, modifying the Germanic ideas, and in turn receiving new ambitions from their masters. Ere long the bishops will begin to take place in the feudal hierarchy, and will form a recognized part of the new nobility of the realm; though for a very long time the Franks clearly regarded the clerical life as unsuited to their character, and left the influence and fortunes of the church entirely in Gallo-Roman hands.

Before Hlodowig died (511) he had destroyed all the old chieftains and knights who ruled in Gaul. He took the place of Roman and Goth; the Visigoth shrank away southward; the Burgundian became tributary; the Frank was recognized as undisputed master of all the country; the northern barrier lines between Gaul and Germany perished; as fresh bands of Franks poured into northern France from time to time, the Austrasian princes renewed the Germanic influence over Gaul; and for five centuries the history of France must be regarded as in most respects subordinate to that of Germany.

Partition of the Frank kingdom.

Germanic use prevailed in the new kingdom, and when Hlodowig was gone, his four sons all became kings, each representing one of the divisions of the original invasion. Theodorik, the eldest, took the north-eastern part, and became king of what ere long began to be called Austrasia; he lay on both banks of the Rhine, and was almost entirely German, with his capital at Metz. Hildebert, eldest son of Hlotehild, had the central district, the country round Paris, with Paris as his capital. Hlodomir, the next, was king of Orleans, and had western Gaul along the Loire. The youngest, Hlothar, was king over the old Salian land, the north-western corner of Gaul, with his capital at Soissons. The partition was a division of estates rather than of governments; the four kings regarded the country north of the Loire as their home, and divided out all beyond that river at will by arbitrary lines. As yet a king was little more than a leader in war, and his free men, his "leudes," looked to him to give them plentiful employment in that way, even compelling him at times to go on expeditions against his own better judgment. Thus it fell out that this first partition did not weaken the Franks; they attacked their neighbors on every hand. In one of these wars (in 524) Hlodomir, king of Orleans, was killed; his brothers seized his inheritance, and on Hildebert's death (558) Hlothar of Soissons became sole king of the Franks; in 555 he had taken possession of Austrasia. Hlothar's rule brings the name of Neustria into prominence. The two branches of the Frankish power become clearly distinguishable,—the German Austrasians coming down to Lorraine, and including the eastern part of Champagne, as these districts were later called, and the Gallic Neustria covering almost all modern France. And Neustria settled quickly into a monarchy of more modern type. Round Hlothar were grouped his reeves or counts; the clergy made their court to him; the "leudes" now became the king's "trusty men;" not a few Gallo-Romans also held office under him.

Neustria.

558-598.

Second partition of Frankish kingdom.

On Hlothar's death (561) the Frankish kingdom was once more divided into four parts—Austrasia, Paris, Soissons, and Burgundy,—the eldest son, Sigebert (as in the earlier partition), taking the north-eastern country. When Haribert, king of Paris, died in 567, Hilperik, his brother, king of Soissons, seized his share, and became king of Neustria. And now the three Frankish kingdoms of Austrasia, Neustria, and Burgundy take definite forms. Speaking generally, Austrasia lay between the Meuse and the Rhine, Neustria between the Meuse and the Loire, though Austrasia trenched somewhat on Neustria on one hand, and stretched far up and even beyond the Rhine on the other side. Burgundy included the upper waters of these rivers, and of the Saone as well. The rivalry lay between the Austrasians and the Neustrians; the Burgundians, being the weakest and most peaceful of the three, sided sometimes with the one, sometimes with the other. This rivalry finds its expression in the half-legendary strife between the haughty high-born Brunhild, wife of Sigebert, king of Austrasia, and Fredegond, the low-born mistress of Hilperik, king of Neustria.

The mayors of the palace.

Before the end of the 6th century we discern a new power rising into distinctness,—the power of the mayor of the palace, an officer, as his name denoted, having great authority in the king's court, elected by the chiefs, and acting almost independently of his master. In Neustria we usually find the mayor of the palace siding with the royal power; in Austrasia, where the nobility were much stronger, he checks and overshadows the king; in Burgundy he is only an insignificant person, being of inferior importance to the patrician, whose office, as the name tells us, was a relic of past Roman days. Another, and a far more beneficial influence, also appeared at this time; the Benedictines came across from Italy, and spreading throughout France, formed many centres of fresh life in the confusion of the land. They revived the faith in industry, well-nigh destroyed by the Franks; they did something to rescue the older inhabitants from misery, and culture and letters, thanks to their well-directed energies, again raised their heads.

At the end of the century the two queens, Brunhild and Fredegond, were the two rulers of all the country; for Brunhild had charge of her two grandsons, Theodebert II., king of Austrasia, and Theodoric II., king of Burgundy, while Fredegond governed Neustria for the youthful Hlothar II. So early does the extraordinary prominence of regency appear in French history. After Fredegond's death in 598, Brunhild seized on almost the whole of Neustria, and for a while seemed once more to unite the Merwing lordship under her rule. Her chief aim was the establishment of a solid monarchy in Austrasia, which should curb the power of the nobles; they, in opposition to her, placed at their head two brothers, Arnulf bishop of Metz, and Pippin of Landen, the ancestor of that great family under the auspices of which modern society laid its foundations in both Germany and France, the great Karling or Carolingian dynasty. Led by these two men, heads of the lay and spiritual aristocracies, the Austrasian nobles met the aged queen; her army deserted her, leaving her with her four great-grandchildren in the hands of Hlothar II., the nominal chief. He put the children to death at once, and after shameful indignities, the queen, it is said, was tied to the heels of a wild horse and so dashed to pieces. Her death was a triumph of aristocracy over monarchy. Hlothar II., now sole king of Franks, was entirely in the hands of the mayor of the palace, who became a real power in the state, representing the interests of the nobles as against the centralizing tendencies of the kings.

This victory of Neustria, though it paved the way for the eventual domination of the Carolings, was in itself "the triumph of weakness over strength, of the Gallo-Romans and the priests" (Sismondi). The victorious nobles endeavored to secure their supremacy. The bishops, who were now found sitting in the assembly of the "leudes," drew up

628–732. a new ordinance, a "perpetual constitution," a first attempt to substitute ideas of justice in the place of custom based on force. This, however, in the nature of things, could not check the growing power of the nobles, especially in Austrasia; though for a time royalty, under Dagobert (628–638) showed a good front in Neustria. In him the Merwing monarchy reached its highest point; his splendid court at Paris laid the foundations, not altogether sound ones, of the civilization of France. At his death his monarchy crumbled away. Children were kings in both Austrasia and Neustria; we reach the days of the "do-naught" princes, the *rois fainéants*, and of the struggle between the mayors of Austrasia and Neustria. Ebroin, the Neustrian, for a time held out against his rivals; but the Austrasians placed at their head the representatives of the Caroling family, Martin and Pippin, grandsons of Pippin of Landen; and, Ebroin having been assassinated, Neustria had nothing wherewith to resist the onslaught of the German Franks. Led by Pippin of Heristal, they burst into the valley of the Seine, and at Testry in the Vermandois, the long struggle of the two Frankish powers came at last to an end (687). There the Neustrians under Berthar, mayor of the palace to Theodoric III., were entirely defeated, and henceforth, though the line of Merwing kings lasts till 752, they become insignificant and powerless. We turn our eyes with pleasure towards the rising splendor of the Caroling house. France finds herself on the skirts of a new Roman empire, of which the seat is in Germany, and which in its main features belongs to German not to French history.

The Carolings.

To no small extent the Neustrian Franks had lost their old Germanic vigor before this time; perhaps among the chief symptoms of change is the fact that many Frankish names may be read among the upper clergy of the time. In the absence of sufficient evidence it is impossible to say how far they had condescended to learn the "rustic Latin" which the older inhabitants all spoke, the parent of the modern French language; still, there can be no doubt that they must have spoken it to some extent, if not as their sole speech. Now, however, the Austrasian conquerors began to bring things back to a German form. The ancient "Fields of March" are held again; thither come the warriors in arms as of old; German conceptions as to justice seem again to prevail over the more orderly Roman law. The new-comers are above all things an army; and it is the fortune of the Austrasians, not only that they have soldiers and love fighting, but that they have great captains at their head. From Testry (687) to the end of his life in 714, Pippin of Heristal was unquestioned master of all Franks, the kings under him being utterly insignificant. While he kept his Neustrian subjects submissive, he applied the enthusiasms of the sword and the cross to the wild Germans on his eastern border. Under him began the heroic labors of those English monks whose is the high honor of having first introduced the Christian faith among the pagan Teutons.

Charles Martel.

On Pippin's death things seemed likely to fall back into confusion; the Neustrians shook off the yoke of their German lords, and Austrasia was threatened at once from every side; Frisians and Saxons, as well as Neustrian Franks, overran the country, vainly opposed by Pippin's widow, Plectrude, who ruled in the name of her grandson, a child. Austrasia, however, was saved by the energy of Pippin's natural son Charles, whom Plectrude had thrown into prison, and who now emerged as a strong leader of the nobles. He defeated the Neustrians at Vincy, near Cambrai, in 717, repelled the Saxons from the Rhine, reduced Plectrude, who had taken refuge at Cologne, and became undoubted head of the Franks, as his father had been before him. His father's rise had been the work of the lay and spiritual nobility; the power of Charles was based on the sword alone; he was regarded by the churchmen as their foe; he took of their lands to reward his soldiers, punishing the noble bishops while he encouraged the more popular monks. Though the clergy treated his memory with vindictive anger, the lay lords were firm on his side, and enabled him to found the great dynasty of the Carolings. For it was their ready sword which won him the victory of Poitiers (or Tours), in which Europe set a limit to the advance of Asia, in 732. The Arabs, possessors of almost the whole of Spain, had for several years poured over the Pyrenees into southern Gaul; held in check a while by the vigorous Odo (or Eudes) king of Aquitaine, they proved at last too strong for him and he appealed to Charles to rescue him. The Franks responded nobly to the call, and in a few years Charles had driven the Saracens out of all their points of vantage north of the Pyrenees. It is said that to the battle of Poitiers Charles owes his name of "Martel," the Hammer, for the vigor with which he smote the Mussulmans. Other accounts have been given of this sobriquet; on the whole the common explanation of it is the most probable and the best supported. All the rest of his life this great duke of the Franks struggled against the pertinacious foes who attacked his frontiers. His power may be said to have been limited by the Rhine to the north and east, and by the Loire to the south.

732–771.

Just before his death he divided his dukedom between his sons Carloman and Pippin the Short. As usual, the elder had the Germanic share, but under the influence of Boniface, the English monk and missionary, whom he made archbishop of Mainz, he, after six years of successful rule, laid down the burden of power and became a Benedictine monk. His ducal rights he handed over to his brother Pippin who had become sole duke of Franks. His father and brother had opposed the power of the bishops by the help of the monks; it remained for Pippin to go a step farther, and linking together the monks with the papacy, to win for himself the name of king. The monks had been the papal militia for the conversion of Germans; the converted Germans in their turn became firm friends of the Frankish dukes. The head of the whole movement was St. Boniface the founder of the church in Germany; he it was who, acting under command of Pope Zachary, crowned Pippin king of Franks in the cathedral at Soissons. Pippin thereby became lord by a new title of the eastern and western Francia, or Frank-land, ruling over a large part of modern Germany and of modern France north of the Loire at least. The last of the Merwing shadow-kings, Hilderik III., was deposed, and thrust into the convent of St. Omer, where he shortly after died, and the race became extinct. On three sides Pippin was called to combat three powers, foes of his new royalty, foes also of the Church of Rome. The pagan Saxons did not detain him long: in one campaign he extorted from them the right to send his monks among them as missionaries; the rest he left to time. The Lombards, under their king Haistulf (Adolphus), had seized Ravenna, and threatened Rome herself, and Pope Stephen fled to Pippin for help. The Frank king crossed the Alps, and compelled Haistulf to give up to the Church of Rome the town of Ravenna, the Emilia, the Pentapolis, and the duchy of Rome itself. This is the famous "Donation of Pippin," the foundation of that temporal power of the papacy the end of which we have seen with our own eyes. The papacy raised up the Franks as their champions and defenders; they were set as a counterpoise to the grand claims of the empire at Constantinople, and as antagonists to enemies in Italy. No wonder if before long the papacy saw its advantage in the restoration of an empire of the West under new auspices, and if Germany in return willingly interfered in the affairs of Italy. The political life of modern Europe now begins. The rest of Pippin's reign was chiefly occupied with the resistance he found in southern Gaul. In 758 he took Narbonne, the capital of the Arabs, and drove the Mahometans out; he attacked the Aquitanians, who, after their wont, made tenacious resistance. On the death of their duke Waiffer, he overran their whole country, though he never occupied it permanently. Centuries must elapse before northern and southern Gaul could become one France.

Pippin the Short.

Charles the Great.

In 768 Pippin died at Paris, leaving his dominions to his two sons Charles and Carloman. In 771 Carloman also died, and Charles became sole king of Franks. The reign of "Charlemagne" is begun, the great German lord who in fact and legend filled all the world. The seat of his father's power lay, on the whole, in Neustria, and his chief struggles had been for dominion over Aquitaine; the seat of the power of Charles himself lay on or near the Rhine; his three chief palaces were at Engelenheim, Aix-la-Chapelle, and Nimwegen. His whole temper, history, relations, were strictly German; the part played in his life by Neustria and Aquitaine was, by comparison, insignificant, for Charles the Great belongs to world's history, not to the history of France.

771–814. His first task after his father's death was to complete the reduction of Aquitaine; for here war had broken out again when Pippin's death seemed to the southerners to give them their opportunity. Charles beat the old Duke Hunold in the field, and drove him to take refuge with the Lombards, where some time later he fell, helping to defend Verona against his and their hereditary foe. The struggle in Aquitaine, hopeless if vexatious, lingered on, until at last the wise king, as imperial ideas grew stronger in him, saw that his one hope of success with them lay in giving them an independent life of their own, under due restrictions. He therefore set over them his little son Hlodowig as king, and appointed William Courtnez, count of Toulouse, as his tutor. The child was established at Toulouse, and brought up as an Aquitanian. The south retained its distinctive characteristics, and was saved from the degradation of having to fall back to the lower level in art and civilization which prevailed among the Franks. The kingdom of Aquitaine had for its southern frontier the river Ebro in Spain, and crossing the mountains reached the open sea just below Bayonne; the northern frontier at first was less well defined; before the end of the 8th century it was pushed on as far as to the Loire.

And just as Hlodowig was established in Aquitaine, so in 776 Charles set his second son Pippin over the Lombards, thereby securing his permanent influence over the see of Rome. The papacy throughout leant on him for support, and was even content to recognize his supremacy. For a quarter of a century Charles's life was spent in ceaseless wars on every side, in which he slowly though surely beat down the resistance of heathen Saxons, of Huns, of Lombards, of Saracens. Within the limits of modern France, after the pacification of Aquitaine, the only war was that against the Armoricans, inhabitants of Brittany,—a slow, stubborn contest, which lasted till near the end of his life. For a short time Brittany became a portion of the empire, without, however, in the least losing any part of its independent character.

Charles crowned emperor. By 796 Charles had secured his ascendency throughout Europe, so that when in 799 Pope Leo III. was ejected from Rome by the citizens, he fled to him for refuge and help; and Charles, in the autumn of 800, replaced him on the pontifical throne, receiving in return, on Christmas day, the solemn titles of Emperor of the Romans, Augustus; and certainly, if ever the great echoes of the past were to be awakened, they could not have been aroused for a worthier prince. "A Latin priest gave to a German soldier the name of that which had ceased to exist," says La Vallée. None the less was Charles a real emperor, ruling over subject princes; the Germans and the Romance peoples alike accepted his sway; and for fourteen years, with less of fighting and more of organization, Charles the Great proved that he was worthy of his high title and revived office of Emperor of the West. In 806 at Thionville he settled the succession to his empire; but as death bereft him of his eldest son Charles and his second son Pippin, he was obliged in 813 to make a fresh arrangement. He made Hlodowig, the one surviving son of his second wife Hildegond, his heir and successor, crowned him, and saw him saluted emperor. After this, he lingered a few months, and died early in 814 at Aix-la-Chapelle. It was doubted whether he should be buried there or at St. Denis, where his parents' bones had been laid. Austrasia, however, prevailed over Neustria, the Germans over the Frenchmen, and he lies at rest these thousand years past in the church he himself had built in the city he loved so well.

State of France in his reign. The state of what is now France under his care was this. The land was cut asunder at the Loire; to the north of that river was Francia Occidentalis, the earlier Neustria and Burgundy; to the south of the Loire lay Hlodowig's kingdom of Aquitaine, governed by Roman law, and home of precious remains of Roman culture. In Francia Occidentalis were Frankish nobles, the clergy, the free Franks, the inhabitants of cities, and the slaves, the last in ever-growing numbers. The first and second of these classes soon began to secure their position as great feudal lords, half independent. They laid the foundations of that system of feudal noblesse which became almost omnipotent under the weaker Carolingian princes, which brought about the revolution placing Hugh Capet on the throne, which resisted the centralizing tendencies of the monarchy under Louis XI. and Louis XIII., which became the devout servants of the Great Monarch, and finally ended with the monarchy at the Revolution. The reign of Charles the Great is the time at which these nobles began to see that their strength was based on the land; their position grew more territorial, their allegiance and honors less personal. Charles endeavored to resist this tendency, but his hand could not be everywhere, and the nobles on the whole held their own, though so long as he lived they still bent before his power. 814.

The administration of Gaul at this time was in appearance fairly complete, though it doubtless often failed in its practical application. Handed down from former days, in the larger towns there were always two chief personages, the count and the bishop, of whom the former officer was of Frankish origin, the latter of Roman. To a considerable extent, as was the case throughout all early Christendom, the functions and jurisdiction of the bishops originally answered very closely to those of the lay power, the church-organization being copied from the organization of the empire. Now each of these greater officers had its own jurisdiction and court; each administered therein law, the bishop according to the Roman order, the count according to Frankish usage; and, though their functions might sometimes clash, on the whole they joined in preserving peace and quiet within the walls. The counts also attended to the war-force and collected the taxes; while the bishops, on their side, were charged with the teaching and the moral life of their flocks. Between them they preserved a considerable amount of municipal life and character in the ancient cities. Under the counts we find local officers whose business it is to hold lesser courts in the bourgs and villages round about. These were the centeniers, or hundred-men; there were also here and there traces, as in England, of a lower division into decuries or tythings; the counts had also their "viguers," their "viscounts," as they were afterwards called, who represented them, and they also appointed (if the work were not done by the Missi Dominici, the imperial commissioners) officers called scabini (échevins, or in German Schöffen), local judges who held lesser courts in country places. In addition to these courts each chief and each considerable churchman held his own pleas; by these the condition of the free Franks, of the slaves, and of such persons as were still just above the servile state, was decided, all questions between them and those above them adjudged, with no very happy results in the main.

The emperor, honestly desiring, so far as he could, to arrest the downward progress of the feeble free Franks and of the still more wretched slaves, sent forth the above named Missi Dominici to travel through the different districts of the empire, and to see with their own eyes the state of the people. Usually, they went out in pairs, a layman and an ecclesiastic, so that the secular and church courts and benefices should each be inspected by a man of the same order as the lord whom they visited. They traversed the districts assigned to them in circuit four times a year, held courts to which even the counts were bound to come, looked into the details of government, reformed gross abuses, reported to their master on all persons, even the highest, appointed when needed fresh scabini and others, removed unworthy persons, looked to the poor, protecting them as far as possible from want and want's kinsman the oppressor. The great evil of the time was injustice defended by bribery; the local judges could not resist the powerful or wealthy ill-doer, and so the wrongs of the poor remained unredressed. The Missi, with more or less success, endeavored to lessen these evils. We may believe that in the main the clergy worked willingly with them: they had closer relations with and warmer sympathies for the poor folk; they administered a more stable and intelligent code of laws; they were the depositories of learning, and desired to educate those around them; even in the worst times the humane morality of the Gospel gleams forth. In the days of Charles the Great all churchmen turned to the emperor and paid willing allegiance to him; the ancient political coolness between the Carolings and the episcopate entirely disappears.

The elements of society in Gaul at this time may be easily summed up. There were great Frankish lords, gradually diminishing in numbers as they grew in power and territorial independence; there were great bishops, chiefly in the cities, and lordly abbots in country places, who were all by degrees becoming assimilated in condition to the Frankish

814-840.

nobles; there was also a rustic clergy, whose state was poor in the extreme; then there were the free Franks, scarcely above the level of slaves, and ever slipping down into the servile class; then Gallo-Romans in much the same condition; and lastly the slaves, who are said to have formed nine-tenths of the population. The picture is one of great wretchedness, oppression, injustice; the great Charles himself felt no sure ground under his feet in dealing with the social condition of his subjects. It is clear that society must pass through vast changes before anything like an orderly and flourishing community could exist, and that even the splendid climate and soil of Gaul would long do little to better the condition of its inhabitants. The wretched period which comes to Gaul after the death of Charles is the time in which, from the older relations of chief, free Frank, and slave of war, we pass gradually and almost insensibly to the later feudal relation of lord and vassal and serf. The coming time was, as has been said by Hallam, "the age of the bishops;" but in fact the bishops were only doing in their sphere what the lay chiefs were also achieving in theirs,—laying the foundations of a feudal independence which was for ever striving to lapse into feudal anarchy.

Louis the Pious.

On the death of Charles the Great, the eyes of all turned hopefully to his only surviving son the gentle Hlodowig, Louis the Pious. His father had summoned him to Aix-la-Chapelle, had made him emperor, and then had sent him again to Aquitaine till his time should come. In him all sweet qualities of piety, morality, culture, seemed to find their home. His Aquitanian rule had brought with it untold blessings to the south; he, too, had learnt their best lore, had become acquainted with their art, their poetry, above all with the Roman law; he was a man of thirty-five when he became emperor, vigorous, pure-souled, intelligent. Men thought that his father had done the rough-hewing of his great work, and that the new emperor would be the organizing Augustus following the creative Cæsar. His soul was full of high and conscientious aims; he would make reforms which should regenerate without weakening society; he would restore the clergy to high authority, would give full powers to the great lords, would save free Franks from slavery, and thus secure harmony and peace throughout his vast dominions. How different was the actual result! This noble prince, so dignified, earnest, right-minded, of "sound mind in sound body," gentle and simple, had all the dangerous virtues which grow to be calamities in rough times; his monkish tastes, his Christian forbearance, his want of an unscrupulous will, all pointed towards failure. Even within his house he was not master; and in the broad wild territories of the empire he was destined to a like failure. On the death of his first wife, Hermingond, who had borne him three sons, Hlothar, Pippin, and Hludwig, he married Judith, daughter of Welf the Bavarian, a dangerous and ambitious lady. Her son Charles, afterwards styled "the Bald," brought the emperor many troubles, for the natural jealousies sprang up between the children of the first bed and the second wife and her son. War soon followed, in which personal ambitions were seconded by the ancient enmity between German and Gallic Franks. Struggle followed struggle, partition led to partition; there is no drearier piece of history than Nithard's short chronicle of those years. The unlucky Hlodowig was buffeted about, now deposed, then restored again; now bowing his head before the clergy of Roman France at Compiègne, now recalled to rule, as it seemed, by the unanimous voice of his sons and his subjects. The main result was the separation, which then began, of France from Germany. In the midst of it Hlodowig the Pious died in 840, and was buried at Metz.

His death was the signal for the final disruption of the empire of Charles the Great. Hlothar, his eldest-born son, took the imperial name, and claimed supreme headship over the Franks. The Bavarian or German Hludwig, and Charles, who represented the Franks in France, both resisted; the Franks in Italy, Aquitaine, and Gothia, rallied to the emperor. War broke out at once. As soon as ever the Aquitanians had joined his forces Hlothar challenged his brothers to battle, and they at once accepted his wager.

On the banks of the Cure, near Troyes, was fought the great battle of Fontanet, which brought the griefs of the age to a point. There the whole Frankish race struggled for the mastery. From Italy, Austrasia, Aquitaine, Gothia, came the emperor's supporters; Germany, Neustria, Burgundy, supported Charles and Hludwig. The carnage was terrible; Fontanet is the burial ground of the old Frankish life; free Franks are heard of no more; "there remained in Gaul only lords and serfs; all things are made ready for the increasing of feudalism." Hlothar was entirely defeated and fled northwards to Aix-la-Chapelle; Charles and Bavarian Hludwig were masters of the field. When next year the two brothers found themselves once more menaced by the emperor, they met with all their forces at Strasburg, and took solemn oath each to other, Hludwig swearing in the "Roman" tongue, the earliest French in existence, and Charles the Bald in the "Teudisc" or German; and the armies standing round them repeated the words, the German Franks in German, the Gallic Franks in French. The text of the oaths is preserved for us in Nithard;[1] they are a striking evidence of the way in which Germany and France were asserting each its independent character. The "Romance tongue," the speech of the common people in France, their modification of the Latin they had learnt long before, henceforth took the place of the Latin language on the one side, and of the native Germanic speech of the Franks on the other; henceforth the name of Frenchman may come into use.

840-843.

As a result of this agreement between Charles and Hludwig, Hlothar was driven back to Aix-la-Chapelle. He thence fled to Lyons, to be near his southern friends; and, finally, finding himself completely overborne by their opposition, he made with them the famous Treaty of Verdun in 843, in which three kingdoms were distinctly marked off:—France for Charles the Bald; Germany for Ludwig the Bavarian; for the emperor Italy and a long narrow strip lying between Germany and France, a conventional district, which a little later received from its lord, the second Hlothar, the conventional name of Lotharingia or Lorraine. Charles the Bald had for his kingdom all Gaul west of the Scheldt, the Meuse, the Saone, and Rhone; it ran down to the Mediterranean, and was thence bounded by the Pyrenees and the Atlantic. It included therefore the chief part of modern France. It was Charles the Bald also who allowed the county of Paris to become a part of the duchy of France, so that the dukes of France were also counts of Paris; from this arrangement sprang eventually the decision of the momentous question as to what city should become the capital of modern France. In this manner the magnificent empire of Charles the Great came to an end, and in its place arose the nations of Europe. Speaking of the year 841, Nithard tells us that throughout the breadth of France the utmost confusion and rapine oppressed the people; in thirty years there had been five partitions of the Frankish empire, each marked with its own violence and misery; and the condition of the inhabitants, groaning under the ambitious foreign rule of quarrelsome princes, was as bad as well could be. The time, however, was now coming in which the greater lords of Neustria began to forget their German interests and nature, and to move towards a national French life. At first their action was chiefly disruptive, aiming at a local territorial independence; lay lords and great bishops alike pushed their pretensions to the farthest point; hostile to the imperial ideas of Germany, they had no sympathy with any national ideas for France. Nor is this strange, for France can hardly in any sense be said to have existed in their day. We have reached the time in which feudalism emerges from its earliest stages, and strives to lay the foundations of its independence. From the Treaty of Verdun in 843 to the accession of Hugh Capet in 987, France passes through a dreary and confused period of formation.

Charles the Bald.

Charles the Bald is a fit representative of such an age; he passed a long life sweeping together territories under his nominal sovereignty, and endeavoring to secure to himself the imperial dignity and the commanding position of his great namesake and grandfather; and though he was at the outset king of Neustria, his interests lay far more outside than inside France; the instincts and sympathies of Charles, as of all his family, were German. His schemes and struggles, rewarded in the end with apparent success,—for just before his death he was crowned king of Italy and emperor,—in reality were fatal to the Caroling dynasty. He bought his advancement first by subservience to the greater clergy, and afterwards by granting to the feudal lords the charter of their independence. After the Treaty of Verdun had apparently given to

843-875.

Charles the Bald undisputed lordship over the western portion of the empire, three states still resisted his authority:—Brittany, which, under Nomenoe, asserted and secured her independence; Septimania, which drove out his armies for a while; and Aquitaine, in which the vices of Pippin gave Charles a footing, and made a way to his success. For several years his whole energies were engaged in these bootless struggles, while at the same time his coasts were being ravaged by the Northmen. He was obliged to pay a heavy scot before he could deliver at one time the rich valley of the Somme, at another the walls of Paris herself, from their devastations. In a capitulary of 877, the last year of his reign, we have the levy of a contribution in order to buy them off from the Seine. In 855 the death of the emperor Hlothar was the signal for a fresh division of lands, in which Charles got his share in Lorraine and the kingdom of Provence. His fortunes, however, scarcely mended; overshadowed by nobles and bishops, his tenure of his kingly throne was ever precarious. The great lords, seeing in him a tendency towards resistance of their claims, called in German aid to dispossess him; and Ludwig the German came to their help. The inhabitants of Gaul, roused by the appearance on their soil of these German antagonists, rose and drove them back to the Rhine. Charles seized the opportunity of strengthening himself, as he hoped, by appealing to the church; the church by its spokesman, the great Hincmar of Rheims, replied by accepting the call, by declaring her authority over kings, and by tracing the lines of episcopal and royal power:—"If kings rule after God's will, they are subject to none; if they be great sinners, then is their judgment in the hands of the bishops." Hincmar, in these words, stretched wide the rule by which the clergy had claimed to exercise judicial functions in the case of ordinary malefactors. And thus the clergy rewarded themselves for having saved Charles from the hands of the nobles and the Germans. The reins of power were now entirely left in Hincmar's hands, and the dreary capitularies of the reign bear evidence in every page of the overwhelming influence of the clergy. Not satisfied with his supremacy in church and state, the great archbishop pressed forward into philosophical and theological controversy, and took his share in those discussions which heralded the incoming of scholasticism. He opposed the views and influence of John Scotus Erigena, the head of the palace school of Charles, and may be perhaps said to have given that direction to thought and speculation which marks in the main the course of the whole philosophy of the schools.

Towards the end of his reign there was only one prince, Ludwig the German, who shared with him the vast empire of Charles the Great. And in 875 on the death of Ludwig II., emperor and king of Italy, a handful of bishops and counts assembled at Pavia offered the imperial crown to both these princes. Charles arriving first was forthwith proclaimed "protector, lord, and king of Italy" by the pope. In the next year Ludwig the German also died, and Charles, not content with the imperial dignity, which he already possessed, nor with the ample extent of the territories nominally subject to him, desired to restore the old imperial unity, and to obtain the crown of Germany in addition to those of the west and south. The sons of Ludwig naturally resisted; and then, in order to secure the hearty aid of his followers, he held the diet of Quiersy-sur-Oise (Carisiacum) in which was drawn up the great capitulary sometimes styled the Magna Charta of French feudalism. Beneath a cumbrous covering of words, and connecting the hereditary succession of his own son with his large concessions to his nobles, Charles in fact conceded hereditary rights to all freeholders. Any lord who should desire to renounce the world might leave his benefices and honors to his son, or otherwise as might seem good to him; and any lord whose hold on his worldly goods was brought to an end by death might leave his dignity to his son (Baluze, *Capitularies,* ii. p. 259), and thus in definite terms the hereditary usage of centuries became hereditary right. Hitherto, in France at least, a fiefholder held at his lord's pleasure, and was, in theory, liable to deprivation at any time; henceforth, he was as secure in law as in fact, and could transmit his lands and dignities to his son without risk of loss. The title of duke or count is henceforth attached to one family; as the royal and the imperial power become weaker, the great families grow in strength; until a century of *fainéant* Carolings comes at last to an end, and their place is taken by the representative of one of the great houses, the duke of France and count of Paris. Then the new kingdom of France with its new capital will begin with Hugh Capet in 975. For the family of the counts of Paris had come to occupy the ground abandoned by the Carolings; they were the champions of the Gallic people against the Northmen. Only twenty-seven years after the death of Charles the Great, in 841, Rouen had fallen into Norman hands, opening the way for them up the rich Seine valley as far as to Paris. From that moment the city had no peace; and in 861 Charles the Bald invested a brave adventurer, Robert the Strong, with the county of Paris, and set him to resist the invaders. Bravely he struggled against them, and in the end gave up his life in defence of his people. In so doing he laid the foundations of the first French monarchy; his two sons were, to all practical intents, local kings of France; his great-grandson was Hugh Capet. Very different was the career of Charles the Bald. His famous order to his assembled lords, "Let each man defend himself in his fortress," with which high sanction for castle building and local independence he dismissed his feudal levies to shift for themselves, showed that the centre of power was completely gone. The king abandoned his people to any one who would defend them; their defenders rose to greatness, and the Caroling house sank into supine nothingness. Yet he still struggled, though in vain, against the sons of Ludwig the German; after an unsuccessful campaign in North Italy, death overtook him as he was recrossing the Mont Cenis pass (877).

875-893.

Louis his son succeeded him, the Louis II. of French historians, the "Stammerer." He had been for ten years king of Aquitaine, and, when he succeeded to his father's throne, found himself little but the slave and puppet of the great nobles. He soon died (879), leaving a kingship weakened and divided. His two sons, Louis III. in the north and Carloman in the south, were set on their thrones by the nobles, headed by Count Hugh, "first of abbots." These also soon died,—Louis in 882, Carloman in 884; and the representatives of the Caroling family were reduced to two princes of the name of Charles,—Charles the Fat, the emperor, son of Ludwig the German, and Charles "the Simple," "the Fool," a child of five years, youngest son of the stammering king. To the emperor fell the nominal sovereignty over the chief part of the Caroling territories. He, however, was incapable, lazy, a most degenerate shoot of the great house of Pippin. In France he did almost nothing; the Northmen scourged the land incessantly, and in 885-886 laid terrible siege to Paris. The citizens, led by their bishop Gozlin, by Hugh, "first of abbots" (for he was abbot of St. Martin at Tours as well as of St. Denis), and by Odo (or Eudes), count of Paris, made heroic and dauntless resistance. In vain did Hrolf the Northman press the town with active siege or dull blockade; the death of Gozlin and Hugh could not shake the fortitude of the defenders; Count Eudes repulsed attack after attack, and held his own. At last Charles the Fat appeared on Montmartre with a great host of Germans; and the Parisians hoped to see vengeance taken on their pagan foes. Charles the Fat, however, had none of their heroism; he contented himself with buying the Northmen off. As they retired, the citizens rushed out and inflicted one great blow on them, and the great siege was over. Charles withdrew into Germany, and in 887 was deposed and abandoned by all. He died the next year at Reichenau.

The Capetian line begins.

On his death in 888 the nobles of France, irritated against their half-foreign Caroling lords, chose Eudes, the stout defender of Paris, the elder son of Robert the Strong, as their king; he ruled over the land between the Meuse and the Loire, and was the forerunner of the Capetian line of princes, the first person who may be spoken of as a French king. The Carolings still spoke German, and had small love for France; the family of Robert the Strong was patriotic and vigorous, and had shown in the great siege that it might be trusted for defence. In the election of Eudes we see the victory of the feudal lords over the imperial or royal power; we feel that the Frankish name and influence are dying out, and that another set of lords and defenders is rising up to cope with the Northmen and to reduce the land into something like order. Eudes ruled from 888 to 893, striving manfully against the Northmen, whom he so far quelled

893-987. as to induce them to cease from their devastations of France, and to turn their arms against the English shores. He tried in vain to conquer the southern part of France, and after a long struggle was fain to leave them in their independence. Then the southern lords held a great assembly with the Caroling party of the north at Rheims in 893, and elected Charles the Simple their king. He placed himself under the protection of Arnulf, king of Germany, who formally invested him with the kingdom of France, and sent soldiers to assert his claims. This was quite natural; for in the eyes of the Carolings the head of the German branch was the head of the whole family; all other members of it were his vassals, them he protected, to him they swore allegiance. After a struggle of some years Eudes died, and Charles then became sole king of France. Robert, brother of Eudes, received the great title of duke of France; and these two personages headed the two parties, the Germanic Carolings and the French-speaking nobles.

Charles the Simple. Charles the Simple reigned undisturbed for many years: perhaps he was not altogether so foolish as his name declares him. In his day the Northmen, hitherto mere depredators, became permanent settlers in France. Everything there was so weak and defenceless that the invaders had only to choose; the miserable people, the old Celtic inhabitants of Gaul, welcomed their settling; it was a relief from the infinite woes under which the land was suffering. One band of Northmen established themselves on the Loire; another, under Hrolf, the fierce leader of the attack on Paris, settled at Rouen (911) and subdued all the country round, on both sides of the Seine. An orderly and strong government once more grew up in France, and Charles the Simple, advised by the churchmen, made terms with Hrolf, giving him his daughter Gisela to wife, and on due feudal tenure granting him the lands he had won by the sword (912). The stout pagan was baptized by the name of Robert; his followers, after their fashion, loyally did as he had done, and the history of Normandy began: Hrolf becomes Duke Robert, his people become Frenchmen. The duchy soon grew into a compact and orderly state, prosperous and vigorous; Norman towns and churches sprang up on all hands, French manners and speech soon ruled supreme, and in all the arts of peace, in building, commerce, letters, the Normans forthwith took the lead. The noble Scandinavian race, destined to influence so large a portion of the world's history, herein made worthy mark on the soil and the institutions of France.

Soon after this time the French lords, headed by Robert, duke of France, the "king of the barons," second son of Robert the Strong, rose against their Caroling king, and shut him up in Laon, the last stronghold of his family; thence he fled into Lorraine. On the death of Robert, the barons made Rodolf of Burgundy their king, and continued the strife; and Charles, falling into the hands of Hubert of Vermandois, was held by him as a hostage till his death in 929. Rodolf then became undisturbed king till he too died in 936. The barons under the guidance of Hugh "the White" or "the Great," son of Robert, the greatest man of his age, sent over to England for Louis, son of Charles, who had been carried thither by his mother for safety. This is that "Louis d'Outremer," "Louis from Over-sea," who now became king; after showing unusual vigor in a struggle with Otho the Great of Germany, who claimed the kingship over France, he was recognized by all in 941. His reign could be nothing but the miserable record of a struggle against the great lords, Hugh the Great and Richard of Normandy. In this perpetual and wearisome strife he spent his latter days, and died, still a young man, in 954. He was the only man of energy among all the later Carolings. His son Lothair succeeded; his was a long and inglorious reign, ending in 986. His son Louis followed, ruling for a single year. He died childless in 987; and the only heir to the throne—if the feudal lords chose to recognize an hereditary claim—was his uncle Charles, duke of Lorraine. The barons did not choose to be so tied; they set the Caroling prince aside, and elected Hugh, duke of France, to be king. He was afterwards solemnly crowned at Rheims by Archbishop Adalberon.

Thus did Hugh Capet, founder of a great dynasty, come to the throne. With him begins the true history of the kingdom of France; we have reached the epoch of the feudal monarchy.

II. The Feudal Monarchy.

987-996. Hugh Capet, first true king of France. Hugh Capet, eldest son of Hugh the Great, duke of France, was but a Neustrian noble when he was elected king. The house of the Carolings was entirely set aside, its claims and rights denied, by the new force now growing up, the force of feudalism. The head of the barons should be one of themselves; he should stand clear of the imperial ideas and ambitions which had ruled the conduct of his predecessors; he should be a Frenchman in speech and birth and thought, and not a German; but, above all, he must be strong enough to hold his own. And among the great lords of northern France, the representative of the house of Robert the Strong held the most central position, and united in himself most elements of strength. His lands lay between the Burgundians and the Normans, and stretched, north and south, from Flanders to Aquitaine. Not so long ago the duke of France had been the champion of the whole land against the invasions of the Northmen, and the successful defence of Paris had assured to the duke that position of protector of French interests which passed naturally into a kingship. The connections of the house were also a great source of strength; the duke was abbot of St. Martin near Tours, the spiritual lord of the Loire, and abbot of St. Denis near Paris, the spiritual lord of the Seine. And not only in connection with the church was he strong; his alliances with the lay-lords were equally fortunate. The lesser barons looked up to him; he was brother to Eudes Henry, duke of Burgundy, on the one side, and Richard the Fearless, duke of Normandy, on the other side, was his brother-in-law. Lastly, his was a compact and central territory: he was feudal lord of all Picardy, and held a large part of Champagne; Paris, Orleans, Chartres, the counties of Blois, Perche, Tours, Maine, were also his. The domains of the dukes of France formed a long and rather narrow strip; the western border running nearly north and south, touched the sea just above the mouth of the Somme, and reached the Loire a little below Orleans. Paris was as nearly as might be the centre of this district, which was bounded to the north by Flanders and Hainault, to the east by Champagne and a corner of Burgundy, to the south by Aquitaine, to the west by Normandy. The lords of these districts regarded themselves as at least the equals of the new king; the chief of them were the dukes of Normandy, Brittany, Burgundy, and Aquitaine, and the counts of Flanders, Champagne, and Vermandois.

The accession of Hugh to the throne was not undisputed. Charles of Lorraine, rightful heir to the Caroling throne, resisted him for a time, and was upheld by a formidable party among the nobles and churchmen. Their headquarters were at Laon, on the northern frontier of Hugh's domain; their strongest friend was William Fier-à-bras, duke of Aquitaine, on its southern limit. The hearty support of the Normans alone secured the new king's throne. After a short, sharp struggle, in which clerical treachery was as prominent as knightly valor, Hugh got his rival into his hands, and imprisoned him at Orleans, where he died. In a short time all the princes north of the Loire had recognized his authority. The clergy of his domains and territories looked up to him as their friend and champion, and willingly, as an end of strife, deposed Archbishop Arnulf of Rheims, who was nephew of the fallen Caroling prince, and elected in his room the famous Gerbert (afterwards pope as Sylvester II.), the most learned man of his age, who had dared to visit Saracenic Spain, and to bring thence to the north some of that science which gave him the fascinating reputation of being a sorcerer. He had been also in Italy, welcomed and rewarded by Otho the Great; he had taken the lead in the election of Hugh Capet. His elevation to the archbishopric of Rheims placed Hugh in direct antagonism to the papacy, and added much to the troubles of the king's life. And in truth his reign was a constant struggle; he won his kingly name with a life-time of anxious work, and with loss of much of his own domain, which he had to grant out as rewards to the faithfulness of his followers. At the time of his death in 996 it looked as if he was a weaker man than he had been nine years before. The Norman and Aquitanian dukes were stronger than he was, stronger than they themselves had been nine years before; in Burgundy his brother's power was little more than a nominal lordship; the eastern frontier of France seemed to be split up into a chain of independent principalities.

996-1041.

Hereditary principle in France.

On the Christmas day after his election in 987, Hugh Capet had called together his friends at Orleans, and had persuaded them to elect his eldest son Robert as a joint-king. Himself king by the will of his peers, he clearly desired to give the new kingship the hereditary impress, and to secure it to his family; and it may be noticed that in no country has the strict law of hereditary succession been so potent as in France, overbearing, as it did in the extreme case of Henry IV., even the opposition which that prince aroused, and securing an unbroken male descent down to the Revolution.

Robert.

Robert succeeded as sole king in 996,—not a good exchange for the infant kingship. For if the vigorous Hugh was embarrassed by both friends and foes, Robert, with far more piety and far less force of character, seemed certain to be overwhelmed. For Robert "the Pious" or "the Debonair," was an easy kindly man, the delight of monkish chroniclers, endowed with all the charming and dangerous virtues which commend themselves in the man, and often prove fatal to the king. His was a long inglorious reign of twenty-five years,—a constant struggle, first with the church for his wife, afterwards with his barons for his existence.

His first wife had been his distant cousin. The papacy, which could do nothing against his father, forced him to put her away; and though he did so very reluctantly, he speedily took another wife, Constance of Aquitaine, politically an important alliance, though she led him but a wretched life. The followers who came with her from the south introduced new tastes and ideas into the ruder north, and were regarded with detestation by the clergy as effeminate and vicious foreigners. We note a national feeling springing up,—for nationality is nowhere so marked as in its hatreds; to the barons and clergy of the Seine the people of the Garonne were aliens. The opposition also which existed between feudal nobles and churchmen, and the oppressed people struggling for some liberty of action and belief, expressed itself in the futile rising of the peasantry in Normandy (997), and in the slaughter of the Manichæan heretics of Orleans. The whole country was also vexed with civil strife; the king had to contend with his masterful queen, backed by her rebellious sons Henry, heir to the throne, and Robert, duke of Burgundy; in Normandy Richard the Fearless died in 1027, leaving war between his sons; the successful brother Robert secured the dukedom, and, thanks to dark suspicions as to his methods, went by the title of "the Devil."

Henry I.

Robert I. died in 1031, to the great grief of his poor people, to whom, after his way, he had tried to be as a father. His son Henry, whom he had crowned as joint-king in 1017, succeeding to the throne, had to face the bitter hostility of his mother, and of the duke of Burgundy. The duke of Normandy, following the policy of his house, sided with the king, and, crushing the revolted barons on his flank and that of France, made his already terrible name a curse to central France. A peace was patched up by Fulk Nerra, count of Anjou; Robert was confined in his duchy of Burgundy, and ere long Constance, by dying, smoothed the way to tranquillity; the weak king gave in before the strong nature of Robert le Diable, and Normandy became the most powerful state in France. The condition of the whole country, scourged with incessant private war, and lacking all central authority, became so bad that the church at last intervened; in 1036 the "Peace of God" was proclaimed, and accepted in southern and eastern France; the bishops of Burgundy also did their best for peace, and at last the bishops of the north also followed their example. In 1041 was proclaimed the famous "Treuga Dei," the Truce of God, in which all fighting was forbidden from Thursday evening to Monday morning, on all feast days, in Advent and in Lent; religion thus endeavored to extend her protection over almost all the year, and greatly mitigated, if it did not abolish, the evils of private warfare. Many were the signs that some great change was coming. The terrors and hopes roused at the millennial year; those feelings renewed and strengthened, only to be disappointed, at the date of the thousandth year from the crucifixion of our Lord; the fearful contrast between the famine and misery desolating France and the brilliant dreams of the coming kingdom of the just; the slow but real entry of Oriental learning into the west of Europe; the steady set of a stream of pilgrims toward the Holy Land, pre-eminent among whom was Robert of Normandy; the renewal of Norman adventure and conquest, specially in southern Italy; the establishment of the ascendency of monasticism with its champion Hildebrand at Rome, and its renewed vigor in both France and Germany,—all these things mark the reign of Henry I. as a time of preparation for the world's struggle that was coming, for the terrible strife of Christian and Saracen over the holy places of Palestine. The conquest of Sicily and southern Italy, as well as that of England a few years later, made the Normans the foremost champions of the papacy, and the leading power in Europe.

1059-1096.

During these years the kingship of France was in very unworthy hands: Robert, weak and pious, had done nothing to strengthen his throne; his son Henry, immersed in petty warfare, fared no better, and feeling his end to be drawing near, in 1059 had his son Philip crowned as joint-king with himself. He died in 1060, leaving his throne to a prince weaker even than himself. The contrast between these petty kings of France and the grim dukes of Normandy must strike every one: Richard the Fearless, Robert the Devil, William the Conqueror, colossal figures, strong and fierce, take all the sunlight from gentle Robert, weak Henry, dissolute Philip, kings of France. And, in fact, a history of France which should take account only of her kings and their reigns would be completely delusive; the royal power is felt in this 11th century over a very small part of the surface of the country; the great lords are stronger by far than the king in their midst. Normandy rises to very great eminence; Aquitaine is fairly consolidated into a strong southern power; though towards the east the more Germanic princes split the land into petty lordships, the two Lorraines are sometimes under one duke; on the other side Brittany was entirely independent. Across the whole northern frontier the German influence was supreme. Philip was little able to cope with these antagonists. He made an attempt, which failed, to secure Flanders; he withstood William the Bastard in 1076, and made peace with him; and when, after the Conqueror's death, Norman and English interests were somewhat parted, the dangers of a Norman ascendency over France diminished. Somewhat later (1094) Philip was involved in a contest with Rome, the church being now the champion of Fulk of Anjou, whom the king had wronged by carrying off his wife,—a struggle as honorable for the papacy as it was discreditable to Philip. The church, however, was not now led by the mighty hand of Hildebrand. Gregory VII. had died in 1085, and in the reaction which followed, it looked as if the papacy itself might fall. Germany, ever protesting, opposed its claims, often with an anti-pope of her own; the French king, a weak man, with a wretched cause, was yet able to defy the pontiff; William the Bastard, even in Hildebrand's days, had refused to acknowledge his claims; the Normans in Italy were at best but turbulent friends; the Saracen was still a threatening neighbor. In these dark, cloudy times the papacy, by a wise instinct, took for its motto the ancient "ex Oriente lux," and placed itself in the van of that general movement which led to the crusades. The pope who took the great step was Urban II., a Frenchman by birth; it seemed to him that if he could stir the warm blood of turbulent French nobles, and the sterner valor of the Norman character he might head a holy enterprise, and so doing deliver the papacy from all its difficulties, and perhaps assert its lordship over the world.

Philip I.

The crusades.

Urban crossed the Alps in 1095, and came to Clermont in Auvergne. There he was in a central position, within reach of both southern and northern France, and yet not within the domain of the excommunicated Philip, sitting sulkily at Paris. The pope's famous sermon at the council, though at the moment it seemed to fall flat on princely ears, set the crusades in motion, and was the prelude to great events, great changes in Asia and Europe. France took the foremost part in the movement; she seemed to lead the half-formed nations of Europe in the common enterprise; her great men are the heroes of the epoch; "the crusades," says Michelet, "had their ideal in two Frenchmen; they are begun by Godfrey of Bouillon [who, however, was not strictly a Frenchman], and Saint Louis closes them." The latent uneasiness and misery of the people needed only the call; a countless multitude of the common folk flocked to the banner of Peter the Hermit. The excitement went on increasing throughout the year 1096, and as it slowly

1096-1100. gathered force and form, bystanders must have looked with amazement at the strange materials out of which so great a movement grew. The first crusade was altogether popular in character; there was in it little of knowledge or discipline; it was rather like those instinctive emigrations which, flowing from the north or east from time to time, have overwhelmed the more civilized portions of the world. In the pope's sermon at Clermont there was a striking passage which contrasted the wretchedness of men's daily life in France with the comfort of the "land flowing with milk and honey" towards which he directed their eyes. Religious enthusiasm joined with present misery; the dream of a millennial home in Palestine instead of famine and pestilence in France—here is the force which set the first army moving towards the East. And, naturally enough, that first army was almost entirely composed of the common people; the feudal lord felt none of the stings of want, and as yet had no interest in Eastern adventure.

The first crusade. The vast throng of crusaders who set off eastwards in the summer of 1096 was divided into three hosts. The van was led by the one soldier of the company, Walter the Pennyless,—he had at his back about fifteen thousand footmen; the main body of French pilgrims, led by Peter the Hermit, followed next; then came a rabble of German peasants, under the guidance of Godescalc, a monk; on the skirts of the whole force hung an independent body of horsemen. A small band of Norman knights alone saved this crusade from absolute contempt. With great loss the host traversed Europe and were put across the Bosphorus by the emperor Alexius. There they met the Turk at last, and found him more than their match. The energy of Kilidg Arslan, the sultan of Nicæa, soon destroyed them all; they perished far from the walls of Jerusalem.

Meanwhile the interest in the holy places was far from growing less in France. It at last attracted the attention of the lord as well as of the vassal, and the second expedition promised to be very different from the first. Like the first, it was also divided into three hosts,—a northern, a central, and a southern. The northern army was composed of Flemings and Lorrainers, under command of Godfrey of Bouillon, duke of Lower Lorraine, a Caroling prince; it had little or no French blood in it. The central army was French, Norman, and Burgundian, headed by Hugh, count of Vermandois, King Philip's brother, who commanded the Frenchmen; by Robert, duke of Normandy, leading Englishmen and Normans; by Alan of Brittany, with his Celtic following; and by Stephen of Blois, head of that powerful house, who had espoused Adela, the daughter of William the Bastard, and was father of Stephen afterwards king of England. The third army, by far the most complete and best equipped, was composed of the southerners subject to Raymond of Toulouse. The Italian Normans, under Tancred and Bohemond, set forth by themselves. These all, by sea or land, converged on Constantinople, and great was the anxiety of Alexius, who had but one wish, that he might see them safely across the narrow strait which severs Europe from Asia. At last they were all passed over; and William of Tyre declares that at a great muster held on the Asiatic shore there stood forth seven hundred thousand men in all. The figures may be extravagant; there is no doubt that the host was vast and strong. And so Kilidg Arslan found it. He attacked them again and again as they moved southwards through Asia Minor; but they defeated and crippled him so that he could not stay their advance. They reached Antioch, and took it after a long siege and fierce fighting, which broke the power of the Seljukian Turks. They left Bohemond the Norman as prince of Antioch, and marched onwards. Baldwin, Godfrey's brother, moving eastward to succor the Christian lord of Edessa, took the place for himself, and founded the Frankish county of Edessa in 1097. The main body, reduced by many causes to about forty thousand warriors, reached Jerusalem, and after a desperate siege, signalized by prodigies of valor, stormed the holy city on the 15th of July, 1099. The crusaders at once elected Godfrey of Bouillon king of Jerusalem; and though he did not accept so sacred a title, he became lord of the holy city, and the Latin kingdom of Jerusalem began. So long as he lived, he ruled with vigor and success; and the year 1100 seemed to have almost fulfilled the millennial hopes which had been so bright a century before. The battle of Antioch in 1098 had broken the Seljukian power; that of Ascalon in 1099 checked the Fatimites; and Godfrey seemed likely to found a permanent 1100. Christian lordship in the East. But death soon closed his career, and the organization of the great conquest was left to others. Four Latin principalities, Jerusalem, Tripolis, Antioch, and Edessa, were formed, and arranged on the strictest principles of conscious feudalism: the new kingdom of Jerusalem held only of the papacy.

At home the French monarchy was far from quiet, indolent Philip being threatened by the vigorous attack of William II. of England, who claimed once more the French Vexin, and also made war on the count of Maine. In this obscure warfare Philip's eldest son Louis, to whom was entrusted the defence of the western frontier, showed ample promise of his vigor, though it was the arrow in the New Forest which in 1100 relieved the French king of all fear of his rival. Henry Beauclerc, the Conqueror's youngest son, succeeded William in England, and before long (1106) had conquered and captured at Tinchebray his elder brother Robert Courthose, the crusading duke of Normandy. Under his capable government England and Normandy enjoyed repose and prosperity.

When it was known in the West that Godfrey of Bouillon was dead, and that the infant kingdom of Jerusalem was in danger, William IX. of Aquitaine, who, now that Raymond of Toulouse had settled at Tripolis, had become the foremost prince of southern France, set forth with new levies to the succor of the cause. He was joined by some few northern barons, one of whom, Herpin of Bourges, sold his lordship to Philip of France, and began that transfer of feudal territory which was of the highest service to the kingly power. With Bourges the French monarchy for the first time got footing on the south bank of the Loire. The expedition failed ignominiously; William came home to Aquitaine almost alone; and an attempt made somewhat later by Bohemond of Antioch on Constantinople itself came also to nothing. With these two failures the first crusade ended. As yet its effects on France could hardly be felt; the papacy alone was at first seen to be a gainer by the movement. For the new and rigid feudalism of Jerusalem, with its hierarchy of lords, and its code of justice, the famous Assises, all eventually looked to the papacy as its head. While the Western monarchs all strove against the pope, the pope was the sole support and undisputed master of the monarchy of the East. In one respect this first crusade is specially interesting to France; her language, newly assured of independent life, no longer a patois or a dialect of the common Latin, received fresh recognition, and spread abroad in the world. As Latin was the common speech of the church, so French became the common speech of warlike Christendom. It had been carried by the Normans into England and Sicily; now it was the recognized tongue of the Latinized East; and from this time onward it was adopted as the language of feudal and political life.

Louis VI. In the year 1100 Philip, following the traditional usage of his house, had made his son Louis joint-king, and put off the burdens of his royalty. The young man, full of vigor and a true king, had a hard struggle at the first; the limits of the royal power were very narrow; Louis is said to have built the greater Châtelet at Paris as a defence against the neighboring lord of Montmorency, who disputed with him the mastership over the plain of St. Denis; on the other side, he had much ado to come by the castle of Montleheri, which barred his way southwards to Orleans; his mastery over his own barons was very slight; his suzerainty in districts farther off, over Champagne and Burgundy, over Normandy and elsewhere, was scarcely more than nominal. But Louis had force of character; his nicknames testify thereto, for was he not styled "the Eveillé, the Wideawake," and "the Batailleur, the Bruiser"? He knew how to rouse enthusiasm among his followers; no prince ever had a more loyal household or a stronger; the crusades relieved him of some of his most turbulent neighbors; the upspringing of the communes, with their civic liberties, afforded a counterpoise to the feudal violence of the baron's castle; above all, the royal domains under him were well administered. First of Capetian kings, he was felt to be the fount of justice, and it was seen that, as his wise biographer Suger says, "he studied the peace and comfort of ploughmen, laborers, and poor folk, a thing long unwonted," and all the more grateful for its novelty. The most marked of these charac-

1100-1131. teristics of King Louis VI.'s reign was the growth of town liberties, which began just before and after the year 1100. France has always been remarkable for the large number of her small towns and her deficiency in large ones; the time we have reached gives us the beginning of this phenomenon. The little towns all through central France now became the refuge of the population against feudal lawlessness and oppression; and in the very centre, in the district round Paris, they took up the defence of the royal power against its most dangerous feudal neighbor, the duke of Normandy. "At this period," says Ordericus Vitalis, "popular communities were established by the bishops, in such sort that parish priests accompanied the king to siege or battle, bearing the parish flag, and followed by all the youth of the township." This movement showed itself most clearly in the towns just to the north of Paris. Laon, Noyon, Beauvais, the three seats of the clerical party, Saint Quentin, and a few others, all at this time bargained for and bought their liberties. The king placed himself at their head. As each parish priest, representing some little town, marched with the banner of that saint to whom his church was dedicated, so did King Louis go forth with the flag of his own church, the oriflamme of St. Denis. He is the first king of France who bore it officially; by it he declared himself champion of the Church of France, and of the new burgher-life which was springing up around him. The peasant also was glad to be on the same side. In the king's struggle against feudal independence we see continually how well he was seconded by the aggrieved rustics as well as by the civic levies, or by the "damsels," the young gentlemen who formed his warlike court. It would be misleading to say that this new burgher-life was the king's doing; he seems to have felt but little interest in it, great as was its influence on the future. He granted and withdrew charters according as it suited him, or as men offered him more or less. Even to the larger towns, the chief cities of the royal domain, Paris, Orleans, Melun, Étampes, and Compiègne, he only granted privileges, not any real constitutional rights. It is one of the misfortunes of French history that constitutional liberties never seem possible,—that even in the outset they are blighted, and in the end they perish.

By degrees Louis VI. secured his frontiers to the east, the north, and the south; with the west, where lay the fiercer Norman, it was a harder task. In 1119 he lost the battle of Brenneville, and had to abandon the cause of William Clito, son of Robert duke of Normandy, who claimed the duchy against Henry I. of England. In 1124 he was once more in collision with his Norman neighbor; for Henry Beauclerc had allied himself with his son-in-law Henry V. of Germany, who promised to attack the French king from the east, while Henry I. should assault him in the west. Louis VI. raised all central France to the rescue; it was seen how powerful he had become. His own men came in at once, and formed the nucleus of his army; his body-guard and the men of Paris, Orleans, and Étampes were in the centre round the sacred oriflamme, which Louis now brought forth for the first time. Champagne and Burgundy were there; Vermandois also with horse and foot; Pontoise, Amiens, and Beauvais sent the men of their communes. The greater lords farther off, though they held back, did not contest the king's right to call them out. The emperor, struck by this show of energy, or aware of troubles behind his back in Germany, abandoned all his plans of revenge against Rheims, where the council of French clergy had excommunicated him. The king soon made peace with Henry of England, and the storm passed over.

The fortunate issue of this war, and the king's interposition in the affairs of his neighbors, the submission of William of Aquitaine to his judgment, his attempt to find a lordship in Flanders for his friend William Clito, marked Louis VI. out as a powerful king, who had in fact triumphed over opposition at home and abroad. He followed precedent, and had Philip his eldest son crowned in 1129; he, however, was killed by accident in 1131, and the king then took his younger son Louis, "Louis the Young," as men called him, and crowned him as joint-king. The troubles of England, connected with the reign of Stephen, relieved him of anxiety for the rest of his days on his western borders; and the offer of William of Aquitaine to wed his daughter Eleanor to the young joint-king seemed to promise the happiest future for France. Louis VI. just lived to arrange the marriage, and then, on his way to St. Denis, where he yearned to end his days, for it was the school of his youth and the home of Abbot Suger his dearest friend, he was taken ill at Paris, and there died in the year 1137. 1137-1147.

This was the first real king of France, a man of noble nature and true kingly gifts. His greatest cross was his unwieldy bulk, though it could not hinder his activity; he was of humble heart and kindly, cheerful in health or sickness, a true father to his people. Had his successor been a man like himself, the task of welding France into one kingdom might have been achieved centuries ere it was at last brought to pass.

Louis VII.

But Louis VII., the Young, and his queen Eleanor of Aquitaine, left by her father's death at this same time heiress of his great possessions in the south, were far below the level of the fat king, and retarded instead of forwarding the growth of the French monarchy. The advance of the country in mental and material prosperity during the late reign had been immense. Thanks to the crusades, and to the tranquillity which prevailed at home, town-life flourished, religion woke to new life, church-building took a fresh departure, philosophy began to feel her strength. If these are the days of St. Bernard, last of fathers, they were also the days of Abélard, one of the first of intellectual inquirers. To him is due the mental reputation of Paris, which in its turn led on at the end of the century to the establishment of the university of Paris, mother of all the learned corporations of modern Europe.

The second crusade.

The abbot Suger.

Louis VII. was no sooner sole king than he began to show how far he was below his great father; he was weak, timid before the church, vexed with a scrupulous conscience, the delight of monkish chroniclers, the contempt of men. From the beginning his ventures failed. He tried to coerce the great count of Toulouse into submission, and was ignominiously repulsed; he carried on a quarrel with the papacy over the cathedral at Bourges; declared, with Suger's support, that he had the right to nominate to that archbishopric; found Theobald count of Champagne for his own purposes opposed to him; attacked him impetuously, and burnt down Vitry church, in which a crowd of poor folk had taken refuge. The village bears in consequence to this day the name of Vitry le Brûlé, the Burnt. Then, stung with remorse, he gave way before the pope, who enjoined on him a crusade as a penance. In vain did the prudent and patriotic Suger oppose the royal impulse. Weak and excitable, the young king could not be held; the passionate appeals of St. Bernard were far more to his taste. It is interesting to note these two great and rival churchmen pitted against one another: St. Bernard champion of the universal lordship of the papacy, Suger endeavoring to defend the independence of the French monarchy. St. Bernard was the life of the movement; he was, however, too prudent to undertake the leading of it; he would provide the impulse, others must shape it to its end. In this crusade (1147) Germany preceded France, and the expeditions were headed by Conrad the emperor, and by the French king, who entrusted the charge of his country to his old preceptor Suger, although he would not follow his advice. This great churchman, a little man, weakly and thin, was of obscure and ignoble origin; he was educated at St. Denis, side by side with the good king Louis VI., and afterwards appointed abbot of that famous church. While St. Bernard represented patristic learning, and Abélard Greek philosophy, Suger was noted as a diligent student of holy scripture. He was the trusted adviser of both Louis VI. and Louis VII., and by his conduct as regent justified their confidence, and earned the name of Pater Patriæ. He has left in his writings more than one proof of his interest in the well-being of the French people, and of their wretchedness under their feudal masters,—one village "under the lord's castle trodden down and as miserable as if it were under Saracen oppression;" another, "subject to three talliages,—almost entirely destitute through the rapacity of its masters;" another, "so ravaged by the lord that it became utterly unfruitful and useless;" or again, in a fourth place, "the poor folk could scarce exist under the burden of so wicked an oppression." Under Suger's eye prosperity in part came back; but he could not hinder the failure of the crusading king, whose career in the East was a discredit and calamity. It alienated Queen Eleanor, lost him south-

1149-1180.

ern France, made him the contempt of his subjects. In 1149 he returned home with the merest fragment of an army, and Suger humbly withdrew from public life to St. Denis, spending the remnant of his days in good works and wise reforms within that narrower sphere.

The fortunes of Henry II.

At once Queen Eleanor sent to the pope for a divorce, and Louis VII. made but a half-hearted opposition, for she was in truth far too proud and vehement for him. The pope granted her wish in 1152, and immediately after Henry of Anjou wooed and won her, becoming thereby the strongest prince in France. The king tried in vain to make a league against him. Henry compelled all his foes to make peace with him, and became lord over France from the Norman frontier across to the Gulf of Lyons. In 1154 he ascended the English throne as Henry II. Vigorous and determined, fortunate in his marriage, his own resources, his kingship in England, it seemed certain that he would overthrow his feeble rival, and wear on his head the two crowns of France and England. Forthwith began the struggle which lasted all his life. He made Rouen his chief and favorite capital,—for he was far less English than French,—attempted Toulouse, attacked the Bretons, reduced Louis VII. to peace, getting Margaret the daughter of Louis as wife for his eldest son Henry. She brought him some frontier castles, which much strengthened his hold on Normandy. By about the year 1160 Henry II. had reached the highest limit of his almost imperial power. He had planted out his sons as vassal kings in Normandy, Anjou, Ireland; he completely overshadowed all the other princes of Europe. It was not till he tried to restrain the clergy that his troubles began. The Constitutions of Clarendon were passed in 1164; the quarrel with Becket did not tarry. The French king gladly supported Henry's foe, and the struggle lasted till Becket's murder in 1172, a crime which was fatal to the fortunes of Henry II. In 1172 Eleanor, deeming herself wronged by her spouse, set her Aquitanians in revolt against him; her sons also joined her, and Louis VII. entered once more into the strife. He was soon taught that it was folly for him to measure swords with Henry; the great Angevin monarch held firm hold of all his Continental possessions.

Then Louis in 1179, feeling himself old, caused his son Philip, then aged fifteen, to be crowned as joint-king. At the coronation of Philip Augustus at Rheims it is said that the twelve peers of France,—six laymen, six ecclesiastics,—were all present. They were the dukes of Normandy, Burgundy, and Guienne, the counts of Flanders, Champagne, and Toulouse, the archbishop of Rheims, and the bishops of Laon, Noyon, Chalons, Beauvais, and Langres.

This was the last act of this long-reigning prince, who died in 1180. He had been sole king since 1137, and in the main had done little harm if little good. He was kindly and pious, learned beyond the princes of his age; and so long as he listened to the sage counsels of Suger he reigned not amiss. In his days agriculture largely improved, lands were brought under tillage, the countryman had peace and felt some sunshine of prosperity; the lesser towns also flourished, for Louis VII. was friendly on the whole to the communal advance, and issued no less than twenty-four civic charters. His greatest misfortune was his spouse, his greatest blunder his crusade; for a weak well-meaning man, it is wonderful how little harm he did. As so often occurs in history, he is the mean prince between two great men; we are obliged to contrast him with Louis VI., his active and able father, and with Philip Augustus, his proud, unscrupulous, and vigorous son. It is under these three princes that the French feudal monarchy takes definite shape.

Philip Augustus.

Philip Augustus, cold and patient, proud and firm, without high impulses, lacking in enthusiasm, ungenerous, sometimes even deceitful and mean, a hard man and terrible rather than noble, a man who trusted in law and cared little for justice, was clearly a formidable person. His reign of forty-three years—just the same in length with that of his father—could not fail to have great influence on the fortunes of his country. History must favor him: the contrasts, "Louis the Young," his father, and John Lackland of England, are all entirely in his favor; the rivalry between the houses of Capet and Anjou turned to his advantage; the sum of results in his reign leaves on us the sense of greatness and strength, supported by good fortune.

1182-1199.

Philip Augustus began his long reign with acts of vigor and severity. His gentler father could not be persuaded to touch the Jews: but Philip banished them from the realm in 1182; he issued edicts, which he also enforced, against vices, and against heretics; in all he showed signs of a strong and unpleasant character. In 1185 he began with his neighbors,—had a little war with the count of Flanders, which won him the county of Vermandois and the border city of Amiens, key of the line of the Somme. Next, he fell to blows with the duke of Burgundy, and reduced him to submission. In 1186 we find him holding peaceful discussions with his most formidable neighbor, the duke of Normandy, and beginning a movement which after long years ended in the annexation of the proud duchy to the kingdom. Richard Cœur de Lion was too turbulent a prince to let things long remain at peace. Disputes sprang up as to frontier districts, such as the Vexin, and as to the falling-in of the Breton dukedom. Sometimes with Henry II., sometimes with his rebellious son, Philip was constantly conferring or quarrelling, though the grandeur of the old king of England overawed his young rival, whose policy with respect to him looks to us timid and irresolute, and sometimes mean. So things went on till 1187, when tidings of the fall of Jerusalem seemed to still all lesser controversy; and Philip and Henry, meeting once more under the Gisors oak, made peace and took the cross. All Europe was stirred into action; the emperor Frederick Barbarossa and the chief German dukes, Richard Cœur de Lion, with all the greater lords and barons, prepared to set forth. But ere they went troubles again broke out between the two kings, and Henry, deserted by his sons, was forced to a shameful peace, which involved the cession of Berri to France, and involved also the death of the broken-hearted monarch (1189).

With the death of Henry II. we feel that we have passed the highest point in the fortunes of the house of Anjou, and that now the Capets must prevail in France.

The third crusade.

Now followed the third crusade, which brought much barren glory to the new king of England, which caused the death of Barbarossa, drowned in the little river Cydnus (Carasu) in Cilicia, which added nothing to the honor or the power of Philip Augustus. He saw the taking of Ptolemais, and ere long, wearying of the uncongenial sport, handed over his Frenchmen to his kinsman the duke of Burgundy, and, swearing not to molest Richard's territories, set sail for Europe. He broke his word at once by allying himself with John, and fanning that mean prince's jealousy of his nephew Arthur of Brittany. When tidings reached Philip that Richard had been taken prisoner by Leopold of Austria, the French king did not hesitate at once to take advantage of his misfortune. He attacked Normandy, and, in concert with John, laid siege to Rouen. When, however, the emperor let Richard go free, his onward course was checked, and the war ended by a truce, Philip becoming master of Auvergne and withdrawing his hand from Normandy (1196). Richard at once did his best to raise up obstacles against him. Now rose the noble walls of Château Gaillard to protect Rouen, which, since Gisors had returned to France, was entirely open towards the east. For a while his warlike genius and skill in fortification seemed to check the French king's ambition. His end, however, was at hand; besieging Chalus, he was wounded by an arrow, and the wound was fatal. He died in 1199, leaving his crown to his brother John, whose weakness was sure to be Philip's opportunity. Of all the great house of Anjou none remained save John and little Arthur of Brittany; it was clear that ill-will must spring up between these two princes, and what so clear as that Philip would be ready to pluck advantage from the quarrel? At once, on John's accession, while England and Normandy accepted him, the other French-speaking districts, Anjou, Maine, Poitou, and Touraine, as well as Brittany, declared for Arthur, and placed themselves under the willing protection of Philip, who suggested a fair division—the French-speaking lands, including Normandy, for Arthur, England for King John. It was clearly impossible that John, with his un-English character and bringing up, should accept banishment to the island; war broke out, and Philip, in Arthur's name, seized on Brittany, and presently making peace with John, abandoned Arthur's cause. He made his profit out of the short war and peace, no doubt; but the true reason for his peaceable humor was his controversy with the pope, who had interfered with him over the old royal difficulty, his wife. Philip had sent away Ingeborg, his Danish queen, and had taken the fair Agnes of Meran. The pope, Innocent III., came to the rescue of the wronged lady, threatening Philip with excommunication and France with interdict. In 1200 he carried out his threat. The proud king struggled a while against papal interference; in the end he found it better to yield, and replaced Ingeborg on his throne. He was now ready to interpose once more between King John and hapless Arthur. In 1202 John gave him the chance. Arthur fell into his uncle's hands, was lodged in the castle at Rouen, and from that day vanished from life and history. His subjects at once rose in his behalf, and Philip marched southwards into Poitou. Having there secured his authority as Arthur's avenger, he turned north again and swiftly fell on Normandy. In the autumn of 1203 he laid siege to Château Gaillard, then defended by Roger de Lacy, constable of Chester. In vain did Innocent III. interfere between the kings. Philip now had justice and an outraged people on his side, and soon showed the pope that his intervention would not be allowed. Early in 1204 the great fortress fell. John, who had done nothing to avert the blow, had actually fled from his capital Rouen to England; from that day onward the centre of the kingdom was destined to be at London; the controversy for precedence between England and Normandy on that day came to an end. Philip passed triumphantly through Normandy. Poitou, Touraine, Anjou, also placed themselves in his hand, and King John retained a few places near the coast, with Rochelle as his one port of entry into France. Brittany, hitherto a fief of Normandy, henceforth must pay homage to the conqueror of that duchy.

The Albigensian crusade.

The next decade of years was marked by the beginning of great troubles in the south. There flourished sciences, literature, the arts; there men thought and spoke as they would; there the Jew and the infidel could live side by side with the Christian; there the church was weak and feudalism had no hold. The earlier efforts of Innocent III. bearing little fruit, in 1208 his vengeance fell on Raymond of Toulouse, and the Albigensian crusade began. The pope called on the French to help; and, though Philip himself did not interfere, he did not hinder crowds of his ecclesiastics and lay lords from taking the cross. Under the command of St. Dominic, the spiritual power plied its merciless arms; led by Simon of Montfort the elder, the lay sword vigorously supported the thunders of the church. Languedoc was laid waste, her fair culture trodden in the dust, her ancient cities, centres of civilization, burnt and ravaged. No war was ever more atrocious; the grim fanaticism of Simon ably seconded the pitiless orthodoxy of Dominic. The war raged till 1212, when Raymond was forced to flee into Aragon, while Montfort seemed certain to found for himself a great southern principality. The attempt of Peter of Aragon to drive him out, and to keep back the northerner from his borders, ended in that prince's defeat and death, and by 1215 Simon was lord of almost all the south; the great Lateran Council held in that year, confirmed him and his crusaders in possession of it. The two Raymonds of Toulouse, father and son, now made yet one more effort; the south was weary of the foreign invader, and made common cause with them; Toulouse rose against Simon, and in the siege which followed he was killed (1217). Philip now interfered at last, with an army reinforcing Amaury, Simon's son; the heroic south resisted gallantly, and the elder Raymond was able to bequeath his whole inheritance to his son. For a few years the invader and the persecutor were driven out of the land.

Meanwhile Philip had not been idle; the crusade was doing his work in the south, and the incapacity of King John of England gave him an opening in the north. In both he showed himself as the chief friend of the papacy; but while in the south he mainly contented himself with passive approval till towards the end of the struggle, in the north he set himself to take an active part, and in 1213 called an assembly of barons at Soissons, to prepare for an invasion of England. From this, however, he was stayed by Pandulf, the pope's legate, and turned his hand instead against Ferrand of Flanders, who had refused to obey his summons. His fleet, sent up to occupy the mouth of the Scheldt, was attacked and ruined by English ships, and Philip got but a poor consolation by pillaging some of the wealthy Flemish cities. In 1214 he had to face a grand coalition of enemies. Ferrand was supported on one hand by the king of England, on the other by the emperor Otho,—the former undertaking to attack Poitou, the latter to enter Flanders. The moment was very critical for Philip; his barons went in heart with the feudal lords against their royal master. John, however, though he landed at La Rochelle and took Angers, fell back on the first resistance, and was of no avail. Otho entered Flanders, and Philip came up to meet him. They met at Bouvines (29th Aug., 1214), and there Philip won a great victory over Flemings, Germans, and English. Otho fled, a ruined man; Ferrand of Flanders, the earl of Salisbury, and Renaud of Boulogne were prisoners. To the battle of Bouvines are due on the one hand the firm establishment of the French monarchy, on the other the security of English baronial liberties by Magna Charta. Philip had now secured the west, weakened the south, and crushed the great coalition of the north. Little remained for him but to consolidate his power. He had sent his son Louis into England to support the barons against King John; when, however, John died the English barons and people refused to depose his son Henry III.; Louis had to withdraw to France.

Character of Philip Augustus.

For the remainder of his life Philip lived in peace, save when he interposed to support the northern invaders of the south of France. His government was wise and tranquil; he allied himself closely with the church throughout; and when he died in 1223 he left a large part of the fortune he had amassed to his clergy, while he took care to hand his great territories unbroken to his son Louis VIII.

Philip Augustus was, as has been said, "a great king, not a great man." His name survives to France in the memory of the fact that by conquering Normandy he made royalty great. He was also king of Paris, for he built the present Notre Dame, erected her market, paved and cleansed the streets, built almshouses, secured a good water-supply, strengthened her defences by making new walls around the city; above all, he sanctioned and supported, if he did not actually found, her university. To his action in this and to the abatement of grudges between France and England we owe it that the first of English universities, Oxford, drew her earliest inspiration from Paris, and was established in the main on the same lines. New branches of study were cultivated; medicine, experimental philosophy, and law began to occupy the minds of men. And Philip was, by character and knowledge of his position, a lawyer. If great men are noted for their passion for justice, great kings are irresistibly attracted towards law; and Philip, with his delight in the newly-revived Roman law, stands fair comparison with the "English Justinian," Edward I. For the Roman law provided high sanction for his kingly claims,—a sharp instrument for the punishing of popes and princes. The king's sagacity carried him safely through great crises of the fate of royalty, through his struggles with the papacy and with the powerful feudal princes. Besides Normandy and Brittany, Flanders, Champagne, and Languedoc had to bow before his authority; while he reduced the power of the great lords, he actually had the courage to give them a special organization by establishing the great court of peers, whom he called together to help him in condemning King John. Proud, cold, and sagacious, Philip is among the greatest of the founders of the later French royalty.

Louis VIII.

His successor Louis VIII. reigned only three years (1223–1226). In an attempt to carry out the wishes of the church in the south, and to crush the heretics, he was attacked by camp fever after the siege of Avignon. He died, leaving behind him a young son Louis, then twelve years old, under the care of his vigorous and ambitious widow Blanche of Castile. The early years of the reign of Louis IX. were spent in ceaseless strife. The great lords thought that they discerned in the accession of a child their watched-for opportunity; but the vigor of Queen Blanche, and the hearty support of Paris and the towns, made them accept the treaty of St. Aubin du Cormier in 1231; the king's position was secured, and his troubles came to an end. Henry III. of England, on whose aid the princes had depended, failed them, and they were fain to make the best terms they could. This struggle was followed by a long contest with the bishops, in which the young king learnt lessons which stood him in good stead; it is probably to this contest that he owed the successes of his later life,—that he was able, as few kings had been, to combine earnest devotion with an

Saint Louis.

1242-1249. absolute superiority to priestly rule and influence. In many ways circumstances proved friendly to the young king. Theobald of Champagne, becoming king of Navarre, sold some valuable fiefs to Louis; the Treaty of Meaux a little time before had closed the contest between north and south by the submission of Raymond VII., count of Toulouse; one after another the leading nobles ceased to compete with the crown. During all these early years of his reign Louis had constant help from the strong hand of his mother; imperious and masterful, she ruled him and the land thoroughly and successfully. He stood wisely clear of the great struggle which went on all these years between Frederick II. and the papacy.

In 1242 came the king's first serious warfare. He had tried to set his brother Alphonse over Poitou and Auvergne, whereon the reluctant nobles called in Henry III. to their help. Henry came with a small army and large supplies. Louis, however, hastened down to meet him, reduced all the country north of the Charente, defeated him twice, and that incompetent prince fell back to Bordeaux, where he wasted his time and means. In 1243 he was obliged to make his peace with Louis, and gladly withdrew to England. At this same time, Raymond VII. also rose against the king; he was, however, soon reduced to order. In 1244 the last of the Albigensians perished at Mont Segur, the whole of them preferring to be burnt rather than retract their opinions. Fitly to end this period of his life, Louis IX. issued an edict that no lord should hold fiefs under both the king of France and the king of England; almost all his lords abandoned their English allegiance, and rallied round him alone. This movement made the distinction between English and French feeling stronger, and rendered the wars of the future more really national. In 1245 Charles of Anjou, the king's brother, wedded the great heiress of the south, the Countess Beatrice. This fortunate marriage closed the independent political life of Provence, which thus passed to the house of Anjou; its fortunes were consequently long bound up with those of the kingdom of Sicily.

Up to this time Louis IX., being mostly under the command of his mother, had shown little sign of greater qualities; now came the crisis which called them forth. He had acted with singular prudence in the contests which surrounded his earlier years, had held aloof from the investiture wars, had stood clear of eastern complications, had kept his barons quiet. Now, however, he was no longer to confine himself to affairs at home; the East, with its dazzling attractions of religion and romance, called for his care; by going thither he would escape from the conflict nearer home, the internecine struggle between the emperor Frederick II. and the papacy, under Innocent IV., and would fulfil the devout longings of his pious spirit by succoring the afflicted Christians against the Moslem and the Tartar. Louis took the cross in 1244, with his three brothers, Robert of Artois, Alphonse of Poitiers, and Charles of Anjou; at Christmas, 1245, "the day of new clothes" when his courtiers donned their new-made cloaks, they found the significant cross on every shoulder; still nothing was done a while, for in truth France was rightly very reluctant to embark in eastern politics. It was not till 1248 that Louis set sail from Aigues-Mortes for Cyprus, the rendezvous for this crusade. The sultan of Cairo was now lord of Palestine; the Tartars had destroyed the power of the sultan of Konieh; Jerusalem was a defenceless heap of ruins. It therefore seemed best to attack the Moslem power at its centre; and this crusade, instead of making for Constantinople, Asia Minor, and Jerusalem, began on the other side by an attack on the headquarters of the Mahometan power in Egypt. In June, 1249, the good king landed on the Egyptian shore and took Damietta without a blow. There the crusaders lingered till the place became a Capua to them; for idleness brought on debauch, and debauch disease; and fever, the avenger of war, soon attacked the army. After nearly six months of ruinous delay the king marched southward, fought the heroic though inconclusive battle of Massourah, which finally arrested his farther progress towards Cairo; and after another long delay the Christians were obliged to retire towards Damietta. On the retreat the whole army was taken by the Saracens, who massacred the common folk and held the nobles to ransom. Louis had to surrender Damietta, and to pay a heavy sum before he could sail from Egypt; and even so, he was obliged to leave behind a vast number of Christian captives. Of the remnant of his great host only about one hundred knights followed him to Palestine,—a fever-

1253-1270. stricken company depressed with ill-fortune and defeat; the rest made for home. Louis landed at Ptolemais, one of the very few cities left in Christian hands, and found little to restore his confidence or the spirits of his followers. He remained four years in the Holy Land, chiefly engaged in arranging the ransom of his captive soldiers; he freed all the prisoners left in Egypt, strengthened the few places held by the Christians, and was almost unmolested by the Saracens, who were nearly as weak in Palestine as he was. At last, on the death of his noble mother Blanche in 1253, finding that his army had almost entirely melted away, that he could not hope to achieve anything in Palestine, and that he was much wanted at home, he set sail at last, and reached France in September, 1254, a sorrowful and beaten man. The one bright spot in his crusade was the development of the king's character; men recognized in him the hero and saint, and what was least wise in his career has covered him with greatest glory.

Still, the best part of his reign was to come; nowhere had better government ever been seen in Europe than that which Louis carried on for the sixteen peaceful years which followed his first crusade. Some of his acts have been sharply criticised; all, however, were in the direction and interests of peace. In 1258 he made treaty with King James of Aragon, settling all points of lordship at issue on that frontier; in 1259 he came to terms with Henry III. of England, yielding to him the Limousin, Perigord, and parts of Saintonge, in return for Henry's abandonment of all claims on the rest of France. Louis hoped thereby to secure perpetual peace and amity between the two countries. At home all his action tended to good. His noble character, his recognized justice, fairness, and holiness, enabled him to intervene as a peacemaker between his lords; there was in him a generous vein of sympathy and love for his people, which prompted him to succor those in distress, to govern well because mercifully, to rule in church and state as one who loved justice and judgment, and to whom the welfare of his subjects was a chief object and the aim of life.

Throughout it all, however, he still cherished in heart the enthusiasm of the crusading spirit. He had failed once; he would try again for the faith against the miscreant. And so in 1267 he again took the cross, and in 1270, in spite of the remonstrances of his wisest friends, set sail once more,—this time not for Constantinople or Palestine, or even Egypt, but for Tunis. The probable motive of this attack on Tunis was the ambition of the king's brother, Charles of Anjou; for a strong Saracen power on that shore was always a menace to his newly acquired Sicilian and Neapolitan kingdom. Be that as it may, the expedition, as a crusade, attacking the very outskirt instead of the heart of the Moslem strength, was foredoomed to fail. The failure came from the beginning; hardly were the crusaders landed when fever and dysentery set in. The king caught it and died. With him ended the crusading era (St. Bartholomew's day, 1270).

Louis the Saint had been a great king, as well as a pious and a virtuous one; in this he stands almost alone in French history. Nor was he backward in matters of learning; his age is an epoch in the growth of French literature. The university of Paris under his care rose to high repute; the greatest learned men in Europe are connected with this period of its history; Albertus Magnus, Roger Bacon, Saint Thomas Aquinas, all studied at Paris. In his reign Robert of Sorbon (1252) founded his college for ecclesiastics, and the famous Sorbonne began its long career. Literature flourished in prose and poetry; the arts took a fresh beginning; Saint Louis raised that chief ornament of architecture in Paris, the Sainte Chapelle.

Above all, the king was notable for his justice, and the use he made of the law. The law, the natural ally of the throne in France, came to his help: by its aid he attacked or undermined feudal privileges; he established a higher jurisdiction than that of the feudal courts, appointed itinerant justices, insisted on a real right of appeal in last resort to himself, curtailed the powers of baronial courts, and the freedom of baronial warfare, and finally rendered the king's "parliament" a great law-court. His legists issued a new code, the "Establishments of Saint Louis," in which feudal custom was largely modified by the Roman law. The king also increased and consolidated the royal domain, acquiring

1270-1297. property whenever it was possible, and administering throughout a uniform rule of law. The kingdom also was greatly enlarged by his care; a large portion of the lands of the count of Toulouse, Chartres also, Blois, Sancerre, Macon, Perche, Arles, and Foix, all became his; Normandy was formally made over to him by Henry III. His brother Charles of Anjou not only secured Provence for himself, and eventually for France, but by finally conquering the last of the Hohenstauffen secured, a doubtful good, French influence in southern Italy. Frederick II. had died in 1250; Manfred, his base-born son, became king of Naples; and Charles, invoked against the hated Hohenstauffen by Pope Urban IV., defeated Manfred in 1266, and his nephew Conradin, the last of the house, in 1268, thereby becoming king of the Two Sicilies. Then began that system of traditional savageness and cruelty which characterizes all the mediæval relations of France with Italy. The "Pragmatic Sanction of Saint Louis" is placed in the year 1269, and (if genuine, which is doubtful) laid down the maxims on which the liberties of the Gallican Church are founded. The king and his lawyers were certainly quite as unwilling to allow the church as the baronage to win independence, and to plunge the kingdom into confusion.

Philip III. Philip III., the Rash, succeeded on his father's death,—an unlearned, weak man, whose history is uneventful, save that it is the period in which the foreign influence of France received a great check through the Sicilian Vespers (1282), which deprived Charles of Anjou of his throne, in spite of the urgent efforts of the papacy. Philip was also unlucky in his dealings with Aragon; on his return from an expedition into Spain, in which he ruined a great fleet and army, he fell ill and died, in 1285.

Philip IV., the Fair. In 1274 the count of Champagne, Henry of Navarre, had died, leaving one child, a girl, three years old. She was affianced in 1276 to Philip, son of Philip III., and Navarre was thus brought into the French kingdom. And so it fell out that when Philip IV., the "Fair," that proud young prince, succeeded, he was already master of the fortunes of a larger France than had ever yet been known. Lawyers surrounded his throne from the beginning; he was the fitting leader in a great revival of the Roman law, that terrible enemy to feudalism and the mediæval papacy.

In the beginning of his reign Philip IV. worked by means of his lawyers; they put a stop, in large part, to clerical administration; the parliament fell completely into their hands, and ere long (1302) was permanently fixed at Paris, and became the chief legal authority in the realm. The king's fiscal necessities threatened to overwhelm him; the older system of sustenance, based on the royal domain, had completely given way. To this reign France owes the first beginnings of a formidable system of taxation; to Philip IV. is due the ill-sounding maltôte, the "ill-levied" tax. He seized what he could, wrung the Jews, confiscated the wealth of the Templars, turned everything into hard cash, sold privileges to towns, tampered with the coin; by sumptuary laws he succeeded in taxing even his nobles. This state of need and greed brought on the great strife of his reign, the quarrel with Boniface VIII. It was a many-sided struggle,—that of the temporal against the spiritual authority; that of the civil against the canon law; that of the lawyers against the clergy; that of France against Italy. Soon after his accession in 1294 Boniface VIII. had tried to mediate between the two great lawyer-princes, Edward I. of England and Philip the Fair. The kings took it much amiss; and when in 1296 Boniface issued the famous bull Clericis laicos, which forbade the clergy to pay taxes to the civil power unless the papal power sanctioned them, Philip answered by an ordinance which prohibited the export of valuables of all kinds from the kingdom. The pope's reply created open breach, and Philip let loose his lawyers on the Italian priests. The strife, however, was speedily allayed, and a seeming reconciliation took place over the canonization of Louis IX., which occurred on the anniversary of his death, St. Bartholomew's day, 1297. Boniface also mediated successfully between the French and English kings, securing a large part of Aquitaine to France. It was, however, but a truce, which enabled Philip, not only to win this portion of Aquitaine, but to attach to himself the friendship of the duke of Brittany, and to occupy Flanders. So things went on till the year of jubilee, 1300, when Boniface seemed to have been lifted up above all the princes of the earth. About this time the pope nominated as his legate in France Saisset bishop of Pamiers, an open foe to the French crown. He made use of his new authority to stir up strife in the south, and Philip IV. arrested him at Pamiers as a traitor. Forthwith the old strife broke out again,—a terrible war of words ensuing, lawyer's pamphlets met by papal bulls, which affirmed (as in the great Ausculta fili bull) the supremacy of the pope over all kings. The king threw himself on the patriotism of his people, and called together the three Estates of France, nobles, clergy, and burghers, to sit at Paris and consider his grievances. The nobles and burghers spoke out bravely for their king against the papal claims; the clergy applied for leave to attend the council convoked at Rome. Their request was refused; if they went their goods would be forfeited. 1300-1314.

Just before this had broken out a revolt at Bruges (1302), in which the enraged Flemish had risen on and destroyed their new masters; the French nobles, eager for vengeance and spoil, hastily assembled and marched northwards, under the guidance of Robert of Artois; hard by Courtrai the Flemish burghers, led by Guy of Namur, inflicted on them the worst defeat ever yet sustained by French chivalry; the "Day of the Spurs" was a fitting name for a carnage after which four thousand gilt spurs were hung as trophies in Courtrai cathedral.

The foremost men of France had perished in a ditch; and though for the moment Boniface rejoiced, and deemed his rival to be ruined, in the event this overthrow of feudalism turned completely to the king's advantage. The bishops, thinking also that the royal power was broken, set forth for Rome. For the moment even Philip seemed to lose confidence, and the papacy enunciated its highest claims. The king, however, soon recovered force; he made peace with Edward of England, ceding Guienne to him, and marrying his daugher Isabella to the younger Edward. It was now that he debased the coin and imposed the odious maltôte. William of Nogaret was sent to Italy to lodge with the pope the king's appeal from his authority to a general council and a legitimate pope. In reply the pope announced that he was about to lay an interdict on the kingdom. Then Nogaret called in the help of the Colonnas, the family foes of Boniface, who gladly seized the pope at Anagni; the mortifications and privations of the moment were too much for the aged pontiff, and though the Romans delivered him from captivity, he gave way and died. Thus was Philip IV. delivered from his worst antagonist. In 1304 he made peace with the Flemish, giving up his claim to Flanders, and drawing himself together to complete his victory over the papacy. In 1305 he succeeded in forcing on the conclave of cardinals his nominee Bertrand de Goth, archbishop of Bordeaux, who became pope as Clement V., and was consecrated at Lyons; then the great "captivity" began. Clement, as the price of his elevation, cancelled the bulls of Boniface, and pardoned the king's lawyers; he created nine French cardinals, so as to secure the king's influence in the conclave. Philip pressed him to condemn the memory of Boniface, and to consent to the ruin of the Templars; this, however, the poor pope avoided, with pretexts sufficient for the time. When Philip pressed him still more closely, for the Templars were rich and unpopular, and busy rumor had darkened their character with fancied details of unholy crimes, Clement endeavored to escape by flight. The king arrested him, and brought him back to Poitiers. In 1309 this miserable pontiff was allowed to travel southward, though Philip absolutely refused to let him return to Rome, and was fain to fix his seat at Avignon on the Rhone, a city then in the possession of Charles V. of Anjou, and hard by the papal county of the Venaissin. Here the papacy abode in discredit and subjection to the French crown for seventy years.

The condemnation of Boniface was deferred a while; it was but a barren revenge, and the Templars were a richer spoil. In spite of their heroic defence and resistance, they were condemned in 1310, and perished as martyrs to their cause. In 1312 the abolition of the Order was decreed by Clement V., and their wealth, in large part, fell into the king's hands. These gloomy years fitly close the reign of Philip IV.; he died in 1314 from the effects of a hunting accident. He had not added much to the dimensions of the kingdom; the addition of Lyons (1312) was his greatest achievement in this way; he had immensely increased the royal authority at home, and had triumphed over the papacy, the conqueror of the empire.

The sons of Philip the Fair.

Philip IV., died, leaving three sons, who all succeeded him. In the house of Capet, there had hitherto been alternately weak and strong monarchs; now, however, the vigor of the race was gone. The reign of Louis X., "le Hutin," the quarreller, was brief and unimportant; it was naturally enough a time of reaction, in which things seemed to fall back into feudal anarchy and weakness. There was great distress and famine in France in 1315–1316, and a campaign against the Flemings was a complete failure. In June, 1316, Louis died, leaving his queen with child. She bore a son, named John, who lived seven days, being during that time nominal king of France; on his death, the late king's next brother Philip V., "the Tall," succeeded to the throne, basing his claims on the so-styled Salic law of France, according to which "no woman could succeed to Salian soil," and, *a fortiori*, no woman could succeed to the Salian, that is, to the French throne. He reigned six miserable years, without credit, though he published not a few ordinances. He died in 1322, and was succeeded by his youngest brother Charles IV., "the Fair," whose six years' reign ended in 1328. With him the direct line of the House of Capet came to an end,—cursed with barrenness and incapacity, men held, by the curse of the dying Templars.

The house of Valois.

Charles, count of Valois, was the younger brother of Philip the Fair, and therefore uncle of the three sovereigns lately dead. His eldest son Philip had been appointed guardian to the queen of Charles IV.; and when it appeared that she had given birth to a daughter and not a son, the barons, joining with the notables of Paris and the good towns, met to decide who was by right the heir to the throne, "for the twelve peers of France said and say that the crown of France is of such noble estate that by no succession can it come to a woman nor to a woman's son," as Froissart tells us. This being their view, the baby daughter of Charles IV. was at once set aside, and the claim of Edward III. of England, if, indeed, he ever made it, rested on Isabella of France, his mother, sister of the three sovereigns. And if succession through a female had been possible, then the daughters of those three kings had rights to be reserved. It was, however, clear that the throne must go to a man, and the crown was given to Philip of Valois, founder of a new house of sovereigns.

Philip VI.

The new monarch was a very formidable person. He had been a great feudal lord, hot and vehement, after feudal fashion; he was now to show that he could be a severe master, a terrible king. He began his reign by subduing the revolted Flemings on behalf of his cousin Louis of Flanders, and having replaced him in his dignities, returned to Paris, and there held high state as king. And he clearly was a great sovereign: the weakness of the late king had not seriously injured France; the new king was the elect of the great lords, and they believed that his would be a new feudal monarchy; they were in the glow of their revenge over the Flemings for the day of Courtrai; his cousins reigned in Hungary and Naples, his sisters were married to the greatest of the lords; the queen of Navarre was his cousin; even the youthful king of England did him homage for Guienne and Ponthieu. The barons soon found out their mistake. Philip VI., supported by the lawyers, struck them whenever they gave him opening; he also dealt harshly with the traders, hampering and all but ruining them, till the country was alarmed and discontented. On the other hand, young Edward of England had succeeded to a troubled inheritance, and at the beginning was far weaker than his rival: his own sagacity, and the advance of constitutional rights in England, soon enabled him to repair the breaches in his kingdom, and to gather fresh strength from the prosperity and good-will of a united people. While France followed a more restrictive policy, England threw open her ports to all comers; trade grew in London as it waned in Paris; by his marriage with Philippa of Hainault, Edward secured a noble queen, and with her the happiness of his subjects and the all-important friendship of the Low Countries. In 1336 the folly of Philip VI. persuaded Louis of Flanders to arrest the English merchants then in Flanders; whereon Edward retaliated by stopping the export of wool; and Jacquemart van Arteveldt of Ghent, then at the beginning of his power, persuaded the Flemish cities to throw off all allegiance to their French-loving count, and to place themselves under the protection of Edward. In return Philip VI. put himself in communication with the Scots, the hereditary foes of England; and the great wars which were destined to last 116 years, and to exhaust the strength of two strong nations, were now about to begin. They brought brilliant and barren triumphs to England, and, like most wars, were a wasteful and terrible mistake, which, if crowned with ultimate success, might, by removing the centre of the kingdom into France, have marred the future welfare of England; for the happy constitutional development of the country could never have taken place with a sovereign living at Paris, and French interests becoming ever more powerful. Fortunately, therefore, while the war evoked by its brilliant successes the national pride of Englishmen, by its eventual failure it was prevented from inflicting permanent damage on England.

Beginnings of war between England and France.

The war began in 1337, and ended in 1453; the epochs in it are the treaty of Bretigny in 1360, the treaty of Troyes in 1422, the final expulsion of the English in 1453.

The "Hundred Years' War."

The French king seems to have believed himself equal to the burdens of a great war, and able to carry out the most far-reaching plans. The pope was entirely in his hands, and useful as a humble instrument to curb and harass the emperor. Philip had proved himself master of the Flemish, and, with help of the king of Scotland, hoped so to embarrass Edward III. as to have no difficulty in eventually driving him to cede all his French possessions. While he thought it his interest to wear out his antagonist without any open fighting, it was Edward's interest to make vigorous and striking war. France therefore stood on the defensive; England was always the attacking party. On two sides, in Flanders and in Brittany, France had outposts which, if well defended, might long keep the English power far away from her vitals. Unluckily for his side, Philip was harsh and rash, and threw these advantages away. In Flanders the repressive commercial policy of the count, dictated from Paris, gave Edward the opportunity, in the end of 1337, of sending the earl of Derby with a strong fleet to raise the blockade of Cadsand, and to open the Flemish markets by a brilliant action, in which the French chivalry was found powerless against the English yeomen-archers; and in 1338 Edward crossed over to Antwerp to see what forward movement could be made. The other frontier war was that of Brittany, which began a little later (1341). The openings of the war were gloomy and wasteful, without glory. Edward did not actually send defiance to Philip till 1339, when he proclaimed himself king of France, and quartered the lilies of France on the royal shield. The Flemish proved a very reed; and though the French army came up to meet the English in the Vermandois country, no fighting took place, and the campaign of 1339 ended obscurely. Norman and Genoese ships threatened the southern shores of England, landing at Southampton and in the Isle of Wight unopposed. In 1340 Edward returned to Flanders; on his way he attacked the French fleet which lay at Sluys, and utterly destroyed it. The great victory of Sluys gave England for centuries the mastery of the British channel. But, important as it was, it gave no success to the land-campaign. Edward wasted his strength on an unsuccessful siege of Tournai, and, ill-supported by his Flemish allies, could achieve nothing. The French king in this year seized on Guienne; and from Scotland tidings came that Edinburgh castle, the strongest place held by the English, had fallen into the hands of Douglas. Neither from Flanders nor from Guienne could Edward hope to reach the heart of the French power; a third inlet now presented itself in Brittany. On the death of John III. of Brittany in 1341, John of Montfort, his youngest brother, claimed the great fief against his niece Jeanne, daughter of his elder brother Guy, count of Penthievre. He urged that the Salic law which had been recognized in the case of the crown, should also apply to this great duchy, so nearly an independent sovereignty. Jeanne had been married to Charles of Blois, whom John III. of Brittany had chosen as his heir; Charles was also nephew of King Philip, who gladly espoused his cause. Thereon John of Montfort appealed to Edward, and the two kings again met in border strife in Brittany. The Bretons

1345-1356.

sided with John against the influence of France. Both the claimants were made prisoners; the ladies carried on a chivalric warfare, Jeanne of Montfort against Jeanne of Blois, and all went favorably for the French party till Philip, with a barbarity as foolish as it was scandalous, tempted the chief Breton lords to Paris and beheaded them without trial. The war, suspended by a truce, broke out again, and the English raised large forces and supplies, meaning to attack on three sides at once,—from Flanders, Brittany, and Guienne. The Flemish expedition came to nothing; for the people of Ghent in 1345 murdered Jacques van Artevveldt as he was endeavoring to persuade them to receive the Prince of Wales as their count; and Edward, on learning this adverse news, returned to England. Thence in July, 1346, he sailed for Normandy, and landing at La Hogue overran with ease the country up to Paris. He was not, however, strong enough to attack the capital, for Philip lay with a large army watching him at St. Denis. After a short hesitation Edward crossed the Seine at Poissy, and struck northwards, closely followed by Philip. He got across the Somme safely, and at Crécy in Ponthieu stood at bay to await the French. Though his numbers were far less than theirs, he had a good position, and his men were of good stuff; and when it came to the battle, the defeat of the French was crushing. Philip had to fall back with his shattered army; Edward withdrew unmolested to Calais, which he took after a long siege in 1347. Philip had been obliged to call up his son John from the south, where he was observing the English under the earl of Derby; thereupon the English overran all the south, taking Poitiers, and finding no opposition. Queen Philippa of Hainault had also defeated and taken David of Scotland at Neville's Cross.

The campaign of 1346–1347 was on all hands disastrous to King Philip. He sued for and obtained a truce for ten months. These were the days of the "black death," which raged in France from 1347 to 1349, and completed the gloom of the country, vexed by an arbitrary and grasping monarch, by unsuccessful war, and now by the black cloud of pestilence. In 1350 King Philip died, leaving his crown to John of Normandy. He had added two districts and a title to France: he bought Montpellier from James of Aragon, and in 1349 also bought the territories of Humbert, dauphin of Vienne, who resigned the world, under influence of the revived religion of the time, a consequence of the plague, and became a Carmelite friar. The fief and the title of dauphin were granted to Charles, the king's grandson, who was the first person who attached that title to the heir to the French throne. Apart from these small advantages the kingdom of France had suffered terribly from the reign of the false and heartless Philip VI. Nor was France destined to enjoy better things under John "the Good," one of the worst sovereigns with whom she has been cursed. He took as his model and example the chivalric John of Bohemia, who had been one of the most extravagant and worthless of the princes of his time, and had perished in his old age at Crécy. The first act of the new king was to take from his kinsman, Charles "the Bad" of Navarre, Champagne and other lands; and Charles went over to the English king. King John was keen to fight; the States-General gave him the means for carrying on war, by establishing the odious "gabelle" on salt and other imposts. John hoped with his new army to drive the English completely out of the country. Petty war began again on all the frontiers,—an abortive attack on Calais, a guerilla warfare in Brittany, slight fighting also in Guienne. Edward in 1355 landed at Calais, but was recalled to pacify Scotland; Charles of Navarre and the duke of Lancaster were on the Breton border; the Black Prince sailed for Bordeaux. In 1356 he rode northward with a small army to the Loire, and King John, hastily summoning all his nobles and fief holders, set out to meet him. Hereon the Black Prince, whose forces were weak, began to retreat; but the French king outmarched and intercepted him near Poitiers. He had the English completely in his power, and with a little patience could have starved them into submission; instead, he deemed it his chivalric duty to avenge Crécy in arms, and the great battle of Poitiers was the result (19th September, 1356). The carnage and utter ruin of the French feudal army were quite incredible; the dead seemed more than the whole army of the Black Prince; the prisoners were too many to be held. The French army, bereft of leaders, melted away, and the Black Prince rode triumphantly back to Bordeaux with the captive King John and his brave little son in his train. A two years' truce ensued; King John was carried over to London, where he found a fellow in misfortune in David of Scotland, who had been for 11 years a captive in English hands. The utter degradation of the nobles, and the misery of the country, gave to the cities of France an opportunity which one great man, Étienne Marcel, provost of the traders at Paris, was not slow to grasp. He fortified the capital and armed the citizens; the civic clergy made common cause with him; and when the dauphin Charles convoked the three Estates at Paris, it was soon seen that the nobles had become completely discredited and powerless. It was a moment in which a new life might have begun for France; in vain did the noble order clamor for war and taxes,—they to do the war, with what skill and success all men now knew, and the others to pay the taxes. Clergy, however, and burghers resisted. The Estates parted, leaving what power there was still in France in the hands of Étienne Marcel. He strove in vain to reconcile Charles the dauphin with Charles of Navarre, who stood forward as a champion of the towns. Very reluctantly did Marcel entrust his fortunes to such hands. With help of Lecocq, bishop of Laon, he called the Estates again together, and endeavored to lay down sound principles of government, which Charles the dauphin was compelled to accept. Paris, however, stood alone, and even there all were not agreed. Marcel and Bishop Lecocq, seeing the critical state of things, obtained the release of Charles of Navarre, then a prisoner. The result was that ere long the dauphin-regent was at open war with Navarre and with Paris. The outbreak of the miserable peasantry, the Jacquerie, who fought partly for revenge against the nobles, partly to help Paris, darkened the time; they were repressed with savage bloodshed, and in 1358 the dauphin's party in Paris assassinated the only great man France had seen for long. With Étienne Marcel's death all hope of a constitutional life died out from France; the dauphin entered Paris, and set his foot on the conquered liberties of his country. Paris had stood almost alone; civic strength is wanting in France; the towns but feebly supported Marcel; they compelled the movement to lose its popular and general character, and to become a first attempt to govern France from Paris alone. After some insincere negotiations, and a fear of desultory warfare, in which Edward III. traversed France without meeting with a single foe to fight, peace was at last agreed to at Bretigny in May, 1360. By this act Edward III. renounced the French throne, and gave up all he claimed or held north of the Loire, while he was secured in the lordship of the south and west, as well as of that part of northern Picardy which included Calais, Guines, and Ponthieu. The treaty also fixed the ransom to be paid by King John.

John "the Good."

1356-1364.

Étienne Marcel.

The peace of Bretigny.

France was left smaller than she had been under Philip Augustus, yet she received this treaty with infinite thankfulness; worn out with war and weakness, any diminutio of territory seemed better to her than a continuance of he unbearable misfortunes. Under Charles, first as regent, the as king, she enjoyed an uneasy rest and peace for 20 years The monarchy was disgraced by failure and captivity; th nobles, weakened and discredited in war and peace, heade by factious and self-seeking lords, could offer no hope fo France; the cities had shown, during the effort of Marcel that rare man of energy and genius, that they were unfit t take the command; the Jacquerie had declared the peas antry to be wretched and powerless; the black death wit equal hand had smitten all, and had shown with lurid ligh the scandalous manners of the Avignon papacy, the want of patriotic or religious energy in the clergy; the country wa pitilessly ravaged by the free companies, the inheritance o the war. In all Europe it was a dark and gloomy time; i France men might well despair. King John, after return ing for a brief space to France, went back into his pleasan captivity in England, leaving his country to be ruled by th regent the dauphin. In 1364 he died, and Charles V., "the Wise," became king in name, as he had now been for some years in fact. This cold, prudent, sickl prince, a scholar who laid the foundations of the great l brary of Paris by placing 900 MSS. in three chambers i the Louvre, had nothing to dazzle the ordinary eye; to th timid spirits of that age he seemed to be a malevolent wiz

Charles V.

1364-1378.

ard, and his name of "Wise" had in it more of fear than of love. Yet he was a successful prince for the times; he discerned that nothing could be gained by fighting battles,—that Ennius had given him the clue to victory in describing Fabius as one who "cunctando restituit rem;" and he had the passive coldness of heart needful to carry out such a plan.

Du Guesclin.

He also is notable for two things: he reformed the current coin, and recognized the real worth of Du Guesclin, the first great leader of mercenaries in France, a grim fighting-man, hostile to the show of feudal warfare, and herald of a new age of contests, in which the feudal levies would fall into the background. The invention of gunpowder in this century, the incapacity of the great lords, the rise of free lances and mercenary troops, all told that a new era had arrived. It was by the hand of Du Guesclin that Charles overcame his cousin and namesake Charles of Navarre, and compelled him to peace. On the other hand, in the Breton war which followed just after, he was defeated by Sir John Chandos and the partisans of John of Montfort, who made him prisoner; the treaty of Guerande which followed gave them the dukedom of Brittany; and Charles V., unable to resist, was fain to receive the new duke's homage, and to confirm him in the duchy. The king did not rest till he had ransomed Du Guesclin from the hands of Chandos; he then gave him commission to raise a paid army of freebooters, the scourge of France, and to march with them to support, against the Black Prince, the claims of Henry of Trastamare to the crown of Castile. Successful at first, by help of the king of Aragon, he was made constable of Spain at the coronation of Henry at Burgos; Edward the Black Prince, however, intervened, and at the battle of Najara (1367) Du Guesclin was again a prisoner in English hands, and Henry lost his throne. Fever destroyed the victorious host, and the Black Prince, withdrawing into Gascony, carried with him the seeds of the disorder which shortened his days. Du Guesclin soon got his liberty again; and Charles V., seeing how much his great rival of England was weakened, determined at last on open war. He allied himself with Henry of Trastamare, listened to the grievances of the Aquitanians, summoned the Black Prince to appear and answer the complaints. In 1369 Henry defeated Pedro, took him prisoner, and murdered him in a brawl; thus perished the hopes of the English party in the south. About the same time Charles V. sent open defiance and declaration of war to England. Without delay he surprised the English in the north, recovering all Ponthieu at once; the national pride was aroused; Philip, duke of Burgundy, who had, through the prudent help of Charles, lately won as a bride the heiress of Flanders, was stationed at Rouen, to cover the western approach to Paris, with strict orders not to fight; the Aquitanians were more than half French at heart. The record of the war is as the smoke of a furnace. We see the reek of burnt and plundered towns; there were no brilliant feats of arms; the Black Prince, gloomy and sick, abandoned the struggle, and returned to England to die; the new governor, the earl of Pembroke, did not even succeed in landing: he was attacked and defeated off Rochelle by Henry of Castile, his whole fleet with all its treasure and stores taken or sunk, and he himself was a prisoner in Henry's hands. Du Guesclin had already driven the English out of the west into Brittany; he now overran Poitou, which received him gladly; all the south seemed to be at his feet. The attempt of Edward III. to relieve the little that remained to him in France failed utterly, and by 1372 Poitou was finally lost to England. Charles set himself to reduce Brittany with considerable success; a diversion from Calais caused plentiful misery in the open country; but, as the French again refused to fight, it did nothing to restore the English cause. By 1375 England held nothing in France except Calais, Cherbourg, Bayonne, and Bordeaux. Edward III., utterly worn out with war, agreed to a truce, through intervention of the pope; it was signed in 1375. In 1377, on its expiry, Charles, who in the two years had sedulously improved the state of France, renewed the war. By sea and land the English were utterly overmatched, and by 1378 Charles was master of the situation on all hands. Now, however, he pushed his advantages too far; and the cold skill which had overthrown the English was used in vain against the Bretons, whose duchy he desired to absorb. Languedoc and Flanders also revolted against him. France was heavily burdened with taxes, and the future was dark and threatening. In the midst of these things, death overtook the coldly-calculating monarch in September, 1380.

1380-1390.

Charles VI.

Little had France to hope from the boy who was now called on to fill the throne. Charles VI. was not twelve years old, a light-witted, handsome boy, under the guardianship of the royal dukes his uncles, who had no principles except that of their own interest to guide them in bringing up the king and ruling the people. They selfishly quarrelled round his person; the duke of Anjou stole his money and set off to make good his claims on Naples and Sicily; the duke of Burgundy had great prospects in the Low Countries; the duke of Berri ruled in southern France, and was a man of no character or worth; the duke of Bourbon, the late king's brother-in-law, with Burgundy, had charge of the boy's education; Oliver Clisson was made constable of France in the room of Du Guesclin. Before Charles VI. had reached years of discretion he was involved by the French nobles in war against the Flemish cities, which, under guidance of the great Philip van Arteveldt, had overthrown the authority of the count of Flanders. The French cities showed ominous signs of being inclined to ally themselves with the civic movement in the north. The men of Ghent came out to meet their French foes, and at the battle of Roosebek (1382) were utterly defeated and crushed. Philip van Arteveldt himself was slain. It was a great triumph of the nobles over the cities; and Paris felt it when the king returned. All movement there and in the other northern cities of France was ruthlessly repressed; the noble reaction also overthrew the "new men" and the lawyers, by whose means the late king had chiefly governed. Two years later, the royal dukes signed a truce with England, including Ghent in it; and Louis de Mâle, count of Flanders, having perished at the same time, Margaret, his daughter, wife of Philip of Burgundy, succeeded to his inheritance (1384). Thus began the high fortunes of the house of Burgundy, which at one time seemed to overshadow emperor and king of France. In 1385 another of the brothers, Louis, duke of Anjou, died, with all his Italian ambitions unfulfilled. In 1386 Charles VI., under guidance of his uncles, declared war on England, and exhausted all France in preparations; the attempt proved the sorriest failure. The regency of the dukes became daily more unpopular, until in 1388 Charles dismissed his two uncles, the dukes of Burgundy and Berri, and began to rule. For a while all went much better; he recalled his father's friends and advisers, lightened the burdens of the people, allowed the new ministers free hand in making prudent government; and learning how bad had been the state of the south under the duke of Berri, deprived him of that command in 1390. Men thought that the young king, if not good himself, was well content to allow good men to govern in his name; at any rate the rule of the selfish dukes seemed to be over. Their bad influences, however, still surrounded him; an attempt to assassinate Oliver Clisson the constable was connected with their intrigues and those of the duke of Brittany; and in setting forth to punish the attempt on his favorite the constable, the unlucky young king, who had sapped his health by debauchery, suddenly became mad. The dukes of Burgundy and Berri at once seized the reins, and put aside his brother the young duke of Orleans.

Burgundians and Armagnacs.

It was the beginning of that great civil discord between Burgundy and Orleans, the Burgundians and Armagnacs, which worked so much ill for France in the earlier part of the next century. The rule of the uncles was disastrous for France; no good government seemed even possible for that unhappy land. From time to time the unfortunate king had lucid intervals; he seems even to have tried to put a stop to the great schism of the West, that struggle between rival popes, the scandalous quarrel of "Urbanists," followers of Urban VI.. elected at Rome (in 1378) in opposition to the French power, and of "Clementines," followers of the Avignon pope, Clement VII.

Urbanists and Clementines.

But his lucid intervals were too short and few; and the French court was also too much engaged in the Burgundian and Orleanist contest to care much for the peace of the church. There is no more gloomy period of French history than the coming 50 years. It is the record of party strife of a mean and unscrupulous kind, in which also Paris begins her new rôle of partisan. The struggle in the 15th

1390-1407.

century between royalty and aristocracy is an unlovely sight, whether it be watched in England, in Germany, or in France. In France the contest took a peculiar form; the whole country seemed to be arrayed under two hostile banners—that of the house of Burgundy, and that of the duke of Orleans. The house of Burgundy was headed by men of grasp and power, and its party bore the name of Burgundians, little as it expressed the true position; while the duke of Orleans was a mean and foolish person, and his party did not go by his name, but, by some accident, took that of the count of Armagnac, who was father-in-law to the duke of Orleans, and a prince of great name and vigor in the south of France. The duke of Burgundy was Philip the Bold, fourth son of King John of France, to whom his father had granted the duchy on the death of Philip de Rouvres, who had left no heirs, so that his inheritance had escheated to the crown. The duke was therefore uncle to Charles VI., and to his rival in France, Louis, duke of Orleans. By his marriage with Margaret of Flanders, to whom the county of Burgundy had descended by female succession, he reunited the duchy and county, and also became lord of Flanders. Though the county (Franche Comté) carried him to the east of France into the empire, his chief power lay in the north. His connection with Germany led him to espouse the side of the Urbanists against the corrupt Avignon papacy, the policy of the duke made him popular with the cities of the north of France, and specially with Paris,—a popularity in no way impaired by his terrible punishment of Liége, which opposed him in 1408; that policy professed to relieve the cities of their worst burdens, and to give them a position of some independence in the presence of their unhappy sovereign and the corrupt court around him. In his foreign politics the duke had also added much to his strength by supporting the house of Lancaster in its successful attack on Richard II.; the friendship of Henry IV. and Henry V. of England was the result. In resources the house of Burgundy was deemed the richest in the world, and its magnificence on great occasions rivalled all that had been dreamt in fable. Lastly, while the French monarchs were a weary series of diseased or dissolute princes, their Burgundian cousins were all strong men—men of faults enough, no doubt, but not of weak vices.

On the other hand, the duke of Orleans, with his following of nobles, was of the south; all his strength lay beyond the Loire, and his party represented the old aristocracy against the modern princes and the popular instincts of the cities. There is no greater mistake than that of speaking of the Burgundian dukes as the last great leaders of feudalism; the feudalism of the age was far more definitely on the side of the Armagnacs. In his church politics Orleans supported the southern Avignon pope against the Germanic and Italian Urbanists; in his foreign politics he and the court went with the losing Yorkist party in England, Richard II. having in 1396 espoused Isabelle of Valois, eldest daughter of Charles VI. At the beginning the Armagnacs were a mere court and noble party; no general or patriotic feelings seemed to be in question; as, however, time went on, and the house of Burgundy drew closer and closer to that of Lancaster, and when England and Burgundy in the days of Henry V. and Bedford seemed to be subjecting France for ever to the foreigner, then the Armagnac party gradually asserted a far higher position for itself, took up the national cause, and rousing the hitherto unconscious patriotism of the people, swept away the invader and his friends.

Party strife in France.

An obscure strife went on until 1404, when Duke Philip of Burgundy died, leaving his vast inheritance to John the Fearless, the deadly foe of Louis of Orleans. Paris was with him, as with his father before him; the duke entered the capital in 1405, and issued a popular proclamation against the ill-government of the queen-regent and Orleans. Much profession of a desire for better things was made, with small results. So things went on till 1407, when, after the duke of Berri, who tried to play the part of a mediator, had brought the two princes together, the duke of Orleans was foully assassinated by a Burgundian partisan. The duke of Burgundy, though he at first withdrew from Paris, speedily returned, avowed the act, and was received with plaudits by the mob. For a few years the strife continued, obscure and bad; a great league of French princes and nobles was made to stem the success of the Burgundians; and it was about this time that the Armagnac name became common. Paris, however, dominated by the "Cabochians," the butchers' party, the party of the "marrow-bones and cleavers," and entirely devoted to the Burgundians, enabled John the Fearless to hold his own in France; the king himself seemed favorable to the same party. In 1412 the princes were obliged to come to terms, and the Burgundian triumph seemed complete. In 1413 the wheel went round, and we find the Armagnacs in Paris, rudely sweeping away all the Cabochians with their professions of good civic rule. The duke of Berri was made captain of Paris, and for a while all went against the Burgundians, until in 1414 Duke John was fain to make the first peace of Arras, and to confess himself worsted in the strife. The young dauphin Louis took the nominal lead of the national party, and ruled supreme in Paris in great ease and self-indulgence.

1412-1422.

Henry V. of England.

The year before Henry V. had succeeded to the throne of England,—a bright and vigorous young man, eager to be stirring in the world, brave and fearless, with a stern grasp of things beneath all,—a very sheet anchor of firmness and determined character. Almost at the very opening of his reign, the moment he had secured his throne, he began a negotiation with France which boded no good. He offered to marry Catharine, the king's third daughter, and therewith to renew the old treaty of Bretigny, if her dower were Normandy, Maine, and Anjou, not without a good sum of money. The French court, on the other hand, offered him her hand with Aquitaine and the money, an offer rejected instantly; and Henry made ready for a rough wooing in arms. In 1415 he crossed to Harfleur, and while parties still fought in France, after a long and exhausting siege took the place; thence he rode northward for Calais, feeling his army too much reduced to attempt more. The Armagnacs, who had gathered at Rouen, also pushed fast to the north, and having choice of passage over the Somme, Amiens being in their hands, got before King Henry, while he had to make a long round before he could get across that stream. Consequently, when on his way he reached Azincourt, he found the whole chivalry of France arrayed against him in his path. The great battle of Azincourt followed, with frightful ruin and carnage of the French. With a huge crowd of prisoners the young king passed on to Calais, and thence to England. The Armagnacs' party lay buried in the hasty graves of Azincourt; never had there been such slaughter of nobles. Still, for three years they made head against their foes; till in 1418 the duke of Burgundy's friends opened Paris' gates to his soldiers, and for the time the Armagnacs seemed to be completely defeated; only the dauphin Charles made feeble war from Poitiers. Henry V. with a fresh army had already made another descent on the Normandy coast; the dukes of Anjou, Brittany, and Burgundy made several and independent treaties with him; and it seemed as though France had completely fallen in pieces. Henry took Rouen, and although the common peril somewhat silenced the strife of faction, no steps were taken to meet him or check his course; on the contrary, matters were made even more hopeless by the murder of John, duke of Burgundy, in 1419, even as he was kneeling and offering reconciliation at the young dauphin's feet. The young Duke Philip now drew at once towards Henry, whom his father had apparently wished with sincerity to check; Paris, too, was weary of the Armagnac struggle, and desired to welcome Henry of England; the queen of France also went over to the Anglo-Burgundian side. The end of it was that on May 21, 1420, was signed the famous treaty of Troyes, which secured the crown of France to Henry, by the exclusion of the dauphin Charles, whenever poor mad Charles VI. should cease to live. Meanwhile Henry was made regent of France, promising to maintain all rights and privileges of the parliament and nobles, and to crush the dauphin with his Armagnac friends, in token whereof he was at once wedded to Catharine of France, and set forth to quell the opposition of the provinces. By Christmas all France north of the Loire was in English hands. All the lands to the south of the river remained firmly fixed in their allegiance to the dauphin and the Armagnacs, and these began to feel themselves to be the true French party, as opposed to the foreign rule of the English. For barely two years that rule was carried on by Henry V. with inflexible justice, and northern France saw with amazement the presence of a real king and an orderly government. In 1422 King Henry died; a few weeks later Charles VI. died also; and

The treaty of Troyes.

1423-1429.

Charles VII.

the face of affairs began to change, although at the first Charles VII. the "Well-served," the lazy, listless prince, seemed to have little heart for the perils and efforts of his position. He was proclaimed king at Mehun in Berri, for the true France for the time lay on that side of the Loire; and the regent Bedford, who took the reins at Paris, was a vigorous and powerful prince, who was not likely to give way to an idle dreamer. At the outset Charles suffered two defeats, at Crevant in 1423 and at Verneuil in 1424, and things seemed to be come to their worst. Yet he was prudent, conciliatory, and willing to wait; and as the English power in France,—that triangle of which the base was the sea line from Harfleur to Calais, and the apex Paris,—was unnatural, and far from being really strong, and as the relations between Bedford and Burgundy might not always be friendly, the man who could wait had many chances in his favor. Before long things began to mend; Charles wedded Mary of Anjou, and won over that great house to the French side; more and more was he regarded as the nation's king; symptoms of a wish for reconciliation with Burgundy appeared; the most vehement Armagnacs were sent away from court. Causes of disagreement also shook the friendship between Burgundy and England.

Feeling the evils of inaction most, Bedford in 1428 decided on a forward movement, and sent the earl of Salisbury to the south. He first secured his position on the north of the Loire, then, crossing that river, laid siege to Orleans, the key to the south, and the last bulwark of the national party. All efforts to vex or dislodge him failed; the attempt early in 1429 to stop the English supplies was completely defeated at Bouvray; from the salt fish captured, the battle has taken the name of "the Day of the Herrings." Dunois, bastard of Orleans, was wounded; the Scots, the king's bodyguard, on whom fell ever the grimmest of the fighting, suffered terribly, and their leader was killed. All went well for Bedford till it suited the duke of Burgundy to withdraw from his side, carrying with him a large part of the fighting power of the besiegers. Things were already looking rather gloomy in the English camp, when a new and unexpected rumor struck all hearts cold with fear. A virgin, an Amazon, had been raised up as a deliverer for France, and would soon be on them, armed with mysterious powers.

The Maid of Orleans.

A young peasant girl, one Jeanne Darc, had been brought up in the village of Domrémy, hard by the Lorraine border. The district, always French in feeling, had lately suffered much from Burgundian raids; and this young damsel, brooding over the treatment of her village and her country, and filled with that strange vision-power which is no rare phenomenon in itself with young girls, came at last to believe with warm and active faith in heavenly appearances and messages, all urging her to deliver France and her king. From faith to action the bridge is short; and ere long the young dreamer of seventeen set forth to work her miracle. Her history is quite unique in the world; and though probably France would ere many years have shaken off the English yoke, for its strength was rapidly going, still to her is the credit of having proved its weakness, and of having asserted the triumphant power of a great belief. All gave way before her; Charles VII., persuaded doubtless by his mother-in-law Yolande of Aragon, who warmly espoused her cause, listened readily to the maiden's voice; and as that voice urged only what was noble and pure, she carried conviction as she went. In the end she received the king's commission to undertake the relief of Orleans. Her coming was fresh blood to the defence; a new spirit seemed to be poured out on all her followers, and in like manner a deep dejection settled down on the English. The blockade was forced, and in eight days the besiegers raised the siege and marched away. They withdrew to Jargeau, where they were attacked and routed with great loss. A little later Talbot himself, who had marched to help them, was also defeated and taken. Then, compelling Charles to come out from his inglorious ease, she carried him triumphantly with her to Rheims, where he was duly crowned king, the Maid of Orleans standing by, and holding aloft the royal standard.

She would gladly have gone home to Domrémy now, her mission being accomplished; for she was entirely free from all ambitious or secondary aims. But she was too great a power to be spared. Northern France was still in English hands, and till the English were cast out her work was not complete; so they made her stay, sweet child, to do the work which, had there been any manliness in them, they ought to have found it easy to achieve for themselves. The dread of her went before her,—a pillar of cloud and darkness to the English, but light and hope to her countrymen. Men believed that she was called of God to regenerate the world, to destroy the Saracen at last, to bring in the millennial age. Her statue was set up in the churches, and crowds prayed before her image as before a popular saint.

1429-1439.

The incapacity and ill-faith of those round the king gave the English some time to recover themselves; Bedford and Burgundy drew together again, and steps were taken to secure Paris. When, however, Jeanne, weary of courtly delays, marched, contemptuous of the king, as far as to St. Denis, friends sprang up on every side. In Normandy, on the English line of communications, four strong places were surprised; and Bedford, made timid as to his supplies, fell back to Rouen, leaving only a small garrison in Paris. Jeanne, ill-supported by the royal troops, failed in her attack on the city walls, and was made prisoner by the Burgundians; they handed her over to the English, and she was, after grievous indignities, and such treatment as chivalry alone could have dealt her, condemned as a witch, and burnt as a relapsed heretic at Rouen in 1431. Betrayed by the French court, sold by the Burgundians, murdered by the English, unrescued by the people of France which she so much loved, Jeanne Darc died the martyr's death, a pious, simple soul, a heroine of the purest metal. She saved her country, for the English power never recovered from the shock. The churchmen who burnt her, the Frenchmen of the unpatriotic party, would have been amazed could they have foreseen that nearly 450 years afterwards, churchmen again would glorify her name as the saint of the church, in opposition to both the religious liberties and the national feelings of her country.

The treaty of Arras.

The Pragmatic Sanction of Bourges.

The war, after having greatly weakened the noblesse, and having caused infinite sufferings to France, now drew toward a close; the duke of Burgundy at last agreed to abandon his English allies, and at a great congress at Arras in 1435 signed a treaty with Charles VII., by which he solemnly came over to the French side. On condition that he should get Auxerre and Macon as well as the towns on and near the river Somme, he was willing to recognize Charles as king of France. His price was high, yet it was worth all that was given; for after all he was of the French blood royal, and not a foreigner. The death of Bedford, which took place about the same time, was almost a more terrible blow to the fortunes of the English. Paris opened her gates to her king in April, 1436; the long war kept on with slight movements now and then for several years. In these same days the council of Basel sat, and declared the supremacy of councils over the papacy; the long evils of schism had brought the pontiff very low. In connection with this council Charles VII. in 1438 held a national council at Bourges, and enacted therein his Pragmatic Sanction, in which the French church repeated the conclusions of the Basel council, and affirmed the liberties of the Gallican Church, in close connection with its allegiance rather to the king than the pope; it also claimed for capitular bodies and monasteries the right of electing their heads, declared the worst of the taxes levied by the papacy on the church illegal, and restrained the right of appeal to Rome. The French Church received the proclamation with gratitude and applause, while the papacy protested, and the dukes of Brittany and Burgundy refused to recognize it or adopt its principles within their dominions. It continued to be the church-law of France till the necessities of Francis I. bartered it away in 1516 for the Bologna concordat.

The next year was marked by the meeting of the States-General, and the establishment, in principle at least, of a standing army. The Estates petitioned the willing king that the system of finance in the realm should be remodelled, and a permanent tax established for the support of an army. Thus, it was thought, solidity would be given to the royal power, and the long-standing curse of the freebooters and brigands cleared away. No sooner was this done than the nobles began to chafe under it; they scented in the air the coming troubles; they took as their head, poor innocents, the young dauphin Louis, who was willing

1439–1453.

The Praguerie.

enough to resist the concentration of power in royal hands. Their champion of 1439, the leader of the "Praguerie," as this new league was called, in imitation, it is said, of the Hussite movement at Prague, the enthusiastic defender of noble privilege against the royal power, was the man who afterwards, as Louis XI., was the destroyer of the noblesse on behalf of royalty. Some of the nobles stood firmly by the king, and, aided by them and by an army of paid soldiers serving under the new conditions, Charles VII., no contemptible antagonist when once aroused, attacked and overthrew the Praguerie: the cities and the country people would have none of it; they preferred peace under a king's strong hand. Louis was sent down to the east to govern Dauphiny; the lessons of the civil war were not lost on Charles; he crushed the freebooters of Champagne, drove the English out of Pontoise in 1441, moved actively up and down France, reducing anarchy, restoring order, resisting English attacks. In the last he was loyally supported by the dauphin, who was glad to find a field for his restless temper. He repulsed the English at Dieppe, and put down the count of Armagnac in the south. During the two years' truce with England which now followed, Charles VII. and Louis drew off their free-lances eastward, and the dauphin came into rude collison with the Swiss not far from Basel, in 1444. Some sixteen hundred mountaineers long and heroically withstood at Saint Jacob the attack of several thousand Frenchmen, fighting stubbornly till they all perished. It is said that the experience so dearly bought on the field of Saint Jacob was very useful to Louis in after days, when he was content to leave Charles the Bold to ruin himself by his attacks on Switzerland. The red wine grown on the slope of the graveyard where they fell is called "Schweitzer-blut," Swiss-blood, to this day. It was at this time also that the cardinal of Winchester wedded Henry VI. of England to Margaret of Anjou, the ambitious daughter of King René, the laughter-loving troubadour of Provence, who cared so much for poetry and so little for kingship. The king and dauphin returned to Paris, having defended their border-lands with credit, and having much reduced the numbers of the lawless free-lances. They next set themselves to organize a regular army of fifteen companies of one hundred lances (each lance representing six fighting men), led by fifteen captains appointed by the king, and raised in different districts of France. This army partly absorbed and partly crushed the troublesome free-lances, and became a powerful police, which restored security and made good government once more possible. Round his own person Charles placed those sturdy and faithful fighting men the Scottish guard; under John Stewart d'Aubigné they served the French king well, and at the end of his troubles were placed as a colony at St. Martin d'Auxigny near Bourges, where their descendants still live in the enjoyment of special village-advantages, preserved to them by long use and tradition through all the changes of French history. This army, with the contingent due from the nobles, which was also reduced to order and made to receive pay, raised the power of the French monarchy far above anything that had as yet been seen; and had Charles VII. been more ambitious he might have begun to play the part reserved for his son. The dauphin, discontented again, was obliged once more to withdraw into Dauphiny, where he governed prudently and with activity.

Close of the Hundred Years' War.

In 1449 the last scene of the Anglo-French war began. In that year English adventurers landed on the Breton coast; the duke called the French king to his aid. Charles did not tarry this time; he broke the truce with England, sent Dunois into Normandy, and himself soon followed. In both duchies, Brittany and Normandy, the French were welcomed with delight; no love for England lingered in the west. Somerset and Talbot failed to defend Rouen, and were driven from point to point, till every stronghold was lost to them. Dunois then passed into Guienne, and in a few months Bayonne, the last stronghold of the English, fell into his hands (1451). When Talbot was sent over to Bordeaux with 5000 men to recover the south, the old English feeling revived,—for England was their best customer, and they had little in common with France. It was, however, but a last flicker of the flame; in July, 1453, at the siege of Castillon, the aged Talbot was slain, and the war at once came to an end; the south passed finally into the kingdom of France. Normandy and Guienne were assimilated to France in taxation and army organization; and all that remained to England across the Channel was Calais with Havre and Guines Castle. Her foreign ambitions and struggles over, England was left to consume herself in civil strife, while France might rest and recover from the terrible sufferings she had undergone. The state of the country had become utterly wretched. We are told that from the Loire to the Somme, as fertile a part as any in France, all lay desert, given up to wolves, and traversed only by the robber and the free-lance; the peasant, despairing of his tillage, got him a weapon, and took to the roads; the *danse Macabre*, grimly limned on churchyard-walls, was a parable of the age, in which all men lived in the presence of death; mysteries and moralities were the chief literature of the time; Froissart was gone, and Commines had not yet come; the duke of Orleans, so long a prisoner in England, is the one true poet of the time; the "good king René" is but in his earlier days, and gave himself most to poetry in his old age; within the walls of a few towns rose some splendid examples of domestic architecture, like the house of Jacques Cœur, the great merchant at Bourges; the stir and movement of the Renaissance finds little sympathy in France in these dark days.

1453–1461.

State of France.

With the end of the English wars new life began to gleam out on France; the people grew more tranquil, finding that toil and thrift bore again their wholesome fruits; Charles VII. did not fail in his duty, and took his part in restoring quiet, order, and justice in the land. With the return of peace came also the arts of peace; the poet's song is heard. Olivier Basselin, whose verses were afterwards retouched and published by Jean de Houx, belongs to this period; now, too, comes Villon, the first of French poets, whose writings ring still with some of the misery of the past; and Alain Chartier follows a little later.

The French crown, though it had beaten back the English, was still closely girt in with rival neighbors, the great dukes on every frontier. All round the east and north lay the lands of Philip of Burgundy; to the west was the duke of Brittany, cherishing a jealous independence; the royal dukes, Berri, Bourbon, Anjou, are all so many potential sources of danger and difficulty to the crown. The conditions of the nobility are altogether changed; the old barons have sunk into insignificance; the struggle of the future will lie between the king's cousins and himself, rather than with the older lords. A few non-royal princes, such as Armagnac, or St. Pol, or Brittany, remain, and will go down with the others; the "new men" of the day, the bastard Dunois or the constables Du Guesclin and Clisson, grow to greater prominence; it is clear that the old feudalism is giving place to a newer order, in which the aristocracy, from the king's brothers downwards, will group themselves around the throne, and begin the process which reaches its unhappy perfection under Louis XIV.

Directly after the expulsion of the English, troubles began between King Charles VII. and the dauphin Louis; the latter could not brook a quiet life in Dauphiny, and the king refused him that larger sphere in the government of Normandy which he coveted. Against his father's will, Louis married Charlotte of Savoy, daughter of his strongest neighbor in Dauphiny; suspicion and bad feeling grew strong between father and son; Louis was specially afraid of his father's counsellors; the king was specially afraid of his son's craftiness and ambition. It came to an open rupture, and Louis in 1456 fled to the court of Duke Philip of Burgundy. There he lived at refuge at Geneppe, meddling a good deal in Burgundian politics, and already opposing himself to his great rival Charles of Charolais, afterwards Charles the Bold, the last duke of Burgundy. Bickerings, under his bad influence, took place between king and duke; they never burst out into flame. So things went on uncomfortably enough, till Charles VII. died in 1461, and the reign of Louis XI. began.

Contrast of Charles VII. and Louis XI.

Between father and son what contrast could be greater? Charles VII., the "Well-served," so easy-going, so open and free from guile; Louis XI., so shy of counsellors, so energetic and untiring, so close and guileful. History does but apologize for Charles, and even when she fears and dislikes Louis, she cannot forbear to wonder and admire. And yet Louis enslaved his country, while Charles had seen it rescued from foreign rule; Charles restored something of its prosperity, while Louis spent his life in crush-

1461-1465. ing its institutions and in destroying its elements of independence. A great and terrible prince, Louis XI. failed in having little or no constructive power; he was strong to throw down the older society, he built little in its room. It is the fatal evil of absolute monarchy that it is not bound to replace what it crushes; so that the old order passes away, and no new society springs up in its place. It is to this that France owes the barrenness of her constitutional history.

Reign of Louis XI. The reign of Louis XI. is well divided into three periods. The first six years of it represent his strife with his great lords (1461–1467); the next period, of nine years, is occupied by his rivalry with Charles the Bold (1469–1476); the third, a time of seven years, gives us the king "triumphant and miserable" (1476–1483).

We are so wont to associate the name of Louis XI. with all that is cold, measured, and crafty that we can scarcely believe we are reading his history when we hear the narrative of his first acts on coming to the throne. He appears as a young impulsive prince, whose frank imprudence calculated no cost. He offended the duke of Burgundy's followers who escorted him to his consecration at Rheims, and thence into Paris, by sending them away empty; he deprived the duke of Bourbon of the government of Guienne, which he held; he dismissed all his father's ministers and friends; he set free the noble captives whom his father had been obliged to restrain; he alienated the nobles and clergy by negotiating with the pope and threatening to abolish the Pragmatic Sanction. In all this he seemed inclined to depend on the support of the good towns. Most serious of all was his action with respect to the district of the river Somme, at that time the northern frontier of France. The towns there had been handed over to Philip of Burgundy by the treaty of Arras, with a stipulation that the crown might ransom them at any time, and this Louis succeeded in doing in 1463. The act was quite blameless and patriotic in itself, yet it was exceedingly unwise, for it thoroughly alienated Charles the Bold, and led to the wars of the earlier period of the reign. Lastly, as if he had not done enough to offend the nobles, Louis in 1464 attacked their hunting rights, touching them in their tenderest part. No wonder that this year saw the formation of a great league against him, and the outbreak of a dangerous civil war. The "League of the Public Weal" was nominally headed by his own brother Charles, heir to the throne; it was joined by Charles of Charolais, who had completely taken the command of affairs in the Burgundian territories, his father the old duke being too feeble to withstand him; the dukes of Brittany, Nemours, Bourbon, John of Anjou, duke of Calabria, the count of Armagnac, the aged Dunois, and a host of other princes and nobles flocked in; and the king had scarcely any forces at his back with which to withstand them. His plans for the campaign against the league were admirable, though they were frustrated by the bad faith of his captains, who mostly sympathized with this outbreak of the feudal nobility. Louis himself marched southward to quell the duke of Bourbon and his friends, and returning from that task, only half done for lack of time, he found that Charles of Charolais had passed by Paris, which was faithful to the king, and was coming down southwards intending to join the dukes of Berri and Brittany, who were on their way towards the capital. The hostile armies met at Montleheri on the Orleans road; and after a strange battle minutely described by Commines—a battle in which both sides ran away, and neither ventured at first to claim a victory—the king withdrew to Corbeil, and then marched into Paris (1465). There the armies of the league closed in on him; and after a siege of several weeks, Louis, feeling disaffection all around him, and doubtful how long Paris herself would bear for him the burdens of blockade, signed the peace of Conflans, which, to all appearances, secured the complete victory to the noblesse, "each man carrying off his piece." Instantly the contented princes broke up their half-starved armies and went home, leaving Louis behind to plot and contrive against them, a far wiser man, thanks to the lesson they had taught him. They did not let him wait long for a chance. The treaty of Conflans had given the duchy of Normandy to the king's brother Charles; he speedily quarrelled with his neighbor the duke of Brittany, and Louis came down at once into Normandy, which threw itself into his arms, and the whole work of the league was broken up. The count of Charolais, occupied with revolts at Dinan and Liége, could not interfere, and presently his father the old Duke Philip died (1467), leaving to him the vast lordships of the house of Burgundy.

1467-1472.

Charles the Bold. And now the "imperial dreamer," Charles the Bold, was brought into immediate rivalry with that royal trickster, the "universal spider," Louis XI. Charles was by far the nobler spirit of the two; his vigor and intelligence, his industry and wish to raise all around him to a higher cultivation, his wise reforms at home, and attempts to render his father's dissolute and careless rule into a well-ordered lordship—all these things marked him out as the leading spirit of the time. He was completely free from those mean faults which marked his antagonist: he could not lie nor cheat; he was not cold and heartless; he despised the immoral life, the loose tales, the disorderly company of the dauphin's sojourn at Geneppe. Unfortunately, in this noble and otherwise harmonious instrument there was that "one little rift," which gradually ruined all: his pride, which was high, would not have been fatal to him; it was his anger, combined with a certain strength of obstinacy, which brought him to ruin. His territories were partly held under France, partly under the empire: the Artois district, which also may be taken to include the Somme towns, the county of Rhetel, the duchy of Bar, the duchy of Burgundy, with Auxerre and Nevers, were feudally in France; the rest of his lands under the empire. He had therefore interests and means of interference on either hand; and, in fact, it is clear that Charles set before himself two quite different lines of policy, according as he looked one way or the other. He looked towards Paris, and seeing the king there growing stronger, desired to curb him by a league of princes; he looked towards the east, and saw there a splendid field for his ambition, in the scattered territories which lay on the edge of the Holy Roman Empire. At first he followed the former line, seeking to weaken his neighbors, and by coalition against the strongest of them to become undoubted master of the rest; this was in the times of his active hostility towards Louis XI.; afterwards he made truce with the king, and turned his arms against the east, attacking first Lorraine, and then Switzerland.

At the time of Duke Philip's death a new league had been formed against Louis, embracing the king of England, Edward IV., the dukes of Burgundy and Brittany, and the kings of Aragon and Castile. Louis strained every nerve, he conciliated Paris, struck hard at disaffected partisans, and in 1468 convoked the States-General at Tours. The three Estates were asked to give an opinion as to the power of the crown to alienate Normandy, the step insisted on by the duke of Burgundy. Their reply was to the effect that the nation forbids the crown to dismember the realm; they supported their opinion by liberal promises of help. Thus fortified by the sympathy of his people, Louis began to break up the coalition. He made terms with the duke of Bourbon and the house of Anjou; his brother Charles was a cipher; the king of England was paralyzed by the antagonism of Warwick; he attacked and reduced Brittany; Burgundy, the most formidable, alone remained to be dealt with. How should he meet him?—by war or by negotiation? His court was divided in opinion; the king decided for himself in favor of the way of negotiation, and came to the astonishing conclusion that he would go and meet the duke and win him over to friendship. He miscalculated both his own powers of persuasion and the force of his antagonist's temper. The interview of Peronne followed; Charles held his visitor as a captive, and in the end compelled him to sign a treaty of peace, on the basis of that of Conflans, which had closed the War of the Public Weal. And as if this were not sufficient humiliation, Charles made the king accompany him on his expedition to punish the men of Liége, who, trusting to the help of Louis, had again revolted (1469). This done, he allowed the degraded monarch to return home to Paris. An assembly of notables at Tours speedily declared the treaty of Peronne null, and the king made some small frontier war on the duke, which was ended by a truce at Amiens in 1471. The truce was spent in preparation for a fresh struggle, which Louis, to whom time was everything, succeeded in deferring from point to point, till the death of his brother Charles, now duke of Guienne, in 1472 broke up the formidable combination. Charles the Bold at once broke truce and made war on the

1472-1483.

king, marching into northern France, sacking towns and ravaging the country, till he reached Beauvais. There the despair of the citizens and the bravery of the women saved the town. Charles raised the siege and marched on Rouen, hoping to meet the duke of Brittany; but that prince had his hands full, for Louis had overrun his territories, and had reduced him to terms. The duke of Burgundy saw that the coalition had completely failed; he too made fresh truce with Louis at Senlis (1472), and only deferred, he no doubt thought, the direct attack on his dangerous rival. Henceforth Charles the Bold turned his attention mainly to the east, and Louis gladly saw him go forth to spend his strength on distant ventures; saw the interview at Trèves with the emperor Frederick III., at which the duke's plans were foiled by the suspicions of the Germans and the king's intrigues; saw the long siege of Neusz wearing out his power; bought off the hostility of Edward IV. of England, who had undertaken to march on Paris; saw Charles embark on his Swiss enterprise; saw the subjugation of Lorraine and capture of Nanci (1475), the battle of Granson, the still more fatal defeat of Morat (1476), and lastly the final struggle of Nanci, and the duke's death on the field (January, 1477).

While Duke Charles had thus been running on his fate, Louis XI. had actively attacked the larger nobles of France, and had either reduced them to submission or had destroyed them. By the time of the fall of the house of Burgundy scarcely one great prince was left who could be formidable; even the power of the duke of Brittany was much straitened. The king had, therefore, free hand to make the best profit he could out of the disasters of his Burgundian rival, and the weakness of his heiress, the young duchess Mary. As Duke Charles had left no male heir, the king at once resumed the duchy of Burgundy, as a male fief of the kingdom; he also took possession of Franche Comté at the same time; the king's armies recovered all Picardy, and even entered Flanders. Then Mary of Burgundy, hoping to raise up a barrier against this dangerous neighbor, offered her hand with all her great territories to young Maximilian of Austria, and married him within six months after her father's death. To this wedding is due the rise to real greatness of the house of Austria; it begins the era of the larger politics of modern times.

After a little hesitation Louis determined to continue the struggle against the Burgundian power. He secured Franche Comté, and on his northern frontier retook Arras, that troublesome border city, the "bonny Carlisle" of those days; and advancing to relieve Therouenne, then besieged by Maximilian, fought and lost the battle of Guinegate (1479). The war was languid after this; a truce followed in 1480, and a time of quiet for France. The misconduct of the French cavalry, which had lost the battle of Guinegate, was followed by the abolition of the free-archer army; the cities were ordered to provide money in place of men, and the age of mercenary foreign armies began. In 1480 also, on the death of the old poet-king René, the two important districts of Anjou and Provence fell in to the crown, Margaret of Anjou, René's daughter and heiress, having ceded them to Louis in return for help; and in the end of 1482 the third peace of Arras closed a while the rivalry between France and Burgundy. Charles the dauphin was engaged to marry the little Margaret, Maximilian's daughter, and as her dower she was to bring Franche Comté and sundry places on the border line disputed between the two princes. In these last days Louis XI. shut himself up in gloomy seclusion in his castle of Plessis near Tours, and there he died in 1483. A great king and a terrible, he has left an indelible mark on the history of France, for he was the founder of France in its later form, as an absolute monarchy ruled with little regard to its own true welfare. He had crushed the older feudalism, and substituted autocracy for anarchy; in all ways he did what he could to centralize the administration; he imposed heavy taxes, and enabled his people to bear them; he employed men of middle condition, and cared for commerce and industry; he treated his towns fairly well, travelled much up and down the realm, acted judiciously in retaining the local estates and parliaments. To his rule is due the rise of that official spirit which marks the practical progress of the life of France; there is no lack of intelligence and vigor in his numerous ordinances, which show that his despotism was not unenlightened or selfish. Though not himself a man of learning, he favored the universities, and set up a printing press in the Sorbonne. We may believe that Louis was perfectly sincere when on his deathbed he longed for a few more years to have set the state in order. He had crushed all resistance; he had enlarged the borders of France, till the kingdom took nearly its modern dimensions; he had organized its army and administration. The danger was lest in the hands of a feeble boy these great results should be squandered away, and the old anarchy once more raise its head.

Character and aims of Louis XI.

1483-1494.

Charles VIII.

For Charles VIII., who now succeeded, was but thirteen years old, a weak boy whom his father had entirely neglected, the training of his son not appearing to be an essential part of his work in life. The young prince had amused himself with romances, but had learnt nothing useful. A head, however, was found for him in the person of his elder sister Anne, whom Louis XI. had married to Peter II., lord of Beaujeu and duke of Bourbon. To her the dying king entrusted the guardianship of his son; and for more than nine years Anne of France was virtual king. For those years all went well. Her prudence and high intelligence overcame her brother's ill-will, and defeated the plots of the nobles, and, almost in spite of Charles, won for him a complete triumph over feudalism. She was, in truth, a very remarkable woman, and history, because she was just and true and successful, has left her on one side, neglected and forgotten. Yet France flourished greatly under her: she solaced the people according to her father's dying wish; she also with vigorous and triumphant hand overcame the rivalry of Maximilian of Austria, and the selfish opposition of the princes. She it was who enabled Henry of Richmond to seize the throne of England, and to give peace to that troubled realm; she it was who defeated the allies at the battle of St. Aubin du Cormier (1488), thereby asserting the power of France against Brittany; she it was who compelled Maximilian, in the treaty of Sablé, to close the struggle, and to leave the French monarchy in peace. Finally, it was she who out-manœuvred Maximilian in his wooing of Anne of Brittany, and secured the great prize, the heiress and her lands, for her brother Charles. In 1491 the marriage took place which led to the eventual absorption (in 1515) of Brittany into the kingdom of France. After this "Madame la Grande," as this noble lady was rightly styled, withdrew from public life, leaving the country in a healthier state than it had been in for ages, leaving also to the young king a splendid army and a well-filled treasury.

Anne of France as regent.

The Italian expeditions begin.

With her disappearance from the scene, the controlling hand is lost, and France begins the age of her Italian expeditions, which, while they introduced her into the general arena of modern politics, and formed the platform on which the rivalry between the houses of France and Austria displayed itself, also influenced the home-life of France disastrously, and exhausted resources and energies so much needed for the wholesome development of the country. The Italian wars led to the civil wars, and they, in the end, cleared the ground for the despotism of Louis XIV.

When the house of Anjou came to an end in 1481, and Anjou and Maine fell in to the crown, there fell in also a far less valuable piece of property—the claim of that house, descended from Charles the youngest brother of St. Louis, on the kingdom of Naples and Sicily. There was much to tempt an ambitious prince in the state of Italy. Savoy, which held the passage into the peninsula, was then thoroughly French in sympathy; Milan, under Lodovico Sforza, "il Moro," was in alliance with Charles; Genoa preferred the French to the Aragonese claimants for influence over Italy; the popular feeling in the cities, especially in Florence, was opposed to the despotism of the Medici, and turned to France for deliverance; the misrule of the Spanish kings of Naples had made Naples thoroughly discontented; Venice was, as of old, the friend of France. Tempted by these reasons, in 1494 Charles VIII. set forth for Italy with a splendid host. He displayed before the eyes of Europe the first example of a modern army, in its three well-balanced branches of infantry, cavalry, and artillery. There was nothing in Italy to withstand his onslaught; he swept through the land in triumph; Charles believed himself to be a great conqueror, giving law to admiring subject-lands; he entered Pisa, Florence, Rome, itself. Wherever he went, his heedless ignorance, and the gross misconduct of his followers, left behind implacable hostility, 1495-1501. and turned all friendship into bitterness. At last he entered Naples, and seemed to have asserted to the full the French claim to be supreme in Italy, whereas at that very time his position had become completely untenable. A league of Italian states was formed behind his back; Lodovico il Moro, Ferdinand of Naples, the emperor, Pope Alexander VI., Ferdinand and Isabella, who were now welding Spain into a great and united monarchy, all combined against France; and in presence of this formidable confederacy, Charles VIII. had to cut his way home as promptly as he could. At Fornovo, north of the Apennines, he defeated the allies in July, 1495; and by November the main French army had got safely out of Italy. The forces left behind in Naples were worn out by war and pestilence, and the poor remnant of these, too, bringing with them the seeds of horrible contagious diseases, forced their way back to France in 1496. It was the last effort of the king. His health was ruined by debauchery in Italy, repeated in France; and yet towards the end of his reign he not merely introduced Italian arts, but attempted to reform the state, to rule prudently, to solace the poor; wherefore when he died in 1498 the people lamented him greatly, for he had been kindly and affable, brave also on the battle-field; and much is forgiven to a king.

Louis XII. His children died before him, so that Louis of Orleans, his cousin, was nearest heir to the throne, and succeeded as Louis XII. By his accession in 1498 he reunited the fief of Orleans county to the crown; by marrying Anne of Brittany, his predecessor's widow, he secured also the great duchy of Brittany. The dispensation of Pope Alexander VI., which enabled him to put away his wife Jeanne, second daughter of Louis XI., was brought into France by Cæsar Borgia, who gained thereby his title of duke of Valentinois, a large sum of money, a French bride, and promises of support in his great schemes in Italy.

As a younger man Louis XII. had been idle and dissipated; and to the end self-indulgence clung to him, as a Nessus-shirt, eating into his bones. Yet he was kindly and humane to his people, friendly and without revenge or malice, even in the case of those who had done him most mischief. His reign was the reversal of all the principles of Louis XI. That prince had avoided foreign complications, and had sternly repressed his nobles at home: Louis XII. began at once to interfere in foreign politics, and desired to strengthen the great nobles round the throne. The days were good for France, with this cheerful "pater patriæ" ruling over it. He tried to govern with economy and care, and to develop the resources of the country: it is said that one-third of the realm was brought under cultivation in his time. His ministers were men of real ability. George of Amboise, archbishop of Rouen, the chief of them, was a prudent and sagacious ruler, who, however, unfortunately wanted to be pope, and urged the king in the direction of Italian politics, which he would have done much better to have left alone. Louis XII. was lazy and of small intelligence; George of Amboise and Cæsar Borgia with their Italian ambitions easily made him take up a spirited foreign policy which was disastrous at home. Louis XII. had different aims in Italy from those of Charles VIII. His grandfather Louis had married, in 1389, Valentina Visconti, daughter of Gian Galeazzo, duke of Milan; and it had been agreed that if the duke had no male heirs, Milan should pass to the descendants of Valentina. This had now taken place; and Louis XII., as Valentina's grandson, claimed the duchy; he also asserted his rights to the Two Sicilies. Utterly as the last Italian expedition had failed, the French people were not yet weary of the adventure, and preparations for a new war began at once. In 1499 the king crossed the Alps into the Milanese, and carried all before him for a while. The duchy at first accepted him with enthusiasm; but in 1500 it had had enough of the French and recalled Lodovico, who returned in triumph to Milan. The Swiss mercenaries, however, betrayed him at Novara into the hands of Louis XII., who carried him off to France. The triumph of the French in 1500 was also the highest point of the fortunes of their ally Cæsar Borgia, who seemed for a while to be completely successful. In this year Louis made a treaty at Granada, by which he and Ferdinand the Catholic agreed to despoil Frederick of Naples; and in 1501 Louis made a second expedition into Italy. Again all seemed easy at the outset, and he seized the kingdom of Naples without difficulty; falling out, however, with his partner in the bad bargain, Ferdinand the Catholic, he was speedily swept completely out of the peninsula, with terrible loss of honor, men, and wealth. 1504-1514.

It now became necessary to arrange for the future of France. Louis XII. had only a daughter, Claude, and it was proposed that she should be affianced to Charles of Austria, the future statesman and emperor. This scheme formed the basis of the three treaties of Blois (1504). In 1500, by the treaty of Granada, Louis had in fact handed Naples over to Spain; now by the three treaties he alienated his best friends, the Venetians and the papacy, while he in fact also handed Milan over to the Austrian house, together with territories considered to be integral parts of France. The marriage with Charles came to nothing; the good sense of some, the popular feeling in the country, the open expressions of the States-General of Tours in 1506, worked against the marriage, which had no strong advocate except Queen Anne. Claude, on intercession of the Estates, was affianced to Francis of Angoulême, her distant cousin, the heir presumptive to the throne.

In 1507 Louis made war on Venice; and in the following year the famous treaty of Cambrai was signed by George of Amboise and Margaret of Austria. It was an agreement for a partition of the Venetian territories,—one of the most shameless public deeds in history. The pope, the king of Aragon, Maximilian, Louis XII., were each to have a share. The war was pushed on with great vigor: the battle of Agnadello (14th May, 1509) cleared the king's way towards Venice; Louis was received with open arms by the north Italian towns, and pushed forwards to within sight of Venice. The other princes came up on every side; the proud "Queen of the Adriatic" was compelled to shrink within her walls, and wait till time dissolved the league. This was not long. The pope, Julius II., had no wish to hand northern Italy over to France; he had joined in the shameless league of Cambrai because he wanted to wrest the Romagna cities from Venice, and because he hoped entirely to destroy the ancient friendship between Venice and France. Successful in both aims, he now withdrew from the league, made peace with the Venetians, and stood forward as the head of a new Italian combination, with the Swiss for his fighting men. The strife was close and hot between pope and king; Louis XII. lost his chief adviser and friend George of Amboise, the splendid churchman of the age, the French Wolsey; he thought no weapon better than the dangerous one of a council, with claims opposed to those of the papacy; first a national council at Tours, then an attempted general council at Pisa, were called on to resist the papal claims. In reply Julius II. created the Holy League of 1511, with Ferdinand of Aragon, Henry VIII. of England, and the Venetians, as its chief members, against the French. Louis XII. showed vigor; he sent his nephew Gaston of Foix to subdue the Romagna and threaten the Venetian territories. At the battle of Ravenna in 1512, Gaston won a brilliant victory and lost his life. From that moment disaster dogged the footsteps of the French in Italy, and before winter they had been driven completely out of the peninsula; the succession of the Medicean pope, Leo X., to Julius II. seemed to promise the continuance of a policy hostile to France in Italy. Another attempt on northern Italy proved but another failure, although now Louis XII., taught by his mishaps, had secured the alliance of Venice; the disastrous defeat of La Tremoille near Novara (1513) compelled the French once more to withdraw beyond the Alps. In this same year an army under the duke of Longueville, endeavoring to relieve Therouenne, besieged by the English and Maximilian, the emperor-elect, was caught and crushed at Guinegate. A diversion in favor of Louis XII., made by James IV. of Scotland, failed completely; the Scottish king was defeated and slain at Flodden Field. While his northern frontier was thus exposed, Louis found equal danger threatening him on the east; on this side, however, he managed to buy off the Swiss who had attacked the duchy of Burgundy. He was also reconciled with the papacy and the house of Austria. Early in 1514 the death of Anne of Brittany his spouse, a lady of high ambitions, strong artistic tastes, and humane feelings towards her Bretons, but a bad queen for France, cleared the way for changes. Claude, the king's eldest daughter, was now definitely married to Francis of Angoulême, and invested with the duchy of Brittany; and the king himself, still hoping for a male

1515.

heir to succeed him, married again, wedding Mary Tudor, the lovely young sister of Henry VIII. This marriage was probably the chief cause of his death, which followed on New Year's Day, 1515. His was, in foreign policy, an inglorious and disastrous reign; at home, a time of comfort and material prosperity. Agriculture flourished, the arts of Italy came in, though (save in architecture) France could claim little artistic glory of her own; the organization of justice and administration was carried out; in letters and learning France still lagged behind her neighbors.

Francis I.

His character and aims.

The heir to the crown was Francis of Angoulême, great-grandson of that Louis of Orleans who had been assassinated in the bad days of the strife between Burgundians and Armagnacs, in 1407, and great-great-grandson of Charles V. of France. He was still very young, very eager to be king, very full of far-reaching schemes. Few things in history are more striking than the sudden change at this moment, from the rule of middle-aged men or (as men of fifty were then often called) old men, to the rule of youths,—from sagacious, worldly-prudent monarchs to impulsive boys,—from Henry VII. to Henry VIII., from Louis XII. to Francis I., from Ferdinand to Charles. On the whole Francis I. was the least worthy of the three. He was brilliant, "the king of culture," apt scholar in Renaissance art and immorality; brave also and chivalrous, so long as the chivalry involved no self-denial, for he was also thoroughly selfish, and his personal aims and ideals were mean. His reign was to be a reaction from that of Louis XII.; Francis should set the monarchy once more upright, and secure its autocratic development. He reversed his predecessor's home policy, and was hailed with wild delight by the young nobles, who had found Louis XII. too sparing of gifts. Gifts they wanted now, not power; and they preferred a prince who gave while he crushed them to one who prudently forbore to give while he allowed them to retain their strength. The reputation of Francis I. is infinitely beyond his deserts; his reign was a real misfortune for France, and led the way to the terrible waste and mismanagement which mark her history throughout the century. For Francis was an altogether shallow person: he could not read the character of his great antagonist Charles V., nor the meaning of the vast movement which was but now beginning to develop itself out of, and to take the place of, the Renaissance. He wasted all the energies of France on bootless foreign wars: never has any land been so sinned against as France; her vast wealth of resources, her intelligent and thrifty people, her commanding central position, were all as nothing to her rulers in comparison with that most wasteful and disastrous of snares, a spirited foreign policy.

The concordat of Francis I.

From the beginning Francis chose his chief officers unwisely: in Antoine du Prat, his new chancellor, he had a violent and lawless adviser; in Charles of Bourbon, his new constable, an untrustworthy commander. Forthwith, he plunged into Italian politics, being determined to make good his claim both to Naples and to Milan; he made most friendly arrangements with the archduke Charles, his future rival, promising to help him in securing, when the time came, the vast inheritances of his two grandfathers, Maximilian the emperor-elect, and Ferdinand of Aragon: never was a less wise agreement entered on. This done, the Italian war began; Francis descended into Italy, and won the brilliant battle of Marignano, in which the French chivalry crushed the Swiss burghers and peasant mercenaries. The French then overran the north of Italy, and, in conjunction with the Venetians, carried all before them. But the triumphs of the sword were speedily wrested from him by the adroitness of the politician; in an interview with Leo X. at Bologna, Francis bartered the liberties of the Gallican Church for shadowy advantages in Italy: the Pragmatic Sanction of Bourges, which now for nearly a century had secured to the Church of France independence in the choice of her chief officers, was replaced by a concordat, whereby the king allowed the papacy once more to drain the wealth of the Church of France, while the pope allowed the king almost autocratic power over it. He was to appoint to all benefices, with exception of a few privileged offices; the pope was no longer to be threatened with general councils, while he should receive again the annates of the church.

1516-1529.

The struggle for the empire.

The years which followed this brilliantly-disastrous opening brought little good to France. In 1516 the death of Ferdinand the Catholic placed Charles on the throne of Spain; in 1519 the death of Maximilian threw open to the young princes the most dazzling prize of human ambition, the headship of the Holy Roman Empire. Francis I., Charles, and Henry VIII. were all candidates for the votes of the seven electors, though the last never seriously entered the lists. The struggle lay between Francis, the brilliant young prince, who seemed to represent the new opinions in literature and art, and Charles of Austria and Spain, who was as yet unknown and despised, and, from his education under the virtuous and scholastic Adrian of Utrecht, was thought likely to represent the older and reactionary opinions of the clergy. After a long and sharp competition, the great prize fell to Charles, henceforth known to history as that great monarch and emperor Charles V.

The rivalry of Charles V. and Francis I.

The battle of Pavia.

The Treaty of Cambrai.

The rivalry between the princes could not cease there. Charles, as representative of the house of Burgundy, claimed all that had been lost when Charles the Bold fell; and in 1521 war broke out between him and Francis, the first of a series of struggles between the two rivals. While the king wasted the resources of his country on these wars, his proud and unwise mother, Louise of Savoy, guided by Antoine du Prat, ruled, to the sorrow of all, at home. The war brought no glory with it: on the Flemish frontier a place or two was taken; in Biscay Fontarabia fell before the arms of France; in Italy Francis had to meet a new league of pope and emperor, and his troops were swept completely out of the Milanese. In the midst of all came the defection of that great prince the Constable Bourbon, head of the younger branch of the Bourbon house, the most powerful feudal lord in France. Louise of Savoy had enraged and offended him, or he her; the king slighted him, and in 1523 the constable made a secret treaty with Charles V. and Henry VIII., and, taking flight into Italy, joined the Spaniards under Lannoy. The French, who had again invaded the Milanese, were again driven out in 1524; on the other hand the incursions of the imperialists into Picardy, Provence, and the south-east were all complete failures. Encouraged by the repulse of Bourbon from Marseilles, Francis I. once more crossed the Alps, and overran a great part of the valley of the Po; at the siege of Pavia he was attacked by Pescara and Bourbon, utterly defeated and taken prisoner (24th February, 1525); the broken remnants of the French were swept out of Italy at once, and Francis I. was carried into Spain, a captive at Madrid. His mother, best in adversity, behaved with high pride and spirit; she overawed disaffection, made preparations for resistance, looked out for friends on every side. Had Francis been in truth a hero, he might even as a prisoner have held his own; but he was unable to bear the monotony of confinement, and longed for the pleasures of France. On this mean nature Charles V. easily worked, and made the captive monarch sign the treaty of Madrid (January 14, 1526),—a compact which Francis meant to break as soon as he could, for he knew neither heroism nor good faith. The treaty stipulated that Francis should give up the duchy of Burgundy to Charles, and marry Eleanor of Portugal, Charles's sister; that Francis should also abandon his claims on Flanders, Milan, and Naples, and should place two sons in the emperor's hands as hostages. Following the precedent of Louis XI. in the case of Normandy, he summoned an assembly of nobles and the parliament of Paris to Cognac, where they declared the cession of Burgundy to be impossible. He refused to return to Spain, and made alliances wherever he could,—with the pope, with Venice, Milan, and England. The next year saw the ruin of this league in the discomfiture of Clement VII. and the sack of Rome by the German mercenaries under Bourbon, who was killed in the assault. The war went on till 1529, when Francis having lost two armies in it, and gained nothing but loss and harm, was willing for peace; Charles V., alarmed at the progress of the Turks, was not less willing; and in August, 1529, the famous Treaty of Cambrai, "the Ladies' Peace," was agreed to by Margaret of Austria and Louise of Savoy. Though Charles V. gave up all claim on the duchy of Burgundy, he had secured to himself Flanders and Artois, and had entirely cleared French influences out of Italy, which

1529-1541.

now became firmly fixed under the imperial hand, as a connecting link between his Spanish and his German possessions. Francis lost ground and credit by these successive treaties, conceived in bad faith, and not honestly carried out. His whole policy, throughout, was tortuous and uncertain; he was misled by showy advantages, and not sufficiently sagacious to discern his true interests. He had in fact little grasp of the great movements of his age, and floated to and fro; neither from the enthusiasm of the Reformation, nor from the instinctive loyalty of his subjects, nor even from the threatening power of Charles, could he succeed in creating for himself a consistent and honorable policy. His Italian ambitions proved a fatal hinderance to his reign; in hopes of recovering Milan, for example, he let Charles delude him, and displeased his natural allies. His foreign alliances were insecure; he would not evoke the sympathy and help of his own people.

No sooner had the treaty of Cambrai been effectual in bringing his sons back to France, than Francis began to look out for new pretexts and means for war. Affairs were not unpromising. His mother's death in 1531 left him in possession of a huge fortune, which she had wrung from defenceless France; the powers which were jealous of Austria, the Turk, the English king, the members of the Smalkald league, all looked to Francis as their leader; Clement VII., though his misfortunes had thrown him into the emperor's hands, was not unwilling to treat with France; and in 1533 by the compact of Marseilles the pope broke up the friendship between Francis and Henry VIII., while he married his niece Catherine de' Medici to Henry, the second son of Francis. This compact was a real disaster to France; the promised dowry of Catherine,—certain Italian cities,—was never paid, and the death of Clement VII. in 1534 made the political alliance with the papacy a failure. The influence of Catherine affected and corrupted French history for half a century. Preparations for war went on; Francis made a new scheme for a national army, though in practice he preferred the tyrant's arm, the foreign mercenary. From his day till the Revolution the French army was largely composed of bodies of men tempted out of other countries, chiefly from Switzerland or Germany.

Catherine de' Medici.

While the emperor strove to appease the Protestant princes of Germany by the peace of Kadan (1534), Francis strengthened himself with a definite alliance with Soliman; and when on the death of Francesco Sforza, duke of Milan, who left no heirs, Charles seized the duchy as its over-lord, Francis, after some bootless negotiation, declared war on his great rival (1536). His usual fortunes prevailed so long as he was the attacking party: his forces were soon swept out of Piedmont, and the emperor carried the war over the frontier into Provence. That also failed, and Charles was fain to withdraw after great losses into Italy. The defence of Provence—a defence which took the form of a ruthless destruction of all its resources—had been entrusted to Anne of Montmorency, who henceforward became constable of France and exerted great influence over Francis I. Though these two campaigns, the French in Italy and the imperialist in Provence, had equally failed in 1536, peace did not follow till 1538, when, after the terrible defeat of Ferdinand of Austria by the Turks, Charles was anxious to have free hand in Germany. Under the mediation of Paul III. the agreement of Nice was come to, which included a ten years' truce, and the abandonment by Francis of all his foreign allies and aims. He seemed a while to have fallen completely under the influence of the sagacious emperor. He gave way entirely to the church party of the time, a party headed by gloomy Henry, now dauphin, who never lost the impress of his Spanish captivity, and by the constable Anne of Montmorency; for a time the artistic or Renaissance party, represented by Anne duchess of Étampes and Catherine de' Medici, fell into disfavor. The emperor even ventured to pass through France, on his way from Spain to the Netherlands. All this friendship, however, fell to dust, when it was found that Charles refused to invest the duke of Orleans, the second son of Francis, with the duchy of Milan, and when the emperor's second expedition against the sea-power of the Turks had proved a complete failure, and Charles had returned to Spain with loss of all his fleet and army. Then Francis hesitated no longer, and declared war against him (1541). The shock the emperor had suffered inspirited all his foes; the sultan and the Protestant German princes were all eager for war; the influence of Anne of Montmorency had to give way before that of the house of Guise, that frontier-family, half French, half German, which was destined to play a large part in the troubled history of the coming half-century. Claude, duke of Guise, a veteran of the earliest days of Francis, was vehemently opposed to Charles and the Austro-Spanish power, and ruled in the king's councils. This last war was as mischievous as its predecessors: no great battles were fought; in the frontier affairs the combatants were about equally fortunate; the battle of Cerisolles, won by the French under Enghien (1544), was the only considerable success they had, and even that was almost barren of results, for the danger to northern France was imminent; there a combined invasion had been planned and partly executed by Charles and Henry VIII.; and the country, almost undefended, was at their mercy. The two monarchs, however, distrusted one another; and Charles V., anxious about Germany, sent to Francis proposals for peace from Crespy Couvrant, near Laon, where he had halted his army; Francis, almost in despair, gladly made terms with him. The king gave up his claims on Flanders and Artois, the emperor his on the duchy of Burgundy; the king abandoned his old Neapolitan ambition, and Charles promised one of the princesses of the house of Austria, with Milan as her dower, to the duke of Orleans, second son of Francis. The duke dying next year, this portion of the agreement was not carried out. The peace of Crespy, which ended the wars between the two great rivals, was signed in autumn, 1544, and like the wars which led to it was indecisive and lame. Charles learnt that with all his great power he could not strike a fatal blow at France; France ought to have learnt that she was very weak for foreign conquest, and that her true business was to consolidate and develop her power at home. Henry VIII. deemed himself wronged by this independent action on the part of Charles, who also had his grievances with the English monarch; he stood out till 1546, and then made peace with Francis, with the aim of forming a fresh combination against Charles. In the midst of new projects, and much activity, the marrer of man's plots came on the scene, and carried off in the same year, 1547, the English king and Francis I., leaving Charles V. undisputed arbiter of the affairs of Europe. In this same year he also crushed the Protestant princes at the battle of Mühlberg.

1541-1547.

The Guise family.

The peace of Crespy.

Francis reigned long enough to have been able to do much for France, and, following Louis XII., might have been another "father of his country," setting it in the way of true grandeur and prosperity. And something of this he seemed to see. He liked in the great movements of the age to take that middle course which commends itself to France: like France herself he wished to be Catholic and yet to become champion of the Reformed cause; he loved letters and art; he was a brilliant and chivalrous personage, who had the French qualities strongly marked in character and action. His people felt that he, in the main, represented them; they honored and loved him as a part of themselves. They accepted their position as a united nation—united, that is, under a master who offered them no constitutional rights or liberties; it was enough for them that their master was good-natured and kindly; his vices and weaknesses were little blamed, and much followed. History will record that he was mean and selfish, false and licentious, and that, if he knew what was the nobler path for himself and his country, he could not rise to the heroism of following it, when to do so demanded self-denial. History ought also to remember that he was pitted against the ablest statesman of his age, and that he was called on, with insufficient knowledge and strength, to defend the liberties of Europe against an overwhelming power. That he failed to choose the right weapons, that he failed to make the best use of the weapons he did take up—this was the real weakness of his life. His reign filled those years in which Renaissance passed into Reformation—in which the new enthusiasm for art and letters made the way ready for a more grave and solemn enthusiasm in religion, an enthusiasm which in its simpler side aimed at restoring purity of faith and manners, while in its more extreme developments it mixed itself up with bold political theories, or with a condemnation of all that learning and culture could do for human life. Under the direct kingship of God, men believed that all the older usages,

The character of his reign.

1547.

restrictions, and political principles of life were out of place. The Anabaptists carried out, in harsh developments, many of the ideas proclaimed half a century before by Savonarola at Florence. Now, in the history of France no principle appears so well established as this, that she ever "subordinated her religious feelings to her political interests." It is almost as generally true that her political interests were ever subordinated to the personal interests of her leaders. Consequently, we shall always expect to find very little movement of public opinion in France, and only a weak influence of religious sentiment on the general current of affairs; we shall also find her appreciation of political interests weak and ill-informed, her desire for self-government at home as dimly felt as her desire for a right policy abroad; and lastly, we shall see that for ages her history is the history of men not of institutions, and that her worst struggles are caused by personal not national questions. It is one of the grand results of the Revolution that it raised France from this vicious moral and mental state, introducing the rule of ideas and opinions, and the general participation of citizens in their own affairs.

Why the Reformation failed in France.

In the reign of Francis I. the court looked not unkindly on the Reformers, more particularly in the earlier years, while the new opinions were mostly those of Luther. Margaret, the king's sister, the duchess of Étampes, his mistress, Renée of France, the daughter of Louis XII., who took Clement Marot as her secretary, and was a declared Protestant,—all these ladies patronized and protected the Reformers. The king himself, regarding them as a people having ideas and some education and enlightenment, was well inclined towards them for a time. Later on, the excesses of the image-breakers, and the tendency of some of them to depreciate carnal learning, entirely alienated him from them. He never had any religious sympathy with them; and though both he and his mother sided in the beginning with the learned world against the monks and "hypocrites," as Louise of Savoy calls them, they never were interested in those theological questions which, though they might seem to them often to degenerate into unmeaning subtleties, still in reality gave to the reforming movement its true strength. The nobles went with the court, and beyond it. About half the great families with more or less earnestness adopted the Reformed opinions, and that more specially in their second or Calvinistic development. With them went a not inconsiderable body of the upper clergy. With these strong elements in its favor, how did the Reformation come to fail in France? It failed, first because the general body of the people took absolutely no interest in the matter; no popular feeling had been aroused; no discontent with either the clergy or the monasteries existed; and the people, uneducated and unused to political controversy or expression, were in fact never called on to form a judgment in the matter. Personal religion, or personal judgment as to theological questions, even in their more practical bearings, was but little known or cared for in France. And this was true not only of the people, but of the nobles and the court. There was, too, a want of that wholesome cathartic effect which the Reformation worked elsewhere; men's lives became no purer, the family relation was not strengthened, and from the moral side the movement was a failure also. Lastly, France has few great cities though many small ones, and her cities had little or no use of independence of thought and opinion. The towns were much divided; the capital, with its preponderating influence, was distinctly hostile to the Reformers. The Champagne towns, specially Meaux, showed themselves favorable to the new opinions; in the rest of France they had little sway; the persistent piety of the hill country of the south-east and south was an entirely independent phenomenon, which seemed to exert very little influence on the rest of France. In the later days of Francis I., the politico-religious movement connected with the name of Calvin, the series of ideas which formed the basis of Latin Protestantism, as distinct from the Germanic movement of the north, spread over a great part of the south and west of France. It was warmly welcomed by the dissidents of Dauphiny, the Cevennes, the Garonne valley; the nobles also adopted it with enthusiasm. It became a disruptive force in France. While Paris and northern France cling to the old opinions, round which a good number of the great families group themselves, Poitou and the western provinces are the home of the new ideas in church and state. They utter opinions which combine reform in religion with aristocratic and republican views in politics. France thus divided falls a prey to civil war.

1547-1552.

Henry II.

Henry II., who succeeded in 1547, "had all the faults of his father, with a weaker mind;" and as strength of mind was not one of the characteristics of Francis I., we may imagine how little firmness there was in the gloomy king who now reigned. Party spirit ruled at court. Henry II., with his ancient mistress Diana of Poitiers, was at the head of one party, that of the strict Catholics, and was supported by old Anne of Montmorency, most unlucky of soldiers, most fanatical of Catholics, and by the Guises, who chafed a good deal under the stern rule of the constable. This party had almost extinguished its antagonists; in the struggle of the mistresses, the pious and learned Anne of Étampes had to give place to imperious Diana. Catherine, the queen, was content to bide her time, watching with Italian coolness the game as it went on; of no account beside her rival, and yet quite sure to have her day, and ready to play parties against one another. Meanwhile, she brought to her royal husband ten sickly children, most of whom died young, and three wore the crown. Of the many bad things she did for France, that was perhaps among the worst.

Parties at court.

Mary queen of Scots.

On the accession of Henry II. the duchy of Brittany finally lost even nominal independence; he next got the hand of Mary queen of Scots, then but five years old, for the dauphin Francis; she was carried over to France, and being by birth half a Guise, by education and interests of her married life she became entirely French. It was a great triumph for Henry, for the protector Somerset had laid his plans to secure her for young Edward VI.; it was even more a triumph for the Guises, who saw opened out a broad and clear field for their ambition.

At first Henry II. showed no desire for war, and seemed to shrink from rivalry or collision with Charles V. He would not listen to Paul III., who, in his anxiety after the fall of the Protestant power in Germany in 1547, urged him to resist the emperor's triumphant advance; he seemed to show a dread of war, even among his neighbors. After he had won his advantage over Edward VI., he escaped the war which seemed almost inevitable, recovered Boulogne from the English by a money-payment, and smoothed the way for peace between England and Scotland. He took much interest in the religious question, and treated the Calvinists with great severity; he was also occupied by troubles in the south and west of France. Meanwhile a new pope, Julius III., was the weak dependant of the emperor, and there seemed to be no head left for any movement against the universal domination of Charles V. His career from 1547 to 1552 was, to all appearance, a triumphal march of unbroken success. Yet Germany was far from acquiescence; the princes were still discontented and watchful; even Ferdinand of Austria, his brother, was offended by the emperor's anxiety to secure everything, even the imperial crown, for his son Philip; Maurice of Saxony, that great problem of the age, was preparing for a second treachery, or, it may be, for a patriotic effort. These German malcontents now appealed to Henry for help; and at last Henry seemed inclined to come. He had lately made alliance with England, and in 1552 formed a league at Chambord with the German princes; the old connection with the Turk was also talked of. The Germans agreed to allow him to hold (as imperial vicar, not as king of France), the "three bishoprics," Metz, Verdun, and Toul; he also assumed a protectorate over the spiritual princes, those great bishops and electors of the Rhine, whose stake in the empire was so important. The general lines of French foreign politics are all here clearly marked; in this Henry II. is the forerunner of Henry IV. and of Louis XIV.; the imperial politics of Napoleon start from much the same lines; the proclamations of Napoleon III. before the Franco-German war seemed like thin echoes of the same.

Maurice of Saxony.

Early in 1552 Maurice of Saxony struck his great blow at his master in the Tyrol, destroying in an instant all the emperor's plans for the suppression of Lutheran opinions, and the reunion of Germany in a Catholic empire; and while Charles V. fled for his life, Henry II. with a splendid army crossed the frontiers

1552-1558.

of Lorraine. Anne of Montmorency, whose opposition to the war had been overborne by the Guises, who warmly desired to see a French predominance in Lorraine, was sent forward to reduce Metz, and quickly got that important city into his hands; Toul and Verdun soon opened their gates, and were secured, in reality if not in name, to France. Eager to undertake a protectorate of the Rhine, Henry II. tried also to lay hands on Strasburg; the citizens, however, resisted, and he had to withdraw; the same fate befell his troops in an attempt on Spires. Still Metz and the line of the Vosges mountains formed a splendid acquisition for France. The French army, leaving strong garrisons in Lorraine, withdrew through Luxemburg and the northern frontier; its remaining exploits were few and mean, for the one gleam of good fortune enjoyed by Anne of Montmorency, who was unwise and arrogant, and a most inefficient commander, soon deserted him. Charles V., as soon as he could gather forces, laid siege to Metz, but, after nearly three months of late autumnal operations, was fain to break up and withdraw, baffled and with loss of half his army, across the Rhine. Though some success attended his arms on the northern frontier, it was of no permanent value: the loss of Metz, and the failure in the attempt to take it, proved to the worn-out emperor that the day of his power and opportunity was past. The conclusions of the diet of Augsburg in 1555 settled for half a century the struggle between Lutheran and Catholic, but settled it in a way not at all to his mind; for it was the safeguard of princely interests against his plans for an imperial unity. Weary of the losing strife, yearning for ease, ordered by his physicians to withdraw from active life, Charles in the course of 1555 and 1556 resigned all his great lordships and titles, leaving Philip his son to succeed him in Italy, the Netherlands, and Spain, and his brother Ferdinand of Austria to wear in his stead the imperial diadem. These great changes sundered a while the interests of Austria from those of Spain.

Charles V. lays down his dignities.

Henry endeavored to take advantage of the check in the fortunes of his antagonists; he sent Anne of Montmorency to support Gaspard Coligny, the admiral of France, in Picardy, and in harmony with Paul IV., instructed Francis, duke of Guise, to enter Italy to oppose the duke of Alva. As of old, the French arms at first carried all before them, and Guise deeming himself heir to the crown of Naples (for he was the eldest great-grandson of René II., titular king of Naples) pushed eagerly forward as far as the Abruzzi. There he was met and outgeneraled by Alva, who drove him back to Rome, whence he was now recalled by urgent summons to France; for the great disaster of St. Quentin had laid Paris itself open to the assault of an enterprising enemy. With the departure of Guise from Italy the age of the Italian expeditions comes to an end. On the northern side of the realm things had gone just as badly. Philibert of Savoy, commanding for Philip with Spanish and English troops, marched into France as far as to the Somme, and laid siege to St. Quentin, which was bravely defended by Admiral Coligny. Anne of Montmorency, coming up to relieve the place, managed his movements so clumsily that he was caught by Count Egmont and the Flemish horse, and with incredibly small loss to the conquerors, was utterly routed (1557). Montmorency himself and a crowd of nobles and soldiers were taken; the slaughter was great. Coligny made a gallant and tenacious stand in the town itself, but at last was overwhelmed, and the place fell. Terrible as these mishaps were to France, Philip II. was not of a temper to push an advantage vigorously; and while his army lingered, Francis of Guise came swiftly back from Italy; and instead of wasting strength in a doubtful attack on the allies in Picardy, by a sudden stroke of genius he assaulted and took Calais (January, 1558), and swept the English finally off the soil of France. This unexpected and brilliant blow cheered and solaced the afflicted country, while it finally secured the ascendency of the house of Guise. The duke's brother, the cardinal of Lorraine, carried all before him in the king's councils; the dauphin, betrothed long before, was now married to Mary of Scots; a secret treaty bound the young queen to bring her kingdom over with her; it was thought that France with Scotland would be at least a match for England joined with Spain. In the same year, 1558, the French advance along the coast, after they had taken Dunkirk and Nieuport, was finally checked by the brilliant genius of Count Egmont, who defeated them at Gravelines. All now began to wish for peace, especially Montmorency, weary of being a prisoner, and anxious to get back to court, that he might check the fortunes of the Guises; Philip desired it, that he might have free hand against heresy. And so at Cateau Cambresis a peace was made in April, 1559, by which France retained the three bishoprics and Calais, surrendering Thionville, Montmédy, and one or two other frontier towns, while she recovered Ham and St. Quentin; the house of Savoy was reinstated by Philip, as a reward to Philibert for his services, and formed a solid barrier for a time between France and Italy; cross marriages between Spain, France, and Savoy were arranged; and finally the treaty contained secret articles by which the Guises for France and Granvella for the Netherlands agreed to crush heresy with the strong hand. As a sequel to this peace, Henry II. held a great tournament at Paris, at which he was accidentally slain by a Scottish knight in the lists.

1559-1560.

Peace of Cateau Cambresis.

Francis II.

The Guises now shot up into unbounded power. The new king, Francis II., was devoted to his young wife, and she was entirely led by her uncles the Guises; so strong they seemed that Philip of Spain was alarmed lest Mary Stewart should also win the English crown, and he allowed the accession of Queen Elizabeth, in consequence of his fears, to pass unchallenged. As yet, parties at court were not marked simply by their theological views; that would follow in time. On the Guise side the cardinal of Lorraine was the cleverest man, the true head, while Francis the duke was the arm; he showed leanings towards the Lutherans. On the other side the head was the dull and obstinate Anne of Montmorency, the constable, an unwavering Catholic, supported by the three Coligny brothers, who all were or became Huguenots. The queen-mother, Catherine, fluctuated uneasily between the parties, and though Catholic herself, or rather not a Protestant, did not hesitate to befriend the Huguenots, if the political arena seemed to need their gallant swords. Their noblest leader was Coligny the admiral; their recognized head was Antony king of Navarre, a man as foolish as fearless. He was heir presumptive to the throne after the Valois boys, and claimed to have charge of the young king. Though the Guises had the lead at first, the Huguenots seemed, from their strong aristocratic connections, to have the fairer prospects before them.

The civil wars.

Thirty years of desolate civil strife are before us, and we must set it all down briefly and dryly. The prelude to the troubles was played by the Huguenots, who in 1560, guided by La Renaudie, a Perigord gentleman, formed a plot to carry off the young king; for Francis II. had already treated them with considerable severity, and had dismissed from his councils both the princes of the blood royal and the Constable Montmorency. The plot failed miserably, and La Renaudie lost his life; it only secured more firmly the authority of the Guises. As a counterpoise to their influence, the queen-mother now conferred the vacant chancellorship on one of the wisest men France has ever seen, her Lord Bacon, Michel L'Hôpital, a man of the utmost prudence and moderation, who, had the times been better, might have won constitutional liberties for his country, and appeased her civil strife. As it was, he saved her from the Inquisition; his hand drew the edicts which aimed at enforcing toleration on France; he guided the assembly of notables which gathered at Fontainebleau, and induced them to attempt a compromise which moderate Catholics and Calvinists might accept, and which might lessen the power of the Guises. This assembly was followed by a meeting of the States-General at Orleans, at which the prince of Condé and the king of Navarre were seized by the Guises on a charge of having had to do with La Renaudie's plot. It would have gone hard with them had not the sickly king at this very time fallen ill and died (1560).

Charles IX.

This was a grievous blow to the Guises; they had their hands on their rivals, and would have got rid of them in a few days; they had laid their plans to crush the south, and put down the Huguenots by martial law; the queen-mother was powerless, the middle party behind her was as nothing. Now, as in a moment, all was shattered; Catherine de' Medici rose at once to the command of affairs; the new king, Charles IX., was only ten years old, and her position as regent was assured. The Guises would gladly have ruled with her; but she had no fancy for that; she and Chancellor L'Hôpital were not likely

1560-1562.

to ally themselves with all that was severe and repressive. Still, parties made a kind of armistice for a while; the queen-mother drew towards easy-tempered Antony of Navarre; the Guises retained much of their power; Condé was set free; the extremer measures proposed by the Huguenots, who wished the king of Navarre to seize the regency for himself, were not regarded with any favor. While the Guises had been omnipotent, the discontented parties excluded by them from power and office were held together by the bonds of a common adversity; the change of affairs loosened their friendship. They fell into three groups:—the princes of the blood, with the queen-mother; the constable Anne of Montmorency and his Catholic friends; and thirdly, the Huguenot nobles and cities of the south and west. The princes of the blood, through Antony of Navarre, had close connections with the Huguenots; and when the queen-mother had secured him, she doubtless deemed that she would at least be able to neutralize their influence on affairs. She therefore set herself to secure also the constable and his party, and created a kind of triumvirate (composed of herself, Antony of Navarre, and Anne of Montmorency), with which she hoped to rule the country, and to keep the Guises in check. Here was a splendid field for those intrigues in which she had her being; yet the queen's ultimate aim was a good one, for she really desired the tranquillity of France, and hoped to see Catholics and Huguenots dwelling like brethren side by side. It must not be forgotten that the best part of her policy was inspired by the Chancellor L'Hôpital.

Now it was that Mary Stewart, the queen-dowager, was compelled to leave France for Scotland; her departure clearly marks the fall of the Guises, and it also showed Philip of Spain that it was no longer necessary for him to refuse aid and counsel to the Guises; their claims were no longer formidable to him on the larger sphere of European politics; no longer could Mary Stewart dream of wearing the triple crown of Scotland, France, and England.

The triumvirate.

The tolerant language of L'Hôpital at the States-General of Orleans in 1561 satisfied neither side. The Huguenots were restless; the Bourbon princes tried to crush the Guises, in return for their own imprisonment the year before; the constable was offended by the encouragement shown to the Huguenots; it was plain that new changes impended. Montmorency began them by going over to the Guises; and the fatal triumvirate of Francis, duke of Guise, Montmorency, and St. André, the marshal, was formed. We find the king of Spain forthwith entering the field of French intrigues and politics, as the support and stay of this triumvirate. Parties take a simpler form at once,—one party of Catholics, and another of Huguenots, with the queen-mother and the moderates left powerless between them. These last, guided still by L'Hôpital, once more convoked the States-General at Pontoise: the nobles and the third estate seemed to side completely with the queen and the moderates; a controversy between Huguenots and Jesuits at Poissy only added to the discontent of the Catholics, who were now joined by foolish Antony king of Navarre. The edict of January, 1562, is the most remarkable of the attempts made by the queen-mother to satisfy the Huguenots; but party-passion was already too strong for it to succeed; civil war had become inevitable. The recall of the duke of Guise from Lorraine by his party made an outbreak certain. The Guises themselves were not without Lutheran sympathies; their border-position between France and Germany, their literary tastes, and relations with German princes, made this natural enough. Still they were Catholics, and Lutheran sympathies were very different from Huguenot politics. The sudden outbreak at Vassy on the borders of Champagne, which marked the entry of the Guises into France proper, and the murder of Huguenots in the granary in which they were holding service,—a massacre condemned by Francis of Guise himself,—mark the opening of the civil wars (1st March, 1562). The period may be divided into four parts:—(1) the wars before the establishment of the League (1562–1570); (2) the period of the St. Bartholomew (1570–1573); (3) the struggle of the new Politique party against the Leaguers (1573–1589); (4) the efforts of Henry IV. to crush the League and reduce the country to peace (1589–1598). The period can also be divided by that series of agreements, or peaces, which break it up into eight wars.

Periods of the civil wars.

1562–1569.

The first war.

1. The war of 1562, on the skirts of which Philip of Spain interfered on the one side, and Queen Elizabeth with the Calvinistic German princes on the other, showed at once that the Huguenots were by far the weaker party. The English troops at Havre enabled them at first to command the lower Seine up to Rouen; but the other party, after a long siege which cost poor Antony of Navarre his life, took that place, and relieved Paris of anxiety. The Huguenots had also spread far and wide over the south and west, occupying Orleans; the bridge of Orleans was their point of junction between Poitou and Germany. While the strength of the Catholics lay to the east, in Picardy, and at Paris, the Huguenot power was mostly concentrated in the south and west of France. Condé, who commanded at Orleans, supported by German allies, made an attempt on Paris, but finding the capital too strong for him, turned to the west, intending to join the English troops from Havre. Montmorency, however, caught him at Dreux; and in the battle that ensued the marshal of France, St. André, perished; Condé was captured by the Catholics, Montmorency by the Huguenots. Coligny, the admiral, drew off his defeated troops with great skill, and fell back to beyond the Loire; the duke of Guise remained as sole head of the Catholics. Pushing on his advantage, the duke immediately laid siege to Orleans, and there he fell by the hand of a Huguenot assassin. Both parties had suffered so much that the queen-mother thought she might interpose with terms of peace; the edict of Amboise (March, 1563) closed the war, allowing the Calvinists freedom of worship in the towns they held, and some other scanty privileges. A three years' quiet followed, though all men suspected their neighbors, and the high Catholic party tried hard to make Catharine sacrifice L'Hôpital and take sharp measures with the Huguenots. They on their side were restless and suspicious, and it was felt that another war could not be far off. Intrigues were incessant, all men thinking to make their profit out of the weakness of France. The struggle between Calvinists and Catholics in the Netherlands roused much feeling, though Catherine refused to favor either party. She collected an army of her own; it was rumored that she intended to take the Huguenots by surprise, and annihilate them. In autumn, 1567, their patience gave way, and they raised the standard of revolt, in harmony with the heroic Netherlanders. Condé and the Châtillons beleaguered Paris from the north, and fought the battle of St. Denis, in which the old constable Anne of Montmorency was killed. The Huguenots, however, were defeated and forced to withdraw, Condé marching eastwards to join the German troops now coming up to his aid. No more serious fighting followed; the peace of Longjumeau (March, 1568) closed the second war, leaving matters much as they were. The aristocratic resistance against the Catholic sovereigns, against what is often called "the Catholic Reaction," had proved itself hollow; in Germany and the Netherlands, as well as in France, the Protestant cause seemed to fail; it was not until the religious question became mixed up with questions as to political rights and freedom, as in the Low Countries, that a new spirit of hope began to spring up.

The second war.

The peace of Longjumeau gave no security to the Huguenot nobles; they felt that the assassin might catch them any day. An attempt to seize Condé and Coligny failed, and served only to irritate their party; Cardinal Châtillon escaped to England; Jeanne of Navarre and her young son Henry took refuge at La Rochelle; L'Hôpital was dismissed the court. The queen-mother seemed to have thrown off her cloak of moderation, and to be ready to relieve herself of the Huguenots by any means, fair or foul. War accordingly could not fail to break out again before the end of the year. Condé had never been so strong; with his friends in England and the Low Countries, and the enthusiastic support of a great party of nobles and religious adherents at home, his hopes rose; he even talked of deposing the Valois and reigning in their stead. He lost his life, however, early in 1569, at the battle of Jarnac. Coligny once more with difficulty, as at Dreux, saved the broken remnants of the defeated Huguenots. Condé's death, regarded at the time by the Huguenots as an irreparable calamity, proved in the end to be no serious loss; for it made room for the true head of the party, Henry of Navarre. No sooner had Jeanne of Navarre heard of the mishap of Jarnac than she came into the Huguenot

The third war.

camp, and presented to the soldiers her young son Henry and the young prince of Condé, a mere child. Her gallant bearing and the true soldier-spirit of Coligny, who shone most brightly in adversity, restored their temper; they even won some small advantages. Before long, however, the duke of Anjou, the king's youngest brother, caught and punished them severely at Moncontour. Both parties thenceforward wore themselves out with desultory warfare. In August, 1570, the peace of St. Germain-en-Laye closed the third war, and ended the first period.

2. It was the most favorable peace the Huguenots had won as yet; it secured them, beside previous rights, four strongholds. The Catholics were dissatisfied; they could not sympathize with the queen-mother in her alarm at the growing strength of Philip II., head of the Catholics in Europe; they dreaded the existence and growing influence of a party now beginning to receive a definite name, an honorable nickname, the Politiques. These were that large body of French gentlemen who loved the honor of their country rather than their religious party, and who, though Catholics, were yet moderate and tolerant. The day will come when they will assert themselves as the true patriot party, and, supporting Henry IV., will find out a solution for the vexed questions and the troubles of their times.

The Politiques.

On the other hand, the Huguenots were frightened by the peace, and regarded its favorable terms as baits and snares. They withdrew sullenly to La Rochelle; the friendly attitude of Charles IX. alarmed them still more; they were scarcely reassured by seeing him ally himself with the house of Austria, then not friendly with Spain. A pair of marriages now proposed by the court amazed them still more. It was suggested that the duke of Anjou should marry Queen Elizabeth of England, and Henry of Navarre Margaret of Valois, the king's sister. Charles IX. hoped thus to be rid of his brother whom he disliked, and to win powerful support against Spain, by the one match, and by the other to bring the civil wars to a close. The sketch of a far-reaching resistance to Philip II. was drawn out; so convinced of his good faith was the prudent and sagacious William of Orange, that on the strength of these plans he refused good terms now offered him by Spain. There seems no doubt that whatever the subtle Catharine may have thought and meant, Charles IX. was sincere. Catherine cared more for her favorite son Henry of Anjou than for the king, whom she despised; she took no pleasure in those schemes for helping the Netherlanders in their revolt, by which Charles hoped to occupy his Huguenot subjects, while he preserved peace at home. She seems all this while to have wished to see some half dozen Huguenot leaders assassinated; thereby she thought the party would be neutralized. She was far from pleased at the ascendency which Coligny, from the moment the king saw him, exercised in the royal councils. The duke of Alençon, the remaining son of Catherine, the brother who did not come to the throne, was deeply interested in the plans for a war in the Netherlands; Anjou, who had withdrawn from the scheme of marriage with Queen Elizabeth, was at this moment a candidate for the throne of Poland; while negotiations respecting it were going on, Margaret of Valois was married to Henry of Navarre,—the worst of wives to a husband none too good. Coligny, who had strongly opposed the candidature of Anjou for the throne of Poland, was set on by an assassin, employed by the queen-mother and her favorite son, and badly wounded; the Huguenots were in utmost alarm, filling the air with cries and menaces. Charles showed great concern for his friend's recovery, and threatened vengeance on the assassins. What was his astonishment to learn that those assassins were his mother and brother! Catherine worked on his fears, and the plot for the great massacre was combined in an instant. The very next day after the king's consent was wrung from him, 24th August, 1572, the massacre of St. Bartholomew's day took place.

The St. Bartholomew.

The murder of Coligny was completed; his son-in-law Teligny perished; all the chief Huguenots were slain; the slaughter spread to country towns; the church and the civil power were at one, and the victims, taken at unawares, could make no resistance. The two Bourbons, Henry and the prince of Condé, were spared; they bought their lives by a sudden conversion to Catholicism. The chief guilt of this great crime lies with Catherine de' Medici; for though it is certain that she did not plan it long before, assassination was a recognized part of her way of dealing with Huguenots; only she was too fine to do it in the coarse and wholesale way of the St. Bartholomew. It is from her that the taste for murder in France chiefly sprang. The Guises may well share with her; they planned and executed the hasty act; they too had long dabbled in murder. The king's share in it was, like himself, weak and impulsive; he was the last to come in, the first to repent. The evil deed was highly applauded as a master-stroke by pope and Spanish king. Yet it soon became clear that the crime was a blunder also. The effects of it, startling for the moment, enabled the middle party to take the lead. The duke of Alençon never approved of the massacre; the moderates throughout France were shocked and outraged; the Huguenots, weakened for a while, were content to unite with the Politiques, and place themselves under their leading; Catherine lost her power of balancing between the parties, for they are now but two,—that of the League, and that of the rest of France.

The fourth war.

A short war followed, —a revolt of the southern cities rather than a war. They made tenacious and heroic resistance; a large part of the royal forces sympathized rather with them than with the League; and in July, 1573, the edict of Boulogne granted them even more than they had been promised by the peace of St. Germains.

The Wars of the League.

3. We have reached the period of the "Wars of the League," as the four later civils wars are often called. The last of the four is alone of any real importance.

Just as the peace of La Rochelle was concluded, the duke of Anjou, having been elected king of Poland, left France; it was not long before troubles began again. The duke of Alençon was vexed by his mother's neglect; as heir presumptive to the crown he thought he deserved better treatment, and sought to give himself consideration by drawing towards the middle party; Catherine seemed to be intriguing for the ruin of that party; nothing was safe while she was moving. The king had never held up his head since the St. Bartholomew; it was seen that he now was dying, and the queen-mother took the opportunity of laying hands on the middle party. She arrested Alençon, Montmorency, and Henry of Navarre, together with some lesser chiefs; in the midst of it all Charles IX. died (1574) in misery, leaving the ill-omened crown to Henry of Anjou, king of Poland, his next brother, his mother's favorite, the worst of a bad breed.

The fifth war.

At the same time the fifth civil war broke out, interesting chiefly because it was during its continuance that the famous League was actually formed.

Henry III.

Henry III., when he heard of his brother's death, was only too eager to slip away like a culprit from Poland, though he showed no alacrity in returning to France, and dallied with the pleasures of Italy for months. An attempt to draw him over to the side of the Politiques failed completely; he attached himself on the contrary to the Guises, and plunged into the grossest dissipation, while he posed himself before men as a good and zealous Catholic. The Politiques and Huguenots therefore made a compact in 1575, at Milhaud on the Tarn, and chose the prince of Condé as their head; Henry of Navarre escaped from Paris, threw off his forced Catholicism, and joined them. Against them the strict Catholics seemed powerless; the queen-mother closed this war with the peace of Chastenoy (May, 1576), with terms unusually favorable for both Politiques and Huguenots: for the latter free worship throughout France, except at Paris; for the chiefs of the former great governments,—for Alençon a large central district, for Condé Picardy, for Henry of Navarre Guienne.

The Catholic League.

To resist all this the high Catholic party framed the League they had long been meditating; it is said that the cardinal of Lorraine had sketched it years before, at the time of the later sittings of the council of Trent. Lesser compacts had already been made from time to time; now it was proposed to form one great league, towards which all should gravitate. The head of the League was Henry, duke of Guise, the second "Balafré," who had won that title in fighting against the German reiters the year before, when they entered France under Condé. He certainly hoped at this time to succeed to the throne of France, either by deposing the corrupt and feeble Henry III., "as Pippin dealt with Hilderik," or by seizing the throne, when the king's debaucheries should have brought him to the grave. The

1576-1584.

Catholics of the more advanced type, and specially the Jesuits, now in the first flush of credit and success, supported him warmly. The headquarters of the movement were in Picardy, its first object opposition to the establishment of Condé as governor of that province. The League was also very popular with the common folk, especially in the towns of the north. It soon found that Paris was its natural centre; thence it spread swiftly across the whole of France; it was warmly supported by Philip of Spain. The States-General, convoked at Blois in 1576, could bring no rest to France; opinion was just as much divided there as in the country; and the year 1577 saw another petty war, counted as the sixth, which was closed by the peace of Bergerac, another ineffectual truce, which settled nothing.

The sixth war.

It was a peace made with the Politiques and Huguenots by the court; it is significant of the new state of affairs that the League openly refused to be bound by it, and continued a harassing, objectless warfare. The duke of Anjou (he had taken that title on his brother Henry's accession to the throne) in 1578 deserted the court party, towards which his mother had drawn him, and made friends with the Calvinists in the Netherlands. The southern provinces named him "Defender of their liberties;" they had hopes he might wed Elizabeth of England; they quite mistook their man.

The seventh war.

In 1579 "the Gallants' War" broke out; the Leaguers had it all their own way; but Henry III., not too friendly to them, and, urged by his brother Anjou, to whom had been offered sovereignty over the seven United Provinces in 1580, offered the insurgents easy terms, and the treaty of Fleix closed the seventh war. Anjou in the Netherlands could but show his weakness; nothing went well with him; and at last, having utterly wearied out his friends, he fled, after the failure of his attempt to secure Antwerp, into France. There he fell ill of consumption, and died in 1584.

This changed at once the complexion of the succession question. Hitherto, though no children seemed likely to be born to him, Henry III. was young and might live long, and his brother was there as his heir. Now, Henry III. was the last prince of the Valois, and Henry of Navarre in hereditary succession was heir presumptive to the throne, unless the Salic law were to be set aside.

The descent of Henry of Navarre.

The fourth son of St. Louis, Robert, count of Clermont, who married Beatrix, heiress of Bourbon, was the founder of the house of Bourbon. Of this family the two elder branches had died out:—John, who had been a central figure in the war of the Public Weal, in 1488; Peter, husband of Anne of France, in 1503; neither of them leaving heirs male. Of the younger branch Francis died in 1525, and the famous Constable Bourbon in 1527. This left as the only representatives of the family the counts of La Marche; of these the elder had died out in 1438, and the junior alone survived in the counts of Vendôme. The head of this branch, Charles, was made duke of Vendôme by Francis I. in 1515; he was father of Antony, duke of Vendôme, who, by marrying the heroic Jeanne of Albret, became king of Navarre, and of Louis, who founded the house of Condé; lastly, Antony was the father of Henry IV. He was therefore a very distant cousin to Henry III.; the houses of Capet, of Alençon, of Orleans, of Angoulême, of Maine, and of Burgundy, as well as the elder Bourbons, had to fall extinct before Henry of Navarre could become heir to the crown. All this, however, had now happened; and the Huguenots greatly rejoiced in the prospect of a Calvinist king. The Politique party showed no ill will towards him; both they and the court party declared that if he would become once more a Catholic they would rally to him; the Guises and the League were naturally all the more firmly set against him; and Henry of Navarre saw that he could not as yet safely endanger his influence with the Huguenots, while his conversion would not disarm the hostility of the League. They had before this put forward as heir to the throne Henry's uncle, the wretched old Cardinal Bourbon, who had all the faults and none of the good qualities of his brother Antony. Under cover of his name the duke of Guise hoped to secure the succession for himself; he also sold himself and his party to Philip of Spain, who was now in fullest expectation of a final triumph over his foes. He had assassinated William the Silent; any day Elizabeth or Henry of Navarre might be found murdered; the domination of Spain over Europe seemed almost secured.

1585-1589.

The pact of Joinville, signed between Philip, Guise, and Mayenne, gives us the measure of the aims of the high Catholic party.

The Sixteen of Paris.

Paris warmly sided with them; the new development of the League, the "Sixteen of Paris," one representative for each of the districts of the capital, formed a vigorous organization and called for the king's deposition; they invited Henry, duke of Guise, to Paris. Soon after this Henry III. humbled himself, and signed the treaty of Nemours (1585) with the Leaguers. He hereby became nominal head of the League, and its real slave.

The eighth war, the "War of the Three Henries."

The eighth war, the "War of the Three Henries," that is, of Henry III. and Henry of Guise against Henry of Navarre, now broke out. The pope made his voice heard; Sixtus excommunicated the Bourbons, Henry and Condé, and blessed the Leaguers. For the first time there was some real life in one of these civil wars; for Henry of Navarre rose nobly to the level of his troubles. At first the balance of successes was somewhat in favor of the Leaguers; the political atmosphere grew even more threatening, and terrible things, like lightning-flashes, gleamed out now and again. Such, for example, was the execution of Mary Stewart, queen of Scots, in 1586. It was known that Philip II. was preparing to crush England. Elizabeth did what she could to support Henry of Navarre; he had the good fortune to win the battle of Coutras, in which the duke of Joyeuse, one of the favorites of Henry III., was defeated and killed. The duke of Guise, on the other hand, was too strong for the Germans, who had marched into France to join the Huguenots, and defeated them at Vimory and Auneau, after which he marched in triumph to Paris, in spite of the orders and opposition of the king, who, finding himself powerless, withdrew to Chartres. Once more Henry III. was obliged to accept such terms as the Leaguers chose to impose; and with rage in his heart he signed the "Edict of Union" (1588), in which he named the duke of Guise lieutenant-general of the kingdom, and declared that no heretic could succeed to the throne. Unable to endure the humiliation, Henry III. that same winter assassinated the duke and the cardinal of Guise, and seized many leaders of the League, though he missed the duke of Mayenne. This scandalous murder of the "King of Paris," as the capital fondly called the duke, brought the wretched king no solace nor power. His mother did not live to see the end of her son; she died in this the darkest period of his career, and must have been aware that her cunning and her immoral life had brought nothing but misery to herself and all her race. The power of the League party seemed as great as ever; the duke of Mayenne entered Paris, and declared open war on Henry III., who, after some hesitation, threw himself into the hands of his cousin Henry of Navarre in the spring of 1589. The old Politique party now rallied to the king; the Huguenots were staunch for their old leader; things looked less dark for them since the destruction of the Spanish Armada in the previous summer. The Swiss, aroused by the threats of the duke of Savoy at Geneva, joined the Germans, who once more entered north-eastern France; the Leaguers were unable to make head either against them or against the armies of the two kings; they fell back on Paris, and the allies hemmed them in. The defence of the capital was but languid; the populace missed their idol, the duke of Guise, and the moderate party, never extinguished, recovered strength. All looked as if the royalists would soon reduce the last stronghold of the League, when Henry III. was suddenly slain by the dagger of a fanatical half-witted priest. The king had only time to commend Henry of Navarre to his courtiers as his heir, and to exhort him to become a Catholic, before he closed his eyes, and ended the long roll of his vices and crimes. And thus in crime and shame the house of Valois went down. For a few years the throne remained practically vacant: the heroism of Henry of Navarre, the loss of strength in the Catholic powers, the want of a vigorous head to the League,—these things all sustained the Bourbon in his arduous struggle; the middle party grew in strength daily, and when once Henry had allowed himself to be converted, he became the national sovereign, the national favorite, and the high Catholics fell to the fatal position of an unpatriotic faction depending on the arm of the foreigner.

Henry IV.

4. The civil wars were not over, for the heat of party raged as yet unslaked; the Politiques

1589-1590.

The claimants for the throne.

could not all at once adopt a Huguenot king, the League party had pledged itself to resist the heretic, and Henry at first had little more than the Huguenots at his back. There were also formidable claimants for the throne. Charles II., duke of Lorraine, who had married Claude, younger daughter of Henry II., and who was therefore brother-in-law to Henry IV., set up a vague claim; the king of Spain, Philip II., thought that the Salic law had prevailed long enough in France, and that his own wife, the elder daughter of Henry II., had the best claim to the throne; the Guises, though their head was gone, still hoping for the crown, proclaimed their sham-king the cardinal of Bourbon as Charles X., and intrigued behind the shadow of his name. The duke of Mayenne, their present chief, was the most formidable of Henry's opponents; his party called for a convocation of States-General, which should choose a king to succeed, or to replace, their feeble Charles X. During this struggle the high Catholic party, inspired by Jesuit advice, stood forward as the admirers of constitutional principles; they called on the nation to decide the question as to the succession; their Jesuit friends wrote books on the sovereignty of the people. They summoned up troops from every side; the duke of Lorraine sent his son to resist Henry and support his own claim; the king of Spain sent a body of men; the League-princes brought what force they could. Henry of Navarre at the same moment found himself weakened by the silent withdrawal from his camp of the army of Henry III.; the Politique nobles did not care at first to throw in their lot with the Huguenot chieftain; they offered to confer on Henry the post of commander-in-chief, and to reserve the question as to the succession; they let him know that they recognized his hereditary rights, and were hindered only by his heretical opinions; if he would but be converted, they were his. Henry temporized; his true strength, for the time, lay in his Huguenot followers, rugged and faithful fighting-men, whose belief was the motive-power of their allegiance and of their courage. If he joined the Politiques at their price, the price of declaring himself Catholic, the Huguenots would be offended if not alienated. So he neither absolutely refused nor said yes; and the chief Catholic nobles, in the main, stood aloof, watching the struggle between Huguenot and Leaguer, as it worked out its course.

Henry, thus weakened, abandoned the siege of Paris, and fell back; with the bulk of his forces he marched into Normandy, so as to be within reach of English succor; a considerable army went into Champagne, to be ready to join any Swiss or German help that might come. These were the great days of the life of Henry of Navarre. After the rough training of his boyhood, when his noble mother was no more, and he had become entangled with the dissolute Valois court, he had taken willing share in their debaucheries, and seemed no better than the rest; after he had secured his throne, he relapsed again into a scandalous life, which dimmed the lustre of his vigorous government. But now he was at his best; in the life of camps, the excitements of the battlefield, in the flashes of genius with which he fought successfully against heavy odds, Henry showed himself a hero, who strove for a great cause—the cause of European freedom—as well as for his own crown.

The duke of Mayenne followed the Huguenots down into the west, and found Henry awaiting him in a strong position at Arques, near Dieppe; here at bay the "Béarnais" inflicted a heavy blow on his assailants; Mayenne fell back into Picardy; the prince of Lorraine drew off altogether; and Henry marched back triumphantly to Paris, ravaged the suburbs, and then withdrew to Tours, where he was recognized as king by the parliament. His campaign of 1589 had been most successful; he had defeated the League in a great battle, thanks to his skilful use of his position at Arques, and the gallantry of his troops, which more than counterbalanced the great disparity in numbers. He had seen dissension break out among his enemies; even the pope, Sixtus V., had shown him some favor, and the Politique nobles were certainly not going against him. Early in 1590 Henry had secured Anjou, Maine, and Normandy, and in March defeated Mayenne in a great pitched battle at Ivry, not far from Dreux. The Leaguers fell back in consternation to Paris. Henry reduced all the country round the capital, and sat down before it for a stubborn siege. The duke of Parma had at that time his hands full in the Low Countries; young prince Maurice was beginning to show his great abilities as a soldier, and had got possession of Breda; all, however, had to be suspended by the Spaniards on that side, rather than let Henry of Navarre take Paris. Parma with great skill relieved the capital without striking a blow, and the campaign of 1590 ended in a failure for Henry. The success of Parma, however, made Frenchmen feel that Henry's was the national cause, and that the League flourished only by interference of the foreigner. Were the king of Navarre but a Catholic, he should be a king of France of whom they might all be proud. This feeling was strengthened by the death of the old Cardinal Bourbon, which re-opened at once the succession question, and compelled Philip of Spain to show his hand. He now claimed the throne for his daughter Elizabeth, as eldest daughter of the eldest daughter of Henry II. All the neighbors of France claimed something; Frenchmen felt that it was either Henry IV. or dismemberment. The "Béarnais" grew in men's minds to be the champion of the Salic law, of the hereditary principle of royalty against feudal weakness, of unity against dismemberment, of the nation against the foreigner.

1590-1598.

The middle party, the Politiques of Europe,—the English, that is, and the Germans,—sent help to Henry, by means of which he was able to hold his own in the north-west and south-west throughout 1591. Late in the year the violence of the Sixteen of Paris drew on them severe punishment from the duke of Mayenne; and consequently the duke ceased to be the recognized head of the League, which now looked entirely to Philip II. and Parma, while Paris ceased to be its headquarters; and more moderate counsels having taken the place of its fierce fanaticism, the capital came under the authority of the lawyers and citizens, instead of the priesthood and the bloodthirsty mob. Henry meanwhile, who was closely beleaguering Rouen, was again outgeneralled by Parma, and had to raise the siege. Parma, following him westwards, was wounded at Caudebec; and though he carried his army triumphantly back to the Netherlands, his career was ended by this trifling wound. He did no more, and died in 1592.

The conversion of Henry IV.

In 1593, Mayenne having sold his own claims to Philip of Spain, the opposition to Henry looked more solid and dangerous than ever; he therefore thought the time was come for the great step which should rally to him all the moderate Catholics. After a decent period of negotiation and conferences, he declared himself convinced, and heard mass at St. Denis. The conversion had immediate effect; it took the heart out of the opposition; city after city came in; the longing for peace was strong in every breast, and the conversion seemed to remove the last obstacle. The Huguenots, little as they liked it, could not oppose the step, and hoped to profit by their champion's improved position. Their ablest man, Sully, had even advised Henry to make the plunge. In 1594 Paris opened her gates to Henry, who had been solemnly crowned, just before, at Chartres. He was welcomed with immense enthusiasm, and from that day onwards has ever been the favorite hero of the capital. By 1595 only one foe remained,—the Spanish court. The League was now completely broken up; the parliament of Paris gladly aided the king to expel the Jesuits from France. In November, 1595, Henry declared war against Spain, for anything was better than the existing state of things, in which Philip's hand secretly supported all opposition. The war in 1596 was far from being successful for Henry; he was comforted, however, by receiving at last the papal absolution, which swept away the last scruples of France.

War with Spain.

By rewards and kindliness,—for Henry was always willing to give and had a pleasant word for all,—most of the reluctant nobles, headed by the duke of Mayenne himself, came in in the course of 1596. Still the war pressed very heavily, and early in 1597 the capture of Amiens by the Spaniards alarmed Paris, and roused the king to fresh energies. With help of Sully (who had not yet received the title by which he is known to history) Henry recovered Amiens, and checked the Spanish advance. It was noticed that while the old Leaguers came very heartily to the king's help, the Huguenots hung back in a discontented and suspicious spirit. After the fall of Amiens the war languished; the pope offered to mediate, and Henry had time to breathe. He felt that his old comrades the offended Huguenots had good cause for complaint; and in April, 1598, he issued the famous Edict of Nantes, which secured

The Edict of Nantes.

their position for nearly a century. They got toleration for their opinions; might worship openly in all places, with the exception of a few towns in which the League had been strong; were qualified to hold office in financial posts and in the law; had a Protestant chamber in the parliaments. The number of Huguenots is said to have been at this time rather over a million in all, though little trust can be put in figures; they were strong in Burgundy, Poitou, Saintonge, Provence, Guyenne, and Dauphiny; in the rest of France there were but few of them.

The treaty of Vervins.

Immediately after the publication of the Edict of Nantes the Treaty of Vervins was signed. Though Henry by it broke faith with Queen Elizabeth, he secured an honorable peace for his country, and undisputed kingship for himself. It was the last act of Philip II., the confession that his great schemes were unfulfilled, his policy a failure.

III. The Bourbon Monarchy.

1598 an epoch for France.

The year 1598 closes the mediæval history of France; henceforth she takes her part in modern history. The power of the feudal noblesse has passed away; the earlier rivalries between France and Austria take a new character; the centralized absolutist monarchy begins. We are coming to the days of the great ministers,—first Sully, then Richelieu, lastly Colbert, under whose rule France becomes great, almost in spite of her kings. The age now past had little to look back on with pleasure; the utter corruption of the court, reign after reign, the selfish partisanship of the nobles, and the harsh incidence of civil war, incline us to believe the age to have been thoroughly wretched. Yet the condition of the French people was less miserable than it had been; without seeing much prosperity we hear less of famine than in previous or in later ages; for civil wars do not so much exhaust the well-being of a country as might appear. It has been observed that the wars of the Roses did little to check the progress of England; and in like manner the wars of the League do not seem to have deeply afflicted France. These wars, in fact, were all the fighting of lords and princes with their retainers; they were languid and partial; and though their story might be wretched enough, the wretchedness of it chiefly fell on the heads of the belligerents themselves. There is no Jacquerie in this age, as in the 15th and as in the 18th century in France; and in some respects the country made a real advance. In arts she has never been really great, and her age of poetry was not yet come. Ronsard and Du Bartas, great as their reputation was once, do not rise into the first rank of poets, and there are no better names. In political and legal writings, on the other hand, we have the great names of Montaigne and L'Hôpital, of Bodin and Hottmann, of Cujas and Étienne Pasquier. Stephanus and Joseph Scaliger represent classical tastes and chronological investigation. Town-life was but little injured, except in Paris herself, by the wars of the period; and even Paris was not altogether the worse for them, for even Henry III. took an interest in the capital, and tried to develop its resources.

The *Christian Republic.*

Whether the *Christian Republic*, that great political romance, was ever laid before the eyes of Henry IV. we shall never know; at all events it represents, in a rather extreme form, the broader politics of modern history, and marks a great change in the relations of states. Many of its ideas were, consciously or not, adopted by the imperialism of our own century; for they favored the national vanity, which sought to impose its principles and wishes on Europe. It represented the resistance of France to the Austro-Spanish power, affirmed the general principle of toleration, endeavored to substitute a court of arbitration in place of war, recognized many different forms of government, and sought to weld all civilized Europe into one harmonious community. That it was a dream the world's history has plentifully proved; that there was in it much to admire, much to strive for, is equally proved by the persistence of many of its ideas, and their agreement with the best parts of the development of Europe in modern times.

Parties at Henry's court.

In 1598, on the close of the Spanish war, when Henry IV. was at last fully recognized as king of France on all sides, we find at his court representatives of the two policies which for ages contended for the possession of the great resources of the country. These were the Hispano-Catholic policy, which aimed at uniting French and Spanish interests against the north and west of Europe; and on the other side, the policy of the tolerant party, which desired to make France the leader of the Protestant and liberal part of Europe, which allied itself with the Dutch, with the North German Lutherans, with the English, with the Swedes. It is the glory of Sully, of Richelieu, and of Colbert, that they advanced the greatness of France by following the latter of these lines; whereas Louis XIV. lost power from the moment that he abandoned himself to the Spanish policy.

Maximilian of Bethune, duke of Sully.

So at Henry's court we find Maximilian of Bethune, lord of Rosny (he was not made duke of Sully till 1606), who headed the liberal party, the party of economy and good government, opposed to Villeroy, who represented the Spanish party, and seemed to have an equal share in the king's regard. Between these two were Jeannin, a great lawyer, and president of the Paris parliament, who worked with Sully and Sillery, who held a middle course, and was the most trusted diplomatist of his time. Villeroy and the Spanish advisers were strongly supported by the court, especially after the appearance of Mary de' Medici. The court of Spain was only too glad to thwart Henry where it could; the English court, after the accession of James, was too much set on windy schemes and grand impossibilities to afford a counterpoise on the other side. Sully had been made head of the finances in 1597, and had found everything in frightful disorder. His stern temper, severe manners, even his narrow grasp, proved him to be admirably suited for the part he had to play; a more enlightened statesman might have failed where he succeeded. We find in his finance no large views as to economic principles; we only see a rigid determination to stop waste, to punish thieves in high places, to make the taxes yield their full worth to the crown. So far as he occupied himself with general politics, Sully's views were right and liberal; he disliked the Spanish tendencies of the court, and did his best to keep his master clear of them. He could not make the king economical, or reduce the outgoings of the state; on the contrary, he felt himself obliged to make a strong army and plentiful artillery, and to accumulate good store of coin at the arsenal, so as to be ready for any need. In spite of these expenses, he speedily lessened the severity of the taxation; and as good government made tranquillity, and tranquillity plenty, France bore her burdens with increasing willingness and ability. The chief failure of Sully's administration lay in his having done nothing to equalize taxation, by compelling noble land to bear its share with the labor of the peasant. He laid on some new taxes, increased some of the worst of the existing imposts, reduced the amount of the public debt; and encouraged agriculture. Henry, who with all his faults had broader views than his finance minister, also did his best for manufactures; the edicts of the reign are numerous, and for the most part very sensible and helpful.

Biron's plot.

Mary de' Medici.

Though the civil wars were over before 1598, content had not returned to the country. Henry was often ungrateful to his old friends and loyal supporters; and the leaders of the Politique party, who might well think they had secured his throne for him, were especially dissatisfied. Consequently, when war broke out with the duke of Savoy in 1600 over some frontier question, the duke of Biron entered into a great plot with Savoy and Spain, and carried with him a formidable party of nobles. Sully, however, was prepared for all; his artillery and munitions of war were such as had never before been seen; and the duke of Savoy, seeing Montmélian, an impregnable stronghold, as it was deemed, actually taken, sued for peace. He retained Saluzzo, for Henry had no desire to meddle in Italian politics, and ceded to France Bresse and Bugey, Valromey and Gex, so securing French influences up to the very gates of Geneva, and making it certain that the duke of Savoy must never again hope to crush that vigorous republic. Just before the end of this war, his divorce from Margaret of Valois having come from the pope, Henry married Mary de' Medici (1600), then in the prime of her beauty; later on she grew fat and heavy. She was always stiff and obstinate, a prejudiced follower of the old ways, who spent her life first in thwarting, afterwards in obliterating, the traces of the higher schemes and acts of her spouse. The duke of Biron, utterly dissatisfied at the result of the Savoyard war, plunged into fresh conspiracy; then Henry IV. felt no more pity for him, but seized and beheaded him; it was believed that the queen herself was mixed up in his plot, which had far-reaching ramifications. By 1605 Henry had reduced all the rest of his recalcitrant nobles, treating them without rancor or revenge if they came in, and setting trusty officers of his own to watch over them.

The state of Europe.

Assassination of Henry IV.

The remainder of the king's life was occupied with two things:—first, the strengthening of the resources of France at home; secondly, the preparations for authoritative intervention in the affairs of Europe, which were now beginning to attract the attention of all. The king was called on to intervene as a mediator between the papacy and Venice in 1606–1607, and decided their quarrel in a way which ought to have roused the gratitude of the papal power. Chiefly through Henry's firmness, a truce for twelve years was signed between Spain and the United Provinces,—for the Spaniards, exhausted by the siege of Ostend, the greatest siege the world had ever seen (1601–1604), and quite unable to cope with the genius of Maurice of Nassau, gladly accepted the peaceful overtures of Olden Barneveldt and the commercial grandees of the towns, who then, as afterwards, were opposed to the democratic and war-loving population of the country, which supported the house of Orange. This truce closed the great struggle of the Low Countries for their independence, and virtually secured it to them. While, however, tranquillity reigned in Holland and Italy, Germany was growing ever more uneasy; in more districts than one the struggle between the communions, deferred not ended by the peace of Augsburg of 1555, had become acute. Not only in the Slavonic lands connected with the house of Austria were there excitement and disturbance, but in the Rhine districts questions had arisen which called out the warm interest of all the three confessions,—the Catholic, Lutheran, and Calvinistic. The death of the duke of Cleves in 1609 brought matters to a head; the Dutch and Spaniards, the elector of Brandenburg, and the emperor, all interfered. Then Henry IV. took up the cause of the Protestant princes, and sent envoys to the Evangelic Union of Halle (January, 1610), and made most vigorous preparations for war, in combination with Maurice of Nassau, who agreed to join him with 20,000 Dutchmen in Cleves. It was arranged that the queen should be regent in the king's absence, and as she had never been solemnly crowned, she delayed Henry's departure till that ceremony had taken place; in the days of waiting the king, fretting to be off, went to visit Sully, who lay ill at the Arsenal, and to feast his eyes once more on the splendid armory and munitions of war collected there. As he went, he was assassinated by Ravaillac, who plunged a knife into his heart. It is said to have been the eighteenth attempt made on his life. All the grand plans for interference in the affairs of Europe, and for the reduction of the house of Austria, fell to the ground at once, and German affairs were left to seethe as they would, until in 1618–1619 they came to a head in the outbreak of the Thirty Years' War. The knife of Ravaillac, whether he was set on by the queen and the Spanish party or not, did their work; it left the Protestants of the north to fight for themselves, relieved the king of Spain of grave anxieties, and plunged France once more into confusion and trouble. Not till the reign of Richelieu had succeeded the administration of Sully did France resume her true direction and lead the resistance to the house of Austria.

Character of Henry IV.

Henry IV. had the great quality of individuality. He stands out fresh and clear as a distinct personage, of high soul, bright temper, original and characteristic speech. All great men leave sayings behind them, and Henry's ring with vigorous good nature and humor. His brilliancy in war was that of a captain; he had not the coolness and combination of a general; his moral character was restless, bad, ungrateful, self-indulgent; he took little trouble to help his subjects to greater comfort, though he ever wished them well. They felt that there was in him something of the lazy kindliness of Louis XII. He chose a grand minister in Sully, and, in spite of some wavering, followed him in the right policy for France. He had the faults of the Bourbons; yet he was their greatest king,—on the whole, their noblest man.

Voltaire sums up the good deeds of his reign in nervous phrases:—

> "Justice is reformed, and—far harder task!—the two religions live in peace—to all appearance. Agriculture is encouraged; as Sully said, 'Plough and cow, these are the breasts of France, whereat she sucks; they are the true mines and treasures of Peru.' Commerce and the arts, which Sully cared for less, were still honored; gold and silver stuffs enriched Lyons and France. Henry established manufactures of tapestry; French glass after the Venetian style began to be made. To him alone France owes the silk-worm and the mulberry, in spite of Sully. It was Henry who dug the canal which joins the Seine and the Loire. Under him Paris grew and grew fair; he built the Place Royale, he rebuilt the old bridges. Before his day the St. Germain suburb was not connected with the town, and was improved; he saw to that. He built that fine bridge on which every Frenchman as he passes still looks up with emotion at his statue. St. Germain, Monceaux, Fontainebleau, above all the Louvre, were enlarged, almost rebuilt, by him. He established in his long gallery in the Louvre artists of all kinds, and encouraged them frequently with his presence as well as his presents."

Finally, he had made France the arbiter of Europe, as was felt at Venice and Amsterdam, and as would have been also felt on the Rhine, had not the Spanish faction, and the undying hatred of the Catholic fanaticism, cut short his life on the very eve of great events.

Louis XIII. and the regency.

The States-General of 1614.

The regency in France belonged in theory to the princes of the blood-royal; as, however, Catharine de' Medici had made her a precedent, and as Henry IV. had as good as named his spouse regent, Marie de' Medici seized the office at once. She took no vengeance on Sully for his opposition to her in past time, but made friends with him, taking from him all real power and command of the finances, while she left him the charge of the artillery and woods, together with the government of Poitou. The princes of the blood-royal were easily disposed of: Condé was in exile, the prince of Conti a cipher; the count of Soissons she quieted with great gifts. Then she composed a council of regency, which was managed by her favorites Concini and his wife Leonora Galigai. Concini, who purchased the marquisate of Ancre, and was made marshal, though an ambitious and greedy foreigner, did not use his power amiss for a time. When the princes, headed by Condé, opposed him and clamored for the convocation of the States-General, Concini quieted them skilfully, and in 1614 caused the young king's majority to be declared,—for Louis XIII. was then thirteen years old,—and summoned the States-General to meet at Paris. As this was the last time that they were called together before the eve of the Revolution, it may be well to say a word as to the body, its nature and composition. The States-General of France, in which the three orders met from time to time at invitation of the king, was an assembly of clergy, nobles, and "third estate" or commons. The three formed three entirely independent chambers, sitting, debating, and voting separately. Consequently the vote of two orders could always veto the wishes of the third; and as clergy were a class and nobles a caste, and as to a large extent the interests of these bodies were identical, and as, moreover, they both enjoyed a fatal immunity from the burdens of taxation, the chance of legislation or taxation on fair principles was very small indeed. Representing the clerical estate sat the bishops and abbots, together with a certain number of lower clergy: in the noble house sat the holders of noble fiefs; the third estate was represented (except in 1789) chiefly by deputies elected in the towns. These bodies had really no legislative power; and though just before the Revolution the parliament of Paris opened the way to great changes by declaring that taxes could only be legally voted by the States-General, they had, as a fact, very little authority even in this respect; in only a few cases did they sanction taxation or vote subsidies; the royal power found it more convenient, till the bankrupt state of the country under Louis XVI. compelled it to call on the Estates for help, to arrange the taxation as it thought good. The great doctrine of the relation between tax-paying and political power was unknown in France. The true function of the Estates seemed to be limited to expressions of opinion on points submitted to them by the king, and to the laying before him, on their side, grievances which they had brought up in their *cahiers* or "quires," from the country. These grievances they could not remedy: all they could do was solemnly to call the attention of the king to them, who could redress them if he liked. This solemn process was almost the only occasion on which the Estates met together. They went to church together at the opening, and then in one chamber were met by the king, who addressed them and dismissed them to their several chambers with the business he chose to entrust to their deliberations; then, once more, at the end of their labors they all met again. At the upper end of the hall a platform was erected for the king and his court, the twelve peers, and the household officers; on the right hand of it sat the clergy, on the left the nobles, in front, at the foot of the hall, the third estate. Each order presented its statement of grievances; the king replied with promises and assurances, which came to very little, and the Estates were then dismissed; and if the court had got the money or the help it sought, very little more was thought about gravamina to be redressed. So little was their practical importance,—so rarely were they convoked, that their composition, method of election or nomination, rules of procedure, rights and legislative competency, were never made clear. It was not in the interests of the monarchy, or indeed of the privileged orders, that the Estates should have any power, or meet very often.

Parliament in France.

This, then, was all that France, before the Revolution, ever had by way of what Englishmen call a parliament. The word parliament in France has always signified only a law court; and the parliament of Paris, the chief law court of the realm, claimed a certain constitutional power, as having the duty of registering the royal edicts. As a rule, it proved itself the obsequious servant of the king's will; from time to time, however, it was stubborn, and, refusing to register, held that the royal edict so unregistered was void of authority. In such cases the king was wont to hold what was curiously styled a "lit de justice," a "bed of justice," or solemn visitation of the parliament, in which he personally attended and compelled the reluctant body to register his edict.

Pays d'élection.

These things, for the "generalities" or "Pays d'élection,"—that is, for the chief part of France,—were the sum total of constitutional life and power enjoyed,—a total which, under a strong and determined monarch, or such a minister as Richelieu, meant absolutely nothing at all.

Pays d'états.

In the outlying districts, called the "Pays d'états," more liberties existed; these parts voted their own local taxation, and managed to a great extent their own local affairs; they were, however, a mere fringe round the borders of ancient France,—the estate of Flanders (namely Douai and Lille), Provence, Béarn, Lower Navarre, Bigorre, Foix, Soule, Armagnac, Nébouzan, and Marsan.

Richelieu appears.

The States-General of 1614 did nothing; they faithfully represented the jealousies and ill-will between the orders, and broke up in confusion. Armand du Plessis of Richelieu, bishop of Luçon, was the orator of the clergy on this occasion, the person charged to lay the grievances of his order before the king. This is the only interesting fact in the history of this meeting of the Estates. In 1615 Louis XIII. married Anne of Austria, who afterwards played a considerable part in the troubles of the Fronde. For two years Marshal Ancre steered his perilous way between the young king, who cared little for him,—his mother's favorite, not his,—the princes of the blood, and the discontented Huguenots. In 1617 the new favorite of Louis, Charles d'Albert, count of Luynes, overthrew and killed him; Leonora Galigai, his wife, was executed as a sorceress; the queen-mother and Richelieu, who was just hoping to secure his foothold at court, both fell,—she withdrew to Blois, he to Luçon; the young king, weak and frivolous, fell into the hands of the noblesse. After a time the nobles were as little pleased with Luynes as they had been with Concini, and rallied round the court of Mary de' Medici at Angers. Richelieu, whose great abilities had already been recognized, was charged by Luynes with the delicate task of attempting a reconciliation between the king and his mother; he succeeded by the treaty of Angers in 1620 in averting civil war. Then Luynes, thinking it well to amuse the king, marched with him into Béarn, where the inhabitants, suddenly bereft (in 1617) of their rights as Protestants, were in open ferment and revolt. Here, as in all the south and west of France, the Huguenots were uneasy and suspicious; the incidents of war in Bohemia, where the Calvinists had but just been crushed, and the political changes in the United Provinces, excited their already high-wrought feelings. They claimed the full benefit of the Edict of Nantes, which seemed to the court to be the establishment of a republic in the heart of the monarchy. In 1621 they held an assembly at their capital, La Rochelle, and made a kind of declaration of independence. They divided their 700 congregations throughout France into eight circles, after the German fashion, thus indicating a tendency towards decentralization, which must be offensive to the court and the general body of French people; they arranged their own levies of men and money, and in fact went far towards the full organization of what they styled "the republic of the Reformed churches of France and Béarn." They named the duke of Bouillon their chief, and made Lesdiguières most plentiful offers. These great nobles, however, refused to join them, and the duke of Rohan with his brother Soubise became the heads of this Huguenot movement. There were in it not a few elements of constitutional life; these Protestants had a far better idea of wholesome government than prevailed elsewhere in France. The noblesse, however, would have nothing to do with them, and their efforts were of little avail. The king, who showed considerable energy, took the command against them, and encouraged his army to treat them with barbarous cruelty, for he was a weak and heartless creature. At the siege of Montauban, however, he failed completely, and had to withdraw discomfited. Soon after this, in the end of 1621, Luynes was taken with camp fever and died. The king, who was weary of him, heard with pleasure the tidings of his death. Round him were now formed two parties,—that of the queen-mother upheld by Richelieu, and that of the prince of Condé. The king, leaning towards the latter, which wished for war, set forth on a second campaign against the Huguenots, and conducted it with the same mischievous cruelty as before. The Huguenots showed nothing but weakness; their chief men submitted, and place after place fell. After this war had lasted about a year, the queen-mother got the upper hand at court, and Condé had to withdraw; by a treaty which recalled the old peaces of the civil wars, the chief part of the Edict of Nantes was confirmed, while the Huguenots were forbidden to hold political meetings or to fortify towns; they retained only La Rochelle and Montauban as strongholds (October, 1623).

Richelieu begins to rule.

Richelieu, who in 1622 had received the cardinal's hat in reward of his services in reconciling the king with his mother, was now ready to take charge of and to rule the weak, unstable king, who already appeared to fear and dislike his future master. He entered the council in April, 1624.

His policy.

"I venture on nothing without first thinking it out; but once decided, I go straight to my point, overthrow or cut down whatever stands in my way, and finally cover it all up with my cardinal's red robe." Such are the words put into Richelieu's mouth; and whether he said them or not, they represent fairly enough his deliberation, resolution, and cold severity. Nor does the final touch as to the red robe of his clerical office go much beyond the truth; for he made great use of his dignity as a cardinal to cover the intrigues and cruelties on which otherwise he might perhaps have never ventured. In his earlier days he seems to have desired to build up a strong monarchy, absolute, without constitutional checks, on the goodwill of a satisfied and well-governed people. The alliance between despotism and democracy, which our own age has also seen, appeared to be especially adapted for France, where the constitutional life was always so weak. As soon, however, as the despotism was established on a firm footing, the people were forgotten; and Richelieu's administration in the end oppressed them quite as much as it crushed the nobles or kept the church in order.

His earlier history.

When Richelieu entered the king's council in 1624 he was thirty-nine years old. Born in 1585, he was the youngest son of a noble family of Poitou, springing originally from the village of Richelieu. In that family the elder son, if he chose, took orders, because they could always dispose of the bishopric of Luçon, a kind of family benefice; the younger son became a soldier. As such, Armand du Plessis learnt lessons in warfare, which were very useful to him at a later time; the cardinal's robe did not take the place of the soldier's coat,—it only concealed it. When, however, his brother gave up his preferment at Luçon, Armand at once left the calling of a soldier, was ordained, and succeeded to the bishopric in 1607, at the age of twenty-two. The States-General of 1614 made the young prelate's fortune; he pleased Concini and the queen-mother, acted with consummate skill and pru-

1624-1626.
Periods of his career.

dence through the ten years which followed, was made cardinal in 1622, and member of the council in 1624. His later life may be divided into four periods:—(1) from 1624 to 1626, the time of his first resistance against the Austro-Spanish power and his failure, as shown by the peace of Monzon; (2) from 1626 to 1628, when he punished the Huguenots of La Rochelle for that failure, and laid firmer foundations for his after-success; (3) from 1628 to 1635, the period in which he secured his own and his master's despotism in France, and began to interfere in the affairs of Europe; and lastly (4), from 1635 to 1643, the days of his successful lead in the arena of general politics, and of his triumphant overthrow of his domestic foes; the fruits of this period he left for Mazarin to gather in abroad by his triumphs at the peace of Westphalia; Louis XIV. carried out his principles to their utmost development in domestic policy.

First period of his public career.

1. When he began to rule in 1624, the Austro-Spanish power had already become very strong. The first results of the Thirty Years' War were all in their favor; they held the Palatinate and the course of the Rhine, by which they could communicate with the Spanish Netherlands and intimidate the Dutch; they were also masters of the important Valtelline, that long pass which led from the Milanese territory, at this time in their hands, to their German friends in Bavaria and Tyrol. Richelieu determined to attack them both in Germany and in the Italian Alps,—in Germany by supporting the leadership of Christian IV. of Denmark, though he would have much preferred that of Gustavus Adolphus; in the Alps by allying himself with Charles Emmanuel, duke of Savoy, with Venice, and with the Grison leagues. With hardly any resistance he swept the Spanish and papal troops out of the Valtelline; for Urban VIII. was only half-hearted on the side of Spain, and was to some extent influenced by the true winner of some of Richelieu's greatest triumphs, the crafty Capuchin, Father Joseph. Just, however, as all was going on well, Richelieu was paralyzed by an unlucky outburst of Huguenot independence; affairs in Germany took a bad turn, for Wallenstein now appears on the scene with a new imperial army; the attack of the duke of Savoy on Genoa failed; the French in Piedmont and the Valtelline felt themselves insecure. A temporary peace was made with the Huguenots, and in May, 1626, the treaty of Monzon with Spain closed Richelieu's first attempt to reduce the preponderance of that power. It is perhaps the darkest hour of his career; the treaty was secretly and treacherously agreed on; he left his allies to shift for themselves; he seemed to reverse his whole policy. The truth was that the strength of the Spanish party at home, the ill-success of the Lutherans in Germany, and the weakening effect of Huguenot insurrection made it impossible for him to persevere.

The treaty of Monzon.

Second period of his career.

2. It was clear that he must bridle the Rochelle Protestants before he could advance a step; so doing, he would also make a beginning in his second aim, that of bringing down the noblesse,—for some of the proudest aristocrats of France were Huguenots; then he could coerce the queen-mother and her party, with its Spanish leanings; and after that he would be free to resume his foreign policy. This second period of his public career, therefore, is chiefly occupied with the overthrow of the Huguenot power, which was concentrated at La Rochelle. It was, however, preceded by a great court intrigue, for he was already very obnoxious to the nobles near the throne, and to the princes of the blood. The plot was easily detected and crushed; Marshal Ornano perished in prison; Gaston of Orleans, the king's dissolute younger brother, was compelled to make abject submission; the duke of Vendôme lost his government of Brittany; the duchess of Chevreuse was banished; the queen herself was warned to behave more wisely in the future. The influence of women during this century is almost uniformly baleful; that of Henrietta Maria, sister of Louis XIII. and wife of Charles I., led to the attempt of Buckingham to recover his popularity in England by espousing the Huguenot cause, which was exciting a warm interest in the English people. The Huguenots, irritated by the establishment of Fort Louis as a check on La Rochelle, declared war on France herself; they were secretly encouraged by Anne of Austria and the court party, as well as by the Spaniards, who were delighted to see the cardinal thwarted and France weakened by civil war. They were also openly backed by England, which declared war on France, and sent a strong fleet under Buckingham to succor La Rochelle. But there was in light-headed handsome Buckingham nothing of the soldier; he failed ignominiously, while the cardinal's siege grew daily stricter and more certain of success. After fourteen perilous months of siege, Richelieu entered the town in triumph. With the fall of La Rochelle ends the stubborn resistance of the Huguenots to the monarchy; the siege was a kind of after-blow to the civil wars of the previous century. No very severe penalties were exacted from the town; it was simply rendered powerless. The fall of the place roused a warm patriotic feeling in France; it was regarded as a great defeat of England. Buckingham's assassination had opened the way to peace, which was signed between the courts of England and France in September, 1628.

1626-1631.

Third period of his career.

3. It was full time for Richelieu to interfere elsewhere. The utter collapse of the resistance against the house of Austria in Germany had come. Wallenstein was omnipotent in the north; Christian IV. had been driven back into Denmark; the king of Spain was in league with the duke of Rohan and the discontented Huguenots of Languedoc; affairs in Italy were very threatening; the Spaniards were pressing Casale, the key of the great valley of the Po; on the two sieges, La Rochelle and Casale, which took place at the same time, the fortunes of Europe turned. Richelieu, while he sent his agent Charnacé to North Germany to do what he could to check the Austrian advance and to raise up fresh barriers, set himself to relieve Casale. In January, 1629, he had carried Louis XIII. into Italy, and the Spaniards at once raised the siege of Casale. Thence he returned into Languedoc, where the Protestant rebels were moving; they too were speedily put down; and Richelieu, with Father Joseph, once more posed before Europe as the champion of Catholicism. Urban VIII., who little knew his man, wrote him a letter of warm thanks and congratulations. With the fall of Montauban, the last glimmer of local independence in France died out. Before the end of 1629 Richelieu was called on once more to interfere, and this time more seriously, in Italy; the pope, the duke of Mantua, the republic of Venice, all in alarm appealed to him to save them from Spanish domination. He prevailed on the king to appoint him lieutenant-general, and, with a splendid staff and army crossed the mountains into Italy early in 1630. His campaign, which did not include any open warfare against Spain, was thoroughly successful; he reduced all Savoy to submission, in spite of the duke's ill-will. While he was thus making a splendid and theatrical campaign in Italy, he was quietly engaged on far greater things elsewhere; he was busy organizing and encouraging the resistance of northern Europe to the house of Austria. Charnacé with Gustavus Adolphus, and Father Joseph at the Ratisbon Diet, were charged with this duty, and fulfilled it with eminent success. It was in 1630 that Gustavus accepted the friendship and help of France, and early in 1631 signed at Bärenwald a treaty of alliance with that power, which consented to pay him a great subsidy for five years. This treaty, in which Gustavus promised not to coerce peaceful Catholics, was approved even by Urban VIII. At the Ratisbon Diet in June, 1630, Father Joseph had a more delicate task; yet he too succeeded. The jealousies of the German princes neutralized all the advantages of the emperor Ferdinand, and brought about the fall of Wallenstein, who withdrew in haughty disdain to Bohemia; the princes also protested against the attempts of Ferdinand on Italy; and he, wishing above all things to conciliate them, and to get his son Ferdinand named Rex Romanorum, promised to secure the Gonzaga-Nevers duke at Mantua, and to withdraw his troops from the second siege of Casale. The first treaty of Cherasco (April, 1631) brought the Italian war to an end; a second treaty, made by Richelieu with Victor Amadeus, the new duke of Savoy, secured for France Pinerolo, the key of the approaches to Turin. Giulio Mazarini, the pope's agent, made his first public appearance in the negotiations of this Italian war, and laid the foundations of his fortunes in France.

Gustavus Adolphus enters in.

The Day of Dupes.

A little before this time Richelieu had passed through the most critical moment of his career; the queen-mother, the reigning queen, Gaston of Orleans, still heir to the throne, the house of Guise, a group

1632-1638.

of generals and officers of the crown, the duke of Bouillon, the count of Soissons, all the favorites and courtiers of Louis XIII., had conspired together to overthrow the cardinal. In the very moment of their apparent success, when the king, as they thought, had entirely given him up, the skilful audacity of Richelieu reversed all their plans. He threw himself on Louis XIII. for support, and the king, glad to be delivered from their hands, gave the cardinal *carte blanche;* the "great storm of the court," the "Day of Dupes," passed by and left him stronger than before. He showed no hesitation in punishing and crippling his foes. The queen-mother was got rid of; she took refuge at Brussels, and her ladies were exiled; Gaston fled to Lorraine, the duke of Guise to Italy; the parliament of Paris, which had favored the plot, was reduced to humble submission. Richelieu was now made duke and peer, with the government of Brittany. The attempts of the emigrant nobles to raise the provinces on the borders were sternly and swiftly put down; the battle of Castelnaudary in Languedoc closed the series of outbreaks. The duke of Montmorency, son of the constable, was taken there, and afterwards executed. After pacifying Languedoc, Richelieu rearranged the governorships of the provinces, removing hostile or suspected governors, and putting his own friends in their places. By the end of 1632 he had crushed all the serious elements of resistance throughout France.

This period coincides with the splendid career and premature death of Gustavus Adolphus. His rapid advance and high aims had alarmed Richelieu; his fall at Lützen was a distinct relief to his ally; it enabled him to step in between the combatants with emphasis, and to shape the latter years of the Thirty Years' War so that they might conduce to the advantage of France. In July, 1632, he had seized the duchy of Lorraine, almost without striking a blow, the duke having taken part with the emigrants against him. He was now prepared to advance thence to the Rhine; he took the Protestant adventurers, Bernard of Saxe-Weimar and others, into his pay. Things worked well for Richelieu: the murder of Wallenstein in 1634, the abandonment of the prince's party by the elector of Saxony (peace of Prague, 1635), the lack of a head for the German Calvinists,—all these things combined to open the way for the last and most brilliant period of Richelieu's career.

Fourth period of his career.

4. Late in 1634 he had renewed his alliances with Sweden and the German Calvinists; he persuaded the Dutch to attack the Spanish Netherlands in May, 1635; he declared war on Spain, and came openly into the field, in which hitherto he had worked only by secret and oblique methods. He had under his command such a force as France had never seen: 132,000 men in four armies seemed likely soon to bring the weary war to an end. One army was to join the Dutch under Frederick Henry of Orange and to march on Brussels, a second to unite with Bernard of Weimar and the Swedes across the Rhine, a third to hold the line of the Vosges and protect Lorraine; the fourth with the duke of Savoy should reduce the Milanese country. The result, however, in no way answered the expectations; the campaigns of 1635 and 1636 were unsuccessful and burdensome; neither glory nor profit followed; the Spaniards and Austrians invaded France on three sides,—in Picardy, across the Pyrenees, and in Burgundy. Nor was 1637 more decisive. Though the invaders had been swept out, no important actions took place, no great results followed. The successes of Bernard of Saxe-Weimar on the Rhine in 1638 first showed that the Austro-Spanish power was checked. In this year the first steps were made towards the peace of Westphalia. The birth of the dauphin Louis also now ruined the court party, and secured to Richelieu a firmer lease of power; if their sickly king were to die, as seemed only too likely, he would continue to guide the fortunes of the state under a regency; the hopes and future of Gaston of Orleans were reduced to nothing. The fall of Breisach at the end of the year, which placed the upper Rhine completely in the hands of Bernard of Saxe-Weimar, though it might not be altogether grateful to Richelieu, who feared the skill and abilities of the ambitious and patriotic German, proved to the world that the Austrian power was worn out. The death of Father Joseph at the same moment caused the cardinal no small embarrassment; his place was taken by the supple Mazarin. The death of Bernard, just as his plans seemed on the point of being realized—just as he thought he had made for himself a principality on the Rhine to check the progress as much of France as of Austria—came very opportunely for Richelieu. There was now no one engaged in the war who could interfere with his objects; he got possession of the army which had served Bernard so well, the best body of fighting men the war had produced after the Swedes had been exhausted; he also seized on the districts in their hands. In 1641 the count of Soissons went over to the Spaniards and invaded northern France. He fell in battle, and the attempt failed. In Germany and Italy the strength of France was more and more distinctly shown. The last battles of the Thirty Years' War were chiefly won by Frenchmen; the cession of Sedan by the duke of Bouillon. and the capture of Perpignan close to the Spanish border, were "the last present made by Richelieu to France" (Michelet). The one helped to secure her northern, the other her southern frontier. The cardinal's last struggle for supremacy took place now. In 1641 the parliament of Paris was humbled, and its ambition to rival the English parliament rudely destroyed; in 1642 the conspiracy of Cinq Mars gave expression to the old and undying hatred of the court for Richelieu. The plot was detected and unravelled as soon as it was spun, and Cinq Mars with his friend De Thou perished on the scaffold at Lyons. After this, all were prostrate and obedient; the court party was utterly foiled, its chief members dead or exiled; the cardinal's foreign policy was triumphant, and neither Spain nor Austria could do more. But he had no time to enjoy the successes his cold heart and strong hand had won; he fell into the hands of the one enemy whom no subtlety could baffle, and died in December, 1642. Richelieu had an inflexible will, vigorous abilities, and a clear idea of what he desired that France should be; and it is hardly too much to say that he made France what she has continued to be almost to our days. Not till the centre of power in Germany had passed from Austria to Prussia did the old foreign policy of France fail; not till constitutional life had got firm hold on the French people did the republic succeed in reversing the evil principles and consequences of Richelieu's home government. His leading idea was that unity brings strength; and into unity his stern resolves and pitiless severities forced his reluctant country. In the career of Louis XIV. we read the true commentary on his acts and principles; in the corrupt and deadly despotism of the 18th century we read its punishment; even the Revolution, though it scourged the older system with scorpions, could not at once destroy it, or build on surer foundations. When we remember how Richelieu crushed, one after another, those elements of society, which had in them germs of a modern constitutional life, we are tempted to speculate on the splendid career which was possible for France had a wiser statesman ruled her in these critical years. The base subserviency of the church, the humiliation of the lawyers in the parliaments, the loss of noble independence, the overthrow of all healthy civic life, the steady depression of Huguenot opinions. the silence of the States-General, the diminution of local liberties even in the "pays d'états," the assertion of the king's independent right to levy taxes and issue edicts,—all these evils might have been avoided, and the strong life, strong often to turbulence, which lived in these different institutions might have been harmonized, brought into friendly and fruitful action, until an original and characteristic constitutional history had given France that strength and prosperity, that home development of magnificent resources, which would have secured her the undisputed lead and lordship among the nations of Europe. Instead, Richelieu gave her unity and glory. The burdens of France increased enormously; her aggressive power, now that she was concentrated in the hand of a despot, who had unchecked command of the persons and purses of his subjects was immensely increased. If we look into Richelieu's character, we shall discern, side by side with that pride which could rejoice in debasing the noblest and strongest, a vanity which, like a vein of impurer metal, spoilt the ring and clearness of his life. He was always conscious of effects: as an author, a dramatist, or a statesman, he was on the look-out for "situations;" his most striking political successes seemed due as much to the necessity of impressing men by startling novelties as to an honest belief in the justice of his cause or the wholesomeness of his course of action. His extraordinary powers, his life-long devotion to the policy he had drawn out for himself and France, secure him his safe posi-

Character of Richelieu.

1642.

tion as a great man,—a great man on the lower level,—one whom one fears, perhaps admires, but never loves; because there were in him no really high aims, nor any true love of the people under him, nor any desire to rule them well. Richelieu has been often compared with Wolsey and contrasted with Mazarin. The red robe of the cardinal is common to all three; beyond this the comparison with Wolsey is of little value, for the men were essentially unlike in character and aim. The contrast with Mazarin, who lived with him, studied his policy, and succeeded him, is of more value and interest. It is brilliantly treated by Voltaire in his *Henriade* (vii. 327 *sq.*):—

> "Henri, dans ce moment, voit sur des fleurs-de-lis
> Deux mortels orgueilleux auprès du trône assis.
> Ils tiennent sous leurs pieds tout un peuple à la chaîne;
> Tous deux sont revêtus de la pourpre romaine;
> Tous deux sont entourés de gardes, de soldats;
> Il les prend pour des rois. . . . Vous ne vous trompez pas;
> Ils le sont, dit Louis, sans en avoir le titre;
> Du prince et de l'état l'un et l'autre est l'arbitre.
> Richelieu, Mazarin, ministres immortels,
> Jusqu'au trône élevés de l'ombre des autels,
> Enfants de la fortune et de la politique,
> Marcheront à grands pas au pouvoir despotique.
> Richelieu, grand, sublime, implacable ennemi:
> Mazarin, souple, adroit, et dangereux ami;
> L'un fuyant avec art, et cédant à l'orage,
> L'autre aux flots irrités opposant son courage;
> Des princes de mon sang ennemis déclarés;
> Tous deux haïs du peuple, et tous deux admirés;
> Enfin, par leurs efforts, ou par leur industrie,
> Utiles à leurs rois, cruels à la patrie."

One thing they had in common, the love and encouragement of letters; yet even this in Richelieu's hands must be organized, despotic. Still, he and Mazarin have an honorable claim to remembrance when we speak of the writers of the "great age," for it was under them in the first half or so of the century, rather than under Louis XIV. in the latter half, that the chief masterpieces were produced. The tendency of the reign of Louis XIV. was rather to depress than to ennoble literature. Richelieu founded the French Academy in 1635, and set on foot the *Gazette of France;* he established the royal printing press; he desired to patronize learned men, though his own literary efforts failed, and men of real independence of character, like Corneille and Descartes, shunned the fatal honors of his patronage. He was in all his tastes a great and showy prince; his bearing and surroundings were more than noble; he called to his side artists of every kind; art, in its 17th century decadence and formalism, was well content to do his bidding, and gild an age of splendor without genius.

The rise of Mazarin.

Louis XIII. died within six months after Richelieu's death; he did but give time to Mazarin to win the favor of the queen and to secure his position as first minister. Mazarin was destined to fail completely in home government, while in foreign affairs he brought all his great master's policy to a splendid and successful end. At home his rule reversed Richelieu's stern principle of repression. The subtle and flexible Italian, after the manner of his countrymen, hoped to succeed by counterpoises, by playing factions off against one another, by trading on the meaner side of human nature, by love affairs and jealousies, and all the stock in trade of weak intriguing characters. His rule is characterized by the burlesque wars of the Fronde, which sufficiently showed his want of firmness and the degradation of the age.

Louis XIV.

Louis XIII. left at his death two sons, Louis the dauphin, now Louis XIV., and Philip duke of Anjou, afterwards duke of Orleans, who founded the Orleans branch of the Bourbon family, which ceased to reign on the deposition of Louis Philippe in 1848. The regency was in the hands of Anne of Austria, his queen; Gaston of Orleans was named lieutenant-general of the kingdom; the direction of the government was placed with a council, the prince of Condé, Mazarin, Seguier the chancellor, and two more. The king's will, however, was little respected. Anne, a haughty and ambitious woman, with Mazarin to back her, was not likely to care much for the clog of a council of regency.

Regency of Anne of Austria.

The parliament of Paris, flattered at appearing to be the arbiter of the counsels of kings, set aside the will, and declared Anne independent regent. The old court party, of which Anne had always been the head, expected to rule at will; Mazarin was tolerated only because he was necessary to bring foreign affairs to a successful issue; that done he would have to go.

1642-1648.

The "Importants."

The "Importants," as they were nicknamed, a frivolous and unworthy company of noble nobodies, reckoned on a long lease of power; the king was little more than a babe,—he was but four years and a half old,—and it would be strange if they could not secure themselves. The war on the frontiers, however, ruthlessly destroyed their hopes. The Spaniards, cheered by the deaths of Richelieu and Louis XIII., had besieged the little frontier-town of Rocroi; Mazarin hastily sent up an army to relieve the place, commanded by Marshal L'Hôpital and the young duke of Enghien, eldest son of Henry I., prince of Condé, a distant cousin of the king. In spite of L'Hôpital's prudent counsels, Enghien recklessly with the confidence of genius and youthful inexperience attacked and utterly defeated the world-famous Spanish infantry, and killed their aged general Fuentes. The battle of Rocroi (1643) destroyed for ever the older fighting-power of the world, the solid Spanish foot, and gave to France her first taste of that military glory which marks the reign; it was the *baptême de feu* of the child-king of France; it also secured the dominance of Mazarin. The house of Condé was his friend; Rocroi enabled him to hold up his head against both Spain and the "Importants;" their party, for the time, was utterly broken up.

Condé and Turenne.

In these closing years of the Thirty Years' War two able soldiers came to the front, the Great Condé and Turenne,—the one all fire and dash, alike dangerous to friend and foe, the other the greatest tactician of the age. The one represents at its best the old noble fighter, the other the modern skilful officer. In 1644 they drove the imperial general Mercy out of his position at Freiberg, and became masters of the middle Rhine-land; in 1645, pressing the Austrians nearer home, they fought and won the sanguinary second battle of Nördlingen; so much were they weakened by that Cadmean victory that they were unable to keep the advantage, and were thrust back to the Rhine. In 1646 they directed their attention against the elector of Bavaria, in hopes of being able to detach him from Austria; Turenne took undisputed possession of the whole upper Danube valley, and threatened the elector Maximilian at Munich. In 1647 he, to free himself from the invader, who mercilessly ravaged and plundered his lands, signed a separate truce with France, and abandoned at last the imperial cause. Well might the house of Austria now feel that by any sacrifices it must bring the long war to an end. When the elector broke truce early next year, his resistance was crushed by the French at Zusmarshausen, and the fighting in Germany was over. The war had rather more life in it as between France and Spain. In Italy, Flanders, and Catalonia considerable movements went on; that in Flanders, where Condé commanded, was alone decisive; the battle of Lens (9th August, 1648), the last of the fighting on that side, was a crushing and final defeat of the Spanish, and even more fatal to their power than the overthrow of Rocroi.

The peace of Westphalia.

For years there had been negotiations for peace; they had taken definite form as long back as 1639 at Cologne. In 1643 the congresses of Münster and Osnabrück were set permanently going: at Münster, France, Spain, and the Catholic princes were to make terms with the emperor; at Osnabrück negotiations should go on between him and Sweden, and the Protestant princes; the results should be welded into one coherent treaty of peace. The Dutch and Spaniards made peace together in January, 1648, so ending their eighty years' struggle. The terms between the empire and Sweden were signed at Osnabrück in August; those between the empire and France at Münster in October, 1648. The quarrel between France and Spain alone remained unsettled. The peace of Westphalia, as was necessary, largely favored France. As the war had gone on, her growing strength, and at last her preponderance, had made this quite inevitable; yet in actual gain of territory France received but little, only Austrian Alsace being added to the kingdom. In influence and in relative strength, however, she grew much. The power of Germany was broken up; the princes friendly to France, the elector of Treves, the Palatine house, the house of Hesse Cassel, the Swiss cantons, were all strengthened. The three bishoprics, Metz, Verdun, Toul, were ceded in full sovereignty to France, as was also Pinerolo; she might garrison Philipsburg; the chief Rhine fortresses, barriers against her ambition, were to be dismantled; Breisach remained in her

1648.

hands. Austria was cut off from the Netherlands, and was rendered almost powerless. Thus the foreign policy of France was finally triumphant, although Richelieu did not live to see it. He had marked out its course, had watched over the preparations for it, had set it in motion, and had seen it through its earlier failures and difficulties; then he bequeathed it to Mazarin, who, though far inferior to him in tenacity and unity of purpose, was perhaps better fitted to steer things to their end; for his subtle skill and flexibility were exactly calculated for the intricate mazes of long negotiations, and could well defend French purposes amidst the innumerable and conflicting claims and wishes of the states represented at the congresses.

Mazarin and home-affairs.

No sooner had the peace of Westphalia settled, as it did for long years, the basis of the public law of Europe, than Mazarin was obliged to turn his attention to home-affairs, in which he was never so fortunate as in his foreign ventures. It has been noticed that a singular movement, adverse to the claims of monarchy, was at this very moment sweeping across Europe. The rulers of every state seem to lose power, sometimes are overthrown entirely. The characteristics of the Thirty Years' War tended to produce this result,—partly by depressing Austria and Spain, partly by familiarizing men with the careers of brave adventurers not royal, not even princely, partly by arousing enthusiasm for strong Protestantism, as in the English volunteers who supported the Calvinist "winter king," or took service under the "Protestant hero," Gustavus Adolphus, partly also by the results of the war, as seen in the acknowledged independence of the United Provinces and Switzerland, two republics finally freed from royal control. Besides this there was an aristocratic reaction which had brought down the monarchy of the papacy, as was clearly seen in the long pontificate of Urban VIII.; there was the popular reaction which was steadily destroying the absolutist theories of the Stewarts in England; there was a certain weakening of royalty in Scandinavia, whether at Stockholm or at Copenhagen. And France could not fail to feel the same influences at work. Mazarin's easier rule allowed the princes and nobles whom Richelieu had steadily kept down to raise their heads again, and the lawyers who composed the parliament of Paris, flattered at having been allowed to pronounce an authoritative judgment on the last will of Louis XIII., and thinking themselves an institution parallel to the parliament of England, were also much disposed to take advantage of the childhood of the king, the weakness of the queen-mother, the easier disposition of the cardinal. The French people, who had much rejoiced when Richelieu died, thinking that his heavy burdens would be lightened, were deeply irritated to find that they had fallen into the hands of a greedy foreigner; that their financial position was worse and their burdens grew yearly heavier; that Mazarin allowed Emeri, a harsh and cruel creature, also an Italian, to manage the purse of France, and to plunder it at will for his own and his master's profit. These causes are quite enough to account for the outbreak of civil war in 1648. The only wonder is that this war, "War of the Fronde," or the Sling (a nickname drawn from the boys in the city ditches of Paris, who played at mimic fights with slings), proved so hollow and absurd when one sees engaged in it the great names of Condé and Turenne. The name of the Fronde was first adopted by the leader of the movement, the coadjutor to the archbishop of Paris, Paul of Gondi, who is best known to history as the Cardinal de Retz. The immediate cause of the outbreak was the attempt of Mazarin to punish the parliament of Paris for having brought about the dismissal of his corrupt agent Emeri. The news of Condé's great victory at Lens (9th August, 1648) had inspirited the court party, which counted Condé as its champion; and Mazarin determined to use the enthusiasm thus aroused to strike terror into the parliament. On the thanksgiving day for the victory, four members of the parliament were suddenly arrested, one of them being Broussel, "an old counsellor in his dotage, whom the mob loved for his rude manners and his fine head of white hair." All Paris was at once in an uproar; the coadjutor De Retz threw himself into the disturbance, obtained Broussel's release, and quiet for the moment was restored. The queen-mother and Mazarin, alarmed at the troubled look of affairs, fled from Paris to Ruel. The parliament took the lead in what seemed to be a revolution, and De Retz, a born agitator and demagogue, gave to the lawyers a popular force in the discontent of the Paris mob. Though the court had been induced to return to Paris in October, 1648, Mazarin thought it safer to escape with it again early in 1649 to St. Germains. Then the discontented nobles, chiefly influenced by that romantic intriguer, the duchess of Longueville, Condé's sister, united their cause with that of Paris and the parliament, and seemed likely to overbear all opposition. The prince of Conti, Condé's younger brother, the duke of Longueville, a crowd of others, and eventually Turenne himself, formed the heads of a new "War of the Public Weal." Condê saved the court; his siege of Paris, and the weariness of the people, who had to pay for all the brilliant follies of their noble allies, led to the peace of Ruel early in 1649,—a delusive peace, negotiated by the stiff pedantic president of the parliament, Matthew Molé. This movement marks the division between the Old Fronde and the New,—the Old the Fronde of Paris and the parliaments, the New the Fronde of the discontented nobles. These latter were by no means inclined to accept the agreement of Ruel; the second period of the Fronde began at once; Condé tried to play a middle part, intriguing with both sides, and equally disliked by both. He formed a kind of party of his own, that of the "petits maîtres," the frivolous young nobles, dazzled by his bright manners and warlike reputation. The chiefs of the New Fronde began serious negotiations with Spain, and Spanish troops entered northern France, descending as far as to Rheims. Anne of Austria, somewhat strengthened by the adherence of the Old Fronde, ventured now to arrest Condé, Conti, and Longueville, early in 1650. But the duchess of Longueville escaped, whereby the stroke was rendered a

complete failure. She carried Turenne over to the New Fronde, and he, supported by Spanish troops, threatened Paris. The three prisoners were sent down to Havre for safety; Turenne's Spaniards were driven back to the frontier, and the royal troops retook Rethel from them. Feeling that Paris was still too uneasy for him, Mazarin released the three prisoners, and withdrew to Brühl on the Rhine. His cunning thought was that Condé would certainly arouse jealousies and confusion, out of which the royal power might soon recover authority. Nor was he wrong: in the autumn of 1651 the Old Fronde had come entirely over to the court; De Retz, satisfied by the exile of Mazarin, was bought with a cardinal's hat; Condé withdrew, and roused revolt in Guyenne, where he was strong. He reckoned on the help of Turenne and the Spaniards in the north; but all calculations were certain to be vain in a war in which love and vanity, jealousies and mean ambitions, ruled supreme. Turenne at once went over to the court, and took command of the king's troops; Mazarin came back, the king's majority was declared. A struggle for Paris followed, in which Turenne showed himself the master of his great rival, first checking him at Étampes, and then defeating him completely in the suburbs of the capital (1652). Condé with the remnant of his force took refuge in the town through the St. Antoine gate. Next year, all being weary of the war, the young king was invited back to Paris; Condé withdrew into Champagne and joined the Spaniards, with whom he remained till the peace of the Pyrenees. The New Fronde was entirely broken up; the Old Fronde had long been weary of the whole affair; Cardinal de Retz was a prisoner at Vincennes, and his career was over. Ere long Mazarin, who had again withdrawn from court to Sedan, was recalled; the parliament of Paris, which in 1654 demurred to the heavy cost of the Spanish war, was ordered by the king to abase itself; its meetings were forbidden; for nearly a centry and a half its political action was suspended.

War with Spain.

Cromwell and Mazarin.

The peace of the Pyrenees.

Mazarin's end and character.

All this "burlesque war," this "war of children, with a child's nickname," "comic in its origin, its events, its principle," as Michelet says of it, had been like the light scene which the skilful dramatist interposes between the great movements of his tragedy, at once to relieve the strained attention of the hearers and to heighten the effect of the catastrophe. It fills with light and merry motion the period between Richelieu and Louis XIV.; it was "the game of lively schoolboys in the interval between the lessons of those two stern and severe teachers." The Spaniards were still at war with France; and nothing so clearly shows their utter exhaustion as their inability to take any serious advantage of the troubles of their adversaries. The civil wars over, France soon drove Spain to the wall. Condé, in command of Spanish troops could achieve nothing; in 1654 the Spaniards failed at the siege of Arras, and the French took Stenay; Louis XIV., who was with the army, perhaps here imbibed that love of sieges which always marked his military career. In 1655–1656 the fortunes of the war were almost evenly balanced, the Spaniards having perhaps the best of it in the north; and troubles with the noblesse began again, while the new opinions and party of Jansenius of Utrecht, which had been condemned by Pope Innocent X. in 1653, found great favor among the French clergy, who disliked the doctrines and tendencies of the Jesuits. From this time to the end of the reign of Louis XIV. the Jansenists of Paris are in more or less open opposition to the court; in these days they sympathized much with De Retz. Now, however, Mazarin's skill as a foreign minister enabled him to triumph over all opposition. The strong government of Cromwell had in 1654 secured the tranquil progress of England by treaties with the chief northern powers and with Portugal; now in 1655 he had to choose between alliance with France or with Spain. Nor could he hesitate. Spain still spoke her ancient tongue—the tongue of intolerance and Catholic repression; France in Mazarin's hand had been willing to tolerate the Huguenots, and to aid the Protestant party in Germany. A treaty between England and France was accordingly signed in October, 1655, a treaty of peace and commerce; a little later it was followed (March, 1657) by an offensive and defensive alliance. Six thousand English Puritans, led by Turenne, made an immediate change in the character of the war, and the Spaniards began at once to give way. In 1658 Turenne caught them at the Dunes, not far from Dunkirk, and defeated them completely; Dunkirk yielded, and was duly handed over to the keeping of the English; the Spaniards were swept away, Gravelines, Furnes, Oudenarde, all fell; Brussels was threatened. In August of this year Lionne, Mazarin's agent, on occasion of an election to the Holy Roman Empire, concluded an agreement with the princes on the Rhine for the upholding of the peace of Westphalia; and France could show herself as the ally at once of England, Sweden, Bavaria, the ecclesiastical electors, the house of Brunswick. At last in 1659 Spain yielded, being utterly unequal to the strife. The peace of the Pyrenees gave to France Gravelines, Landrécy, Thionville, and Montmédy, and Spain also ceded all she held in Artois; though the duke of Lorraine was replaced at Nancy, the Duchy of Bar, and some smaller places along the Champagne border, were ceded to France. In Germany itself Louis XIV. secured Juliers to the duke of Neuburg, and the original trouble which led to the Thirty Years' War was finally settled eleven years after that war had ended. All French conquests in Catalonia were restored to Spain, while France became finally master of Roussillon and Conflans; Condé was pardoned and taken into favor. Finally, the treaty involved a great marriage compact between Louis XIV. and the infanta Maria Theresa of Spain. The actual marriage, which took place next year, was garnished with a dowry never paid, and with a renunciation by the infanta of all her rights to the Spanish crown or Spanish possessions, which was thrust contemptuously aside when in 1667 Louis XIV. desired to get hold of the Spanish Netherlands, or when forty years later he placed the crown of Spain on the brows of his young grandson Philip. The peace of the Pyrenees and this Spanish marriage firmly established Louis XIV. on his throne as the most powerful monarch of Christendom; it was time for Mazarin to withdraw and leave his pupil in full command of the realm. He spent the last year of his life in teaching the young monarch those lessons of king-craft on which he built up his career,—taught him to avoid a first minister, instilled into him a belief that ill-faith in treaties was good policy, and urged him to cultivate his "natural gift of dissimulation;" called his attention to the miserable state of finance, and commended to him his trusted agent Colbert, as the man best fitted to bring order out of confusion; finally he placed his own huge fortune, some ten millions sterling of our present reckoning, wrung from the misery of France, at the king's disposal. Louis, however, replaced it honorably in the cardinal's hands, who left the bulk of it to his nieces, and with part founded his "College of the Four Nations" for the education of noble children from the districts added to France in 1648 and 1659. To this college he bequeathed that splendid library which he had based on Richelieu's fine collection, and had admirably enlarged by the care and skill of his librarian Naudé. He had done what he could for arts, literature, and science, had established the academy of painting and sculpture, had pensioned Descartes in Holland, and had introduced at Paris the Italian opera. In all the solid elements of good government he was entirely wanting; and it remained for Colbert to struggle against his fate,—the fate of serving a grand monarch, who would neutralize his endeavors to secure financial and commercial prosperity for France. Mazarin died in March, 1661, leaving the state in the unfettered hands of Louis XIV., who, though now twenty-two years old, and a king for 18 years past, had as yet been little but a cipher on the throne.

Character of Louis XIV.

Nothing is more striking in all history than the contrast between the Louis whom men saw under Mazarin's tutelage, and the Louis whom France long adored as her Great Monarch. In the earlier period there was the dull and tranquil docility of a great creature which as yet knows not its amazing strength, and has as yet none of the ambitions of power, and has never tasted blood. His nature, developing itself very slowly and late, seemed to onlookers to be only heavy and commonplace; courtiers noted with keen eyes that the young prince liked amusements, and they promised themselves a bright and joyous reign, in which they would have free leave to spend as they liked the hardly-won wealth of France; it seemed to them perfectly natural that they should waste at will what they had never earned, and they fully believed that the young king would be their accomplice.

1661. His capacity seemed to be small; he was timid and ignorant. Mazarin almost alone was not mistaken in him, and no one knew him so well; "he will set off late but will go further than all the rest," was his judgment, and a just one, on the young monarch's character. For he was serious, severe, obstinate; he learnt little, and that slowly; but what he did learn he never forgot. He would neither bend nor forgive; and when he had once taken on himself the heavy burden of his kingly duties he never flinched nor repined for more than half a century. From the beginning he declared that he would rule without a first minister,—this Mazarin had instilled into him as a fundamental law of his kingcraft; and he kept his word, although it became clear in time that it was quite possible to hold him in close leading strings, so long as he himself did not find it out. At first, however, he was determined to have only agents around him,—men of business who should never expect to become too prominent,—not great lords of church or state, but men of middle or humble origin. With them he was prepared to undertake any amount of dry detail work of public business. Without a sigh he dedicated henceforth four or five hours a day, or even more, to public affairs; his commonplace abilities, his instinct of orderliness, his love of minutiæ, his punctual routine, which would have disgusted a livelier prince, formed the happiness of his life. "His ministers," says Michelet, "might change or die; he, always the same, went through his duties, ceremonies, royal fêtes, and the like, with the regularity of the sun, which he had chosen as his emblem." With a morbid conscience, he easily became subject to his confessor; with a limited intelligence and great lack of knowledge, he was dependent on his ministers without knowing it; with a vein of small vanity in his character, he was not above being led by the flatteries of the woman he loved. Finally, Louis XIV., though heavy-looking, was handsome and majestic in person; no one has ever played the part of a king with such equable gravity and success; his dignity was as striking as his selfishness; for his heart was dull, and neither surprises nor warm feelings could throw him off his balance. His whole reign passed without his ever showing any real feeling for his poor subjects; and his indifference to the health and feelings of those nearest him, his treatment of his court, especially of the ladies of it, was such as nothing but their abject fear of him, and the meanness engendered by the atmosphere of such a court, could explain.

The machinery of his government.

Louis XIV. began his true reign in 1661 by dividing the business of government into three agencies. He placed all foreign affairs under Lionne, who had served him so well in the war against Spain; Le Tellier had charge of the army and was war-secretary, supported by his strong-handed son, the terrible Louvois; and finance was entrusted to Fouquet, the most brilliant and unsatisfactory of his ministers. All three were men of middle origin; Lionne came of a family of gentle birth in Dauphiny; Le Tellier's father was a lawyer; and Fouquet was a citizen who pretended (as many Frenchmen have since done) to be of noble birth. The king had at his side also Mazarin's most trusted dependant Colbert, grandson of a wool-seller of Rheims. It was thought at court, where Louis was no better understood than elsewhere, that Fouquet would before long carry all before him, and fill the coveted post of first minister of the crown. The queen-mother, seeing that the king did nothing for his governor Villeroy, and that he was stepping resolutely forward in the path he had chosen, complained bitterly of her son's ingratitude, and declared with a sneer that he "wanted to pretend to be a man of ability." Fouquet, ambitious and bright, a favorite with the queen-mother, the court ladies, the literary world, the Jansenists, a man who let the finances fall into hopeless confusion and stooped to dishonest representations to save his credit, was not the man to suit the young king, and in a few months' time he had fallen for ever from power, and Colbert sat in his place.

Colbert.

John Baptiste Colbert, who was minister of Louis XIV. for two and twenty years, claimed descent from a Scottish family settled in France, and his character, his common-sense, rigid principles, business ways and tastes, and his simple habits, were just what one might have expected from such an origin; "a mind somewhat heavy and harsh, but solid, active, unwearied in work." He was first named comptroller-general of finance; he had also the supreme care of all home-affairs, and when the navy (after 1669) was first in his own and then in his son's hands, he may be said to have had charge of that also. 1661-1667 Till Louvois succeeded to the ministry of war in 1666, Colbert's influence on all parts of the administration was paramount: and the young king, partly understanding what he was doing, and wholly desirous of doing his best, gladly seconded him in everything. At first Colbert found everything in the financial department in a melancholy state: more than half the sum gathered in taxes disappeared before it reached the treasury, and the expenditure had so far grown as to leave a yearly deficit of nearly twenty-two millions of livres. To reorganize the finances was his first task; and by stern dealing with intermediate officials, by fixing the interest of loans at a maximum of five per cent., by sweeping away masses of useless officers, he succeeded in so far reducing the cost of levying the taxes and the burdens of the state that in six years' time the position of affairs was reversed, and the treasury had a good balance in hand, while the burdens imposed on the people were lightened The years which preceded the Devolution war of 1667 are perhaps the most prosperous that France had ever seen.

France under Colbert.

She made extraordinary progress in all directions. Even in foreign affairs her power was shown: she humbled the papacy, she asserted her precedence over Spain in the streets of London, she helped the emperor Leopold to resist the Turks and enabled Montecuculi to win a decisive victory over them at St. Gothard in Hungary, her fleets in the Mediterranean cleared away the African pirates. At home the triumphs of peace were far more splendid even than these warlike signs of power. Colbert's activity was unflagging; to reorganize the finances might have seemed enough to another minister; he regarded it as only the groundwork of his structure; on it he would raise a new and brilliant France, splendid among the nations, not only feared—that was something—but admired as well, and humbly imitated. So he set himself in these years to develop his country on every side. For agriculture indeed he would do but little, for his temper was the opposite of that of Sully. Sully, a great lord, and owner of broad estates, rated manufactures as of little value by the side of tillage; Colbert, a townsman, and of the middle classes, thought that the encouragement of agriculture signified the increase of noble wealth and privilege, while manufactures would tend to build up a rich and useful burgher class, obedient to the king and fruitful in taxpaying. He therefore devoted his attention to manufactures and commerce, and to the communications by land and water necessary for them. He made good roads, set on foot the canal of Languedoc, declared Marseilles and Dunkirk free ports.

Manufactures.

He then re-established old manufactures and introduced new ones, such as tapestries, silk, mosaics, cabinet-making, lace, cloth of gold, pottery, steel-work, and the like, a long series of "royal manufactures," the industries of taste and luxury, which can flourish only on the favor of the great. Colbert's system was therefore one of protection and bounties, and never enabled France to discover for what forms of labor she was by nature specially suited. The true wealth of France lies in her soil,—in her varied agriculture and the thrifty habits of her people; yet the world has ever believed that these "Louis Quatorze" ornaments, these works of art and of little use, are the special glory of French workmanship, the models of good taste. This royal direction thus given to French industry, though it only slowly (if at all) increased the true wealth of the nation, added largely to its credit, and heightened its splendor in the eyes of the world.

Commerce.

On industrial movement commerce must naturally wait; and Colbert attempted much for the circulation of productions. He set on foot four great companies, though they never really prospered. Patronage and direction, which could establish and freshen manufactures, failed here. In the end Frenchmen, with little gifts for colonization, and no decided bias for the sea, learnt chiefly to produce for their own consumption.

The arts.

In these years, the same royal and official patronage was largely extended to letters and science as well as to the arts. The last was no doubt regarded as directly connected with the general progress of the favorite industries mentioned above; in building a great palace at ruinous cost, Louis XIV. and Colbert both thought that French industry was being encouraged, and money circulated. Versailles was under-

1667.

taken in 1661 (it had previously been a royal hunting-box built by Louis XIII.); the famous colonnade of the Louvre, Perrault's work, was begun in 1665; Bernini was summoned from Rome that same year to assist in the great works. The buildings erected in this period have all the same deadness of style; they are splendid, no doubt, and crowded with ornaments; we note in all a want of spontaneous fire; no longer does genius create; talent, at the service of a master, can only copy or conceal its poverty under the cloak of rich ornamentation. The paving and lighting of Paris was a more beneficial work; the quays, squares, and triumphal gates of the period did much to make up for the abandonment of the capital by its kings,—for after the days of Henry IV. the Bourbons spent very little time in Paris.

Learning.

Colbert also established at Paris those new learned or scientific academies which were intended, after the pattern of the new Royal Society of London, to stimulate and direct the progress of knowledge. Such were the Academy of Inscriptions, founded in 1663; that of the Sciences, in 1666; of Architecture, in 1671. He also established the school of Rome, built the Observatory, and in every way did his utmost to advance learning and observation. In all, his practical principle was to trust to rule and organization, and to leave as little as possible to genius or national selection,—and French industry, arts, and sciences have all suffered accordingly.

Literature.

Nor was the case different in literature: here also Colbert desired to encourage and direct; the baneful patronage of kings finds here its highest example. For the true golden age of French literature scarcely touches the active reign of Louis XIV.; it is to Richelieu's time, when at the head of affairs was one who not merely patronized but who warmly interested himself in literature, that the greatest masterpieces belong. The 17th century saw two periods of literary activity, of which the earlier extends to 1661, and is the period of originality and fire; the later runs from 1661 to the end of the century, and (except for Molière and the great preachers) is lacking in character, if improved in taste and style. France has always been justly proud of her stage, little as we may admire its pedantic limitations, its unnatural heroics, and the frigidity of some of its finest efforts: we feel that we are among those who would have thought Addison's *Cato* far superior to Shakespeare. Still, in its own style, French tragedy produced masterpieces, and these chiefly under Richelieu and Mazarin, rather than under Louis XIV. Rotrou, who showed the way, died in 1630; the great Corneille wrote the *Cid* in 1636, *Les Horaces* and *Cinna* in 1639. After 1646 his powers declined, and though he still wrote to his life's end, no one now cares for his *Agésilaus* or his *Attila*. His brother Thomas, a far inferior dramatist, was worthily reserved for Colbert's days. Molière belonged to both ages; his *Précieuses Ridicules* appeared in 1659, *Sganarelle* in 1660, *L'École des Maris* in 1661, while the *Médecin malgré lui* (1666) and the *Tartuffe* (1667) belong to Louis XIV. Racine's earlier period, and the best part of him, extends to 1677; after that he fell under royal influences, wrote nothing for some years, and afterwards became the quasi-religious poet of the court; the *Esther* appeared in 1689 and the *Athalie*, which the French public treated with indifference, was printed 1691. In other lines of poetry Malherbe, the great purist of the century, who, as Boileau sung, "réduisit la muse aux règles du devoir," died in 1628; Benserade, a trifling wit, flourished with pensions from Richelieu, Mazarin, and Colbert; La Fontaine wrote many of his fables in the days of the *Précieuses*, and published his first volume in 1668,—he was one of Fouquet's friends, and therefore not likely to attract the favor of Louis XIV.; Boileau is properly of the later age; satire and comedy seemed alone able to thrive by the side of obsequious oratory.

The Devolution war.

In these palmy days of the reign, Louis XIV. saw with pleasure war break out between England and the Dutch (1664). He was slowly preparing to take part in it against Charles II. when the death of Philip IV. of Spain changed his views completely. He made peace with England in July, 1667 (treaty of Breda), and plunged into those complications of European law and usage which interested him intensely. The Spanish succession question at once came up,—for no one expected Charles II. of Spain to live long or leave posterity; and the immediate question of the claims of the queen of France on a large part of the Spanish Netherlands occupied his energies. Louis and Lionne snapped their fingers at the queen's renunciations of her Spanish rights, and went even further; they made claims which, to modern international law, seem to be utterly indefensible.

1667-1670.

"Jus Devolutionis."

The claim for the Spanish Netherlands was based on the "Jus Devolutionis," the old feudal custom by which certain territories descended to the offspring, male or female, of the first wife, to the exclusion of the children by the second. Now Maria Theresa, queen of France, was daughter of Elizabeth of France, the first wife of Philip IV., while his other children sprang from his second wife, Maria Anna of Austria; and Louis therefore proposed to apply ancient customs of feudal lordship to international matters, to the transfer of territories from one monarch to another. The customs of different districts varied much; in one way or another he hoped to lay undisputed hands on the Netherlands, Hainault, part of Luxembourg, even of part of Franche Comté; he was prepared to support these flimsy claims by the stronger argument of war. To war it came; the king with Turenne overran the Netherlands in 1667; Condé, who was governor of Burgundy, overran Franche Comté in 1668. It was a little war of town-taking; places fell, like ripe fruit, for the shaking. Meanwhile Lionne, busy over the negotiations which sprang out of the succession question, had sketched out a partition treaty, in which Leopold and Louis arranged the whole affair to their liking. With this in hand the king, who had returned in high triumph to Paris, and who knew of Sir William Temple's Triple Alliance, which had been signed in the spring of 1668, made peace as easily as he had made war, and on May 2, 1668, signed the treaty of Aix-la-Chapelle, by which he restored Franche Comté to Spain, and secured the Netherlands.

Treaty of Aix-la-Chapelle.

It was to all appearance a very moderate peace, and much enhanced the king's reputation; men did not know that it was meant to lay the basis for an entire reconstruction of the map of Europe, so soon as ever sickly young Charles II. of Spain had died; and that, every one thought, must follow very soon. The long reign of that prince (who lived till 1700) had much to do with the great wars which followed, and with the consequent exhaustion of France.

The Triple Alliance.

Louis now set himself to break up the Triple Alliance; it was a combination opposed to all the diplomatic ideas and plans of France. Sweden was her old ally; and her policy was to encourage the two sea powers, England and Holland, to weaken one another on the water, so as to give France a chance of constructing a navy. Therefore she was necessarily jealous of the Alliance; nor was it hard to overthrow it. Sweden, as was said, had joined it as a speculation, and had her price; Charles II. of England could easily be bought; Holland thus left defenceless, having lost her barrier of the Spanish Netherlands, could expect nothing but the anger of her new neighbor. But how changed were the world's politics, when the three Protestant powers, England, Holland, and Sweden could unite, even for a short time, for the defence of their ancient foe, Catholic and cruel Spain!

The king's dislike for the Dutch is one of those things which illustrate the evils of personal rule. They were distasteful to him as Protestants, as burghers, as tradesmen, as a sea power, as a constitutional republic; they had given shelter to refugees who could not bear the brilliant despotism of France. Of old times French policy had favored the growth of the United Provinces, as a counterpoise to Spain; henceforward Spain and Holland were friends, and Louis was eager to revise the old lines of his country's foreign relations. So he at once made use of his connection with the small Rhine-princes, those unpatriotic Germans, who were ever on sale, and who almost till our own days sided with France against Germany. With them he arranged for a great flank attack on the republic; he secured England by buying over her king; the wishes and feelings of the people could easily be disregarded in these early days after the fall of the Commonwealth. In 1670 the treaty of Dover, that standing scandal of the Stewart period, was signed; it contained a secret clause, of which the second duke of Buckingham, who negotiated it with the fair duchess of Orleans, sister of Charles II., was ignorant. The two kings played their comedy behind the backs of the two clever negotiators, and laughed in their sleeves at them and at the English nation. Sweden had been easily detached

1671-1672.

Rise of Louvois.

from Holland, and the Triple Alliance entirely swept away within two years of its formation. The efforts made by Leibnitz and others to divert Louis to a Mediterranean war proved utterly unavailing; Colbert's reluctance to furnish the costs of war was overborne; Lionne died in 1671, and was not there to guide the foreign policy of France; Louvois, the "brutal minister whom all men hated," was just rising to the height of his influence, and threw that influence in with the king's prejudices in favor of a Dutch war. Colbert was the man to be pitied; the rapid rise of Louvois, who wielded all the war-power of the kingdom, and whose reorganization of the army drained the resources of the treasury, not only lessened his influence, but made great war-expenses inevitable; and those terrible outlays were by no means undertaken in the wisest direction. In vain did the dry and common-sense minister try the way of flattery: he was too gross; he could not catch the subtle undertones of praise and adoration which pleased the Great Monarch's love of approbation. "We are bound," he writes, "to save a sixpence in things not necessary, and to lavish thousands when thy glory is in question. A hundred pounds for a useless banquet breaks my heart; but when millions of gold are wanted for a great object, I would sell all I have, pawn wife and children, and go afoot all my life, rather than fail to provide it." Such protestations, which did protest too much, such bathos of adulation, could not please the wilful monarch; Colbert's influence henceforward steadily declined, and Louvois climbed into his place, sitting as an evil genius at his master's ear, to whisper war with Holland, the crushing of Genoa, the double ravaging of the Palatinate,—the horror of which survives even to these days in which atrocities are popular,—the dragonnades of Nantes, the revocation of the Edict of Nantes.

The Dutch War.

Parties in Holland.

The Dutch war broke out in 1672, and France had at last a considerable fleet to send to sea. Thirty ships of war joined the English navy, which was pledged to neutralize the sea-power of Holland, and to find employment for Admiral Ruyter's hands. Ruyter was the stay and strength of the aristocratic or burgher party at Amsterdam—the party which had now ruled for years, and had with no small glory rivalled England on the high seas. Little did Louis XIV. deem that by this war of 1672, and by this very alliance with England, he was laying the foundations of that power which would in the end frustrate his splendid plans, and hold up against him the liberties of Europe. The sea-party in the Provinces had resisted and overcome all the efforts of Spain. Louis was now about to overthrow that party, to make room for the land-party, which, led by William of Orange and England, was to withstand him to the end. The sea-party, the aristocratic and commercial republic, headed by the two distinguished brothers, John and Cornelius de Witt, was inevitably hostile to England, and as naturally friendly to France. The land-party, democratic and agricultural, and headed by the great house of Orange-Nassau, was naturally a friend to Germany, with which it had close connections, and to England also; for it was no rival on the sea, and lastly, William, the head of the house, was first cousin to the king of England.

Louvois had raised the army to 125,000 men; the French navy could count about a hundred sail. With almost all this great force Louis began the Dutch war of 1672. Guided by Turenne he set forth for the Rhine, leaving an army to mask Maestricht. The friendly princes gave him passage; the trembling Dutch with a raw ill-disciplined army of scarcely 25,000 men, under command of the prince of Orange, sheltered themselves behind the half-furnished forts of the river Yssel. By crossing the Rhine into the ancient "Betuwe," Turenne hoped to get between the Dutch and Amsterdam, and with one hand to crush the army, while with the other he coerced the seat of government into submission. The plan was simple and good; the earlier stages of it were successfully carried out; the famous passage of the Rhine dazzled the eyes of all France, and, unopposed in fact, and perfectly easy, made Paris believe her monarch to be a complete hero of romance. Turenne at once pushed on and seized Arnheim, which gave him passage out of the Betuwe into the country behind the Yssel; and had his voice been heard, nothing could have saved the prince of Orange. But, with overwhelming force, the king missed completely the point of the campaign. He set himself to reduce the unimportant Yssel forts, led by his own taste for siege-warfare and Louvois's advice; he wasted time and weakened his army by garrisoning the captured places. Presently he moved on and occupied Utrecht; Naarden, half way from thence to Amsterdam, was taken. The Dutch despaired of help, and offered terms to Louis; but he contemptuously refused them. Then the mob of Amsterdam in fury of despair rose on the De Witts and murdered them both, and called on William of Orange to rescue the state. He at once accepted the perilous task, and with equal skill and courage saved the republic, first by flooding the country, so as to defend Amsterdam from a land-attack, and then by arousing the jealousies of Germany and Spain. Louis had gone back to Paris; his armies achieved nothing more in 1672. In 1673 the interest of the war lay in the siege of Maestricht; for Germany was no longer a safe French roadway, and the line of the Meuse was necessary, if Holland was to be reached at all. Maestricht fell; but then no more was done. Louis returned again in triumph to Paris, and the war lagged. At this time (August, 1673) a great league of the Hague was formed against France; its members were the emperor, the Spaniards, and the Dutch; the young stadtholder became the leader of the opposition to Louis XIV. The campaign on the Rhine, in which William of Orange and Montecuculi were pitted against Turenne and Condé, while the duke of Orleans attacked the Spanish Netherlands, went on the whole against France. The allies took Bonn, and thus compelled the Rhine-princes to abandon France. The Great Elector, Frederick William of Brandenburg, who had hitherto leant towards the French, in 1674 joined the allies; public feeling in England forced Charles II. to make peace with the United Provinces. Sweden, jealous of Brandenburg, remained as almost the sole ally of France

1673-1676.

In this year Turenne was charged with the duty of defending the Alsace frontier; the war, from being offensive, had become strictly defensive, except in Franche Comté, which was retaken by Louis in a six weeks' campaign, and the ancient county now fell for ever into the hands of France. When the king's brilliant campaign was over, Turenne pushed forward into the Palatinate, defeated the imperialists at Sinzheim, and then deliberately destroyed the whole country; this was the well-known first destruction of that fair territory. The allies in September crossed the Rhine at Mainz and then at Strasburg, occupying all the plain of Alsace. It seemed as if Turenne could do little to arrest them. He observed them till winter had set in, and then, making his wonderful march along the west flanks of the Vosges mountains, suddenly came out in force at Belfort, and drove the Germans from point to point, till he had entirely cleared them out of Alsace. As the wasting of the Palatinate was the one great blot on his career, so this famous march raised his strategic fame to its highest point. In the north the campaign was not so brilliant; William of Orange lost the hard-fought battle of Senef, and was unable to carry out his plans for penetrating into France. When he had retaken Grave, the campaign of 1674 was over.

The campaign of 1675 on the Rhine was to be once more a trial of strength between Turenne and Montecuculi. The great Turenne, however, was killed by a chance cannon-shot, and the whole plans of the French were shattered. Marshal Créquy was defeated at Saarbrück; the advantages gained by the king in the north, where he had secured the Meuse by taking Liége, Limburg, and Dinant, were altogether neutralized; the army destined for Holland had to help the dispirited army of the east. Condé, who here fought his last battles, upheld the honor of the French arms on the Rhine, and, having secured Alsace for his master, now withdrew from warfare altogether. The age of an inferior series of generals begins.

In 1676 the war was feeble; nothing was done in the north; in the east the Germans took Philipsburg, a place of the utmost value to France before she had got Strasburg. On sea, however, the year was far more brilliant; in the Mediterranean Du Quense in two great battles destroyed the combined fleets of Holland and Spain; and in the second battle off Palermo, Ruyter himself perished. Both France and Holland now began to wish for peace; the Dutch, seeing their navy ruined, and conscious that they could not recover Maestricht, were very weary of war; and the French were also fretting under the burdens of the struggle, which had ruined all Colbert's plans for the development of their commerce and wealth. Troubles broke out in more than

1677.

one district. Negotiations went on, and war also. In 1677 the French arms were more successful; the duke of Orleans, whom his brother never forgave for it, defeated William of Orange at Cassel, and was never again put in command; the French overran all Flanders; the duke of Lorraine was completely defeated by Marshal Créquy. Towards the end of this year William of Orange was espoused to his young kinswoman, Mary, daughter of the duke of York, and early in 1678 King Charles was obliged to declare war on his royal patron. These things swelled the tide in favor of peace. The burgher party of Amsterdam, afraid of William's growing power, leant strongly on that side; Charles II. had never been sincere in his declaration of war, and gladly forwarded the wishes of Louis.

The peace of Nimwegen.

Finally, the peace of Nimwegen closed the war. The first treaty was one between Holland and France, which restored Maestricht, the only place William had not retaken, to the Dutch; a friendly treaty of commerce was attached to it. The second treaty was between Spain and France; while the king restored some strong place to the Spaniards, they ceded a chain of strong frontier-cities to him; France became mistress of Valenciennes, Condé, Bouchain, Maubeuge, Cambrai, Saint-Omer, Aire, Ypres, and other towns. They also ceded Franche Comté, which has ever since been French. Thirdly, there was a treaty with the German princes, which reaffirmed the treaty of Münster of 1648. France ceded Philipsburg, and retained Freiburg in the Brisgau. The peace of Nimwegen was but a starting point for further ambitious steps, yet it formed the highest point of the greatness of Louis. His fortunes seemed to rise a little higher through the "reunion policy" in the next few years; yet he was already beginning to descend from the topmost height. After this peace France could not enough praise and flatter her great monarch; all thought of resistance died away; the needy nobles flocked to his court and begged for place,—they did not dream of asking for power; the king absorbed them into all possible offices—army and navy, finance, in all were to be seen swarms of noblemen; it is to Louis XIV. that the absolute and fatal severance between noble officer and peasant soldier is due. The clergy were kept in fit subjection; no great cardinal now could overshadow the throne; the Jesuits were in full favor,—masters of speech, miracles of persuasiveness, they set the fashion of that age of pulpit eloquence, which is perhaps the most marked of the literary characteristics of the reign. These were the days of Bourdaloue and Bossuet. From this time to about 1685 the French monarchy stands at its highest; Europe is amazed and paralyzed; France if exhausted is full of glory; the king has become more august and magnificent as he has grown older, and now in the prime of life is, as has been said, "if not the greatest king, the finest actor of royalty the world has ever seen." One person, at any rate, was dissatisfied with and suspicious of the peace of Nimwegen; and that was William of Orange. Four days after the peace had been signed, he made a sudden attack on the French camp at St. Denis near Mons. Marshal Luxembourg was taken by surprise; but the French troops soon recovered and drove out their Dutch assailants with heavy loss.

Louis XIV. at his highest.

With this uncalled-for bloodshed the war ended. The history of the next decade of years in France justified to the full the disapproval William had so roughly expressed, though it could not justify the bloodshed and the failure at Mons. It was in these years that abroad and at home Louis XIV. carried out to the full his autocratic ideas,—the king all powerful at home, the kingdom omnipotent abroad. So in this time, while the other nations thankfully disbanded their armies, those of Louis remained on foot. Vauban was named commissary-general of fortifications, a new office, in 1677, and the moment peace was signed began to fortify and secure all the frontiers of France with strongholds which should be at once gateways for aggression and bulwarks against attack.

The system of "reunions."

Finding also that a complete scheme of defences demanded some points which were not yet in his hands, the king began that system of "reunions," as they were called, by means of which he applied old feudal rules to the acquirement of territories and towns in time of peace. Thus, for example, he filched Strasburg away from Germany, because he wanted that ancient Teutonic city to make his eastern frontier safe and aggressive. The peace of Westphalia to which that of Nimwegen, so far as it dealt with Germany, went back, had in it the feudal term "dependencies."

1677–1683.

When it declared a city to be ceded, it spoke of it as being ceded "with its dependencies;" and Louis XIV. having determined to push this phrase to its furthest application, established in 1679 and the following years three "Chambers of Reunion,"—one for the three bishoprics at Metz, a second at Besançon for Franche Comté, the third at Breisach for Alsace. These bodies inquired into all matters of feudal jurisdiction; and as these old usages, specially the episcopal ones, were wide and vague, they formed a convenient basis for decisions in which the claimant was both judge and executor of his own judgments. The French overlordship over many Germanic districts was at once affirmed and acted on; territories were occupied with French soldiers, and the strong points fortified or further strengthened; and before Europe well knew what was doing, the frontiers of France had been pushed forward into Germany, and so strengthened as to make it very difficult to wrest them again away. The Breisach chamber thus secured almost all the lordships in that district, and succeeded, partly by legal argument, partly by bribery, lastly by force, in winning Strasburg in November, 1681. At the same time by secret agreement with Charles III. of Mantua, the last of the Gonzaga-Nevers dukes, Louis XIV. became master of Casale, which seemed to secure his permanent influence in northern Italy. The capture of Luxembourg, Courtrai, and Dixmuyde, in the little war with Spain which was waged in 1683–1684, set the French frontier well forward on the north side of the three bishoprics. All went well with the monarch in these days. Unfortunately for his glory he had still thirty-two years of reign before him; and these years, the period of Madame de Maintenon, are crowded with blunders, darkened with misfortune. "Here ends," (in 1683), says the duke of Saint-Simon, "the apogee of this reign,—the height of its glory and prosperity. The great captains, the great home and foreign ministers, are no more; only pupils and disciples remain. We are now to see the second age, which will fall short of the first, though it will be far better than the third and last period of the reign." Colbert died in this year; in this year John Sobieski drove the Turks from the walls of Vienna; and from the day of their defeat, the fortunes of the Ottoman allies of France also began to recede. Above all, in this same year Louis XIV. was privately married to Madame de Maintenon, and she, with unbounded influence over him, intentionally or not, had a share in the worst errors of his reign.

Madame de Maintenon.

Françoise d'Aubigné was a Huguenot by birth and breeding; in 1652 the comic poet Scarron, a cripple, and, as he called himself, "an abstract of all human miseries," married her when she was penniless and friendless; eight years later she was left a widow, and again without resources. She had a soft and gentle beauty, a grace and tact, a cold temperament and placid manner, which recommended her, by way of contrast, to Madame de Montespan, the violent and dangerous beauty who for several years reigned supreme over Louis XIV. At her suggestion poor Madame Scarron was engaged, in 1666, as a kind of nursery governess to her children, the duke of Maine and a daughter. It is curious to see how great are the contrasts in her history. At first Louis was offended and hurt at the introduction of this person at court; she seemed odious to him. He gave her the little Maintenon estate with a stipulation that he should see her no more; he thought her a precise and disagreeable *précieuse.* She had been the wife of a playwright, the centre of a little literary coterie; the king, with his instinctive dislike for literature, felt a distaste, almost an aversion, for her. Her placid temperament stood the trial well; after a time, when Madame de Montespan was unusually imperious, he would betake himself to the sweet gentleness of the governess, and cool his heated temper in her calm society. Her influence was all for good; she weaned him from Montespan, and did not take her place; she reconciled him to his poor queen, whom he had so long and so scandalously neglected; and when the queen died in 1683, the governess became the king's wife, and queen in all but name. She never was publicly acknowledged; still her position was recognized, and her power felt. Louis worked with her, consulted her in all things; she was a warm friend to the high Catholic party; though not openly subject to Jesuit influences (her early training making that

Bossuet's four propositions.

Revocation of the Edict of Nantes.

unlikely), she did work which the Jesuits could not but like. The king, naturally religious in a stiff and ignorant way, and Madame de Maintenon, narrow, placid, and obstinately afraid of intellect or independence, worked together towards the same ends. The necessity of disarming any suspicion the king might feel as to the leaven of Huguenot opinion still fermenting within her led Madame de Maintenon often to countenance things which she could not in heart have approved. She had known the light, and could never afterwards have fallen into utter darkness. Jansenists and Huguenots, in these years, felt the king's dislike increased; the eagerness for the submission of the one, the conversion of the other, grew day by day into an absorbing passion. And Louis had had no small temptation to interfere with the Jansenists. They held opinions which, his Jesuit advisers assured him, were of a fatal wrongness; and in 1682 they had sided to a great extent with Innocent XI. against him. His horror of independence of views combined with his horror of a divided allegiance, and led him to act promptly against them. He convoked a great assembly of clergy, which, under the influence of Bossuet, drew up those four articles which have often been quoted as the clearest statement of the liberties of the Gallican church,—liberties, that is, as face to face with the pope, not as against the royal power. These articles affirm (1) the independent authority of the secular power; (2) the superiority of general councils; (3) the inviolable character of the Gallican usages; (4) the fallibility of the pope except when supported by the assent of the church. There was talk also of a Gallican patriarchate, so far did the quarrel go. The Jansenists, the "Ultramontanes" of that day, seemed to side with pope against king. In these years the papacy and the monarch were not on good terms together. Innocent XI. looked with favor on the growing resistance, and rejoiced when Protestant William overthrew Catholic James of England. The Jansenists were thus kept down; the Huguenots were more severely treated, Louvois, unluckily for them, here taking the lead. Great numbers were bribed or threatened into giving up their opinions, others were driven to it by actual hard usage, until in 1685 Louis, believing that all had been converted except a small stiff-necked remainder, with whom he need not scruple to deal sharply, finally ordered the revocation of the Edict of Nantes, and therewith the total abolition of all the privileges unwillingly granted ninety years before to the Huguenots, and always permitted with a grudging hand. The severities of 1685, and the exodus of the Huguenots, finally brought that party to an end as a political organization. Whatever difference of opinions there may be as to the numbers who fled from the kingdom at this time, there can be no doubt as to the quality of them. They were the thriftiest and readiest hands in France; they carried the arts and taste which were till then the special gift of their country, to Spitalfields, or Amsterdam, or even to Berlin. They crowded into the armies which were arrayed against their oppressor; they helped to man the ships which destroyed the navy of France; they planted their industries in many places, and gave that wealth and prosperity to other lands which was driven from their homes. In England they influenced opinion not a little, and steadfastly supported the house of Orange against the Stewarts, friends of the king of France.

The league of Augsburg.

War with Germany.

In this same year 1685 Louis pushed his plans in Germany also further than was prudent. He alarmed the greater princes by intriguing, seriously or not, for the imperial dignity, against the next vacancy; he alarmed the Rhine princes also by claiming the Lower Palatinate for Charlotte Elizabeth of Bavaria, the Princess Palatine, who had married the king's brother the duke of Orleans, and who in this prime of her fortunes and brilliancy almost scared the dismal court with her bright sallies and the freedom of her tongue. When the princes heard this claim, coming so soon after the loss of Strasburg, a claim which would have brought Louis into the very heart of Germany,—they hesitated no longer; and in July, 1686, was signed that great league of Augsburg which was the beginning of the long struggle between France and the rest of Europe. The emperor, the king of Spain, the Dutch, the elector of Saxony, the Palatine elector, and a number of lesser princes, all joined it; in 1687 the pope secretly acceded; the duke of Savoy and the elector of Bavaria also came in; the soul of the combination was William of Orange. It is a strange moment of history in which the pope and the emperor, the king of Spain and the elector of Bavaria, unite to resist the advance of Catholic France and the Catholic king of England. The league was at first purely defensive, and for two years held simply an observant and ready position. The tension, however, was too great, and by 1688 Louis saw clearly that peace could not last much longer. France had had peace for ten years, yet her strength had not increased; for the court had been very profuse in these days, and the "reunions" had cost somewhat,—the exodus of the Huguenots still more. The works at Versailles had wasted men and money; the great ministers and generals were dead, and the country was surely drifting into war again. In the last war the king's armies had followed two lines—that of the Rhine and that of Flanders. Then, however, war was being made on the Dutch alone; now it would have to be against the Dutch and Germans combined. To all appearance the hostility of Germany was likely to be more dangerous than that of Holland, and the Rhine had been proved to be the best roadway of attack for both countries. For this purpose the Cologne country, the electorate and its territory, appeared to Louis to be of the utmost value to him. Occupied with this idea, and not realizing either the force of the character of William of Orange, or the depth of dissatisfaction against James II. in England, the king now committed the great blunder of his life. A small demonstration against Holland would have made it impossible for William to make his attempt on England, and would have cost France very little in expense or risk. But when it came to decision, Louis and Louvois, here as ever his evil genius, were both in favor of securing the influence of France on the Rhine; both thought the dynastic question involved in the Palatinate to be more important than the great European question involved in the plans and movements of William. Moreover, the vacancy in the electorate of Cologne in 1688, in which question the pope was openly opposed to the king's nominee, excited the royal pride, and made interference in Germany a point of honor; a French garrison was sent to occupy Cologne. For these reasons Louis, underrating the danger elsewhere, and thinking that a threat would keep the timid Dutch quiet, despatched the dauphin to the east with the main army in September, 1688. He took Philipsburg; the Palatinate and the three Rhine electorates fell easily into his hands.

The English Revolution.

Affairs in Ireland.

Immediately William, freed from his worst anxieties, set sail for England, and the Revolution took place at once and without bloodshed. The Declaration of Rights was issued by parliament in February, 1689, and William and Mary were seated on the throne of England. James II. took refuge at the French court, and was established at the palace of St. Germains; his presence in France, and that of his family, becomes an element in the politics of more than half a century. And now Louis recognized the error he had committed; his troops were withdrawn from the Palatinate, which (again at the advice of Louvois) had to undergo that scathing of fire and sword which moved the feelings of all Germans, and gave earnestness to the war. Early in 1689 the Diet of Ratisbon declared war against France. The great duke of Marlborough, now only General Churchill, defeated the French at Walcourt near the Sambre; the French were also thrust back into Alsace and Lorraine. King James was furnished with a strong force of troops and ships, with which he landed safely in Ireland, and almost all the island declared for him. A French-Irish court was established at Dublin. William III. sent Schomberg to the north of Ireland to make head against this great danger; and William himself followed so soon as ever he could venture to leave England. Things were looking very serious for him. The French had kept up communications with Ireland without difficulty; the English fleet was not thought to be loyal to the new government, for King James had been a sailor, and many of the higher officers were held likely to side with him. The battle of the Boyne (1st July, 1690), however, cleared away this peril. James lost heart, and fled to France; in a very short time the ascendency of William III. was secured in Ireland. It was not too soon. A very few days after the battle of the Boyne, Tourville, commanding the French fleet, had defeated the Anglo-Dutch navy

1691-1697.

off Beachy Head; and in the same month, Marshal Luxembourg won the battle of Fleurus from Waldeck with his German and Dutch troops. In Piedmont Catinat inflicted a grave defeat on Victor Amadeus at Staffarda. Still, the war of 1690 was in the end indecisive, thanks to the battle of the Boyne. In 1691 Louis seemed determined to make a greater effort, and himself besieged Mons, which he took in spite of the attempts of William to relieve it. Little, however, followed after the fall of Mons; the year was marked by the death of Louvois, whose brutal energy had done much to sustain the war. The campaigns of 1692 were to be differently planned; in Catalonia, in Piedmont, and in Germany, there should be no offensive movement; the whole energy of the nation should be staked on a fresh descent of King James in Ireland, and on a land attack on the Netherlands. The war was therefore to be a duel between Louis and William. Tourville was ordered to engage the English fleet wherever he might meet it; it was believed that Admiral Russell and half the ships would desert in action. The experiment was tried off Cape La Hogue, and with disastrous results to the French arms: it was the ruin of the French fleet, the shipwreck of King James's cause. In the Netherlands Louis in person invested Namur, and, again baffling William III., took that strong place, which carried the line of the Meuse, in June. This, which might have been the decisive success of the war on land, brought with it no results; the victory of Steenkirke, in which Luxembourg defeated William, ended the Netherlands campaign. Elsewhere, as had been planned, the operations of the war were insignificant. The campaigns of 1693 were also indecisive; although Luxembourg again defeated William at Neerwinden, the capture of Charleroi was the only result. The aggressive period of the war was coming to an end. In 1694 it became almost entirely defensive; and the death of Marshal Luxembourg in the first days of 1695 took from Louis his most fortunate general. Villeroy, who succeeded him, was a poor officer; the ancient credit of the French army was upheld by Vauban and Catinat. The war in that year was exceedingly languid. The generals were afraid of the court; the king rewarded and promoted the less able over the heads of the more capable. The recovery of Namur by William III. in this year showed how France had lost strength since 1692. In 1696 Louis succeeded in detaching Victor Amadeus from the allies by abandoning Casale and Pinerolo to him, and securing to him his Savoyard territory; and the duke's daughter was betrothed to the duke of Burgundy, the eldest son of the dauphin, the father of Louis XV. This defection of Savoy, the appearance of Catinat in the Netherlands in 1697, the renewed vigor of the French arms, the difficulty of governing England now that Queen Mary was dead, at last led William III. to accept the mediation of Sweden.

The peace of Ryswick.

1697-1700.

The Spanish succession.

The partition-treaties.

Louis XIV. was at least as willing to come to terms; France was worn out with the long war and its great sacrifices; and, above all, it was seen that Charles II. of Spain had not long to live. To be ready to deal with the great questions of the Spanish succession Louis agreed to terms which he otherwise would not have granted. The peace of Ryswick in 1697 was soon agreed to. Louis recognized William III. as king of England, and Anne, second daughter of James II., and a decided Protestant, as his successor. He ceded to the allies all places won from England, Holland, or Spain since the peace of Nimwegen, and consented to a Dutch garrison in each of the Spanish-Netherland barrier fortresses. These three powers had no fault to find with the treaty of Ryswick; Germany, however, was not so well pleased. She had made war chiefly to reduce the French hold on the Rhine; William had pledged himself that Strasburg should be restored; but, as neither England nor Holland would support him in demanding this of Louis, he was fain to make peace without it. The emperor and the princes were very unwilling to come in; at last, however, they signed a separate peace, in which they got back all places taken by France since Nimwegen, excepting Strasburg, and recovered all the strongholds on the right bank of the Rhine. Lorraine was restored to its German duke; the French candidate for the electorate of Cologne was abandoned; and the claims of the Princess-Palatine on the Lower Palatinate commuted for a sum of money. Germany had fair cause therefore to be well pleased with the result. Louis now turned all his attention to the Spanish question; and the failure of his candidate for the throne of Poland, the prince of Conti, in 1697, perhaps made him all the more anxious to prepare the way for the great triumph which he hoped might be won at Madrid. The closing years of the century were passed in active negotiations for this object. The three houses which hoped to gain by the death of Charles II.,—for nations were now treated as the private inheritance of princes,—were the house of Bourbon, the house of Austria, and the house of Wittelsbach. Austria and France desired to acquire the whole heritage; the Bavarian elector would have been satisfied with a partition. The emperor Leopold, head of the house of Austria, desired the Spanish throne for his younger son the archduke Charles, nephew (by marriage) of Charles II., and grandson of Maria of Spain, spouse of the emperor Ferdinand III.; he was therefore only very distantly related to the dying king. Louis XIV. claimed, in spite of renunciations, for Philip his grandson, grandson of Maria Theresa, half sister to Charles II.,—Philip's elder brother, Louis duke of Burgundy, waiving his claim on his behalf. Lastly, Maximilian Emmanuel, elector of Bavaria, claimed for his son Joseph Ferdinand, on behalf of the child's mother, Maria Antonia, daughter of Leopold I. and Margaret Theresa, daughter of Philip IV. of Spain. Leopold I. was the only male cousin of the Spanish king, and his nearest male relation; and Charles II. had also married Maria Anna of Neuburg, Leopold's sister-in-law. Moreover, his rights had never been renounced, while Maria Theresa, on marrying Louis XIV., had renounced hers, and so also had Maria Antonia, mother of the Bavarian electoral prince. The knotty question, however, was not to be solved by paper-considerations; it was a matter for the law of the stronger, and the more unscrupulous; Louis XIV. therefore won. William III., earnest in his desire for peace, and anxious that France should get no additional strength, threw in his lot with the Bavarian prince, and thought that such a partition might be made as would satisfy all. Charles II. also was strongly in favor of the same cause, and made a will in favor of Joseph Ferdinand. This, however, pleased neither Austria nor France, and Count Harrach, the Austrian envoy, got the will annulled, though he could not persuade the king of Spain to recognize the archduke Charles as his heir. Directly after the signature of the peace of Ryswick, Louis XIV. sent the Marquis d'Harcourt, a most successful choice, to represent his interests at Madrid, and ordered Tallard to amuse William III. with a scheme for a partition-treaty. Harcourt was to intrigue for the whole succession at Madrid, while Tallard should make sure of a part at St. James's, in case Harcourt's difficult mission failed. William III. was only too glad to enter into the scheme; and a first partition-treaty was drawn up, by which France, Austria, and Bavaria each should get its part. This treaty Louis used against itself; for it was one of the most cogent arguments by which Harcourt succeeded in persuading the Spanish court and people that if they would keep the great inheritance unbroken, and not destroy the ancient kingdom, they must have the French prince as their future monarch. In spite of much ill-will and great discouragement, Harcourt won his way into the complete confidence of the court of Spain, and utterly outstripped the rough and unwise Austrians. Early in 1699 the young electoral prince died, and the first partition-treaty became void. A second treaty followed, though it was not accepted by Austria; and Louis XIV. in accepting it had no intention of keeping his word, unless it suited him to do so. French influences, from the moment that this second treaty became known at Madrid, were omnipotent with the Spanish court; and in 1700 Charles II. signed another will, in which he left the whole of the grand inheritance to Philip duke of Anjou. After some simulated, and perhaps a little real hesitation, Louis XIV. accepted the will for his grandson, and enjoyed for a brief while the triumph that it brought,—the triumph of successful diplomacy and of a vastly enlarged influence and power. As time went on, it became clear that the king of Spain would not always be the obedient servant of the king of France, and that the connection between the monarchies was a source of weakness rather than of strength.

Philip of Anjou becomes Philip V. of Spain.

War did not break out in consequence, as had been expected; the English, who had disliked the partition-treaties, even preferred the acceptance of the will by Louis XIV. to the cause for which William, with his larger views of European politics, desired to fight; and Philip of Anjou became king of Spain. Louis XIV. protested at once against the view that the two crowns of France and Spain should never be united,—though he had used their certain separation as an argument to influence Spanish opinion,—and reserved the rights of Philip V. to the French crown; in 1714 there was only one person, and he a sickly child, between him and the hereditary right to the crown of France. Though war did not follow at once, it could not long be delayed, and meanwhile Louis XIV. did all he could to strengthen himself. Early in 1701 he made an agreement with the elector of Bavaria, governor of the Spanish Netherlands, and ejected the Dutch troops from the barrier fortresses. It was a haughty denial of the validity of the peace of Ryswick; and, in open violation of the spirit of the same treaty, he soon after, on the death of James II., recognized James Stewart, his eldest son, the "Old Pretender," the "Chevalier de Saint George," as king of England, under title of James III. About the same time the Germans and Dutch, thoroughly alarmed, signed at the Hague a great treaty, "the Grand Alliance," with William III., and bound themselves to restore the Netherlands barrier, to regain the Milanese territory for the empire, to win for the emperor all the Italian and Mediterranean possessions of Spain, to attack and take the Spanish Indies. The emperor, without delay, sent Prince Eugene, his greatest general, to begin the war in Italy; the double-dealing Victor Amadeus, the skilful strategy of the prince, the excellence of the fresh troops under his command, were too much for Catinat, who was obliged to fall back. Louis, who never had liked his best general, was not at all sorry, and sent Villeroy, one of his worst, to supersede him. Villeroy speedily justified his choice by losing the battle of Chiari (1701); almost the whole of the Mantuan territory fell into Prince Eugene's hands. After the surprise of Cremona, early in 1702, Vendôme, who, indolent as he was, was a good general, replaced Villeroy, and by the indecisive battle of Luzzara (August, 1702) recovered some of the lost foothold of France in Italy.

The war of the Spanish succession begins.

Ere this war had broken out on all sides. The death of William III., and the accession of Queen Anne, early in 1702, made no change in the arrangements of the allies for their four campaigns,—the Italian campaign, which was least in importance; the Belgian, in which they aimed at the fortresses; the German, chiefly on the Danube; the Spanish, in which the archduke Charles struggled for the crown. Catinat, transferred to the Rhine, and ill-supported by an unfriendly court at home, the ill-will of which was reflected in the conduct of his officers, could not make head against the prince of Baden, who crossed the Rhine and took Landau. Catinat, who soon after this sent in his resignation, was coldly allowed to withdraw, and France thus lost the most prudent and capable of her remaining generals. The elector of Bavaria was the only strong and true friend the courts of France and Spain had in this war; he bore the brunt of the early periods of it. Louis of Baden had occupied in force the strong elbow of hills and forests between the valley of the Rhine, and that of the Danube, thereby threatening the elector, and hindering him from joining the French. His position was very strong; yet Villars, who was ambitious and lively, and longed for the marshal's staff, determined to attempt the task of driving him out. He accordingly crossed the Rhine, and attacked the Germans at Friedlingen (14th October, 1702), and by good fortune rather than by skill defeated them. His success, however, was not such as to enable him to shake Louis of Baden; he could not even penetrate into the Black Forest. In the Netherlands Marlborough strengthened his position by taking a group of towns, and keeping Marshal Boufflers and the duke of Burgundy actively employed, as they retreated before him from point to point. The defeat of the French fleet in Vigo Bay, and the outburst of the Protestants of the Cevennes mountains, both added largely to the difficulties of France. In the winter Marlborough enlarged his base of operations by occupying the electorate of Cologne, and early in 1703 he had cleared out all the Spaniards in his rear or on his flank. Before the end of 1703 everything was ready for that great advance which was destined to raise his fame to its highest point. And it was time that he went, as he said, "to teach the Germans how to beat the French;" for in 1703 Villars had been very successful in Germany; he had forced his way through the Black Forest, and had joined the elector of Bavaria in the upper valley of the Danube; and the elector had already driven the Austrians down the valley to below Passau. A threatened attack on Vienna came to nothing. Towards the end of the campaign the elector and Villars drove Louis of Baden from his positions, and defeated Styrum at Höchstatt; Tallard, with the army which had watched Louis of Baden in the lines of Stolhofen, returned to the Rhine and took Old Breisach and Landau, as well as won the battle of Spires. On this side the war had been very favorable to France,—an advantage against which the transfer of Savoy and Portugal to the side of the allies had to be set.

Marlborough's campaign of 1704.

These changes, and the continued resistance of the Huguenots in the south of France, enabled Marlborough to arrange with Prince Eugene his great campaign of 1704, in a conference near Heilbronn. Here the so-called triumvirate,—Marlborough, Eugene, and Heinsius—England, the empire, and the Dutch,—laid their plans to neutralize the French advantages in Bavaria, and by cutting the line of their communications, to relieve Vienna from all anxiety. The peril to Austria was great, for the French and Bavarians formed a long unbroken line from the Vosges to Passau. Quite early, therefore, in 1704, Marlborough began to move; he misled Villeroy and Boufflers, who were watching him, and crossed the Rhine at Cologne, with a view to joining Prince Eugene, who held the famous Stolhofen lines. The French and Bavarians drew together to meet this formidable attack; the elector entrenched himself near Donauwörth; Villeroy and Tallard observed the Stolhofen lines. Marlborough, with Prussian and other help, passed through Mainz, crossed the Black Forest, and came out in the Danube valley, joining Louis of Baden near Ulm. Their united forces defeated the elector and took Donauwörth. Thus doing, they had placed themselves between him and his French allies, Marsin and Tallard; and Marlborough, feeling his communications to be critical, and rather alarmed as to his position, drew back up the Danube, till he had effected a junction with Prince Eugene. The elector had also joined his French friends, and they lay in wait for their antagonists in a strong position on the left bank of the Danube, between Höchstatt and Blenheim. There, on the 13th August, 1704, was fought the great battle of Blenheim. The French and Bavarians had the superiority in numbers and position; this, however, they neutralized by faulty arrangements, and by shutting up a large force in the village of Blenheim. The battle was hot and heavy, and the loss to the allies, who were the assailants, great. Eugene made little impression on the lines, but towards evening Marlborough succeeded in breaking through Tallard's position. Thereby he cut the enemy in two, and the French cavalry fled in panic towards Höchstatt. Many were drowned in the Danube; Marsin and the elector drew off in good condition towards the Black Forest; Tallard was a prisoner, his whole force either dispersed or taken. It was the worst mishap that had ever befallen Louis XIV. Bavaria was entirely subdued; Austria and the empire saved; the elector took refuge in France. Louis of Baden was able now to cross the Rhine; Landau again fell into German hands; Marlborough returned to the Moselle, taking Trarbach and Trèves. The war drew nearer to the frontiers of France, and Germany ran no further risk of invasion.

The battle of Blenheim.

In 1705 the duke's plans for an attack on France were neutralized by the slowness and jealousy of Louis of Baden, who did not care to play second to "the handsome Englishman." The Cevennes insurrection being now over, Villars was free to face the allies, and did so with such skill and success that Marlborough was obliged to fall back towards the Netherlands. On the other hand, Louis XIV. weakened Villars in order to strengthen Villeroy in the Netherlands; so that the campaign of 1705 ended without any decisive operations. Not so 1706, the great year of the succession war. Louis XIV. fully intended that the Netherlands' campaign should have in this year decisive results. It was unfortunate for him that his personal likings led him to place in command on that side the incompetent Villeroy, who had to grapple with the victorious troops and masterly generalship of Marlborough. The result was that the duke easily won the great victory of Ramillies (23d May, 1706), which was as decisive as Blenheim; for as Blenheim swept the French out of Bavaria, so Ramillies made them powerless

The campaigns of 1706.

1706-1708.

in the Netherlands. The allies took Louvain, Brussels and Malines, Ghent and Bruges, all in the name of the archduke Charles, whom they proclaimed king of Spain as Charles III. Antwerp, Oudenarde, all Brabant, accepted him at once. His fortunes seemed equally good elsewhere. The alliance between England and Portugal in 1703 had given a turn to warfare in the Peninsula.

War in Spain.

The archduke in 1704 tried to penetrate into Spain from the Portuguese frontier; this failed, partly from the difficulties of the country, and partly from the ability of the duke of Berwick, a natural son of James II., and nephew of the duke of Marlborough, one of the few real soldiers in the service of the king of France at this time. On the other hand the English fleet under Rooke, which was waiting on the archduke, by a stroke of happy audacity surprised Gibraltar (4th August, 1704), and occupied it in strength. The utmost efforts of the French, under the count of Toulouse, one of the natural sons of Louis XIV., failed to recover this all-important rock. The battle of Malaga, though the French fleet had the best of it, damaged their navy so seriously that they could attempt no more; and in the exhaustion of France it proved impossible to refit the ships, or continue the struggle on the seas. In 1705 Charles III., unmolested by them, sailed round Spain, and landed at Barcelona. The Catalans and Aragonese were inclined to support him, while proud Castile held by Philip V. These were the days of the romantic career of the earl of Peterborough. In 1706 the French and Castilian siege of Barcelona came to nothing; the party of Charles took heart, and supported by English, Portuguese, and French refugees, drove Philip out of Madrid, and placed their candidate on the throne.

In Italy, the death of the emperor Leopold having called Prince Eugene away, Vendôme with unwonted energy defeated the Austrians at Calcinato, and swept the allies out of all the Milanese territory. Turin alone remained in the hands of Victor Amadeus II., and was the object of a fierce siege. Prince Eugene, however, returned in time to save the capital; for Vendôme, after Ramillies, had been ordered to the Netherlands, and the change of commanders was everything to the allies. Prince Eugene attacked the French lines at Turin; differences sprang up between Marsin and the duke of Orleans (the nephew of Louis XIV.), and the Austrians won a great victory. Marsin was killed; the French army would not obey the duke; the whole force melted away, and Italy fell completely into the hands of the allies. Thus in the Netherlands, Spain, and Italy, their fortunes by the autumn of 1706 seemed to be completely triumphant. In Spain, however, the Castilians succeeded in ejecting Charles III., and in replacing their favorite Philip V.; and in the opening of 1707, the victory of Almanza, gained by Berwick over Ruvigny, a French refugee officer of ability, finally settled the Spanish question in favor of the Bourbon dynasty. A treaty of neutrality for Italy, by which the emperor Joseph I. secured his conquests there, also released Louis XIV. from some of his anxieties.

The campaigns of 1707 were as unimportant as those of 1706 had been decisive. The appearance of Charles XII. of Sweden in Germany paralyzed both sides a while; Villars, in command on the Rhine, stormed the Stolhofen lines, and pushed into Bavaria, hoping that the Swede would join him with his invincible Scandinavians. Charles, however, cared not to unite his fortunes to the Catholic side, and after some delay marched eastward towards Poland. Villars fell back to the Rhine; Vendôme quietly watched Marlborough; on the sea Duguay-Trouin, the most brilliant of French captains, harassed the Anglo-Dutch commerce, and won very considerable advantages over the English fleet. In 1708 an expedition for Scotland failed completely; and in the Netherlands the duke of Burgundy and Vendôme were caught by Marlborough and Eugene at Oudenarde (11th July, 1708), and utterly defeated. The allies crossed the French frontier and sat down before Lille,—Eugene besieging, Marlborough protecting. By the end of the year the place had fallen into their hands, after a brilliant defence, which, though unsuccessful, won for Marshal Boufflers the distinction of duke and peer of France. Ghent and Bruges, with all Flanders, were secured by the allies; their light cavalry overran northern France, and appeared almost at the gates of Versailles.

1709-1712.

The straits of France.

The fortunes of France now seemed to be at their worst: famine and a bitter winter closed the disastrous year; everything was at a standstill, trade completely ruined, finance in a dreadful state; even the king began to despair, and to negotiate for peace. He had felt his way thitherwards in vain in 1706; now in 1709 he made serious offers. The allies treated his proposals with great severity;

Louis proposes terms.

he was willing to dismantle Dunkirk and ruin its port if Lille were restored to France, to give up his grandson's throne of Spain if Philip might have Naples; he did not absolutely refuse to abandon the electors of Bavaria and Cologne. With such concessions peace was not impossible. The allies, however, insisted on stipulations which touched the old king's personal honor, declaring that as Louis had placed Philip V. on the Spanish throne, he must, with his own troops, if necessary, dispossess him of it again. They also demanded the cession to Germany of Strasburg and Breisach, the erection of a new line of barrier-fortresses between Holland and France, and other lesser matters. To these Louis would not consent, and the negotiations broke down. He appealed warmly to the country to support him, and was answered by an outburst of patriotism which enabled him to send Villars, at the head of a good army, into the Netherlands.

Malplaquet and its effects.

There he fought the great battle of Malplaquet (11th September, 1709), in which Marlborough and Prince Eugene were again victorious, though their losses were tremendous, as they had been obliged to attack a very strong position held by a powerful army. The fall of Mons was the only advantage which resulted to the allies; with that the campaign came to an end. While the battle actually restored the spirit of the French soldiers, who had been skilfully and successfully withdrawn from the field by Marshal Boufflers, it produced a very bad feeling in England. There men were very weary of the war, and the carnage at Malplaquet had been terrible. Louis again offered large concessions to the allies in 1710; the triumvirate, however, were not content to make peace, and still demanded what they knew he would not consent to—his personal interference against Philip V. The campaign of 1710, which followed, was intended to strengthen the allies, with a view to their penetrating the next year into the heart of France. Douai, Bethune, and some lesser places were taken; Villars covered Cambrai and Arras; in Spain Charles III. again entered Madrid, though he was unable to hold his ground there, and before the year's end Philip V. was again triumphant.

Change of opinion in England.

In this gloomiest state of French affairs, when all was in confusion and despair, the old king at bay and too infirm to head the remnants of his armies, the allies firmly planted in northern France, it was believed that, if they could but hold together, they would in one more campaign succeed in entirely breaking the power of their great rival. In England, however, that change of opinion had begun which saved Louis from this last humiliation. The Tory party, vehemently opposed to Marlborough and the war, were gathering strength; the elections of 1710 went in their favor, and early in 1711 the fall of the duchess of Marlborough at court told every one that the reign of the Whigs was over. The death of Joseph I., the emperor, by placing Charles III. on the imperial throne as Charles VI. (December, 1711), changed the whole position of affairs, and made men still more unwilling to carry on the war. It was felt that Europe could no longer sacrifice herself to place him on the throne of Spain as well as that of the empire, and to create a power which might endanger the stability of Europe, and overthrow the balance at which men were aiming. The warfare of 1711 was languid; Prince Eugene was called away to the imperial election; Marlborough and Villars long watched each other on the northern frontier of France. The only result was the capture by the allies of Bouchain, and the arrangement by Marlborough of "a grand project,"—a plan for the invasion of France in the next campaign, when he hoped to have Eugene by his side. In the winter, however, the duke was overthrown at St. James's, and his plans came to nothing. Negotiations for peace were far more to the taste of the Tories than a vigorous foreign policy; and it was announced, late in 1711, that Utrecht had been chosen as a place of conference; the bases of an agreement were easily arrived at. In 1712 the duke of Ormond replaced Marlborough in the Low Countries; his business was to neutralize the Dutch and Germans, who were still eager

1712-1714.

The peace of Utrecht.

for war; and in May England signed a separate truce abandoning her allies. They continued the war a while, but after being sharply defeated by Villars at Denain (24th July, 1712) they accomplished nothing more; the French retook Douai, Le Quesnoy, and Bouchain. Then the Dutch gave up all thoughts of further war, and came in to the English truce; war ceased on all hands, and negotiations went on merrily at Utrecht. At last, in April, 1713, peace was signed by all the powers except the empire on the basis of the treaty of Ryswick. The Germans, thus once more abandoned by their allies, found it impossible to continue long. Villars outgeneralled Prince Eugene, and by defeating him before Freiburg in the Brisgau, and taking that town, showed to the emperor that he also would do well to come to terms. In 1714 two more treaties were signed by the princes of the empire and the Austrians, and the Succession War at last came to an end.

Results of the Succession War.

England was the chief gainer: she secured her succession through the house of Hanover, which now became a ninth electorate; the Pretender was to be compelled to leave France; the crowns of France and Spain were never to rest on one head; Dunkirk was dismantled; Newfoundland, Acadia, and the Hudson's Bay Territory were transferred from France to her; a friendly commercial treaty followed. Holland got a strong barrier on the side of France; the Spanish Netherlands were handed over to the United Provinces, which undertook to transfer them to Austria on the final conclusion of peace. She, too, made a favorable commercial treaty with France. The duke of Savoy was made a king and got Sicily, while Austria received Naples and Sardinia. Prussia received part of Gelderland, and gave up to France all her claims on the Orange principality. England was recognized as mistress of Gibraltar and Minorca. France recovered Lille, and retained Strasburg and the whole of Alsace. Freiburg in the Brisgau, Breisach and Kehl, she had to restore to Germany; the rights of Philip V. to the throne of Spain remained unshaken; the resistance of Barcelona, which obstinately refused to recognize him, was overcome by Berwick in 1714. Far lighter were the terms of peace than those which the triumvirate had tried to force on Louis XIV.; yet the aged monarch must have deeply felt the permanent retrogression which they involved. His splendid ambitions were shown to be unattainable, after they had well-nigh ruined France in the pursuit; she had paid already a terrible price for the glories of a grand monarch and a great age. It would require the awakening of the Revolution to restore her to her right place in Europe. Her old antagonists, Austria and Spain, were also losers by the war; north Germany, under the guidance of the new kingdom of Prussia, was destined gradually to reduce the supremacy of the south, and at last to take its place; England was fitted for the great destinies she was to fulfil in the course of the century; Holland, secure from all disturbance, withdrew from the political arena.

The calamities of France.

A short time before the conclusion of the peace, when things were almost at their darkest for France, domestic losses in appalling succession had stricken down the king. In April, 1711, the dauphin died; early in 1712 the duke and duchess of Burgundy and their eldest boy were carried off by fever; in 1714 the duke of Berry also died. And now of the direct line of the Bourbons remained only Louis XIV. and his great-grandson, the duke of Anjou, the future Louis XV. If the arrangements as to the Spanish crown held good, the dissolute duke of Orleans, whom Louis XIV. disliked and shunned, was the next heir after the little Louis. The country was famine-stricken and most miserable, finance in hopeless confusion, the debt grown to vast size; an annual deficit had long been going on. The whole of the institutions of the country seemed to have fallen into ruin. The nobles had become needy hangers-on at court; they filled the army, and by making it impossible for merit to rise had contributed largely to the disasters of the Succession War.

1715.

Death of Louis XIV.

The brief remainder of this long reign was of little importance. The ignoble persecution, which had overthrown Port Royal in 1710, continued against the Jansenists to the end; and 1714 Louis tried to strengthen Madame de Maintenon's party against that of the duke of Orleans by decreeing the legitimization of his bastard sons by Madame de Montespan—the duke of Maine and the count of Toulouse,—and by making a will to secure the regency to the duke of Maine and Le Tellier, his Jesuit confessor. Then on the 1st of September, 1715, he died, leaving the crown of France to his great-grandson Louis, a child five years old. Madame de Maintenon, who had at last shown how wearisome was the task she had borne for thirty-two years, and how thankful she was in her old age to be relieved from it, abandoned the king just before his death, and withdrew to St. Cyr. And so passed away a monarch who had certainly been great, though not in the highest sense of that word,—whose soul had been beneath the level of his circumstances. It was with an instinctive movement of relief and pleasure that France heard the tidings of his death. The load of misery he had laid on the shoulders of his people had become too great to bear. He had used them, their strength and the labor of their hands, without stint or regret; but had never done anything to solace their woes, and in the worst and most famine-stricken times the wasteful expenditure of the court remained undiminished, and the cares of the Great Monarch never descended so low as to the poor people, whose fortunes the steady growth of the absolute monarchy had placed entirely in his hands.

A new age begins.

Philip of Orleans regent.

The reaction in France.

For France the 18th century begins with the death of Louis XIV. The party which had surrounded the late king, the party of Madame de Maintenon, the Jesuits, the duke of Maine, represented the past; their opponents were ambitious to represent the future. At their head stood Philip, duke of Orleans, who had in extremest form all the characteristics of the Orleans branch of the Bourbon family,—who was brilliant and most intelligent, highly educated and cultivated; who was brave and capable as a soldier, full of good ideas as to the benevolent management of the people, and lastly, profligate and utterly without rule in his moral life, so that his better side was always neutralized by his worse qualities, and he ended by failing completely in his attempt to govern France on principles opposed to those of Louis XIV. Like so many of the prominent personages of the 18th century, his intellect grasped the future, while his vices clung to the past. Even while the old monarch's remains were being hurried with scanty pomp and tearless eyes to St. Denis, Philip of Orleans swept away all the arrangements of the royal will, and had himself declared regent, with full power to appoint his council of regency. The public opinion, as far as it could exist and express itself, warmly supported this *coup d'état*, and the party of the duke of Maine shrank into utter obscurity. At once the regent set himself to reform the government, and alter the foreign policy of France; in this he was guided partly by his knowledge of the plans of the late duke of Burgundy, and partly by the acute intelligence of his former tutor the Abbé Dubois; the duke of Burgundy represented also the virtuous, the abbé the scandalous, side of the new Government. In home affairs the regent's action aimed at a complete reversal of the late king's methods. He proposed to shift the work of governing from the king to the nobles; there were to be six business councils or boards,—for foreign affairs, army, navy, church affairs (the "council of conscience"), home affairs, and finance. This system of government failed, partly through the indolence of the regent, partly through the inaptness of the nobles for practical business. In church matters, the Jansenists were not unpopular and came back to Paris; Cardinal Noailles, head of the council of conscience, was moderate and tolerant, and the Jesuits felt that their power was much weakened. The regent even talked of inviting back the Huguenots to France; this, however, was beyond his powers. He had Fénelon's *Télémaque* published at last, as a kind of manifesto against the late reign, and a prophecy of the coming era of benevolent princes. He hoped to introduce throughout France the system known as that of the *pays d'états*, a system of local estates or parliaments, which should lead up to a real and substantive States-General, and make all the provinces alike in form of government. This also he could not carry into effect. In foreign affairs Dubois led; his main view was that France and Spain could not be friends, that Philip V. would gladly represent the old high Catholic interference in France, and would do his worst to overthrow the regent, whose character and ideas alike were odious to him. This being so, here was reason for another reversal of the late king's views; France should seek her friends among the natural foes of Spain,—England under the house of Hanover and Holland. The marked Anglomania, the enthusiasm for everything English, which is to be seen at this time in France, worked in well with these new lines of foreign policy. With these views Dubois set himself to resist the bold schemes of Cardinal Alberoni, the adventurer, the would-be regenerator of Spain. In 1717 he succeeded in combining the three countries in opposition to Alberoni, and in 1718, on the emperor acceding to the league, the Quadruple Alliance (France, England, Holland, the empire) was signed. The detection of the Cellamare plot, for the overthrow and assasination of the regent, had enabled Dubois, just before this time, to get rid of all the Spanish party. He deported Cellamare, the Spanish ambassador, and imprisoned the duke of Maine and the leaders of that side; he also took for himself the post of foreign minister. War now began; England crushed the Spanish fleet; the imperialists, in British ships, seized Sicily; Marshal Berwick won some successes in northern Spain. The basis on which Alberoni had built was too slight to bear the strain of unsuccessful war; he fell, and early in 1720 the treaty of London closed this little war. Spain ceased thenceforward to cherish schemes of life and energy; the ancient kingdom lapsed once more into proud decay.

The Quadruple Alliance.

At this very moment France greatly needed some triumph and some tranquillity, for she was now rudely waking from new dreams of gambler wealth at home. The financial difficulties inherited from the late reign had baffled all the skill of the duke of Noailles, who presided over the council of finance. His "chambre ardente," with which he had hoped to cure the evils of the time by punishing and frightening financiers, brought no relief; and the regent, whose active mind and indolent disposition led him to adopt new and brilliant schemes, was carried away by the clever suggestions of John Law of Lauriston, an adventurer, in whose ready brain new ideas as to finance and banking teemed. He had hold of some half-truths respecting the real objects and character of money and commercial circulation.

John Law the financier.

Paper money was a new thing; and Law believed that notes, based on the permanent wealth of the country, the soil, might be made to double the nation's capital, and relieve it of all its embarrassments. He was allowed to establish a bank of his own in 1716. This answered so well that in 1718 Government undertook the whole mystery of banking, with Law as director of the new Royal Bank. In connection with this institution, intended to set afloat paper supported by the property of the state, he started his famous Joint-stock Mississippi Company, with its grant of Louisiana, and all the unknown, and therefore marvellous, wealth and resources of the interior of North America.

The Mississippi Company.

The shares were greedily taken up; the new bank notes seemed to afford an easy and inexhaustible supply of wealth, which would extinguish the debt, and set the country forward in lucrative enterprise. For a few months the fever was amazing; the wildest excesses of stock-jobbing and gambling were committed; on the wings of this paper-wealth the state should escape out of its difficulties, and private persons fly up to splendor. Law himself bought a handful of titled estates, and seemed to become one of the greatest men in France. Early in 1720, however, confidence was shaken, and then the bubble burst. Law stood his ground a while, but at the end of the year he was obliged to take flight, as poor as when he began. The embarrassments of France were not got rid of in this way; the royal bankruptcy which was impending would in the end pull down the monarchy.

Cardinal Dubois.

Dubois, who had prudently kept clear of this downfall, now turned his ambition towards church preferment; on his unworthy head were placed first the archiepiscopal mitre of Cambrai, then the cardinal's hat. His rise made it necessary for him to appease the Jesuits and depress the Jansenists, and this he did without a moment's hesitation. For a year Cardinal Dubois, as first minister, was the foremost man in France. He proclaimed the majority of Louis XV. in 1723; and just as his career of scheming, of clever unprincipled government, seemed crowned with fullest success, a little accident brought him to his grave. Four months later his boon companion the duke of Orleans was carried off by apoplexy. Thus had the long reign of Louis XV. begun with shameless vice and prosperous hypocrisy; as it began, so it continued to the end; and all the time the financial difficulties of the country grew apace. The debt, seed-plot of revolution, soon passed all power of management.

Character of Louis XV.

The young king had some chances given him; he had good preceptors, and intelligent people around his youth. His temperament was, however, entirely bad: the religious element in him was superstition and fear, which led him to mix up piety and debauchery in most ghastly connection; he was coldly selfish, indolent, vicious; the absolutions of his courtly confessors and directors gave him an easy conscience, if he had a conscience at all, and encouraged him to continue his career of shameless immorality, till at last his vices did what religion seemed unwilling to do,—they arrested the scandal of his life by bringing him suddenly and directly to his grave.

The Duke of Bourbon minister.

From 1723 to 1726 the duke of Bourbon, who had been president of the council of regency, was first minister. It is an obscure period, which produced only, through a back-stairs intrigue, the marriage of the young king with Marie Leczinski, daughter of that Stanislas who had been king of Poland, and was to be the last duke of Lorraine, and who rejoiced in the high-sounding title of the "Beneficent Philosopher." In this 18th century princes and great ministers adopted titles and phrases which in our days have descended to the level of the vendors of quack medicines. Still these affectations of princely humanity were a phenomenon of some importance in the period, as showing how the current of feeling and opinion was setting towards those principles of right, that love for mankind, that zeal for good works, which is based on the intrinsic equality of all men. The rule of the brutal duke of Bourbon and his mistress, the Marquise de Prie, came to an end in 1726, and then André Hercule Fleury, bishop of Fréjus, the king's preceptor, took his place. The statesman Fleury, and the church historian, contemporaries, are not the same person. The historian was confessor to Louis XV., the statesman his tutor.

Cardinal Fleury.

André Fleury, now first minister and cardinal, had the credit of being an upright and disinterested man,—Pope calls him "honest Fleury,"—and all society, from the king downwards, thoroughly trusted him. His honesty, however, was narrow and limited, and his home government obscure and uneventful. He made no scandals and attempted no reforms. Against his will and judgment he left his mark on foreign politics, though here, too, his was a "hand-to-mouth" policy, which involved no large view or grasp. At first he succeeded, with no little dexterity, in arresting the war which Austria and Spain, supported by Russia and Prussia, threatened against England and France. The congress of Soissons in 1729 arranged the points at issue, at least for a time.

The north of Europe.

In the north, however, matters were more difficult, for here new elements had entered into the political world. The new ambitions of Russia under Peter the Great, and the consolidation of the young kingdom of Prussia, at once affected the position of Austria, involving that ill-placed state in fresh relations and duties; while the situation of Poland, amidst them all, was obviously threatened. France, of old the friend and always the romantic admirer of Poland, could not fail to be involved in the quick and unstable changes of the chivalric kingdom. This now occurred.

The Polish error.

In 1733, Augustus II. of Poland dying, the electing nobles, instinctively dreading the power of their neighbors, Russia, Prussia, and Austria, who had made a secret compact together as to Polish affairs in 1732, appealed for French help, and re-elected Stanislas Leczinski their king; he had been the nominee of Charles XII. in 1704, and had fallen with him. The Russian party among the nobles elected Augustus III. of Saxony, and as Austrian and Russian soldiers supported him, while France, in fact, did nothing but declare war against Austria, he seated himself firmly upon the throne of Poland. French influence for the time was utterly defeated, and Stanislas, after suitable romantic adventures, found refuge in France. The war with Austria, which began late in 1733, in 1734 occupied the last energies of the last of the old generals of Louis XIV. Marshal Berwick, commanding across the Rhine, was killed in the trenches before Philipsburg; and Villars, in Italy, after one brief campaign, in which he was thwarted by the duke of Savoy, died at Turin about the same time. The French fought well in this Italian war; they won a hotly-contested victory near Parma, lost a sharp affair at La Secchia, and defeated the Austrians at Guastalla. The Spaniards, taking advantage of the weakening of Austria in south Italy, landed Don Carlos at Naples, where he was warmly welcomed, and the "Two Sicilies" passed from Austria to the Spanish Bourbons. The French having taken Philipsburg were in a commanding position on the Rhine, while the Austrians were much weakened in Italy. The emperor therefore made proposals for peace, which pacific Fleury gladly met. The treaty of Vienna (3d October, 1735) seemed to secure French influence in central Europe; the Two Sicilies were made a kingdom for Don Carlos; Lorraine and ducal Bar were given to Stanislas Leczinski, who abandoned all claims on Poland, and at his death the duchies were to fall in to France; the duke of Lorraine was made heir of Tuscany, and succeeded to that government in 1737; France undertook to guarantee the Pragmatic Sanction of Charles VI. Charles VI., under whom the house of Austria daily grew weaker, was daily more eager for the flimsy security of this famous document, which aimed at ensuring the undisputed succession of his daughter Maria Theresa to all his possessions, as head of the house of Austria. Fleury, by acceding to this paper-guarantee, became all powerful with him, and induced the emperor to sign the peace of Belgrade (1739), by which the possession of that important city passed to Turkey. In these years Fleury's policy seemed thoroughly successful, and France was believed to be prosperous. Her prosperity, however, did not reach her people; the misery of the peasantry in 1738–1740 was exceedingly great; famine came each winter; the people died in crowds. D'Argenson in his *Mémoires* declares that "more Frenchmen died of misery in these two years than perished in all the wars of Louis XIV."

The Pragmatic Sanction of Charles VI.

The first Silesian war.

In 1740 died both the emperor Charles VI. and Frederick William, king of Prussia; the strength of the Pragmatic Sanction had now to be brought to the test. Charles VI. left no male issue, and his daughter Maria Theresa, married to a weak prince, Joseph of Lorraine and Tuscany, was his sole heir. To the throne of Prussia succeeded Frederick II., a slight and ingenious prince, who admired the French and played on the flute. He reigned for forty-six years, and was Frederick the Great. Instantly there was a scramble for the great and widespread lands thus left to a woman's care. Joseph of Lorraine failed to get the imperial crown; this, however, was a little matter, and after all it came to him in 1745. For the territories there were several claimants: Bavaria, Spain, and Saxony, all asserted their claims to the whole inheritance; the king of Sardinia wanted some Italian fiefs; the young king of Prussia laid hands on Silesia. France obviously lay outside the quarrel; yet it was hard to think, with Fleury, that a peaceful and reserved position was her best policy. A war-party, headed by the two Belle-Isles, Fouquet's grandsons, negotiators and soldiers, rose up at court in opposition to the old minister. All Europe ranged itself for or against the fair young queen of Hungary. England was warmly for Austria; France, late her ally, now hoped finally to effect the partition of the territories of the house of Hapsburg, and joined Prussia; Spain followed on the same side, being already at war with England; the elector of Bavaria and other German princes, Poland also and Sardinia, were on the same side. At first Maria Theresa seemed to have no friends save England and Russia. The first Silesian war had already begun by the swift seizure of Silesia itself by Frederick. The French plan was to repeat the German campaigns of the Spanish Succession War,—with Bavaria as an ally to cross into the Danube valley, and having taken the outworks of Austria, to threaten Vienna, and drive the queen to submission. The French army was led by Belle-Isle, who was made marshal for the occasion. It crossed the Rhine, pushed down the Danube, took Linz and Passau, and seemed to carry out its plan in full. Maria Theresa took refuge in Hungary; the elector of Bavaria had himself proclaimed archduke of Austria, and then, supported by French help, marched into Bohemia, and took Prague, the capital. He was now crowned king of Bohemia, and soon afterwards elected emperor (1742). Belle-Isle's schemes seemed all to succeed. Time, however, had told on the struggle; Russia began to intervene; England and Holland sent help to Maria Theresa; Prussia, securing the main part of Silesia, made peace with the queen of Hungary; and the French by the autumn of 1742 were left alone in Bohemia, face to face with the revived strength and spirit of the tenacious house of Austria. In mid-winter Belle-Isle was compelled to retreat from Prague, and after terrible sufferings and losses, brought his army back to the Rhine. In this campaign the one great general of the age, Maurice of Saxony, whom the French henceforth called Marshal Saxe, distinguished himself greatly. Early in 1743 the aged Fleury, whose last days had been embittered by the war and by its failure, died in his ninetieth year. Henceforward, Louis XV. had no one at his side to save him from the disasters of mistress-government, of which the malign influences grew yearly stronger. The war in 1743 again followed the ideas of Marlborough. The English and Germans hoped to command middle Germany, to capture or eject Charles VII. at Frankfort, and then to catch the French in Bavaria. With this view George II. and the allies pushed forward hastily to the Main, and, but for the equal rashness of the duke of Grammont, would have been intercepted and ruined by the French army. As it was, George II. won the battle of Dettingen, which in England was celebrated by Handel's famous *Te Deum*, and in France aroused vast merriment; for defeat in the 18th century meant the discrediting of the noble officers. The Parisians called the battle the "Journée des bâtons rompus,"—the day on which the marshals' batons were not won by D'Harcourt and Grammont. The French armies of Bavaria and the Rhine fell back into Alsace, and Charles VII., seeing how little help they could give, made peace with Maria Theresa. Her fortunes and hopes had risen vastly; she thought she saw her way to the recovery of Silesia from Prussia,—the recovery of Alsace and Lorraine from France. In 1744 war, which had slackened, renewed its force.

The second Silesian war.

A new league of Frankfort brought Frederick of Prussia again into the field. France undertook to reduce the Netherlands, and to check England by landing Charles Edward, the "Young Pretender," in Scotland. This part of the scheme failed completely. In the Netherlands the genius of Marshal Saxe accomplished all France desired; the barrier-towns had been neglected, and fell one after another. The ill-success of their army in Germany, and the vigorous attack of Prince Charles of Lorraine on Alsace, compelled the French to suspend operations in the Netherlands, in order to strengthen Coigny, who commanded on the Rhine. Their want of power spoiled Frederick's campaign in Bohemia; Charles of Lorraine returning thither forced him to withdraw into Saxony. In 1745, in spite of Frederick's wishes, the war on the French side returned to the Netherlands, and there, on the 10th May, the French army won its one decisive victory of the period, defeating the Anglo-German and Dutch forces under the duke of Cumberland at Fontenoy. Louis XV. was present in this action, and showed no lack of fire and bravery. This victory was decisive for the campaign; the Netherland towns fell fast. In Italy also the battle of Bassignano laid Lombardy at the feet of the French. On the other side Frederick the Great, though he still won great victories, felt that Maria Theresa was growing stronger. Her husband's ambition was gratified with the imperial crown; and at the very end of the year she consented to make peace, ceding Silesia to her vigorous rival, and securing the universal recognition of her spouse as emperor. The peace of Dresden (Christmas, 1745) closed the second Silesian war.

The peace of Dresden.

France was now almost isolated; her successes in the late year seemed of little avail to her; the attempt of Charles Edward on Scotland was crushed (April, 1746) by the duke of Cumberland at the battle of Culloden; and the English sea-power began to show its vigor. Off the French and Spanish coasts England gave her foes no rest; in India she recovered Madras, which had fallen into Dupleix's hands, and spoiled the French plans for ascendency in the East. In this year, too, the French armies were very unfortunate in Italy, and lost all their command of the peninsula. The Netherlands campaign, guided by Marshal Saxe, alone sustained the honor of the French arms; Belgium fell completely into their hands. In 1747 Marshal Saxe, though he took Bergen-op-Zoom, failed before Maestricht; and France seemed as far as ever from being able to coerce Holland. In the following year the siege of Maestricht was resumed, but negotiations for peace intervened, and the great fortress was not reduced. The peace of Aix-la-Chapelle, of which the preliminaries had been signed in April, was finally

1748-1754.

The peace of Aix-la-Chapelle.

concluded in October, 1748. It greatly discredited France; the successes of her arms in Belgium, Savoy, and Nice, were of no avail against the strength her antagonists had developed. England and France mutually restored their conquests,—France receiving back Cape Breton and England Madras; the frontier fortresses, chief prizes of the late war, were handed back to Holland. France agreed to remove Charles Edward from within her borders, and guaranteed the succession of the house of Hanover. Silesia was secured to Frederick; the Pragmatic Sanction, in all other points, was once more accepted by Europe; the house of Austria also ceded Parma and Piacenza to the Spanish Don Philip. With this peace closes the long rivalry between France and Austria; when war breaks out again they will be allies.

Madame de Pompadour.

"To the government of an old priest succeeded that of a young mistress," says Michelet; for this was the time in which Madame de Pompadour rose to power. Her authority lasted twenty years,—the twenty years in which France sank rapidly in Europe into weakness and discredit, while her great writers were awaking all the dormant echoes of the world, and summoning together the forces which brought on the Revolution. The mistress made and unmade ministers at will, and changed the whole face of the foreign policy of France; the scandals of the court under her rule set men listening to the new ideas which spread swiftly through France; the more the noblesse descended in worth and strength, the more its younger members talked the language of modern humanity. Almost all, like the state, were more or less bankrupt, and unable by character, training, circumstances, to take advantage of the movement of society around them. When France awoke she scattered them to the winds.

The unsettled condition of Europe.

Europe was very far from being finally pacified by the peace of Aix-la-Chapelle; on the contrary, every one seemed to see rents and holes in it through which he might win new advantages. Frederick the Great was no doubt content with it, and so was England; others, however, were far from such feelings. Maria Theresa had reluctantly set her hand to the cession of Silesia, and scanned the horizon for help to enable her to recover that important duchy.

Rivalry of England and France.

France was almost as uneasy, for England had gained advantages which were in fact her losses; and she, too, hoped ere long to reverse the decisions of the treaty. In India her prospects seemed bright, under the brilliant leadership of Dupleix; in North America the peace had left very serious matters still unsettled, and it was hardly likely that any court save that of the sword could decide the difficult questions still open,—questions as to the limits of the Acadia which had been ceded to England; vital questions as to the connection between Canada and Louisiana, both still French territories; questions as to the islands off the coasts of America, the ownership and possession of which had been left undetermined. Acadia had been ceded without any definite statement as to whether the cession carried any portion of the mainland as well as the peninsula of Nova Scotia; and England claimed the territory as far as the shore of the St. Lawrence river. This was a smaller matter; the question as to the relation between Canada and Louisiana involved no less than the ultimate possession of all North America. For while England held the coast, and hoped to combine the wealth of agriculture with that of commerce, she had always behind her the long line of French possessions and claims, which interfered with her colonizing development, and threatened to push her back to the sea. For France had the Canadian lakes, the valley of the Ohio, and that of the Mississippi; she had communication with the sea on the north at the estuary of the St. Lawrence, on the south in the Gulf of Mexico. Were she to secure the connection through this long line, the English colonies would be terribly straitened and endangered; the French forts along the Ohio seemed a perpetual menace to English interests. Consequently the doors were scarcely shut on the negotiators at Aix-la-Chapelle, when fresh discussions began to spring up, and conferences were held, in a more or less angry tone, at Paris. In 1754 England, thinking that France was only lengthening out the dispute because she hoped to strengthen her navy for a fresh struggle, suddenly made war, without a proper declaration, and fell on French ships and forts whenever she could capture them. It was a high-handed and offensive proceeding. In India also an undeclared war was going on between the officers and forces of the East India Company and the French under Dupleix, which brought out the latent power of that young civilian, Clive, and ended in 1754 in the recall of Dupleix, and in a peace, or at least a cessation of warfare, between the rivals on the Indian shores. It was quite plain that before long this state of half-warfare must develop into a more serious struggle. To that also the whole movement of European politics speedily began to tend. For it was not only at Paris and London that negotiators were busy in these years; the Austrian court, eager for revenge on Prussia, and led by a strong and dangerous statesman, Kaunitz, was looking hither and thither for new alliances. The world had grown weary of the old lines of opinion, the old rules of policy, the old relations of courts. Kaunitz deemed himself the chosen instrument of a new departure, which would rearrange the map of Europe, and restore its proper authority to Austria and the empire. This statesman, father of modern diplomacy, and more especially of that side of it which has ever since been cultivated at Vienna, had administered the Austrian Netherlands in the last years of the late war, and had represented Austria at the congresses of 1748. In 1750 he was sent as ambassador to Versailles, and, as he watched the manners and temper of French society, persuaded himself that he saw his way to new combinations which might be very profitable for his mistress. The experience of Aix-la-Chapelle had convinced him that England was not trustworthy when her interests clashed with those of Austria. He saw how his country had suffered by the peace; it seemed to him that France would be a far better ally than England. Hitherto France had steadily played the part of friend and protector of the smaller North-German states, in their struggle against the dominance of the house of Austria,—this was a natural and necessary result of the secular rivalry against the Austro-Spanish power. Now, however, Prussia had taken up the post of champion of North-German interests and opinions; whereas France, by her new Bourbon relations in Spain, and her support of the Jacobites against the Hanoverians in England, had entirely changed her ground. She was far more likely to find a cordial friend in south than in north Germany; she had nothing to fear from Austria; she had much to lose or gain in the north; the Hanoverian interests of the reigning dynasty in England led the Guelfs to oppose the advance of France on the Rhine; the jealousies on other sides between France and England all tended in the same direction,—the direction of compelling France to look for new friends, and to abandon her ancient policy. Prussia became the inevitable ally of England; France began to look towards Austria. The disagreements between Austria and Holland as to the barrier-towns in the Belgian country naturally threw the sea-powers together; for neither Holland nor England cared to see Austria on that side, or to find a new rival rising up at Antwerp. Now, all political alliances are based rather on interest than on sentiment; and when it grew tolerably clear that the interests of England and France and those of England and Austria had become widely divergent, it became equally clear that new combinations must come. Austria was altogether implacable towards Prussia; England, or rather the English court, in its anxiety for Hanover, felt that Prussia could be no rival, and might be a good friend. Prussia was not a sea-power, and was a very near neighbor to Hanover. And so, when Kaunitz tried to persuade the English cabinet that it ought to join Austria in a war for the recovery of Silesia, he found so cool a reception that he at once turned elsewhere. His knowledge of France taught him how to succeed there; it must be by appeasing and interesting Madame de Pompadour; and the king of Prussia had lately offended not only her but her parasite the Abbé Bernis by his unpleasant trick of plain speaking; and the political independence of late years asserted for Prussia was also highly distasteful at Versailles. He knew that if he could overcome the reluctance of Louis XV., who clung to the older ideas of French policy, and persuade him also that Austria could be a good friend against England, he might succeed in reversing the political conditions of Europe, and perhaps win Silesia back for his mistress. He easily persuaded Madame de Pompadour; her influence was his from 1751; but the king was slow to move. Not till 1755, when the insults of England to the flag of France were too great to be borne,

1754-1755.

France and Austria.

Changes in European policy.

did he determine to accept the good offices of Kaunitz, and to threaten Hanover. England at once drew towards Prussia, Hanover being the bond of union between them. While the two Catholic powers formed their alliance together, and Madame de Pompadour, as men noticed with a smile, showed quite a fervor of devotion which seemed not in the least incompatible with her moral position, the two Protestant powers, England and Prussia, set themselves to resist the Catholic movement, and, if possible, to secure the triumph of toleration in northern Europe. In this France undertook an ultra-conservative line of policy, in union with her old antagonist; she ceased to lead, or even to sympathize with, the advancing states of Europe; it was the old world she would support, the new order of things could no longer count on her. And, besides all this abandonment of traditional policy, in itself no little risk, the new alliance made with Austria was, on the face of it, a political blunder; there was nothing to be gained by it, and much to be lost. For the essential points to which the whole care of France should have been given were across the sea, in Canada and in India; and here she was allying herself with the most inland of European powers, excepting Poland, which could scarcely be reckoned as a power at all, and bending all her energies to attack England by a march across north-western Germany into Hanover; hither went her strength, while the English were left to carry out unmolested the plans on which their future greatness hung. Had the new coalition been successful, Austria would doubtless have crushed Prussia, but what advantages could France have reaped from the war? Her position in it was that of quite an inferior and secondary power; the contest would exhaust her already diminished strength, and teach the world how low she had fallen; and if she failed, it would be little less than ruin to her. England, however, having (early in 1756) signed a treaty of neutrality with Prussia, France delayed no longer. On Mayday, 1756, the "Alliance des trois Cotillons," "of the three petticoats," as it was styled, the coalition of Madame de Pompadour with Maria Theresa and Elizabeth empress of Russia, was formally undertaken, to the vast delight of the French court and nobles, which longed for the pleasures of a great military promenade in such good society, assuming that the French people would, as usual, bear the cost, and leave to them the excitement and the glory. It did not turn out so amusing as they had expected. This treaty of Versailles was immediately followed by a declaration of war on the part of England; and Pitt before very long had smoothed over all difficulties which lay in the way of an offensive and defensive alliance with Prussia. The elder Pitt was regarded with as much fear and hatred by the court of Madame de Pompadour as the younger Pitt was by the republicans forty years later in the days of the Terror. The allies were chiefly tied by circumstances and mutual convenience to occupy different portions of the field of war,—England grappling with France, and Prussia with the Austrians.

The "Alliance des trois Cotillons."

The Seven Years' War.

At the beginning the French navy had no small share of success. During the peace great attention had been paid to it, and the growing importance of her commerce had reared for France no despicable school of mariners. At the outset of the war a great expedition commanded by Marshal Richelieu, who has the bad distinction of having done more than any other man to debauch and corrupt that apt pupil the king, set sail from Toulon harbor, and directed its course for Minorca, which was occupied by the English in force. Richelieu took Port Mahon and invested St. Philippe, on which the English had expended vast toil, hoping to make of it a second Gibraltar,—a second point of influence in the Mediterranean. A relieving force of seventeen ships, commanded by Admiral Byng, son of the first Lord Torrington, was handled so ill that it was defeated and driven off by the French fleet under La Galissonnière, and shortly afterwards the fort of St. Philippe was carried by assault in a very brilliant manner by Richelieu. With it the French became masters of Minorca, and Richelieu returned in glory to Paris. Very different was the reception of Byng in England. There the news of the fall of Minorca had created terrible excitement; the ministry fell, and Pitt took the reins of power in his hands. He and the old Whigs at his back were known to be anxious for vigorous measures, and for a hearty co-operation with Prussia. Byng was sacrificed to the resentment of the people; his incapacity and vacillation in the presence of the enemy were regarded as signs of treason, and he was shot as a traitor. The war, thus favorably begun by France, ought to have been carried on by the same lines; her chief strength should have been directed to the sea. If fortune favored her still in the maritime struggle, she might fairly have hoped to win her cause in Canada and India. But the unlucky likings of Madame de Pompadour for Kaunitz and the Austrian alliance threw the country off its right course, and embarked it on a harassing and perilous Continental struggle. At first, though Spain, Poland, and Holland remained neutral, almost all the rest of Europe,—Russia, the elector of Saxony, the German diet, and Sweden,—declared for Austria; and after that Frederick's sudden invasion of Saxony in autumn, 1756, showed that the war was really begun, Louis XV. in January, 1757, declared war on him, and openly joined the league for his destruction. Hesse and Brunswick alone supported Frederick. For this France willingly abandoned her success on the sea. She had seen Pitt's first effort, the attack on Rochefort, fail ignominiously; she had driven off another fleet which threatened St. Malo and Havre; she had news of successes in both Canada and India; still, rather than make these omens of fortune her own, she turned aside to invade Hanover, and plunged into the larger war, in which she could never hope to win any real profit for herself. While Frederick was attempting in vain to crush the Austrians by reducing Bohemia, whence he was obliged to retreat after the disastrous battle of Kolin (18th June, 1757), the French army, 80,000 strong, and commanded by Marshal D'Estrées, crossed the Rhine, and directed its course towards the Weser. The English and their allies were commanded by the victor of Culloden, the unwieldy duke of Cumberland, who posted them behind the Weser at Hastenbeck; here D'Estrées overtook and defeated him (26th July, 1757). The victory was, however, not complete enough to please the French court, with whom D'Estrées was not popular. He was removed, and the duke of Richelieu taking his place pushed the English before him to the Elbe; at Stade the duke of Cumberland was compelled to surrender his army, and to sign the shameful convention of Kloster-Zeven (8th Sept., 1757), which permitted the defeated Germans to return home. Home also went the duke of Cumberland, shorn of his honors as the savior of the Hanoverian cause; him, however, the English did not shoot, as they had shot poor Byng. Marshal Richelieu having thus disposed of his antagonists, deemed that his work was done; it only remained for him to make the most of his conquest in the way of pillage; so instead of marching on Brandenburg, which was almost bare of troops, he contented himself with extorting a fine fortune from the Westphalians and Hanoverians, with which he built himself a splendid palace at Paris, the Pavilion de Hanovre. This was but a poor result, considering that it was believed that, had he pushed forward, he might have brought the war to an end in one campaign. His selfish indifference to the duties of high generalship wrought the ruin of his cause. While he lingered in Westphalia, the English began to recover from their panic; and Frederick, returning with incredible swiftness out of Saxony, arrested the course of disaster. The French army under Richelieu had been told off to overcome the Anglo-Hanoverian resistance; another army, under the prince of Soubise and the duke of Saxe-Hildburghausen, who commanded the troops of the German circles, was slowly moving towards Berlin, hoping to co-operate with Richelieu's victorious forces. Their progress, however, was rudely interrupted at Rosbach, on the 5th of November, 1757, by Frederick, who caught and utterly ruined them in a battle which cost him almost nothing, and was over in an hour and a half. Rosbach was one of the decisive battles of the world, little as it has been thought of by history. Perhaps it has never happened, before or since, that so hollow and slight a contest has produced such great results. At first it seemed like a mere comedy; the crowd of French captive regiments, the spoils of the camp, the bewilderment of the captors, the "host of cooks and players, of wigmakers and wigs and hairdressers, the parasols and cases of lavender water," the absurdly incongruous lumber with which the young French nobles had prepared for war, contrasted strangely with the gaunt and tattered soldiers of Frederick the Great, grim with war, privations, and forced marches.

The French in Germany.

The battle of Rosbach.

A shout of merriment rang through Germany, and was re-echoed from France herself. The light-hearted French were far from being depressed or vexed by the defeat; in the middle of the 18th century France was utterly indifferent as to glory, and the country saw in Dettingen and Rosbach not its own defeat, but the discomfiture of the frivolous noblesse; to the temper of the times these glaring instances of noble incapacity were rather pleasant than not. The effects of the battle on England were also very marked. It was there seen that Frederick's cause was not hopeless; and the English Government at once refused to be bound by the convention of Kloster-Zeven, appointing as commander-in-chief, in place of the duke of Cumberland, the vigorous and able Ferdinand, duke of Brunswick, one of the best soldiers of the age, who won and thoroughly deserved the respect and confidence even of Frederick the Great. Hitherto England had sent over nothing but money and the duke; now Pitt undertook to bring 20,000 Englishmen into the field, and henceforth England holds a principal place in the French side of the Seven Years' War. The greatest, however, of the results of the battle of Rosbach was its effect on public and national feeling in north Germany. Hitherto all men of cultivation and thought had turned to France for inspiration; all men of taste and fashion regarded France as the arbiter of their destinies in dress and manners; the French language was alone polite in courts and good society; the German tongue was counted rude and barbarous; Frederick the Great himself, the very champion of Germany against France, of modern freedom of thought against his Catholic opponents, the odd "Protestantium Defensor" of his medals, could never bring himself to speak or write German if it could be avoided. But after Rosbach the older fashion passed away; French manners, which before had seemed so beautiful, were now seen to be corrupt and frivolous; the slower Germans saw that their own manners and tongue were worth something; from the battle of Rosbach begins that upspringing of a national life in north Germany, which finds immediate expression in the splendid new-born literature of the day, of which the most direct and marked example is the *Minna von Barnhelm* of Lessing. In this way, then, the battle of Rosbach is an epoch in the national history of Europe. It restored the fortunes of Frederick the Great, and roused a new sense of national patriotism in the North-German peoples.

After 1757 the Seven Years' War may be considered as having two chief theatres,—that of Frederick against Austria, and that of England with Hanover and Brunswick against France and the lesser German princes, the "army of the circles." It is with the latter only that we have to do.

The campaign of 1758.

In 1758 France made great efforts to reorganize her armies, and fit them for decisive action in Low Germany. A new commander-in-chief, the count of Clermont, a weak offshoot of the great house of Condé, replaced Richelieu; Soubise, whose favor at court endured to the end of the reign of Louis XV., and who was the only courtier who ventured to escort that monarch's remains to the grave, was placed at the head of a new army. Under these two generals the court hoped to achieve good results in this campaign. The two main armies were directed, the one towards the Rhine, the other towards the Weser; that of the Rhine, under Clermont, had the strong position of Wesel, now in French hands, as a base of operation, and proposed to push on thence into Hanover, joining the other army under Soubise, which was to advance along the Weser through the Hessian country. Before, however, they could draw their scattered forces together, the new general of the allies, Ferdinand of Brunswick, was on them, and in a campaign which Frederick the Great did not hesitate to compare with that of Turenne in Alsace, he succeeded in dislodging Clermont from Brunswick. He speedily cleared the line of the Weser, recovering Minden, and driving the French under Clermont to the westward. They made no stand, and when they reached the Rhine at Düsseldorf, succeeded in crossing the river only with heavy loss of prisoners,—for Ferdinand stuck to their skirts like an avenging fury, and at last caught them at Crefeld, a little town between the Rhine and the Meuse, not far from Düsseldorf, where he inflicted on them a defeat which covered Clermont with discredit, and utterly ruined the prospects of the campaign. The Germans had now driven the French out of Hanover, Brunswick, and the Rhine provinces; Clermont was recalled, and withdrew into private life. He and his antagonist Ferdinand were both freemasons, and both had sympathies with the philosophical and political ferment of the age; yet the masonic brotherhood had not hindered Ferdinand from punishing him very severely in this campaign. Marshal Contades, a really good general, was sent to take command of the beaten forces; and Soubise, having won the battle of Sondershausen, and having taken Cassel, threatened Ferdinand's rear, while a reorganized army under Contades endangered his communications on the Rhine; they were twice as numerous as the forces he could bring against them, and he was obliged to draw back on Münster, giving up the whole left bank of the Rhine. There he hindered the junction of the two French armies, and compelled Contades to retreat again beyond the Rhine; while Soubise withdrew to the Maine, and lay for the winter about Frankfort and Hanau. So ended the German campaign of 1758, into which the French Government had thrown all its strength, and had once more got in return nothing but discredit, while the other interests of the country had been left to drift to ruin. The English fleets harassed the coasts of France, destroyed ships, burnt building-yards, took Cherbourg, and paralyzed her whole naval force. Abroad, she did nothing for the vital contests her sons were waging; the English took Senegal on one hand, and, in spite of the ability of Montcalm, mastered Louisburg, and Fort Du Quesne on the Ohio, which they renamed Pittsburg. At the same time the struggle in India, which had begun to turn against France, was restored by the brilliant courage of an Irish Jacobite, Lally, whom the French court named governor general. On his arrival he at once effected wonders, recovering the ground the French had lost; he vaunted that no Englishman should be left in the Peninsula. But Lally, brave and brilliant as he was, was also harsh and impetuous, arousing ill-will even by his good qualities. Nothing offended his subordinates so much as his refusal to allow them to pillage at will; and the bright opening of his career in India was very soon clouded over by disputes and insubordination among his officers, which foretold a coming failure.

Affairs in India.

The mishaps of 1758 on every side at last awoke the Abbé Bernis from his dreams of security and glory, and that obsequious churchman, the henchman of Pompadour, in his cowardly alarm, instead of trying to repair the evil done, withdrew to his bishopric of Aix, giving place to an abler statesman, the duke of Choiseul, one of the most unfortunate of the noble ministers who have ever presided over the affairs of France. His first act was the signature of a second treaty of Versailles, in which he and Madame de Pompadour committed France to terms which plainly meant that France should bear the chief burdens of the war, while Austria should win all the fruit. For she promised to keep 100,000 men on foot, to support the whole Swedish contingent, to restore the elector of Saxony, to defend the Austrian Netherlands, and to support the candidature of Joseph, eldest son of Maria Theresa, for the title of Rex Romanorum, and the succession to his father in the empire, and finally to make no peace with England till Prussia had restored Silesia to Austria. With this amazing treaty France again went stupidly down into the contest, as an ox to the shambles.

The duke of Choiseul.

The campaign of 1759.

In 1759 the old blunders were again repeated; all was abandoned for the sake of the German campaigns; the Rhine army under Contades lay in the Cleves country; the Maine army near Frankfort was commanded by the duke of Broglie, who had already given sufficient proof of his incompetence at Rosbach. Between these armies, watching both, and purposing to hinder their junction, and, if he could, to beat them in detail, lay Ferdinand of Brunswick, now reinforced with twelve thousand English and Scottish soldiers, who had joined him in the last autumn. He thought himself strong enough to attack Broglie, but was repulsed with loss at the battle of Bergen on the Nidda, a few miles from Frankfort; and Broglie, made a marshal for this success, succeeded in effecting a junction with Contades at Giessen; thence they advanced together to the Weser, occupying one place after another. At Minden they paused before pushing on to overrun Hanover, while Ferdinand, having gathered all his forces together, came down to observe and check them. Difference arose between Contades and Broglie; the latter was successful popular, incapable; the former a good officer, whom the fatality which had beset the French court since the later days of

Louis XIV. had thrown into the cold shade; the two were hardly likely to work well together. Ferdinand took advantage of their errors, and (1st August, 1759) with much smaller numbers and the worse position, ventured on a great battle at Minden. The English regiments of foot, with unheard-of audacity, charged and overthrew the French cavalry, which, with amazing ineptitude, had been placed in the centre, as if it were the most solid part of the army. Had Lord George Sackville, who commanded the English horse, done his duty also, the whole French army might have been destroyed or made prisoners. As it was, the exploit of the "Minden regiments" rang through Europe; and the French army, hastily evacuating its positions, fell back to the Maine. Contades, the good general, was of course punished; Broglie remained in command. Later on, he showed his gratitude to the Bourbons by opposing the Revolution as an émigré. Henceforward Ferdinand was able to hold his own in western Germany, and England felt secure for Hanover. The French went on placing huge armies in the field for the rest of the war; yet thanks to "the most perfect incapacity," as Napoleon once said, of Broglie and Soubise, this great force achieved nothing, and succeeded only in still further discrediting the noblesse and the monarchy, while it exhausted with fearful speed the resources of the country.

The battle of Minden.

The disasters of France.

Nor did France pay the price here only; her efforts in Germany still hindered her from attending to her interests elsewhere; the disasters of her navy went on; her influence in Canada and India declined day by day. An attempt to invade England in 1759 failed completely; the battle of Quiberon Bay, and the cowardice of Conflans who commanded there, ruined the French navy; a squadron sent out to harass the coasts of Scotland and northern England, under Thurot, a real sailor, was attacked early in 1760 by a stronger force; Thurot was killed, the squadron captured, and so the French naval power came to an end. Henceforward, no help could pass from France to the outlying scenes of conflict. Point by point the English had advanced in Canada, until (September 13, 1759) the battle of Quebec, which proved fatal to both Wolfe and the brave Montcalm, finally decided the destinies of North America. That victory gave to England the ascendency over Canada, and secured to the sons of the Puritans the eventual mastery over the rest of that great continent. The fall of Montreal in 1760 was the close of the struggle. In India also French affairs had gone very ill in these days; the quarrel between Lally and Admiral d'Aché increased in bitterness; the English finally captured even Pondicherry, the last remaining stronghold of the French in India. This year 1759 is, on the whole, the most disastrous in all the annals of France; it proclaimed with a clear voice to all who would hear that the days of the ancient monarchy were numbered. The monarchy could not defend France abroad, it was dying of debt and corruption at home. It was little help to France that in 1760 the unhappy Lally, whom men in their vexation accused of treason, was brought home, tried, and shamefully executed at Paris. It was not on him that the eventual punishment would fall; in 1778 the generous voice of Voltaire made France confess her injustice, and restore to honor the name of the unfortunate and brilliant Irishman. His son Lally-Tollendal gave to the fallen monarchy a loyalty and support it surely little deserved from him.

Changes now began which pointed towards peace. The accession of George III. shook the power of Pitt; in France the subtle address of Choiseul had carried all before him, and he at last saw his way, too late, to reverse the direction which the efforts of France had hitherto taken. The war in Germany, always a blunder, should become of secondary importance; the active friendship of Spain and other Bourbon princes should restore something of the old sea-power of France. The king of Spain had also found out his folly in remaining neutral, while England grew to be supreme on the water; and consequently in 1761 the famous "Family Compact," the Bourbon league, was signed by all the sovereigns of the house of Bourbon. By it they made alliance offensive and defensive, guaranteeing the territories of one another, promising to support each other and to make no separate peace or war, throwing open reciprocally all their harbors and frontiers, and declaring that for war or peace, for trade or pleasure, France, Spain, Naples and Sicily, Parma and Piacenza, should count as but one country, one land blessed by Bourbons, and led by their great chief Louis XV. Here was a splendid scheme for the reconstruction of European politics! It was the Latin races clasped together by the Bourbon family, and determined to reassert their importance in Europe. Had the family compact been signed three years earlier, or had there been one man of real power among the Bourbons, its result might have been serious for the rest of the world; as it was, the chief effect of it was the resignation of Pitt, and the half burlesque ministry of Lord Bute. For Pitt got some inkling of this secret compact, and, confirmed in his suspicions by the equivocal language of the Spanish court, urged on his colleagues the necessity of declaring instant war on Spain, so as to crush her fleets before France could come to her help. But George III. would none of it; the ministers refused to take the bold step, not having the justification for it in their hands; and Pitt threw up the seals of office. When the compact became known to the world in 1762, England justified Pitt's foresight by at once declaring war; in a few months the Spanish navy had ceased to exist, and France lost her West-Indian Islands one after another. Bute with the young king stood aghast at the series of brilliant triumphs which signalized their efforts to bring war to an end. Meanwhile the French armies in Germany continued an inglorious if not any longer a disastrous career. In 1760, 1761, 1762, they still occupied Hesse and the Rhine country, fighting a few battles with varying success, and displaying in the clearest light the incapacity of their leaders. Negotiations for peace went on through 1762 between France and England, and before the year ended the preliminaries of peace had been signed, just in time to save Soubise with his 80,000 men from being ignominiously driven out of Hesse-Cassel. Frederick the Great, thus abandoned by George III., was also ready for peace. In February, 1763, the two treaties of Paris between France and England, Spain and Portugal, and of Hubertsburg, between Prussia and Austria with Saxony were signed, and closed the Seven Years' War. To French historians it had seemed, as Michelet ventures to call it, "an ignoble war;" a record of blunders and follies, met by shouts of derision at home; for the French people were, at the time, as much amused with the downfall of their incapable nobility as if they had belonged to a totally different race. It was as if they wished to say to Europe that these defeats and scandals were not the defeat of the French people, but of an intrusive clique of strangers; it was also as if the inextinguishable gayety of the nation could find even the ruin of the country comical. Doubtless, in more or less unconscious fashion, France felt that the war had brought the domination of the Bourbon monarchy and its noble flatterers nearer to an end.

The Family Compact.

Close of the Seven Years' War.

The peace of Hubertsburg.

The peace of Paris.

A summary of the stipulations of the peace of Paris shows at a glance how low France had fallen, how futile had been the Family Compact. She ceded all her claims to Nova Scotia, Canada, Cape Breton, reserving only her fishing rights and some small islands useful for that industry; she ceded all the territory which lay between the English settlements along the Atlantic and the line of the river Mississippi; she ceded the islands of Grenada, Saint Vincent, Dominique, Tobago. She received back Pondicherry, and a certain district on the east coast of India; she gave up Minorca, the one flower she had plucked in all the war, to England, and withdrew all her troops out of Germany. England came out chief gainer from the war; her development in these years was immense. To this time we owe the maritime supremacy of this country, and the spread of the English language and race to every shore. We have good reason to be proud of it, and to read with kindling eye the chronicle of our incessant advances. Yet it has, too, its dark side: a world filled with pushing Englishmen could scarcely be a paradise; there are races which object to being thrust aside; there are civilizations which English commonplace cannot supersede; the dull self-satisfaction of ordinary "Anglo-Saxonism" is at least as offensive as the livelier "Chauvinisme" of our neighbors.

The state of France.

In the eleven uneventful years which form the remainder of Louis XV.'s reign the characteristics of the 18th century displayed themselves with clearness, and we shall do well to pass them briefly in review. In them we shall recognize at once most of the germs of those movements of the Revolution-era, towards

1763.

which affairs in France had long been tending.

The court.

To begin at the top;—the court was so corrupt that we must go to the history of the most Oriental despots for a parallel. The king, coldly dissolute, idle, careless as to everything except his scandalous pleasures, and the direction of foreign affairs, which he kept in his own hands, shut himself up at Versailles, leaving Madame de Pompadour to manage everything, even the details of his own debaucheries; the infamous Parc aux Cerfs spread shame and misery among hundreds of families, and added heavily to the financial difficulties of the time. No member of the royal family was of any mark; the pious queen lived neglected and forgotten; the dauphin, whom the king disliked, because he did not wish to be reminded of his successor, was a friend of the Jesuits; there was no other prince of consideration. Consequently, all fell into Madame de Pompadour's hands; and till her death in 1764 she too might well have cried "L'état, c'est moi."

The noblesse.

And if the princes of the blood were ciphers, still more so were the nobles,—a needy well-bred throng, if of the older race, an obsequious and despicable crowd, if of the newer creations. To a large extent this proud noblesse was quite modern; for a long time noble fiefs had been changing hands rapidly; and as citizens grew wealthy they bought themselves into the sacred circle of privilege. No love of country, no desire to devote themselves or to resign their rights, existed in a body which had been steadily degraded by Louis XIV., had been tempted into display which meant debt, and had been carefully kept away from their estates, lest social independence should lead them to think and act for themselves. The more embarrassed and dependent they were, the better pleased was the spirit of absolutism, which thought it natural that they should crowd the army and disgrace the country in war by their vices, frivolities, and imbecility. When at last they had to stand up, face to face with the crisis of the Revolution, they were absolutely unable to defend themselves; their pride and poverty alike forbade them to sacrifice their privilege, and to submit to taxation with their fellow subjects.

The clergy.

The clergy were cut asunder, and had a divided existence. The prelates, bishops and dignitaries, and the religious houses, on the one hand, were in all essential respects on the footing of the nobles, and took part with them. They, too, were privileged landholders, who could inflict heavy burdens on the people, while they would bear no weight on their own shoulders. These are the privileged classes, who brought about the Revolution. The king and his court, the nobles, and the upper clergy,—these chiefly caused it, and these were the chief sufferers from it. The rest of the clergy were a very different race; they were simple curés, parish priests, by birth and interest allied with the people, not with their lords,—men whose meaner position gave them a chance of being and doing good. Arthur Young, who travelled through France on the eve of the Revolution, bears witness to their general excellence and devotion to their duties.

The citizens.

The burgher class in France had grown wealthier; manufactures were not unknown; trade increased rapidly; financiers, money-lenders, new nobles sprang from this class; the public creditor in these days grew to be a power in the state, very far removed from the peasant on the soil or the fierce artisan in towns, and yet advancing the revolutionary current by producing many of the writers, and much of the general intelligence of the time.

The lawyers.

By the side of them we may place the legal profession, that conservative body, which struggled in vain against all invasions of ancient usage, whether from the side of king or of people, and which in the end gave many victims and some leaders to the Revolution.

The peasantry.

In the country the state of the people was wretched, though it is true that in many districts the soil was already much subdivided, and the peasant proprietors numerous. It was reckoned that about a quarter of the soil was in their hands; yet their condition was little the better for this. Their burdens were still very heavy, their knowledge and methods of tillage rude; they had no capital to expend on the land, no good tools, no cattle, no manures; winter after winter they fell to famine-level, and sustained a miserable existence till the sun again revived them, and sent them forth once more to labor in the fields. Fortunately, the French winter is short; if, however, a long winter did set in, as in 1709, or again at the beginning of the Revolution, then the sufferings of the people were extreme, and multitudes perished of cold and hunger.

1763.

The feudal aids and services—the corvée, the "pigeon-right," the game laws, the common wine-press, and common mill, and a hundred other oppressive and even fantastic services—left the peasant no rest, and forbade him ever to hope for comfort. As he gained in intelligence, and rose above the dead level of ignorance in which his masters had carefully kept him, he saw more and more to vex and anger him; as the people gained, they became more ripe for revolution. The robber bands in central France, and the inability of the authorities to cope with them; the growth of a large class of restless spirits, who dimly echoed some of the theories of the philosophers, and practised a new and lawless method of distribution of property, by robbing and destroying as they could; the diminution of population in the country, and the tendency of the land in the less fruitful parts to relapse into a wilderness,—these things all go to prove the wretchedness of the peasant life, and were all ominous of change.

The capital.

These conditions of the country, and the improvements of the burgher class, brought on another change which was little noticed at the time, though it afterwards forced itself on the attention of all Europe. For miles round Paris it became known that there was work to be had in the capital. In the 18th century Paris changed her character; no longer a mere court-seat or city of pleasure, she had gradually become a great manufacturing centre, and into her flowed crowds of dissatisfied or starving folk from all the country round. This immigration went on down to the great outbreak. It largely increased the city population, provided the rough material for the excesses of the Revolution, and helped to stamp the mark of Paris on the whole republican movement. It is hardly too much to say that the want of money at court, combined with the want of food in the cottage, brought about the explosion. These were the social and physical conditions of ferment,—the intellectual movement which dignified the Revolution with great names and imbued it with grand ideas demands brief independent notice.

Literature in France.

The literature of the Great Monarch's time is usually assumed to be the golden age of letters in France. Yet if power and effect on the destinies of men and states be taken as the test, the literature of the 18th century far surpasses that of the 17th. Molière and Racine had been at the beck of the court. They never appealed to the people; still less would the lofty muse of Corneille care to speak to common ears. But in the 18th century, by the side of the superstructure of society falling fast to pieces, and the oppressed substructure, growing daily more restless, the authors formed a third and an independent power, eager to push on the ideas of the age, as they found expression in sciences or practical matters, or as they formulated an easy philosophy or announced as startling novelties the earliest commonplaces of political rule. And the significant fact is that these simple rules of political life were really a revelation to France, and for the first time set her people thinking on such matters. So completely had the country ceased to be a political body,—so completely had the pernicious principles of Louis XIV. destroyed liberty and constitutional life, that all had to be begun again; and the field seemed open, as well for what appear to us to be the most harmless commonplaces, as for the most startling speculations and theories. The difficulty was that to France the one was just as new and strange as the other. It must never be forgotten that the Revolution called on her not to amend a constitution, but to make a fresh start, from the very beginning. Moreover, this state of things necessarily placed literature in opposition to all existing powers. The ancient faith, the old traditions of noble lordship, the learning of the lawyers, all alike were attacked with unsparing hand; and literature built up for itself a strong public opinion of its own among the classes which had hitherto been as nothing in the government of the country. The 18th century literature of France received its first impulses from England. The age of Queen Anne, the advance of philosophy and natural sciences and of letters in England, the quickened connection between the two countries in the days of the regency, had enormous influence on intelligent Frenchmen. Montesquieu, a nobleman and a lawyer, with the temper of a constitutional statesman, was the advocate of political liberty, after the English pattern. Voltaire became the champion of tolera-

1763.

tion and freedom of conscience, and had learnt from Locke; the Encyclopedists, following the English leaders in natural science, wrote their vast dictionary of human knowledge, in opposition to all established beliefs; and lastly, Rousseau, the sentimentalist, addressed himself to the sympathies of the people, and was, in the end, the chief teacher of those who carried out the Revolution. Voltaire began his literary life in 1718, with his *Œdipus*, an attack on priestcraft. He had been brought up by the Jesuits, and yearned to attack them; in 1725 his *Henriade* exalted Henry IV., afterwards the hero of all Frenchmen in the Revolution, at the cost of Louis XIV.; then he was in England for three years, and came back full of English deism and English humanitarianism. Henceforth his life passed in alternate attacks on courts and adulation of them; he withdrew at last into the Genevan territory, whence he directed the defence of the oppressed, if they fired his sympathies. Thence also he encouraged the progress of the *Encyclopédie*, which, more than anything, undermined the shaking fabric of society. Meanwhile Montesquieu, in his *Esprit des Lois* (1748), as well as in his previous work on *The Greatness and Fall of the Romans* (1734), appeared as a first master of modern French style, and as a champion of English constitutionalism in opposition to the despotism of France. Though his works have been perhaps more popular in England than in France, their effect on educated opinion was still very strong. His views did not prevail in the Revolution-period; still, they had no small influence destructively, by pointing out to Frenchmen how indefensible was the government under which they were willing to live. "The *Esprit des Lois*," said Count Grimm in 1756, "has produced a complete revolution in the mind of the nation. The best heads in this country (France) for the last seven or eight years have been turned towards objects of importance and utility. Government is becoming more and more a matter of philosophic treatment and discussion." The writers on political economy also deeply influenced the tone of the age; their doctrines effectually disposed of the faulty maxims on which financial affairs had been conducted since the days of Colbert, and prepared men to see the importance of Turgot's plans, and the significance of Necker's *Compte rendu*. Lastly, Jean Jacques Rousseau, the clockmaker's son from Geneva, began his seductive strains. Musician and sentimentalist, he hit the right tone for the popular ear; between 1759 and 1762 he published the *Nouvelle Héloïse*, the *Contrat Social*, and the *Émile*; the *Contrat* was greedily devoured by society, high and low, as a revelation of a new code of politics, in which he boldly affirmed the sovereignty of the people, and the equality of all men, all being born free. His *Émile* was an attack on all existing ideas as to education; nature should take the place of the schoolmaster; and the priest and philosopher should alike be kept aloof from the training-ground for men and women,—for Rousseau was as little tolerant of the Encyclopedists and their science as of the Jesuits and their religion. Lastly, his *Héloïse* dealt with the moral code of mankind, subverting many ideas, filled with noble, often impracticable sentiments, and leaving the impression of change and uncertainty even in those subjects which seemed least open to difficulty. He appealed to men's conscience and sense of right against the ruling vices and selfish immoralities of the day; and men, seeing these glaring evils sanctioned by the presence of the priesthood, if not by its participation, warmly adopted the new ideas, and desired a revolution in morals as much as in religion or politics. It was the outcry of nature against the infinite falsenesses of a complex and corrupt society. The great *Encyclopédie* was managed chiefly by D'Alembert and Diderot; the former traced its ground plan, and wrote the preface and some mathematical treatises, while the latter supervised it, and acted as the chief editor. The general tendency of the work was to attack religion, and to substitute in its place the conclusions of modern science: with D'Alembert and Diderot worked Helvetius the materialist, Holbach, Grimm, Raynal, and Condorcet, of whom the last represents that passion for man, that warmth of heart and sentiment, which draws him somewhat near to Rousseau. Among the great writers of the time must not be omitted the harmonious Buffon, who laid before his countrymen a splendid sketch of the material world and of the creatures that inhabit it. It is the work of a poet rather than of a scientific student: we find a cosmogony, an eloquent picture of man and man's fellow-dwellers on the globe,—if written with truthfulness or not we need not ask; at any rate, with skill and power he enlarges men's horizon. He too can praise God in his works, and in so doing can leave the established beliefs on one side. In all the literature of the age we see new grounds for speculation on every stage: theology, letters, sciences, natural history, politics, constitutional ideas, morality, all alike are grappled with by writers who shake themselves clear of existing trammels. Rejoicing in a new freedom, they familiarize the younger generation of France with revolutionary ideas in every line, and render the coming explosion more complete and more permanent than any movement that the world has seen since the first preaching of the gospel to mankind.

1763-1774.

The fall of the Jesuits.

At the close of the Seven Years' War the Society of Jesus was on its trial throughout Europe. The Order had changed its ground; it had long ruled in kings' courts, and was paying the price of the means by which it had gained ascendency therein; it had become both rich and troublesome to society. And the general tendencies of the times were against it; above all, it incurred the deadly hostility of those enlightened ministers who, in almost every court of Europe, were directing the new-born energies of states. Such men as Pombal in Portugal or Choiseul in France could not but resist Jesuit influences which clashed with their own, whether these regarded the interests of courts or the welfare of peoples. In 1762 the parliament of Paris, influenced largely by Madame de Pompadour, took their affairs, which had become secular enough, into its consideration, and decreed that the Order should be abolished. Louis XV., after some hesitation, confirmed their decision in 1764, and the Order was expelled from France. It is significant of the general movement of the period that the other Catholic powers speedily did the same, until in 1773 Pope Clement XIV. (Ganganelli) finally suppressed the Order.

Choiseul's policy.

On the death of Madame de Pompadour in 1764, Choiseul still continued to hold the chief direction of affairs. His ministry, besides his belated foreign policy of the *pacte de famille*, was noted for more than one solid reform; he reorganized the army, instituted the *École militaire*, saw to the progress, so far as he could, of the navy, encouraged colonization, and in 1768 united Corsica to France. He represented the philosophic spirit at court, in antagonism to the Jesuit party, and the favor of Madame de Pompadour more than neutralized the king's dislike to him,—for Louis XV. was very jealous of any interference with the one branch of government in which he took interest, foreign affairs; and in these Choiseul was ambitious, if not very successful. So things went on till 1770, when a new mistress made the ground untenable for him. The low-born beauty, Madame du Barry, was the tool of all intriguers, and gained unbounded influence over the worn-out king. Choiseul and the Jansenists, who had enjoyed a brief tranquillity after the fall of the Jesuits, now went out of favor; the parliaments, which Madame de Pompadour had used and favored, were exiled, and in their stead came a new system of administration of law. The old purchase system, which gave stability to the parliaments, and dated from early Bourbon times, was swept away, and royal nominees were set to fulfil the functions of the parliaments. It was thought that the change from officials by purchase to officials by royal grace would be welcome. France, however, distrusted them, and said that the "gratuitous justice" so much vaunted, meant nothing but injustice guided by gratuities.

Madame du Barry.

The Parlement Maupeou.

Partition of Poland.

Louis XV. lived long enough to see the first partition of Poland (1772), that great blow to French influences in the north; nor could his interference hinder the signature of the peace of Kainardji in 1774, by which Russia, supported by England, got hold of the Black Sea shores. His effort to seize the Netherlands, as a counterpoise to these rapid additions to the strength of the northern powers, was a complete failure.

Death of Louis XV.

In the same year 1774 Louis XV. died,—died as he had lived, in flagrant vice. His reign of nearly fifty years had been a continual misfortune for France. During the period she is brilliant only in her literature, and even there we are conscious of something unwholesome and unnatural.

Some years before this the dauphin had died, leaving a

The character of Louis XVI.

young son, Louis, who was married in 1770 to Marie Antoinette, daughter of Maria Theresa of Austria. This young couple, handsome and well-meaning, now came to the throne in 1774, inheritors of the terrible destiny which Louis XV. had prepared for his grandchildren. He, cold and selfish, had foreseen the coming tempest; but "it will last my time," he said, and cared no more about it; he felt as little for his grandson as for his country. In the midst of the scandals of the court Louis XVI. had preserved his purity, and with it a charming simplicity which, while it seemed likely to render the difficulties of his position less, seemed also likely to arouse men's sympathies for him, and find him friends in need. And in later days, when he deserved it less, men, even while they struggled against him, often fondly called him "their good king." He loved his people, as a good despot might, and tried to mitigate their misery in famine-times; his kindliness, however, was but weakness—his simplicity stupidity; he was obstinate and yet not firm; and his good and bad qualities alike made him incapable of grappling with the new phenomena of society which broke on his astonished sight. We find that in the most thrilling moments of his history, his chief anxiety often was how he might get out to his hounds.

Marie Antoinette.

Marie Antoinette was a very different personage; she had much of her mother's high spirit; she was always a foreigner in France. In the early days of her beauty, when all Frenchmen were inclined to worship chivalrously at her feet, she shocked them by laughing at usages which seemed to them the ordinary course of nature. As time went on it was plainly seen that she came between the king and his tendencies towards reform; that she formed a court-party of her own, made and unmade ministers with no regard for the feelings of France, and no preferences except for the worse over the better public servants; that she more than neutralized all the king's economical wishes, and was extravagant and reckless; that in the crisis of affairs she led the king away from his subjects, and taught him to rely on German help. And so, while the virtues of Louis XVI. may have retarded the revolutionary outbreak for a few years, his weaknesses and the character of his spouse made the eventual explosion all the more complete and terrible.

Beginning of the reign.

The opening of the reign was a period of hope; all seemed to go so well. The king and queen themselves were no common mortals: so young, so innocent, so graceful, they formed a strange contrast to the gloomy selfishness of the past. And roused by a gleam of hope, literature itself also passed into sentimental idyls; the court was itself idyllic; at the Little Trianon the king and queen played at farm and mill; the unreadable sentimentalities of Florian were the delight of Versailles; the innocent pictures of Gessner's pen had a great popularity; the days of Paul and Virginia were not far off. These things occupied and deluded the upper world; the middle world smiled in bitterness over the keen satires of Beaumarchais; the lower world starved and turned uneasily on its frozen couch. The well-meant attempts of the court to administer charities, "to make little alms and great galas," as Michelet phrases it, only served still more to irritate the discontented crowd.

At first all seemed well; the ministers of Louis XV., obscure and corrupt, vanished; some gleam of prosperity shone on agriculture, and the court was inclined to reduce the disorders of finance. No able statesman could the king find at the beginning; he was obliged to trust to Maurepas, a frivolous and incompetent old man, who did the state one great service, for he led Louis XVI. to entrust the finances to Turgot.

The ministry of Turgot.

Turgot was a disciple of the economists, who had worked miracles of prosperity as intendant of the Limoges district,—a man of good faith, high character, and ability; but, like many others, he thought that what seemed so simple to him would at once commend itself to all, and entirely underrated the resistance which the interested noblesse and the court itself would make to his reforms. He at once proposed his remedies for the evils of the time,—the only true remedies—economy and the abolition of privilege. The state should spend less, and should draw its supplies from all orders of men alike. To the court and the nobles this seemed revolution and ruin: even the king was startled. Instead of supporting his minister manfully, he recalled the banished parliaments, and thought to shelter himself behind the law. The lawyers, however, special lovers of use and privilege, felt instinctively that Turgot was their foe; from that moment his fate was sealed. A great league was formed against him; the powerful help of the scandalous *pacte de famine*, the grain-ring which had been established with the approval and participation of Louis XV., was enlisted in behalf of the privileged orders; a famine ensued in 1775, and lasted three years. Louis XVI. was frightened; all seemed to be against him; and at last in 1776 he dismissed his one great minister. "Turgot and I are the only men in France who care for the people," was the king's mournful complaint; it was time that the people should begin to care for themselves.

1775–1780.

The *pacte de famine.*

Necker becomes finance minister.

Jacques Necker, an ingenious Genevan banker, who seemed to have the art of creating resources, now became finance minister. He was a high-typed charlatan, who grasped no principles, tried no heroic remedies, but thought only how to make credit and float the country over its difficulties. Unfortunately for him, the strain of war expenditure was added to his other burdens, for France was moved by her fate to take part in the American struggle now beginning. Necker's idea was that he might stave off the imminent bankruptcy of the state with paper and credit, and that, to be successful in this, he must lay the proper foundations of credit, knowledge and honesty in dealing. With this end before him, he wished from the beginning to issue his *Compte rendu*, and thereby to let France know how she really stood. This, however, he could not at first carry through, so that he was obliged to borrow for the state on his own credit, and to shift as he best might. People trusted him, and he crossed no angry and alarmed interest: but for the American war, he might have held out a considerable time. The war, however, was growing urgent. At first it had been volunteer work; for young French nobles, fired with a new zeal for liberty, went over to support the colonists in their struggle; and though the court at first was afraid of war, thanks to its embarrassments, it could only look with favor on this new sea-power rising up to counterbalance the overbearing supremacy of England. The most noted of the volunteers was the Marquis de Lafayette, who manned a frigate at his own cost. The Saratoga disaster in 1777 made more active measures necessary; the Americans were enthusiastic, and France, pushed by the popularity of the war at court, made a treaty of alliance and trade with the colonists early in 1778. Then began a great maritime struggle. England declared war on France, and tried to raise up embarrassments for her in Germany; but the skilful diplomacy of Vergennes, foreign minister of France, arranged the peace of Teschen (May, 1779), thereby avoiding a great European war, and also, in all probability, securing the independence of the United States; for it freed France from anxiety by land, and enabled her to push on her war at sea. An alliance with Spain against England followed. The war lasted about five years, and was marked at first by a striking revival of vigor in the French navy. The sea fight off Ushant (July, 1778), though it did not enable the French admiral D'Orvilliers to claim an actual victory, had revived hope and confidence in the country. The war was waged in five theatres,—in the Channel, at Gibraltar, in North America, in the West Indies, and in India. The French attack on Gibraltar in 1779 was entirely foiled by the strength of the place and the ability of Elliot; the threatened descent on the English shores came to nothing; in the West Indies D'Estaing defeated Admiral Byron. In 1780, however the English roused themselves, and their more real strength began to appear. Rodney defeated the Franco-Spanish fleet, relieving Gibraltar and Minorca from blockade; then sailing for the West Indies, he helped the English cause against the insurgent colonists and their friends. At this time a new and powerful engine was set in motion against England; it was in 1780 that the system of the Armed Neutrality, in which French diplomacy had a hand, was proclaimed by Catherine II. of Russia. Freedom of navigation for all was asserted. England had insisted on visiting neutral ships, and on confiscating all warlike munitions; she defined these by a long list of articles possibly useful to a belligerent, such as timber or iron, out of which ships could be built. The contention of the empress was that the flag protects the cargo; also that neutral ships, if escorted by a neutral war ship, are free from visitation, and

The peace of Teschen.

The armed neutrality.

that a "paper blockade,"—that is a blockade announced but not supported by a sufficient force,—is not to be recognized as real. France, Prussia, Spain, Denmark, and Sweden, the kingdom of the Two Sicilies, Austria, all adhered to the Russian proclamation, and equipped armed ships to assert this new and liberal maritime code. When Holland also joined the other states, England at once declared war on her, and crushed her without mercy. As an immediate result, the French navy seemed to secure the ascendant in every quarter. De Grasse defeated Howe in the West Indies, and sailed thence to support Washington and Rochambeau against Lord Cornwallis. The combination was thoroughly successful, ending in the famous capitulation of York Town (October, 1781), which indicated that the struggle between England and her colonies must soon end in the discomfiture of the mother-country. In 1782, however, things seemed to go better with England: in India affairs looked brighter; Rodney defeated De Grasse off Saintes in the Antilles; Gibraltar held out firmly, though Minorca had fallen. Later in the year England made peace with the colonists, and recognized the independence of the United States; it was felt that the new Rockingham ministry would be willing to make peace with France. And France, much as she had distinguished herself in the war, was too much exhausted to wish to push it further. The sea-rights of Europe had been asserted against England; America had secured her freedom; France had played a brilliant part, with one hand protecting Holland, and with the other giving independence to the United States; she, too, was quite ready for peace. In September, 1783, the treaty of Versailles was signed between France, England, and Spain. England restored to Holland the main part of her conquests, ceded Minorca and Florida to Spain, and to France her Indian possessions, confirming also the stipulation of the peace of Utrecht respecting Dunkirk. On the same day England also solemnly recognized the independence of the young republic of the West.

The treaty of Versailles.

The result of the war.

The *Compte rendu.*

The mismanagement at court.

Calonne becomes minister.

France came out of the war with much honor on all hands; as champion of liberty abroad, as founder of republics, as apostle of new ideas, she could scarcely be expected to feel a stronger attachment than before for her own despotic monarchy. The contrast was all against the old régime, and the heavy debts incurred in carrying on the war had added greatly to the embarrassments of the crown. Moreover, Necker was gone. He had struggled hard against the inherent difficulties of his position and the persistent hostility of the court; at last he had persuaded Louis XVI. to let him issue his balance sheet, the famous *Compte rendu*, early in 1781. The document, afterwards shown to be erroneous on the side of hope, was an offence to the spending classes, an assault on their privilege, a kind of act of treason in their eyes; that the king should keep accounts, and lay them before his people, was in their view scandalous; from the moment it appeared Necker's fate was sealed. The *Compte rendu* was more clear than convincing; it made out an actual surplus of ten million livres; and Necker hoped that, seeing this, confidence would recover, and, like a prophecy of good, the *Compte rendu* would then accomplish its own statements and make a solid surplus. For France in these years had certainly been growing richer and stronger; the duties on objects of consumption had increased two million livres a year; and Arthur Young declared that "in these late days the advance of maritime commerce has been more rapid in France than in England. Commerce has doubled in twenty years." Necker had therefore a sound basis to go on; but the court could not endure life on such terms, and in May, 1781, he had to resign office. From this time the queen's influence was omnipotent over the feeble king. She ruled with a succession of obscure and incompetent ministers,—first Joli de Fleury, then D'Ormesson, who, when he resigned office, left only about £14,400 in the treasury, after having borrowed nearly £14,000,000 sterling in two years and a half. These men were followed by the "ladies' minister,"—the Fouquet of that age, even as Necker had been its Law,—Calonne, the "enchanter," the "model minister," as the court styled him. He found "two little bags of gold, with 1200 francs in each, in the royal treasury,"—a rather slight foundation to begin upon. "There was," he says, "neither money nor credit; the current debts of the crown were immense, the income pledged far in advance, the resources dried up, public property valueless, the coin of the realm impoverished and withdrawn from circulation—the whole, in a word, on the very verge of bankruptcy." His idea was to mend matters by a gay and profuse expenditure; the queen should have whatever she wanted; "waste is the true alms-giving of kings" again became a state maxim; and all things should go on merrily, from minute to minute. So the great annual deficit continued unchecked. In the autumn of 1786 Calonne himself, in spite of his lively expedients and "gayety of heart," as he dragged the nation to its ruin, was forced to admit that the finances were in a hopeless state. He seemed to think that the privileged orders, which had so praised and petted him, would be flexible to one they knew to be their friend, and induced Louis XVI. to call an assembly of notables in 1787, before whom he laid the state of the finances and his proposals for reform. For forty years finance had been steadily going wrong; the deficit, which began in 1739, was a million and a third per annum in 1764; was, even in Necker's days, well over two millions; by 1786 had increased to more than six millions and a half; the best estimate Calonne could make for 1787 involved a deficit of five million pounds. Since Necker had come to power the total loans had amounted to fifty million pounds. Calonne, with irresistible force, argued from this that the ruin of the privileged classes impended. The argument was so unpleasant that they would not see it. He proposed that the *taille*, or land-tax, should be levied equally on all; that the odious right of *corvée*, which took the peasant's labor, and brought him under subjection to the lord, the intendant, and the money-lender, also should be swept away; that there should be free trade in grain, so that another *pacte de famine* might be impossible, and that all restrictions on traffic should be abolished. The notables replied with one voice (for they were all men of the privileged orders) that they would none of it. So Calonne fell, astonished at the ingratitude of his friends. Another queen's nominee, the incompetent Cardinal Loménie de Brienne, succeeded him. The anger of the people against the queen and her friends grew daily hotter; and, though she was absolutely guiltless in the matter, the scandal of the diamond necklace story in 1785–1786 seemed to give point to the popular discontent against her. She was frivolous and extravagant, and without the slightest feeling for the French nation; her love of amusement easily led people to take the worst view of all she did; she was identified in their minds with offensive foreign tastes and interests, and credited with French morals at their worst.

Ministry of Loménie de Brienne.

The accession to the ministry of Loménie de Brienne was the beginning of the end of the monarchy. He found at once that he must press on the privileged classes Calonne's proposals; and parties formed afresh,—on the one side the king, the queen, and the minister, supported by some of the noblesse; on the other the duke of Orleans, already beginning to take an active and ominous part in affairs, the main bulk of the nobles, and the parliament of Paris; the lawyers went with them in defending privilege. Below them all were the starving and angry people; in front of them the yawning deficit. The queen and her minister thought to save the ancient monarchy by abandoning the noblesse. To the people, however, it did not appear to be a question of one or other, but of their own claims and rights against both. No doubt the general bulk of the people would have welcomed a king who would reform loyally; Louis XVI., unfortunately, for all his honesty and well-meaning wishes, was not strong enough to face the difficulties before him.

The *lit de justice* of Louis XVI.

In August, 1787, the king held a great *lit de justice*, or personal visitation of the parliament, to enforce the registration of his edicts, and after he had thus overborne its opposition, he exiled that learned body to Troyes. Though the edicts were for a stamp-tax and for the equal distribution of the land-tax, the popular voice went with the parliament; for the more ambitious and active spirits would not accept as sufficient the reforms recommended by the queen's party. Their temper was becoming dangerous; the king's action was considered arbitrary; the people of Paris still deemed the parliament their friend. Before being exiled, the parliament had uttered the word which was destined to bring things to a head. In declaring their forced registration illegal and void, they had stated, in their anxiety to escape the new imposition of the equalized "taille," that the States-General alone could

The cry for the States-General.

legally impose taxes, a doctrine unfortunately unknown in France for many centuries. The whole nation heard the word, and learnt with emotion that the ancient monarchy had long been an usurper. Throughout the kingdom now rose up a cry for the convocation of the States-General. No one clearly knew what they were or how they would work; the last meeting of those august bodies, 173 years back (1614), had broken up in confusion; of the organization, procedure, and powers of the Estates no one could speak with certainty. Nevertheless, at the moment they seemed to offer hopes of a solution of pressing difficulties; and at last the king, with much reluctance, promised that they should be called together within five years.

Court and Parliament of Paris.

The parliament was then recalled to Paris; and the king held a "royal sitting," a different thing from the offensive *lit de justice*, and expounded to the lawyers his views as to the position of affairs. Ominous were his words, for they proved that he had no insight into the great questions seething, and that he clung in a dull and obstinate way to the traditions of the ancient monarchy. He showed France that he meant to deal in a narrow and hostile spirit with the States-General, and that he reserved to himself in all matters the ultimate decision. Lastly, he offered for their registration two edicts, framed, one might think, specially to affront his hearers,—the first (in opposition to the previous declaration of the parliament) authorizing loans to the frightful amount of 420,000,000 livres (£16,800,000); the other ordering the restoration of Protestants to their civil rights. Then the duke of Orleans, great-grandson of the regent Philip, protested, and the parliament, encouraged by his example, declared that the edicts had been registered by force. Orleans was exiled; and the ferment in Paris and through France became extreme.

The Jacobin Club.

The struggle between court and parliament grew bitter; the parliament declared *lettres de cachet* to be illegal, and affirmed that the queen's influence was the cause of the present evils. The court-party in rejoinder proposed to establish a plenary court for the registration of edicts. The parliament protested, and posed itself as defender of the liberties of France. They were forthwith shorn of much of their power, and their function of registration taken away. The local parliaments, throughout France, were treated in like manner, and it is from this circumstance that one of the most tremendous organizations of the Revolution took its rise. Remonstrants travelled up to Paris from different centres,—among others from the Breton parliament of Rennes,—to protest against the high-handed action of the court. The Bretons formed themselves into a club, which, having headquarters in the old Jacobin convent in the St. Honoré street, soon changed its name from the Breton Club to the Jacobin Club, and became the home of the most advanced republicanism.

Distress in Paris.

Things now went even worse. The old *pacte de famine*, which the humanity of the king had kept down, again began its baleful operations; the disorders of finance went on; there was no money with which to carry on the government. Brienne, at last driven to despair, induced the king, in spite of the queen's strong opposition, to convoke the States-General for the 5th May, 1789. Soon after this, unable to face the difficulties of finance, and having tried in vain a kind of concealed bankruptcy, he gave way and sent in his resignation. Necker was recalled. The winter of 1788–1789 was terrible—especially in Paris; and all France was excited by distress and hope. The capital swarmed with incomers from the country districts round; ever since the great hailstorm of July, 1788, when the crops ripe for the sickle had been destroyed in all the best corn-growing district of France, the district round Paris, crowds of desperate country folk had been pressing in. "All this mass floats about Paris," says M. Taine, "is engulfed therein, as in a great sewer, the honest poor and the criminal alike; some seek work, some beg, all prowl about, a prey to hunger and the rumors of the streets. The officials note that a large number of sinister-looking men pass the barriers inwards." . . . "The general aspect of the mob changes; it contains now a quantity of strangers from all parts of the country, mostly in rags, armed with great sticks, whose very look is menacing." "Vagabonds, ragged fellows, many almost naked, with appalling faces—beings one does not remember to have seen

by daylight,—a frightful physiognomy, a hideous attire." Such is the impression left by the crowd of refugees and others who swarmed in the lower districts of Paris; this is the rough material out of which the Parisian and decisive element in the Revolution will be made. The Government thought little of this for the time; the States-General were to meet not in Paris but at Versailles, under the shadow of the monarchy; Paris, long neglected and disliked by the kings of France, was left out of their calculations at this moment.

IV. THE REVOLUTION.

The French Revolution.

We are come to the verge of the French Revolution, which surpasses all other revolutions the world has seen in its completeness, the largeness of its theatre, the long preparation for it, the enunciation by it of new points of view in politics, its swift degradation into imperialism, its influence on the modern history of Europe. It has been truly said that France had for centuries been preparing for it, for centuries she would feel the effects of it. The imperialism, which has traversed and marred its due development, has perhaps already passed away—its destructive work is over; the republic under which France now lives may be the turning point of European history.

Causes of revolution.

For all revolutions there are needed first a favorable concurrence of external circumstances, —such as, in France, the character of Louis XVI. succeeding after his grandfather, the anti-national temper of his court, the outbreak of the American War of Liberation, the ferment of modern ideas in all the countries of Europe. Next, there must be a "semen martyrum," a faith of internal conviction which will strengthen men to face death for their cause, because their minds are lifted above common life and its trivial affairs; this, too, existed in France, and cannot be underrated as a motive power. Sometimes partial and narrow, yet always generous and warm, was the enthusiasm of younger France for the "principles of '89:" the equality of all men before the law and for the burdens of citizenship, the excellence of virtue, the sovereignty of the people, obedience to the law, the blessings of freedom of person, press, and belief, —these and the like, afterwards embodied in the *Déclaration des droits de l'homme*, were great engines which set the Revolution moving, and directed its general course. Joined with these ideas, which cannot reach down to all, there must be a general feeling of misery, oppression, wrong. This the scandals of finance administration, the despair of frequent famines, the grievous incidence of the *corvée* and other ancient services, the inability to get away from the soil or to rise, largely supplied. Moreover, the divergence of classes, which in France had long been increasing, was such as to endanger in itself the stability of society. The older creeds, too, were dying down into their embers, and had lost the power to arouse enthusiasm; while the ancient framework of long worn-out institutions still encumbered all the land, and with their dead weight pressed men down. Selfishness above, hypocrisy in faith, misery below,—these things demanded vocal leaders for attack, and the leaders were not wanting—they were first the great writers, and afterwards the chiefs whom the violence of the time threw to the surface.

The claims of democracy.

Europe had long been uneasy; the "benevolent despots" had tried their utmost for the people and against privilege; enlightened ministers seemed to themselves to be carrying out the principles of Richelieu; they fought against custom and institutions, irritating, weakening, even reversing them. And yet in all they scarcely recognized the existence of Democracy, of a people which would be heard, and would take the foremost place in the rearrangement of Europe. While the monarchs who said of their business with Joseph II., "*C'est d'être royaliste*," were levelling privilege or church immunities, dismissing parliaments or exiling Jesuits with a view to raising their own authority, they little knew that they themselves were in danger. For the new democracy changed the centre and place of sovereignty, and while, as De Tocqueville says, "it swept away the feudal institutions and replaced them with a social and political order more uniform and simple, and based on the equality of the condition of all," it was also sure profoundly to modify the views of Europe as to the position of the monarch, as to the headship and sovereignty in a nation. And the great change began in France, not because she was more, but partly because she was less oppressed than her neighbors. In comparison with the German, the French peasant had many advantages,—there was less serfage, there were more peasant proprietors. "This," said Arthur Young in 1788, "is the mildest government of any considerable country in Europe, our own excepted." This milder state of things made men more capable of indignation against the injustice they could feel; the most crushed do not feel the most; they are helpless, ignorant; but when men have begun to rise and to understand, then they grow dangerous to their masters. The very attempts made by benevolence in high place to succor the misery of the people roused their anger against their lords,—a point to which De Tocqueville dedicates a whole chapter, entitled "Comment on souleva le peuple en voulant le soulager." In addition to this we must remember that the Revolution found much to forward it in the brightness of the French temperament. The simple principles it preached, with accompanying appeals to virtue and patriotism, at once commended themselves to a people fearfully ignorant, yet unusually intelligent and lively. In their strength and their weakness alike the French people were singularly well fitted to be the heralds of the new conditions of political life in Europe.

The States-General of 1789.

The manner of election.

Early in 1789 all France was busy with the elections to the States-General, and in drawing up the *cahiers*, or papers of grievances. From the moment of the king's edict (8th August, 1788), convoking the States-General, discussions had gone on with growing eagerness as to their proper constitution and form. Some urged the pattern of the English constitution; others wished for the forms of 1614; others pointed out the increased importance of the third Estate in numbers and wealth. It was seen that the Estate which in fact would be called on to pay almost the whole sum to be raised must have greater strength than the precedent of 1614 could give it. Bankruptcy stared the court in the face; the king only called the Estates together because the finances were in a frightful condition; he openly sets this forward as the chief reason for their convocation. A demand accordingly arose for two things:—first, that the third Estate should be composed of as many members as the other two orders combined; secondly, that the three orders should debate and vote by head, in one chamber. It was urged on this hand that thus only could those defend themselves who would have to pay the taxes; on the other hand, that to sit in one chamber would be a dangerous innovation, and that a majority of the third Estate would set the unprivileged public above the privileged few. The parliament of Paris, with its lawyer-like preference for precedent over justice, and its incapacity to discern the real issues before it, warmly supported the latter view, and urged the king to follow the rules of 1614. The popularity they had up to that time rather undeservedly enjoyed was destroyed in a moment; it was seen now that the lawyers were as earnest for privilege as the rest. A convocation of notables, chiefly members of the privileged orders, to rule the form of procedure, in spite of Necker's efforts, supported the views of the parliament. The matter grew warm; the princes of the blood, Artois and Condé and the others, who had supported the queen in all her follies, added their remonstrances in the same direction; the popular ferment spread all the more, and Necker became the idol of the people. By his influence the king was induced at last to issue an edict to the effect that there should be in all full a thousand deputies to the States-General, made up in proportion to the population, and that there should be as many deputies of the third Estate as of the other two combined. As to the one-chamber question the decree was silent. In former States-General the third Estate had usually sent more than either of the others; in those of 1560 the third Estate had much exceeded the other two combined, so that this great concession was little more than a continuance of ancient use. It was also decided that the election should be by a double process. The electors, in number about three millions, were limited by no property qualification; it was a kind of simple household suffrage in the country districts, each 200 hearths choosing two representatives, and so on; in the towns two delegates for each 100 inhabitants, and so on upwards,—so that the towns chose twice as many primary delegates as the country districts did for their numbers. These delegates from bailiwicks and towns were empowered to meet in the chief town of each province, there to draw up their *cahiers*, and to choose from their own body the persons who should proceed with the grievances in hand to Versailles as members of the third Estate.

The numbers of the Estates.

The elections to the first Estate, the clergy, returned 291 members,—48 archbishops and bishops, 35 abbés and canons, 208 parish priests; these latter were largely in favor of liberty, and when the time came supported the third Estate in its struggle, while the bishops and higher clergy mostly went with the privileged orders. The second Estate, the noblesse, returned in all 270 persons, one prince of the blood, 28 magistrates, 241 "gentlemen" or holders of noble fiefs. The smallness of their total is due to the proud abstention of the Breton nobles. There were among them a few who sympathized with the popular movement,—at their head the duke of Orleans. The third Estate was composed of 557 members, nearly half of them barristers, and almost all united in defence of the country against privilege. The *cahiers* of all the orders, the third no less than the others, breathed a very moderate spirit. Almost all spoke warmly and hopefully of the king,—all expressed respect for the royal power. The *cahiers* of the nobles urged the interests of their order without hesitation; those of the clergy desired the bettering of the condition of parish priests; those of the third order insisted on the abolition of the unequal rights and services, which were felt throughout France to be a great grievance and hinderance to the well-being of the country.

The treatment of the third Estate.

The National Assembly.

The king's want of wisdom.

When the three Estates met at Versailles, it was seen that the points at issue were not easily to be settled. The action of the king and his ministers was exceedingly foolish and weak; instead of taking a vigorous line with the question of the vote by head or by Estate, they lingered over trivial questions as to order and etiquette, which could only irritate the "representatives of the people," as men now began to call the third Estate. They must kneel to present their *cahiers;* when they met they must enter through a back door, while the others entered through the main gateway and stood in the royal presence. In a number of petty matters the court seemed determined to remind them that they were inferior to those with whom they sat, while they, in the language of the Abbé Sieyès, felt that "the third Estate was the nation, less the privileged orders." The folly of this treatment strengthened their hands, as did also the blunder of providing no separate hall for them to sit in. After the opening session, when all met the king, they installed themselves in the great Hall of the Estates, and so took possession of the ground they were only too eager to occupy. The verification of powers was the first step to be taken. They urged at once that the three orders ought to verify together, sent invitations to the other orders, which verified separately, and set to work at their deliberations. The third Estate waited, refusing to proceed till they had solved the main question. Meanwhile the court upbraided them for wasting precious time; it became daily clearer that all their masters cared for was that they should arrange for the payment of the deficit and be gone; and then after some delay, they began to verify, taking on themselves to call the roll of all three orders. At the first call no response was made by either noble or clergyman; at the second three curés answered, and were received with enthusiasm; after a short time as many as 100 members of the clergy joined them. They named themselves "the National Assembly" (17th June, 1789), and issued a declaration that the creditors of the state were guaranteed by the honor and loyalty of the French nation; that if they were dissolved, taxation levied thereafter would be illegal; that a committee should be named to inquire into the general distress. Then the clergy, by a small majority, agreed to join the third Estate, and did so; Necker thereon advised the king to yield the point of separate chambers, and to "deign to resign himself to the English constitution," a phrase singularly indicative of Necker's temper and views, and just as inapplicable to the real state of the case. The king, however, would not yield. Though Necker knew, and the king should have known, that the army could not be trusted against the Assembly, he committed himself once more to stupid and irritating tactics. The great hall was closed against the representatives, and they adjourned to the neighboring tennis court, where they took solemn oath (20 June, 1789) that they would not separate till "the constitution of the kingdom had been established and confirmed on solid foundations."

The Constituent Assembly.

Under this oath the Assembly claimed a new name, that of the Constituent Assembly,—the Assembly charged to create a new constitution. The king showed utter want of discretion: he annoyed the moderate party in the chamber, who were headed by Count Mirabeau, by refusing to give them any insight into his plans and policy; he alienated any support he had within the Assembly, because he regarded it as a usurping body, insulting to him by its claim of permanence and authority. Next, the Assembly was told that the tennis court was wanted by the count of Artois—the most unlucky of all the supporters of the queen's policy, the most offensive to the people. Once more treated by the court with contempt, because it could not venture to use violence, the Assembly next met in the church of St. Louis at Versailles on the 22d of June. On the 23d they were summoned to a "royal sitting" of all the orders, in which the king lamented the conduct of the commons, and declared the concessions he would grant. The representatives of the people, who had been treated with the scantiest courtesy that morning, received the discourse in silence—a silence deep and anxious, especially when Louis XVI. told them, speaking as an angry master to disobedient servants, that the orders should not act together, but should meet next day in their separate chambers. When he rose to go, he was followed by most of the nobles, the bishops, and some clergy; the third Estate and a large proportion of the parish priests remained, and sent a message to the king to say that they would only retire if forced to do so by the bayonet. Necker, feeling that the king was completely committed, now resigned. The duke of Orleans, with 46 of the nobles, joined the Assembly; after that, force being out of the question, Louis XVI. was obliged to tell the remainder of the noble order to join the others. And thus by June 27, 1789, the orders had all accepted the victory of the commons. The king now threw himself entirely into the hands of the court; Necker's resignation was accepted; attempts were made to get regiments that could be trusted to Versailles; the Swiss and German troops seemed the mainstay of the monarchy.

First collision with the people.

On Monday, 12th July, it came to a collision between the troops and the people. In dispersing a "Necker procession," an enthusiastic unarmed crowd following a bust of the ejected minister, Prince Lambesc, acting under Baron Besenval's orders, fired on the people. A French guard chanced to be among the killed; thereon the whole guard sprang into revolt; the old municipality of Paris, the ancient provost and échevins, who were royal nominees, were swept away; a new provisional municipality arose, and a new Parisian militia.

The tricolor.

The tricolor flag sprang into existence,—red and blue, the old colors of Paris, with white, the significant ground work of the new constitution. The troops cantoned on the Champ de Mars were now powerless against Paris, which had taken the lead in insurrection and incipient revolution; while the Assembly at Versailles was surrounded by foreign troops, and in danger of forcible dispersal. Paris quickly consolidated her movement. On the 14th of July the new civic guard seized the arms at the Invalides, and on the same day took place the assault on the Bastille.

Fall of the Bastille.

The troops at the Champ de Mars could not be trusted; Besenval drew them back to Versailles. The fall of the Bastille was sullied with broken promises and unnecessary bloodshed; for now the fierce passions of civil war began to move, and the Paris mob had in it desperate and savage elements. The Bastille was levelled to the ground; it symbolized the overthrow of the ancient and worn-out institutions of the monarchy.

Then the king again appeared in the Assembly, declared that he would remove his troops from Paris and Versailles, and appealed to the fidelity of the Estates. Paris grew calm at once; Bailly was made mayor, and Lafayette commander of the civic forces.

Louis XVI. in Paris.

Louis XVI. went further still; he visited the capital (17th July) and appeared with the tricolor cockade on his breast. The Parisians welcomed him with enthusiasm, and a happy reconciliation seemed to have taken place. The party of Philip of Orleans sank into the background. Unfortunately for the monarchy, the queen would not loyally accept the situation. Louis XVI. might have become a constitutional sovereign—a first *roi des Français;* his court made it impossible for him. On the very night before his visit to the Hôtel de Ville the emigration of dissatisfied nobles began, and the plans of the court-party at once changed form; from plans they became plots. The queen stayed behind, for she was fearless in disposition and loyal to the king. She only succeeded in involving him with herself in utter ruin.

By the 22d of July the first stage of the Revolution was complete. The events of Paris and Versailles found response throughout France; national guards were organized everywhere; the nobles, attacked by the peasantry, made for the frontiers; some laid down their privileges, and hoped to stay in France. The Assembly, backed by Paris, had all power in its hands; the king had to recall Necker, whose vanity and shallowness were not yet found out.

Constitution-making.

On the 4th of August the Assembly got to work at its business, the framing of a new constitution. With so few solid institutions as France had, with not one true constitutional tradition, with passions aroused and great underhand opposition at court,—it is a marvel that so much was achieved. Privilege was at once abolished, the last relics of feudal use swept clean away; nobles, clergy, the *pays d'états*, cities which enjoyed local liberties and advantages, all laid down their characteristic and special privileges, and begged to be absorbed in the equality of one general French citizenship. Equality is the prominent feature of the Revolution epoch; it overshadows at this moment both liberty and fraternity. The practical carrying out of the principles of equality was not so easy; many who laid down their privilege in words, clung to it in fact; it caused ugly scenes in the country; and the feudal burdens were in some places hardly removed till the very end of 1790. The Assembly next declared the king to be "the restorer of French liberties," and offended him, on the other hand, by reducing his hunting-rights to those of an ordinary landowner. The king's *capitaineries*, a circuit of some 40 to 50 miles round Paris which had been felt to be very mischievous to agriculture, and connected only too closely with the famines of Paris, were much curtailed. When these things were laid before the king, it was seen that his heart was not with the Assembly; on technical grounds he refused to sanction them.

The declaration of the rights of man.

Then the Assembly advanced to the consideration of a great declaration of the rights of man—a general statement of the principles and bases of civil society. Carlyle sneers at the resulting document:—rights, yes, but duties, where are they? and what reference is there to might? Still, it is clear that, had the Assembly not occupied itself with this reasonable and logical statement, its enemies could at once have accused it of haste and inconsequence, of passion and pure love of destruction. As a fact, the Declaration of the Rights of Man ranks, as Madame de Staël says, side by side with the English Bill of Rights and the American Declaration. This last was addressed to a people happily quite ignorant of all feudal questions, while the English Bill of Rights dealt solely with practical matters, assuming the main principles of constitutional life to be known, whereas the French Declaration had to begin a fresh epoch—to appeal to a people shaking themselves free from absolutism and feudal oppressions, to affirm the first principles of civil life, to give practical expression to opinions floating in every mind. To us the Declaration reads like a string of political commonplaces; we are familiar with the whole row. To the French it was very different, for they were beginning a new life, and scarcely knew where to tread.

The clauses of the declaration.

This charter of the Revolution is in substance as follows. (1) All men are born and continue free and equal in rights; social distinctions are purely conventional. (2) Society is an association of men to preserve the natural rights of men. (3) Sovereignty resides in the nation; all authority, vested in an individual or a body of men, comes expressly from the nation. (4) Liberty is the power of doing what we will, so long as it does not injure another; the only limits of each man's natural right are such as secure the same rights to others; these limits are determinable only by the law. (5) The law can forbid only such actions as are mischievous to society; "Quod lex non vetat, permittit." (6) Law is the expression of the general will; all citizens have a right to take part, through their representatives, in the making of the laws; law must be equal for all; all citizens have equal rights (according to their fitness) to fulfil all offices in the state. (7) Accusation, arrest, detention, can only be in accordance with the law, which all are bound to obey. (8) The law must be reasonable; it must not have any retroactive force. (9) Every one is to be deemed innocent till he has been convicted; persons under arrest on suspicion must therefore be treated gently. (10) All men are free to hold what religious views they will, provided they are not subversive of public order. (11) Freedom of speech, of writing and printing (save in cases reserved by the law), is one of the most precious of the rights of man. (12) A public force is needed to guarantee the rights of man; such a force is for the benefit of all, not of its own class. (13) To support such force a common contribution is necessary; it is to be equally laid on all citizens according to their means. (14) All citizens have a right to show (personally or by representatives) that such public contribution is necessary, to consent thereto, to arrange its application, its incidence, its manner of ingathering, its duration. (15) Society has a right to demand from every public servant an account of his administration. (16) A society, the rights of which are not assured, the power of which not definitely distributed, has no constitution. (17) Property being an inviolable and sacred right, no one can be deprived of it, save when public necessity, legally established, evidently demands it, and then only with the condition of a just and previously determined indemnity.

The declaration acted on.

Having laid down these principles, the Assembly went on to abolish such institutions as offended against the liberty and equality of the rights of man. "Nobility, peerage, hereditary distinctions, distinctions of orders, feudal régime, patrimonial justice, titles, denominatives or prerogatives thence derived, orders of chivalry, corporations, etc., which required proof of nobility or presupposed distinctions of birth," were all declared to be swept away, such distinctions alone remaining as belonged to public functionaries in discharge of their duties. Venality or hereditary succession in offices was also abolished; all Frenchmen in all parts of the country should have equal and common rights; no guilds or corporations should remain; nor would the law recognize any religious vows or other engagements which might militate against either natural rights or the constitution. Such, from end to end, is the Declaration of the Rights of Man. Equality of all men, abolition of feudal privilege, inclusion of the monarchy under the control of the sovereign people —these are the chief principles involved in it; out of these the Revolution grew. In itself the Declaration was not subversive of monarchy; only the French monarch, with two centuries of Bourbon tradition behind him, could not stoop to take a new position in France; Louis XVI. could not become a constitutional king. The Assembly also framed its new constitution, according to the promise of its oath of the tennis court. A limited monarchy, without an absolute veto, and a single chamber having alone the right of initiation of laws, formed the chief elements of it,—the nation to order, the king to execute. "The Revolution from its social side attacked the aristocracy," says La Vallée, "from its political side it attacked the monarchy;" and the single chamber, with a royal suspensive veto which might be overruled in time, seemed to the French people best and simplest. The great danger of the Revolution lay in its simplicity; everything was to begin from a pure white basis; there should be no checks or counterpoises; all should be consecutive, logical. The ambitions, vices, prejudices of men were regarded as nothing; the nation, not even educated as yet, was thought fit to be trusted with absolute power. It is indicative of the ferment and the ignorance even of Paris that the very name of veto aroused vehement disturbances; the royal veto was in their eyes the old régime restored.

The constitution.

The excitement of Paris grew; famine reigned; distrust and irritation followed. It was seen that the royal family were surrounding themselves with troops ill-affected towards the Revolution, and with a great number of devoted officers. Rumors flew through the town; plans of vengeance were supposed, communications with foreign powers and emigrant nobles. The king's reception of the Declaration of the Rights of Man had been cold and partial; the new journals of the time threatened fresh disturbances. At this moment (3d October, 1789,) the amazing folly of Versailles showed itself in a great banquet given to the soldiers, in which royalist songs, white cockades, ladies' smiles, and plenty of food goaded the hungry "patriots" of Paris to madness. A vast crowd, chiefly of women, with the national guard, headed unwillingly enough by Lafayette, streamed out of the gates, and marched to Versailles, insulted the Assembly then sitting, and swarmed round the palace gates. When the king came back from his hunting,—his one solace in these difficult days,—he spoke them fair; but a struggle having begun, in which some blood was shed, he became in fact their prisoner. In an interview with Lafayette, he showed his wonted obstinacy, and practically refused to send away his Swiss guards. Things became very threatening, and Louis at last consented to go to Paris. The queen and the dauphin refused to leave his side; a deputation of 100 members of the Assembly also accompanied him.

The Versailles banquet.

The triumph of Paris.

Thus Paris at one blow gained the ascendant over both king and Assembly, and the Revolution entered at once on a new phase. Changes will become easier, the seat of government and movement being narrowed to one city. The vehement eagerness for discussion of political questions, already so prominent a feature of the time, will increase greatly; crowds will frequent the meetings of the Assembly, interfere with its discussions, sway its fears and wishes. "There is a gallery," says Arthur Young, an eye-witness (12th January, 1790), "at each end of the saloon, which is open to all the world. . . . The audience in these galleries are very noisy; they clap when anything pleases them, and they have been known to hiss—an indecorum which is utterly destructive of freedom of debate." The press became more active than ever, with countless pamphlets on the questions of the day; and lastly, the influence of the clubs, especially of that of the "Friends of the Constitution," the Jacobins Club, now began to take the chief direction of affairs for the more thorough revolutionists. With its affiliated clubs throughout France, it formed an all-powerful confederacy, and became the rival of the Assembly itself. The virtual imprisonment of the royal family at the Tuileries frightened the royalist gentry; a second and more numerous emigration now took place. Suspicion and distrust reigned; all held their breath, and thought they felt beneath them the muffled mining of some plot. Royalists accused the ambitious and unsteady Philip of Orleans of making disturbances for his own purposes in Paris; republicans felt sure that the queen and her party were plotting the overthrow of the new order of things with the emigrants and her German relations. The duke of Orleans, a silly and stupid giggler, as Arthur Young found him, was driven by Lafayette to take refuge in England. The two chief parties of the Assembly, the Right and the Left, represented those who hoped, as Mirabeau did or Lafayette, to secure a modified and constitutional monarchy in France, and those who desired to see a republic. Independent of these, who were intent on the framing of the constitution, was the court party, which hoped to restore things to their ancient form, and to bring back the monarchy and the system of the past.

The Jacobins Club.

The emigration.

The making of the constitution.

The Assembly now set itself to frame the constitution,—the task to which it had solemnly dedicated itself. In France herself there were no precedents to go on, no healthy institutions to be worked in. The clergy were powerless; the nobles, who might have modified and influenced matters, were contemptuous and careless. Arthur Young specially notices their flippant treatment of the crisis they were in; they did not really believe that the new order of things could last, and even expected a counter-revolution. Some of them thought that by pushing the innovators onward they would secure an earlier reaction; doing so, they worked their own ruin and the king's death. The active leaders of the Assembly had then no help at home; they spurned the example of the English constitution, which was often urged on them, for they considered it with truth far too monarchical and far too aristocratic for their principles. It was then almost from a "tabula rasa" that they had to start,—without institutions to use, without experience to warn, or examples to guide them. They were sincere, and knew their own minds, fearlessly pushing the principles they held to their results. Their first achievement was to carry out

1790.

the Declaration of the Rights of Man in territorial matters, by totally rearranging the soil of France. They would consolidate and centralize, and show that unity pervaded all.

The geographical rearrangement of France.

With this end in view they swept away all the ancient historic provinces, which one misses so much on the map of France. No more duchies and counties, *pays d'états* and *pays d'élection;* no local rights or specialties were preserved; the local parliaments were swept off, the local administrations abolished; the very names of Breton or Provençal, it was hoped, would be absorbed in the greater name of Frenchmen. Instead of the old divisions, the country was distributed into 83 portions, as nearly as might be of one size, and these were named departments; each department was subdivided into districts, and each district into cantons or communes. This done, the political structure was at once begun in accordance with it: each department should have a council of thirty-six members and an executive directory of five; the districts similarly should have officers, subordinated to those of the department; the communes also, in like wise, under the districts.

Active and passive citizenship.

Then came the distinction between *active* and *passive* citizenship, as a base for the franchise. Active citizens, who paid taxes equivalent to three days' labor and upwards, alone had a vote; there was a higher property-qualification for the electors whom they had to choose. The passive citizens were excluded from all share of power. The electors were charged to choose deputies for the National Assembly, administrators of departments, districts, and communes, and eventually judges, bishops, and parish priests.

Revision of the judicial system.

The judicial system was entirely recast. In place of the local parliaments there were to be three orders of tribunals,—cantonal, district, and departmental; and above all, at Paris, a great supreme court. The system of trial by jury was introduced for criminal cases.

The functions of the Assembly.

The National Assembly should be the fountain of legislation, should be permanent, and of one chamber only; it should be renewed by biennial elections. Its number should be 745, distributed among departments according to the proportions of land, of population, and of taxation. The Assembly also laid down a definition of the citizenship, and marked out the position of the king.

Finance.

It next considered the state of the finances; for now, even as under the old régime, France was threatened with imminent bankruptcy. Loans were not taken up, taxes fell short, patriotic contributions ran dry. In this great peril, Talleyrand-Perigord, bishop of Autun, proposed to apply the lands of the clergy for the purpose of meeting the deficiency.

Sale of church lands.

The committee of finance declared by his voice that the clergy were not proprietors but administrators only, and that the nation could take on itself the expenses of public worship, and resume its ownership of the lands of the church. In spite of the vigorous resistance of the clergy, and their offer to make a gratuitous gift of part of their lands, the Assembly adopted the proposal, and ordered the sale of the ecclesiastical domains. The argument that these lands were part of the absolute property of the Church Catholic in general, and not of the French clergy in particular, was too unpatriotic to be listened to. The sale, however, was a failure; men were too much frightened by the rapid movement of affairs to feel much confidence, and things again seemed to be at a stand-still. Then the Paris commune hit on a plan which succeeded. The municipalities throughout France were authorized to buy these lands from the state, and to sell them again to private purchasers; and the municipalities might pay for them in bonds, or *assignats* as they were called, based on the actual value of the land. It was ordered that the issue of assignats should be limited, and that they should be extinguished as the lands passed into private hands, and hard money was given for them. The measure brought instant relief to the Government, and the assignats, as has been said, "saved the Revolution."

Civil constitution of clergy.

Then followed the "civil constitution of the clergy," in which the state made a great step in the direction often since taken with more or less success,—the direction of controlling the spiritual powers. The Assembly began by affirming the constitution to be based on Christianity, while it refused to admit a state-religion, abolished monastic vows, religious orders, and confraternities, with exception of some useful ones. It then, following the impulse of uniformity given by the new partition of the soil into departments, rearranged the ecclesiastical divisions on the same basis,—a bishop to each department, and so on.

1790.

The end of the Jansenists.

The influence of the Jansenists among the clergy in the Assembly was felt in all this; it is their last appearance in French history; after 1790 their name hardly ever occurs again. It was clear that the upper clergy and the bulk of the lower would resist this proposal. If the state severed the ancient relations between the church and itself, it must, to a large extent, leave the church to manage its own affairs. As it was, the state had laid hands on church lands, had declared against the connection, and yet was determined to rearrange the spiritual domain. Finding strong oppositon, the Assembly next ordered the clergy to take an oath of obedience to the civil constitution. This, however moderate as it was in itself, involved an acknowledgment of the authority of the state, which in fact prejudged the whole question; consequently, fully five-sixths of the clergy refused the oath, and they with their flocks were still a very considerable power in France. The result was that the interference of the Assembly in church matters broke up parties very much, and threw the power almost entirely into the hands of the non-religious sections of the body. The sight of the church in rebellion, the contempt and aversion with which the priests who took the oath were regarded, put religion into definite opposition to the Revolution; though Jansenists and Huguenots were warmly attached to the new order of things, their influence was weak. Henceforward, in the mind of France, Christianity was regarded as identical with reaction.

Abolition of nobility.

The lawyers and the clergymen had thus been dealt with; it remained to abolish nobility. "The lawyers had caused agitation in the country; the clergy had kindled civil war; the nobles were now about to produce foreign wars." The decree of June 19, 1790, swept away the last distinctions of feudal origin, and the nobles and bishops deemed themselves no longer bound by any ties to the new order of things. They did all they could to push matters to excess, with terrible results to themselves. As the nobles alone officered all the regiments of the army, they had great power in their hands.

Officers and privates.

The gulf between them and the privates, the scandals of mismanagement, the spread of revolutionary opinions in the ranks, after a time rectified the evil, and the army before long became the chief support of the new republic. In August, 1790, a kind of struggle went on; in many places the regiments chose officers from among themselves, and turned out their noble masters; in other places they accused the officers of plundering the military chests,—an accusation in some cases only too well founded. At Nancy, under Bouillé's orders, a revolt of three regiments on this ground led to a terrible battle in the streets, in which the regiments and citizens were mercilessly crushed by the garrison and national guards of Metz. It was done by command of the Assembly; Paris, however, and the revolutionists generally, sided with the defeated regiments, and the king, the Assembly, and Lafayette all lost ground through it.

The position of Louis XVI.

Up to this time Louis XVI. had shown himself willing to go with the Assembly. For a while he seemed really to wish to be a constitutional monarch, and, till after the fête of July 14, at which he, the Assembly, the national guard, and a crowd of spectators from all France, renewed, in the midst of boundless enthusiasm, the civic oath, all seemed to promise well. The Assembly had voted a liberal civil list; they had treated him with courteous respect; he seemed thoroughly popular. Had he been a man of any real vigor of character, he might have held the movement entirely in his own hands, and have shaped the future constitution of his country, saving it from extreme measures, great excesses, savage civil war, and tremendous efforts to keep off the foreigner. This, however, was not in him; his amiable disposition drew him one way, the traditional belief in his irresponsible and divine right drew him the other; he became undecided; people grew suspicious. Necker, not a strong man, had hitherto been his guide; he had now lost all his popularity, for public opinion had gone far beyond him, and he was not statesman enough either to direct or to assist it. He sent in his resignation (4th September, 1790), and was followed by the rest of the ministers, who were suspected of underhand communications with the *émigrés* at Coblentz. The king was deeply moved at finding a new ministry not of his own choosing; and finally, when the Assembly made its attack on the clergy, he ceased to feel a wish to keep terms with the Revolution. It must be stopped, either by combining against it all the moderates with the dissatisfied and alienated classes and their supporters, or by calling in the refugees from abroad with foreign help at their back.

The two courses before Louis XVI.

Between these two plans the king stupidly oscillated, in the end ruining both his friends and himself. Bouillé, Lafayette, the royalist deputies, the moderates in and out of the Assembly, desired the former course; the Austrian queen, the count of Artois, the emigrant nobles, who all lacked real patriotism and were half foreign, desired to be replaced by German bayonets. Louis, before the end of 1790, was in negotiation with almost all the kings of Europe; at the same time the queen, who hated Lafayette, kept the constitutional party at home at arm's length. She hoped to neutralize the movement at home, while she intrigued abroad, by winning Mirabeau, the terrible orator of the Assembly, in its earliest days the fearless champion who did not quail before the king or the king's servant, the revolutionary nobleman whom his own order had cast out; he might retain all his opinions, which were not republican, should be subsidized by the court, and should uphold the throne.

Mirabeau's position.

The suspicion and watchfulness of the Jacobins Club, and of the extremer party in the Assembly, did not hinder Mirabeau from openly doing his utmost to preserve portions of the royal authority; and when, early in 1791, he felt that he had some hold on the court, he advised the king to escape to Lyons, and there to establish himself as a mediator between the emigrants and the Assembly, to issue a constitution of his own, embodying the main principles of the Revolution, and appealing to the people to support him. In the midst, however, of these schemes, Mirabeau, worn out by his loose living and the excitement of his political life, suddenly fell ill and died, and with him perished all chance of a constitutional monarchy for France.

The king's flight.

His guiding hand gone, the king thought only how he might escape in safety, and eagerly adopted Bouillé's proposal that he should take refuge under the shelter of his army on the eastern frontier. It was obvious that this step, if successful, would bring him close to the *émigrés* and the German influence; if it failed, would make men regard him as a traitor. It failed. The court got out of Paris (20th June, 1791), and reached Varennes, not far from Verdun; there they were recognized, stopped, and sent back to Paris. Bouillé entered the place a very short time after they had left; found all the streets barred against him, and, comprehending that the game was lost, turned about and fled to the emigrants.

The Revolution triumphs.

The Assembly, at once and with calmness, assumed full direction of affairs; no disturbance followed. The king's return was a triumph of the revolutionary spirit, which showed itself all along his route. All firmly believed that his only wish had been to escape to the emigrants and to make open war on France. The clubs and the advanced section of the Assembly gained greatly in strength. Pétion and Robespierre now began their career as republican leaders. The excitement of Paris broke out in open fighting over the great petition of the clubs in the Champ de Mars for the deposition of the king; and Lafayette dispersed the republican crowd with vigorous bloodshed. The Assembly for the moment seemed to win strength by it; the country showed no wish to be rid of their king. The Jacobins had to draw back for a while; the division between Paris and the country, between the bourgeoisie and the bulk of the people, grew plainer; the Jacobins Club was almost deserted by the members of the Assembly; a new club, the Feuillants, was organized out of the more moderate section of the Jacobins, among whom were Lafayette, Bailly, the two Lameths, and others known as the representatives of the party which wished to unite the old monarchy with the new constitution.

The Feuillants Club.

The old Jacobins became absolutely republican, and, in contempt, called the Feuillants the "Club Monarchique." In these two clubs the new and clean-cut division of the country into monarchists and republicans was plainly to be seen.

The constitution completed.

The Assembly was now coming to the end of its labors; before finishing them, it made the grievous blunder of passing a "self-denying ordinance," and decreed that no member of its body should be eligible for the new Assembly to be at once elected, nor should accept any office under the crown. Lafayette and Bailly resigned their offices as general and mayor of Paris; every one of the men who had voted together in the tennis court, who had gained experience and insight into the proposed constitution, and might have worked it successfully, was rigorously excluded. The constitution was then laid before the king; he accepted it at once, and, going to the Assembly (14th September, 1791), swore that he would observe it faithfully.

Close of the Assembly.

Then, after decreeing a general amnesty for all political crimes and offences, the Assembly (30th September, 1791) closed its critical labors, and declared itself dissolved. As the members passed out of the chamber they held their heads high, in the belief that they had laid the firm foundations of a reasonable and constitutional government. The country welcomed the constitution with delight; a new era was about to begin; the middle classes were all in its favor, and believed that they had the future in their hands. The elections to the new Assembly, which took place before the Constituent dispersed, were loyally made; the middle party seemed to have a great majority; the king accepted the situation fairly. There were no representatives of the old régime in it to irritate men; violent republicans were few; it was thought that all promised well, and that the Legislative Assembly would have a long and peaceful life.

The Legislative Assembly and its parties.

The Legislative Assembly met on October 1, 1791; at once it shaped itself into parties, all more or less loyal to the new constitution. The "Extreme Right and the Right" (to the right, that is, of the president's chair) were usually called the Feuillants, were constitutionalists, who represented the burgher interests, and feared the people, and who wished to uphold the king as far as they could.

Girondists.

The "Left," the Girondists, was composed of men inclined towards a republic, also of the burgher class chiefly, also all devoted to the constitution as it stood; the "Extreme Left," which sat on the higher benches, and took the nickname of "the Mountain," was composed of popular delegates and representatives of the advanced clubs, with Robespierre as their out-of-doors leader at the Jacobins, and Danton at the Cordeliers Club.

The Mountain.

The Centre of the Assembly was timid, and wanting in any principle or clearness; it usually voted with the Left. Thus, the more extreme partisans, whether of royalty or republicanism, were not in the Assembly, but worked outside for their objects; it remained to be seen whether the moderate parties would succeed in holding their own.

The Pilnitz conventions.

The conventions of Pilnitz (27th August, 1791) had already shown the excluded royalists whither they might look for succor; Leopold of Austria and Frederick William of Prussia had then agreed, in vague terms, that they would invade France unless Louis XVI. were set free, the Assembly dissolved, the emigrants restored to their possessions and dignities. It was a challenge to Revolutionary France, and a temptation to the unstable king. At every step he and his friends blundered; a loyal acceptance of the constitution and the new Assembly seemed impossible; the royalists at home stirred up civil strife, especially through the clergy; abroad they threatened open war. The Assembly, backed by the new department of Paris, an organization given to the capital early in 1791, fought against the former; against the latter stood the army, mostly strong republicans, supported by the sympathy of the people generally, whose anger rose at threats of invasion.

The Assembly and its foes.

To meet its pressing dangers, the Assembly, in November, 1791, ordered the emigrants to return, on pain of confiscation of their property, and penalty of death. This decree the king at once vetoed, at the same time issuing a strong order to the emigrants to return. They refused to listen, and the popular feeling on the other hand was much excited by his interference in what seemed to be a matter of life and death to them. The Assembly next passed to attack those of the clergy who had not taken the oath, declaring that "refractory" priests should lose their pay, should be forbidden to perform divine service, should be put under surveillance. The king again exercised his veto: and those who supported the Revolution felt that in the two all-important matters—the threat of foreign war from the *émigrés*, and the threat of domestic war from the "refractory" clergy—Louis XVI.

1791-1792.

was against them, and with their enemies. They murmured the word "traitor."

The threat of invasion.

The Girondist ministry.

War declared against Austria.

After some hesitation the German princes began to show signs of movement; troops were raised by Austria, Prussia, Piedmont; the other monarchs of Europe threatened. France set on foot three armies,—one of the north under Rochambeau, one under Lafayette on the north-east, a third under Luckner on the Rhine as far as to Basel. The Montagnards alone, distrusting the officers and the king, opposed a declaration of war. All France suspected treason, and had only too good reason to think that the king's ministers, excepting Narbonne, minister of war, were in communication with the enemy. The feeling against the ministers was so strong that after the trial of one of them, known to be the queen's agent, they all resigned, and a Girondist cabinet was appointed by the king. Roland, a man of intelligence, spirit, and uprightness, married to the noblest lady of these troubled times,—a lady who was the inspiring genius of the Gironde,—was made minister of the interior. The other name of note was that of Dumouriez, who had the portfolio of foreign affairs. This ministry at once took up a resolute position against the allied sovereigns; and Francis II., the new head of the house of Austria, unlike Leopold, who had never wished for war, at once replied with defiance, ordering France to replace king, clergy, and nobles in their ancient dignities and privileges. On the 20th April, 1792, the Girondist ministry declared war against Francis, and the long wars of the republic and the empire began.

Campaign in Belgium.

The French army was in a state of great confusion; most of its officers had joined the emigrants, eager to show the Germans "the way to Paris;" those who remained were suspected by the people; there was little money in the treasury, little experience in the camp. Dumouriez hoped to make a good beginning by invading Belgium, restless under its Austrian masters, and only lately in revolt. All, however, went amiss. One column was checked near Tournay, lost its guns, killed Dillon its general, and fled with cries of "treason;" a second column was defeated near Mons; Lafayette and the other generals hereon halted and stood on the defensive. All France was uneasy. Had her ancient courage departed? was she powerless without her noble officers? or was she the victim of treachery? The Jacobins grew more vehement; the terrible voice of Marat was now heard calling for heads; suspicion became greater than ever against the king, above all against the Austrian queen, and the guards around them, who were thought to be inclined to betray the people. The Assembly declared itself as sitting in permanence. It levelled measures against the refractory priests; it declared that the king's guard should be dismissed, and that a camp of federal soldiers should be formed at Paris. The king refused to dismiss his guards; and on a strong remonstrance from Roland, he at once dismissed the three chief Girondist ministers. Dumouriez, finding the king obstinate, also resigned office. Louis named a ministry of obscure members of the Feuillant party,—men who believed in the constitution of 1790, and in the royal authority. It was at this time that he sent Mallet du Pan on a secret mission to Vienna, to pray the Germans to rescue him from the tyranny of those "who now ruled with a rod of iron."

Lafayette's position.

Insurrection of the 20th of June.

1792.

The court goes over to the emigrants.

The Girondists, thus ejected from power, made common cause with the Jacobins, and watched with keen eyes the course of Lafayette, the centre of the constitutional party; the ministry and all those who in heart loved the older system or dreaded the progress of the Revolution, looked to Lafayette and his army as their only hope. He was no statesman, loyal and upright as he was, and committed the great blunder of defying the Jacobins. At once his waning popularity was lost; his party was seen to be that of reaction; the people could see no difference between the constitutionalist Feuillants and the aristocrat emigrants, and the doom of the party was sealed. On the 20th of June, 1792, the Jacobins replied to Lafayette's manifesto by raising the Parisian populace against the Assembly. That body, overawed and powerless, could do nothing against so fierce and determined an invasion. They next forced their way into the palace, and there Louis XVI. met them with admirable dignity. The populace shouted "down with the veto," "recall the ministers," and so forth. The king wore the Paris red cap, and the crowd was appeased at once. It was an excited, not a bloodthirsty, mob that day. Louis assured them that "he would do whatever the constitution ordained that he should do,"—words which, though they meant little, yet when joined with the red cap and the king's manly bearing, satisfied the people, who departed quietly. Public opinion seemed at once to go with the monarch and the ministers against this outrage; the Girondists, who had been parties to it, lost ground; Lafayette even ventured to come up to Paris from the army to demand the punishment of the insurgent chiefs. His attempt, however, was a failure. The Assembly threatened to arrest him for leaving his troops without orders; the courtiers of the Tuileries looked coldly on him; the king gave him no thanks; as for the queen, she liked him no better than of old. He had to return quickly to the army. The truth was that at this time the court policy had gone entirely over to the emigrants and their foreign friends. There were 80,000 men at Coblentz commanded by the duke of Brunswick; the royalists cared nothing for such constitutionalists as Lafayette; "in a month I shall be free," was the queen's remark.

Insurrection of the 10th of August.

The *Marseillaise.*

The Paris commune.

Danton.

Robespierre.

Prussia had now also declared against France, and was on the march; this movement restored all power and popularity to the Jacobins. The Assembly took measures in self-defence against the court and the foreigners; men began to call for the deposition of the king; the country was proclaimed in danger, and 50,000 volunteers were decreed; men flocked to enroll themselves from every quarter; the excitement grew daily; the fiercest threats and suggestions made themselves heard. The Jacobins organized, almost openly, a new insurrection, which should force the hand of the Assembly, and "save the Revolution." The vanguard of the attack on the constitution was entrusted to the battalion of men of Marseilles, who have attached their name to the ever-famous song, which has been sung by Frenchmen on so many a hard-won battlefield, in politics or in campaign, the *Marseillaise.* The extravagant proclamation with which Brunswick heralded the opening of his campaign did but add to the fury of people; and on the 10th of August the great insurrection, led by the popular chief Danton, swept over the Assembly and the monarchy, overpowering everything as it passed along. The guards at the Tuileries were of uncertain fidelity to the king; the commissioners of the sections of Paris seized on the Hôtel de Ville, and at once set up an "insurrectionary commune;" they summoned before them the commandant of the national guard, Mandat, who was massacred as he left the hall. The guards, thus left headless, refused to fire on the people; the insurrection swept over all; the king with difficulty, surrounded by his family, took refuge under protection of the trembling Assembly. The Swiss guards of the palace were massacred, the Tuileries taken and sacked; the new municipality, flushed with victory, compelled the Assembly to confirm its powers; to order the election of a new National Convention; to declare the king suspended provisionally, and placed at the Luxembourg under civic guard; to dismiss the ministers; to make into law the decrees passed but vetoed by the king. The Assembly was crushed, the royal family prisoners in the Temple; the Paris people, under inspiration of Robespierre and Danton, were omnipotent. Forthwith began the terrible scenes of the prisons, the mockery of trial, the massacre of the "killers at six francs a day." It was clear that the new commune of Paris was now the sovereign power in France; it established a committee of surveillance, and swept away all the older administration of Paris. Danton, burly representative of popular passions, and of popular kindness also, was the leading spirit of the time. He was no statesman, and had little chance of permanent power, when pitted against the virtuous, the incorruptible Robespierre, who had kept sedulously clear of the insurrection, and was already planning how he might rise by it to the top of his ambition. Danton with all his roughnesses was a man; Robespierre was a vain fop. Danton had comparatively little personal ambition; Robespierre always thought first of himself, and intended to become the dicta-

1792.

Marat.

tor of a new commonwealth. Marat, who must be named here, was the leading spirit of the committee of surveillance, the leader and instigator of all the bloodshed of the Reign of Terror. He wished, too, to be dictator, that he might purify society,—that he might have in his power the sole and unquestioned right to slay.

The invasion.

Lafayette, in spite of the invasion, would have marched on Paris to save society. He found himself abandoned, and took to flight; the Germans, to whom he went, imprisoned him and treated him ill. Meanwhile, the allies took Longwy and Verdun, while they besieged Thionville; the road to Paris seemed quite free to them. The effect on Paris was terrible; no one knew who was in communication with the foreigners; fear and anger made men brutal; the massacres in the prisons went on incessantly. Danton, "fiercely as he might bellow, was ashamed, for he had a human heart; and he delivered from the fury as many of the victims as he could." Meanwhile, the Prussians had forced their way into France through the Argonne, in spite of Dumouriez; and the duke of Brunswick, who hoped to cut him off, and had abandoned the direct road for Paris through Chalons, was met by Kellermann who lay in his path at Valmy. The spirit which Kellermann infused into his raw troops staggered the assailants, who hesitated and drew back. The cannonade of Valmy, for it was little more, was more to France than many a great victory; the Germans had to fall back discomfited; the siege of Thionville was raised. By the 1st of October not one of them remained in France. Unfortunately, no steps were taken to harass them in the retreat; their state was so bad that a little vigor might have entirely ruined them. Shortly afterwards came news to Paris that the army of Alsace under Custine had taken Worms, Spires, and Mainz, where lay the chief magazines of the allies; in the north an attack on Lille was repulsed. Savoy was occupied by French troops, who also seized on the coast line, and occupied Nice and Villafranca, with its great munitions of war. Abroad the Revolution showed itself proud and defiant; at home the National Convention replaced the Legislative Assembly.

V. THE REPUBLIC.

The National Convention: parties in it.

Abolition of royalty.

The trial and execution of Louis XVI.

1793.

The new government of France reflected the changes which had taken place. Paris sent the chief Jacobins to it; the Girondists sat on the right and had a large majority; the Jacobins on the left, high up, with the *sobriquet* of the Mountain; below sat the "Plain" and the "Marsh," the timid moderates, who leant towards the Girondists. Paris was behind all, fierce and bloodstained, supporting the Jacobins. At once the Convention decreed (21st September, 1792) the abolition of royalty in France, and proclaimed the Republic. The 22d of September, 1792, is the "First day of year I. of the Republic." Roland, the most influential of the Girondists, retained office as minister of the interior; and his party, encouraged by the protests of the permanent department of Paris, which felt itself set aside, attacked the anarchy of the capital and the Jacobins. Robespierre was denounced, and great debates ensued; the Girondists, however, in spite of their majority in the Convention, had no force, and little political sagacity. Paris was in no mood for submission to the more moderate and constitutional friends of the republic; before the end of 1792 the commune, and the Mountain with it, had defeated the Gironde, the executive power, and Roland himself. For a time, however, the trial of the king absorbed all attention. It had begun in November, 1792; in December Louis had been questioned by the Convention; all France discussed with vehemence the different views as to the method of the trial. Who should judge him? The parties here split; the Gironde, anxious to gain time, and to save the king from death, and the country from a great blunder, called for an appeal to the sovereign people; they still clung to constitutional forms. The Mountain held that the Convention was competent to undertake the task of an immediate trial. The opinion of the country re-echoed the cries of Paris; and the Convention, on the 15th, 16th, and 17th January, 1793, took on itself to decide the question; by a majority of a few votes (387 against 334) it decreed that the king's punishment should be death. Philip Égalité, his nearest kinsman, was one of those who voted with the majority, to the disgrace of his name; even those who wished for the king's death despised and condemned him for an act dictated by weak ambition and cowardice. On the 21st of January, 1793, Louis XVI. was executed on the Square of the Revolution.

Robespierre's rise.

By this act, as the Montagnards themselves said, "the Revolution threw down the glove to all ancient Europe." They had accused their rivals the Girondists of intriguing to save the monarchy, of coquetting with the emigrants and the foreign sovereigns. The Girondists, in their turn, accused them of being "anarchists sold to the foreigner," men who were treacherously pushing on the Revolution to excess in order to discredit it, and to bring in the foreign help which the court desired; men who were in the pay of Pitt, the supposed Macchiavelli of the time, whose hand was believed to be in everything which could turn to the harm of France. If Henry IV. was the hero of the Revolution, Pitt was its bugbear; Frenchmen were scared in those days by his name, just as twenty years later Englishmen were scared by the name of Napoleon. The truth is that the Girondists represented the burgher classes, and were honestly eager to establish the new constitution in all its parts; they were on the defensive, while the Mountain, the party of offence, represented the suffering populace—eager, defiant, weary of negotiation, suspicious of treason at every point, and zealously determined to push the principles of the Revolution to their limits. In this they were utterly careless of political considerations, eager for war, come what might, quite honest and narrow,—a very dangerous and powerful party. Their victory in the trial and execution of "Louis Capet" was complete; it brought with it inevitably the fall of Roland. When Robespierre and Danton attacked him in the Convention, finding that the Girondists no longer had a majority, he laid with dignity his resignation before the Convention, and was replaced for the time by the indolent and philosophic Garat, the minister of justice. The ascendency of Robespierre was assured—the man to whom the Revolution, as his enemies said, "was the religion of which he was the priest." "Robespierre preaches, Robespierre censures, thunders against the rich and great, lives simply, has no physical passions, has created for himself a reputation for austerity—the austerity of a saint. He speaks of God and Providence, calls himself the friend of the poor and feeble, is followed by the women and the weak, whose adoration and homage he solemnly accepts." This is the dangerous man in whose hands lay the fortunes of France throughout the dark days of the Terror. He was the prophet who should realize on earth the beautiful and popular dreams of the *Contrat Social*.

Conquest of Belgium.

Foreign relations of France.

After the withdrawal of the Germans from France at the end of the previous September, Dumouriez had easily persuaded the Executive Council at Paris that, by seizing the moment of amazement and disquiet, the French armies might secure for France her "natural frontiers,"—that is, might become masters of the whole left bank of the Rhine from Basel to the sea. Custine and Kellermann should master the middle Rhine at Coblentz, and Dumouriez should invade Belgium. He set out at once, and on November 6, 1792, by winning the battle of Jemmapes, roused the amazement of all Europe. It is true that the French were two to one, yet so low had their reputation for fighting-power fallen, that the courage they showed on the field took men by surprise. The Austrians fell back, and Dumouriez occupied all Belgium down to the Meuse. The Scheldt, which had been closed since 1648, thanks to the jealousy of England and Holland, was reopened; Antwerp and all Belgium regarded the French as their deliverers, and a Belgian republic, in which the clergy took the lead, was formed at once. Dumouriez, poorly seconded by the other armies, and ill-provided from France, could push the Austrians no further than Aix-la-Chapelle; Custine, who had occupied Frankfort, and thereby forced the German diet to declare war on France, was driven out of that place, and could scarcely hold his own on the Rhine. While France was laying her hand on monarchy at home, she challenged at the same moment the hostility of Europe, by this conquest of Belgium, and by the declaration of a crusade by the army against all its ancient institutions. The army began henceforth to regard itself as a great republican propaganda; it was by using this belief that Napoleon eventually worked his will on France.

1793.

The position of England.

This development of a warlike tendency in the republic, coupled with the fall of the king, decided the policy of England, which hitherto had shown some sympathy with France. The ferment of opinion in England, roused by the revolutionary movement and republican ideas, was much stilled by the news of the death of Louis XVI.; and Pitt with great ability both used the feeling in favor of the Tory Government at home and tempted the French ministers to declare war against England (1st February, 1793). Pitt at once proclaimed it, by a happy phrase, to be "the war of armed opinions," and drew tighter his friendly relations with the European courts. All ancient lines of policy were entirely obliterated by the new phenomenon. Spain and Portugal agreed; Austria ceased to be jealous of Prussia; Russia and Prussia found the moment good for a farther partition of Poland; the only neutral powers remaining in Europe were Sweden and Denmark, Switzerland, Venice, and Turkey.

France defies the world.

The Mountain did not quail before so great a display of force. "France shall be an armed camp," and every Frenchman a soldier; "conquer or die," the watchword of a united people; the "principles of the Revolution" a new religion for which men of good will should devote themselves. The enthusiasm was great; a levy of 300,000 men was voted at once; the revolutionary propaganda filled Belgium, and alienated the friendly feeling there by its violence. They had also ruined Dumouriez's plans, and he, with an ill-equipped army, and feeling that hostility was rising against him in Paris, set himself to recover ground by a bold attempt to conquer Holland. He was caught by the prince of Coburg at Neerwinden, and defeated after a vehement battle (18th March, 1793).

Dumouriez's plans.

Then, as a last step, Dumouriez came secretly to terms with the Austrians, agreed to evacuate Belgium, and carrying with him the young duke of Chartres, who had shown great gallantry and ability in the face of the enemy, marched for the French frontier, intending to restore the constitution of 1791, to secure the Girondists, overthrow the Jacobins, and proclaim the duke as constitutional king of France. In Paris, the struggle between the parties in the spring of 1793 was acute and close. The news of the disaster of Neerwinden and the march of Dumouriez for Paris aroused all the fury of the Jacobins; the Girondists, with horror, saw themselves innocently implicated in a counter-revolutionary scheme, carried out lightly and suddenly by a general whom they did not trust.

The Committee of Public Safety.

The Jacobins at once took the ascendant, proposed the creation of the terrible Committee of Public Safety, summoned Dumouriez to the bar of the Convention, and sent off four deputies and the minister of war to him. When they came he seized them, sent them over the frontier to the Austrians, and openly proclaimed his objects. His regular troops might have supported him; the volunteers, full of Jacobin ideas, rose on him, and compelled him to take refuge, with the Orleans princes and a handful of soldiers, within the Austrian lines. It was clear enough that the Jacobins would assume that he and the princes had had throughout an understanding with the Gironde. The Convention in alarm decreed that its own members should not be inviolable, but might be arrested on suspicion of treason; that the Orleans family should be sent to Marseilles; that three representatives should be sent to look after each army. The Committee of Public Safety was now formed of nine members re-elected monthly, as a secret spring to push the whole machine forwards without being seen. It was an ominous fact that not one of the nine representatives who formed it was a Girondist. They had still a majority in the Convention; it was all they had. Matters moved on fast; Paris, the commune, the ministers, the army, were all against them; in the country they had no adherents in the east and north-east of France; for the nearer Germany the stronger the Jacobin feeling. In the south-east royalist sentiments were still powerful, though for a time concealed.

Insurrection in La Vendée.

Their headquarters were at Lyons, and violent and bloody disturbances had already occurred there; in the west, in Brittany, Poitou, and Anjou, the royalist feeling was stronger still, and broke out, on the 10th March, 1793, in the terrible Vendean insurrection on behalf of the white flag and the refractory priesthood. The Girondists had their strength in the south-west, with Bordeaux for their headquarters; the Normans and Picards, on the whole, supported the constitution of 1791, and thus could go with the Girondists.

1793.

At the beginning the Vendeans carried all before them, and in fanatical enthusiasm sullied each advantage they gained by horrible massacres, by shooting their prisoners in cold blood, pillaging towns, burning villages, maltreating the defenceless. The civil war from the beginning took a fierce color—a color given it by the royalists. The Girondists also in the south threatened to march on Paris to put down the Jacobins. The allied powers, however, instead of closing in resolutely on France at her weakest, saved her by their long discussions as to what each of them was to take rather than what each was to undertake. At last they moved forwards in the north; Austrians, Dutchmen, and English, under Cobourg and the duke of York, slowly drove back the army of the north, which unfortunately lost its commander Dampierre, who was skilfully reviving its confidence, and besieged Valenciennes. The king of Prussia blockaded Mainz; in the other scenes of war the French were too weak to do anything, and suffered losses and defeats. The struggle of Girondists and Montagnards went on all the same; it was the gloomiest moment of the history of the Revolution. In May a Committee of Twelve was appointed by the moderate party of the Convention, at the suggestion of Barrère, a moderate who had the confidence of more extreme men. It was composed of Girondists. Over against this move the sections of Paris established their Central Revolutionary Committee. On the 31st of May, guided by Danton, Paris rose against the Convention, and compelled it to suppress the Committee of Twelve.

Fall of the Girondists.

Marat at the head of his sans-culottes, supported by the minority of the representatives, the Mountain, on the 2d of June overthrew the Girondists, arresting two of the ministers and thirty-one deputies. More than half the departments rose to defend the defeated party; in the Cevennes the white flag was unfurled, and the emigrants began to stream back into France. "On the one side was Europe with three-fourths of France; on the other side Paris with a few departments" (La Vallée). The position of things might well have seemed desperate for the Mountain, had there been any strong man, any true head, to direct the attack on them. But they had unity, energy, devotion to their principles, the main part of the army at their back; while their antagonists were divided in views and principles, and were in confusion. Danton, who in fact carried his party through the crisis, showed real power and energy. Under his direction the Convention proclaimed martial law in the hostile departments, called up the army, as far as possible, to the capital, and in eight days constructed a new constitution, that of the year I.—simple, thoroughly democratic. It never was really acted on; men were too busy to care about constitutions. The assassination of Marat by Charlotte Corday, which occurred at this moment, inflamed men's minds still more against the Girondists; she had come from Caen, one of their towns, and was thought to agree with them. The first active measures taken by the Jacobins showed that the Girondists were powerless; Paris and the army were at once triumphant, and by the beginning of August the Girondists were crushed.

Elsewhere things looked very dark: Toulon fell into English hands; La Vendée remained unsubdued, and defeated the incompetent officers sent to reduce it; Mainz and Valenciennes fell; all France was vexed with famine, and the assignat-system had utterly paralyzed commerce. The republic, however, was full of energy. After the fête of the 10th of August, with its statues of Nature and Reason, its classical and pagan affectations, and those light frivolities which were natural to Paris even in the darkest days, men turned at once to the ever-recurring question, how the republic should be saved. The convention decreed a *levée en masse* to resist the invader and to keep down the ill-affected at home; to the Committee of Public Safety was entrusted the real government of the country; the new constitution was not to be introduced till peaceful days came round.

The republican calendar.

The overthrow of all things old was further indicated by the issue, on 24th November, 1793, of the new republican calendar. Year I. was fixed to have begun on the 22d of September, 1792, the date of the proclamation of the Republic. The new year should have twelve months like its predecessors, each with a new name, in four groups

1793.

of three; each of 30 days, and each divided into three decades, of which the tenth days should be days of rest, in lieu of the old exploded Sunday. These 12 months of 30 days a piece, cutting across the old months so awkwardly, only made up 360 days; so that a little bundle of 5 days (in leap years of 6) had to be tacked on at the end of the Fructidor month (August-September) in an awkward and shapeless way, and called, poor things, the *Sans-culottides*. Such interferences with symmetry will nature cause, when she sets herself against the spirit of system, and the advance of enlightenment. Attempts were also made at this time to grapple with the confusion in the currency and the crushing deficit; the mass of assignats was reduced by more than a half; a maximum price was set on the necessaries of life; trade also had to bow to the will of the Revolution.

War in 1793.

In the affairs of war the new life of the Revolution found expression in the vigorous plans of Carnot, an engineer officer, who saw the truth of the principle afterwards acted on by Napoleon, that "God aids the big battalions." "Attack in mass, and cover the want of discipline and skill by numbers and enthusiasm,"—this was the new order. For neglecting this Houchard was deprived of command in the north, and had to give place to Jourdan, who, helped by Carnot himself, defeated Coburg at Wattignies (16th Oct., 1793); on the Rhine the battle of Pirmasens was lost (13th October), and the allies occupied Hagenau and Fort-Vauban; they threatened Landau, and had friends in Strasburg. Hoche was then set down to the army of the Moselle, and Pichegru to that of the Rhine. The former, after a series of rather unsuccessful battles against the duke of Brunswick, in which he failed to relieve Landau, suddenly left his adversary, and, in concert with Pichegru, cleared the Vosges, and brilliantly stormed the Wissemburg lines. The Austrians at the end of the year had raised the siege of Landau, and were across the Rhine; the Prussians took winter-quarters at Mainz; the French lay in the Palatinate. In the south also things went better with the new Government; Lyons and Toulon were retaken, though on the slopes of the Pyrenees the Spaniards forced the French to take refuge under the walls of Perpignan.

Close of the war in La Vendée.

In the Vendée the terrible civil war still raged; the peasants, point after point, defeated the isolated columns of the army. A more coherent plan of action, however, gave the victory at Châtillon (16th October, 1793) to the Republicans; then the Vendeans crossed the Loire, and defeated Lechelle near Laval. They next attacked Cherbourg, meaning to make it their point of union with the English; here, however, they were manfully withstood, and, incapable of siege-operations, withdrew. On their return they defeated Rossignol and made a push for Angers, meaning there to recross the Loire to the left bank. Westermann and Kléber drove them thence with loss, and with Marceau pursued them to Le Mans, where, after a terrible battle in the streets, in which no quarter was given or taken, the Vendeans were utterly defeated. Westermann pressed on their heels with pitiless vigor; caught at last between the Loire and the Republicans, they were finally defeated (23d December, 1793). Thenceforward they ceased to be formidable, though still troublesome at times.

So ended 1793, with fortunes, on the whole, very favorable to the French army, and very fatal to the Girondists. Meanwhile, the Reign of Terror had begun at Paris; the queen, the leading Girondists, all who were "aristocrats" or "ci-devants," as the phrases of the day called them, Philip Égalité, and a crowd of others, passed under the guillotine. In La Vendée, the revolutionary fury, goaded by the blood shed by its opponents, spared none it suspected. From Toulon most of the inhabitants had fled for refuge to the English ships; at Lyons the Convention ordered the destruction of the city, and the establishment of a new town to be called "Commune Affranchie;" many hundreds of the citizens were guillotined, and when that process proved too slow, were shot down by platoon fire.

Hebertists and Dantonists.

Two parties were now to be discerned in opposition to the rule of the Committee of Public Safety,—the *Exagérés*, or Hebertists, so named from their leader Hebert, the party of terror and reckless bloodshed; and the *Modérés*, the Dantonists, who tried to calm men's minds, and lessen the atrocities of the time. The Hebertists were the stronger party; they abolished the Catholic worship, swept away the past, set up a goddess of Reason, and professed atheism. The party of Robespierre in the Committee disliked both the indulgent and the savage sections. Early in 1794 the Hebertists were seized and condemned to death; it was a first victory of the Government over the violent party. Had Robespierre been willing to ally himself with Danton, a stable rule, at least for a while, would have been possible. But he refused: he was not a person to brook a manly rival at his side; and Danton, with his party, fell victims to the ambition of the ascetic and heartless Robespierre. "If my friend is culpable, I will sacrifice him to the Republic," was his phrase,—had he said "to myself," he would have hit the truth. Then Robespierre became for a while a dictator; all France bowed before him; the revolutionary spirit in the eleven armies on foot was on his side. The campaigns of 1794 proved glorious for them; the battle of Fleurus (26th June) won for them the second conquest of Belgium; in the Pyrenees the French stormed the Spanish camp at Ceret, and threatened Catalonia; in Italy, where young Bonaparte commanded the artillery, they swept the Piedmontese out of their camp at Saorgio, and got the command of all the strong points along the Alps. It was only on the sea that the French armies failed; Corsica was taken, and Howe defeated the squadron in charge of a corn-fleet from San Domingo.

1794.

Robespierre's rule.

The Great Terror.

Robespierre's fall.

In the midst of his foreign cares Robespierre also busied himself with the exposition of his ideas. Those whom he had destroyed, Hebertists and Dantonists, had been anarchic and atheist; he, pale reflex of Rousseau, would bring back the reign of virtue and the love of God. He desired to be at once high priest and dictator of a regenerated France. To this end he passed a decree recognizing the Supreme Being and declaring that the soul is immortal. His admirers at once hailed him as a great prophet; the emotion throughout the country was great. On the 8th of June, 1794, he took the lead in the great fête of the Supreme Being, which amused and offended many of his old friends. Finding himself far from being admired by them, he determined that the Terror, which he had in some ways mitigated, should go on again; the Convention, however, resisted, and he withdrew completely from public life, giving his enemies the opportunity of strengthening themselves against him. At the same time he left the reins of power in the hands of his terrible colleagues, who at once applied with the utmost ferocity the law by which suspected persons could be put to death with but the shadow of a trial. This was the time of what is called the Great Terror, June and July, 1794. The reaction soon came; in spite of his friends and the power of the Jacobins, he had arrayed against him the majority of the Committees, and almost all the old Montagnards; his pride and vanity, the fête and his conduct of it, their fears of a dictator, their fear for their own heads, all undermined his position. Before long the struggle began. Robespierre was no Marat; he would not strike a crushing blow, and "making solitude, call it peace." He trusted too much to the strength of his ideas, the influence of his party; and on the 27th of July, 1794 (the 9th Thermidor), it came to an explosion in the Convention. Permanence was voted, the arrest of Robespierre and his chief supporters was agreed to; a proclamation to the people was issued; five members of the Convention were carried off to prison. Instantly, the commune of Paris declared itself in insurrection, the tocsin was rung, and the five deputies were at once rescued from the jailer's hands, and carried in triumph to the Hôtel de Ville. Two hundred cannoniers marched on the Tuileries, where the Convention was sitting, and all seemed over there. But the artillerymen were not firm; when the deputies talked to them, they hesitated, and that hesitation was fatal to Robespierre; for those sections of Paris which hated him had also put themselves in motion to defend the Convention; indecision fell on the Jacobins, their forces melted away, and the resistance came to an end. Robespierre tried to shoot himself, and shattered his lower jaw; he and his friends were again arrested, and perished the next day on the scaffold. And thus ended the early history of the French Revolution. From the proclamation of the Republic to the days of the Legislative Assembly, from the overthrow of their power to the death of the king, thence to the fall of the Girondists, then to the death of Hebert and Danton, now to the failure of Robespierre's bloodstained Utopia,—thus had the Revo-

1794-1795.

The future of the army.

lution moved onwards, violent, yet often generous, proudly patriotic, yet destructive of all the stability of the country. There remained but the army. The army was heartily republican, and had suffered enough and triumphed enough to have a high idea of its own organization and its worth. When a man comes to lead it, the army will set itself to organize France into an instrument of tremendous power; a despotism, solid and strong, aggressive abroad, vigorous at home, using all the terms and calls of the Revolution, will take the place of the ill-fated men who have hitherto tried to guide the destinies of the country. It will call itself an empire; it will be a despot ruling with the liberal ideas and phrases.

The reaction on Robespierre's death.

Meanwhile, as Mr. Carlyle says, "here was the end not of Robespierre only, but of the Revolution-system itself," for his death was the signal of a great revulsion of feeling. France, so gay and light of heart, had lived an unnatural life under the preachings of this virtuous dictator; she was weary of the gloom and burden of a system which crushed out gayety, made wealth a crime, and pleasure impossible; and public opinion hailed with joy the tidings that the régime of virtue and the guillotine was over. The Terror was past; the committees which had destroyed Robespierre perished with his death; the "Thermidorians," the Mountain, who had caused this revolution, became a reactionary party, sitting on the right, and remodelling, if not overthrowing, the existing government. The prisons were emptied, the terrible cruelties of Nantes stopped; amnesty was offered to the rebels; the sections of Paris were reduced in importance, the administration of the capital reorganized. All the parties in hiding came forth; the Girondists returned; society began once more to dance and glitter; it was like the temper of England after the return of Charles II. In January, 1795, the Convention closed the Jacobins Club; the agents who had carried out the inhuman orders of the past were put to death.

Close of the Jacobins Club.

The war abroad.

The armies, which by no means sympathized with the movement of affairs at home, still pursued in the autumn and winter of 1794 a brilliant career under Pichegru in the north, Jourdan on the Sambre and Meuse, and other generals for the Moselle and the Rhine. The whole course of the Rhine from Basel to the sea was in their hands; and the winter campaign, in which Pichegru conquered Holland, raised the fame of the commander and of his troops to the highest point. Pichegru had done what Louis XIV. had failed to do; 1795 wiped out the discredit of 1672; Holland and Belgium were to become republics on the French model; the Amsterdam populace welcomed the French as brethren. The capture of the Dutch fleet at the Texel by hussars, who stormed it on horseback, riding across the ice, seemed to the French people to realize a tale of fairyland. At home, too, the suppression of the Chouans, those Breton peasants who, taking advantage of the troubles, plied the trade of brigands and highway robbers, added to the general content. The Vendeans struggled still; their country was a scene of desolation, and the central authority had to recall their barbarous agents, and to try to reduce the district to peace by way of conciliation.

Things look brighter for France.

So ended the year 1794, which saw the reaction set in at Paris, and saw, too, the Revolution triumphant on every frontier, and the area of its influence extended widely. The coalition against France showed signs of breaking; the Dutch made peace, ceding northern Flanders with other districts to France; the king of Prussia also abandoned the coalition, ceding to France the left bank of the Rhine; the Bourbon king of Spain next abandoned "the cause of all kings;" the little states of Germany followed; Portugal made advances in the same direction, as did Naples, the papacy, and other Italian powers. England and Austria alone stood firm against the new ideas, and Pitt, though he could not hope to direct, or have to pay, half Europe, still felt strong enough to carry on the war.

Disturbances in Paris.

Paris, where famine raged unchecked, was still uneasy and dissatisfied with the new Government. Men who knew how to excite the populace to fury told them that the scarcity was factitious; and they broke out into insurrection on the 1st of April, and again on the 20th of May. On each occasion the disturbance was easily put down. The multitude was thus completely overthrown, and the guidance of affairs lay entirely with the middle classes; the reign of wealth and comfort was what men longed for; it was in sharp contrast with the general distress and suffering of the people, and provoked vain contests and bloodshed. The royalists thought that their time was come; and in a large part of the south of France they rose, and pitilessly massacred their political opponents. The murders committed by them far exceeded in indiscriminate butchery and savageness even the brutal bloodshed which had defiled the progress of the Revolution. Throughout 1795 the efforts of the armies of France were languid—there was a feeling of uncertainty; the troops were firm to the republic, but it was not clear that the generals were so as well. Pichegru paralyzed the army of the Rhine, as well as Jourdan's army of the Sambre and Meuse, and ended the year by making an armistice with the Austrians, after which he was recalled and deprived of his command. The English armament, destined to rekindle the troubles of Brittany and La Vendée, failed wretchedly at Quiberon Bay; the genius of Hoche crushed it in the outset, and captured a large number of royalists. The central Government sent him orders to destroy them all. He shot 711 émigrés. And Charette on the other side, to be at least even with him, murdered in cold blood 2000 republican prisoners in his hands.

1795.

Troubles in the west.

Constitution of the year III.

The Constitution of the year III. now appeared, the work of the restored Girondists. It was republican, of a modified type; it entrusted legislation to two councils, the council of the Ancients, 250 persons of forty years of age and upwards, a kind of senate, who sanctioned the laws (or, to put it the other way, had the veto-power); and the council of Five Hundred, men at least thirty years old, who had the preparation and initiation in law-making. The executive power was entrusted to a Directory of five members, under whom should be responsible ministers, and all the machinery of practical government. The general principles of the rights of man were reaffirmed. The Convention at once accepted it, only taking care that the royalists should not be able to get hold of power by means of it. The country generally adopted the new constitution, which seemed likely to be moderate and stable. The royalists made one determined effort (5th October, 1795), to overthrow it; the fighting was severe, and for a time Paris seemed likely to accept a counter-revolution. The energy of Bonaparte, who had been set aside because of his Jacobin opinions, but was now recalled by Barras, swept away the insurrection; Bonaparte had guns, he was a great artillery officer already, and the loose resistance of the royalists was vain against his skill and iron resolution. The elections, which took place this same month, being over, the Convention, as a last and, for the time, a very significant act, decreed the abolition of the punishment of death, and then declared its mission ended, and so ceased to exist.

Bonaparte crushes the royalists.

The army had saved the Convention; it had set a new man forward; and he, for all his faults, a great man and a true ruler, became after a short time the central figure of all Europe.

Earlier history of Napoleon Bonaparte.

Napoleon Bonaparte was born in Corsica, on the 15th August, 1769, just two months after the patriot Paoli had been obliged to cede that island to France. His was a dark and thoughtful boyhood. He loved history, above all the history of great men in the republics of antiquity. He read with eagerness both Cæsar's *Commentaries* and, like so many other great men, Plutarch's *Lives*. The French tongue was a foreign language to the boy; he learnt it late, and never altogether mastered it. In 1785 he was at the military school at Paris, where he learnt to grumble at and to criticise the ancient régime; in the next year he entered the army. When the Revolution began he declared warmly for it, though at first his ambition seemed rather to point to a career in Corsica than to one in France. When Paoli ejected him thence in 1792, he settled, first at Nice, then at Marseilles, with his mother and sisters, who had gone from Corsica with him. In 1793 he became captain of artillery, and was charged to put down the Marseilles federalists; this successfully accomplished, he was made adjutant-general at the siege of Toulon, and by storming the Éguillette fort, secured the fall of the town. He was at once, at the

1794-1795.

age of twenty-four, named a brigadier-general, and, after arming the Provençal shores against English attacks, was sent to command the artillery (in 1794) in Italy. Here his vigor, amazing power of organization, and genius in war gave a new turn to affairs, and secured the brilliant success of the campaign, which, in about a month's time, made France the mistress of the Alps. This triumph made Bonaparte a great favorite with the Robespierres, especially with the younger brother, who had at this moment the charge of the army of Italy; and the young general, without believing much in them, echoed the high-flown sentiments of his chiefs, accepted, with contempt, their opinions, while, as far as he dared, to his honor be it said, he sheltered those who in Italy were obnoxious to their vengeance. In after life he always shunned reference to this period of his career, and his connection with the brief ascendency of Rousseau's reign of virtue as expounded by Robespierre. At the time he saw that it would not last, and tried his best to avoid compromising himself. He got his reward; when Robespierre fell, though he was arrested, and had a narrow escape, his prudence had kept him sufficiently clear of the fallen leader to save him. For a time he was in disgrace, and with other officers of the army of Italy was suspected of strong Jacobin tendencies. When, however, Barras, in October, 1795, needed a vigorous artillery-officer for the streets of Paris, he found one in Bonaparte, whom Pontécoulant, with a clear sight which does him great credit, had made president of the "topographical cabinet." For Bonaparte, not being a real Frenchman, knew the value of geography, and understood how to use a map. The remarkable skill and energy with which the young general crushed the Vendémiaire insurrection secured his fortunes; with the army he had defeated Paris. He was made general of division and commander-in-chief of the army of the interior at the age of twenty-six. The event "showed the world," says Lanfrey, "what can be the weight of a soldier's sword in the balance; from this inauspicious day power learnt to reckon on the army, the army to dispose of power; the path towards a military government was now open."

The Directory.

First, however, the Directory must have its course. The Legislative Assembly, with seemingly the fairest prospects, had lasted less than a year. The National Convention saw the fall of the Girondists, then of Hebert and Danton, lastly of Robespierre, and existed three clear years. The Directory, which came into office with a new constitution on October 28, 1795, had before it no less than four years of power. And yet at first, so far as could be seen, its chances were bad. The five directors, with exception of Barras, who was a noble, and suspected of reactionary leanings, were honest republicans, and men of character; they set themselves to allay the commercial and popular misery of the country, by absorbing a large portion of the assignats, and then by replacing them with "territorial mandates," which represented a fixed amount of public lands; a considerable amount of coin came again into circulation, and credit seemed to revive. They also abolished the commune of Paris, created an army for the "interior," and established guards for the public service. Stability seemed to return; men were weary of the agitations of late years; the famine also abated, so as to render Paris less difficult of management. It was felt that the Government was in a way provisional, that France had need of repose, and as usually happens, indifference succeeded as a reaction from the heroic measures of the past. The councils of the Ancients and of the Five Hundred were one-third new; and the elections had shown that the country was weary of the Revolution, and desired a return to a constitution, and perhaps even to a monarchy. The bourgeoisie of France were the strength of this movement. The republican party, which had offended Paris, and refused to ally itself with the doings of the Jacobins, seemed weak, and was obliged to stand on the defensive. The royalists, to whom had rallied many of the old Girondists, were able to pass more than one decree in favor of their views. Had there been a prince of any resolution at their head, their chances would have been good; as it was, the count of Provence, who in this year was recognized by the crowned heads as Louis XVIII. on the death of his nephew, the dauphin (the titular Louis XVII.), was an intelligent and liberal person, but wanting in power, while his brother the count of Artois (afterwards Charles X.), whom he now named lieutenant-general of the realm, was a miserable and narrow creature, of good manners and bad morals, incapable of any worthy or heroic effort.

1796.

When the Vendeans and Bretons were eager to revolt again, and Charette had prepared everything, the count of Artois could not even be persuaded to land; he returned to England, discredited and despised. The fierce outbreak of despair with which Charette signalized his disappointment and anger was soon mastered by the devotion and genius of Hoche, who circled round the revolted districts, gradually hemmed in the insurgents, and eventually took and shot the desperate chieftain himself. His comrade Stofflet had perished a month before. By April, 1796, the west was completely pacified, and 80,000 of the best soldiers of France were free for foreign service. At the other extreme, the former "Terrorists" formed a great secret society called the Conspiracy of Babeuf; their plans were betrayed to the Directory, and the movement easily crushed; the Government used no vengeance; only Babeuf and one comrade were executed.

Conspiracy of Babeuf.

These things gave stability and confidence to the new administration; it seemed to win the good-will of all except the extreme parties; there was a distinct lull in political passion; and as the Directory proved very enterprising and warlike in foreign affairs, it also secured the army. This was in large part due to the military genius and temper of Carnot, "the organizer of victory," who was one of the Five. He now planned a grand attack on Austria, feeling that the hostility of England might for the moment be neglected. Three armies, led by three young generals, were to make their way in harmony towards Vienna, one under Jourdan, the army of the Sambre and Meuse, the second under Moreau, that of the Rhine and Moselle, the third under Bonaparte, the army of Italy. This army, hitherto commanded by Scherer, who had under him Serrurier, Masséna, and Augereau, had not been inactive in 1794 and 1795. Scherer, however, had no enterprise in him, and was content with partial success; his army lay scattered along the Alps, and he seemed powerless to draw it together so as to crush either Piedmontese or Austrians; the army also was not powerful in numbers, though its quality was very good. Bonaparte, on his arrival to take the command, at once addressed them in the tone of a confident adventurer speaking to hungry mercenaries: "I am going to lead you into the richest plains on earth;—there you will find honor, glory, and wealth." Splendidly seconded by Masséna, La Harpe, and Augereau, he at once took the ascendant, and placed his victorious army between the Piedmontese and the Austrians. By a successson of rapid victories he forced the Turin court to sue for an armistice (28th April, 1796), securing the neutrality of the Sardinian and Savoyard troops, and the cession of Nice and Savoy to France at the end of the war. Then with the swiftness of an eagle he crossed the Po, won the hard-fought battle of Lodi (10th May, 1796), and entered Milan in triumph. There he re-equipped and rested his army, made terms with the dukes of Parma and Modena, raised a contribution of twenty million francs on Lombardy, the half of which, with some of the masterpieces of Italian art, he sent at once to Paris to the Directory, which received his favors with a gratitude which trembled on the verge of jealousy. When they proposed to interfere with him, he threatened to throw up his command; and so marked already was this young officer's popularity in France, that the Government shrank from accepting his resignation, and the great career was not checked. In spite of infinite difficulties, by unscrupulous assertion, audacity, genius in war, Bonaparte succeeded in humbling the Italian states: Venice, with her unarmed neutrality, was easily mastered; Beaulieu, who commanded the Austrian army now falling fast asunder, was driven back towards Tyrol; Mantua was blockaded; the pope, Pius VI., signed an armistice with the young conqueror; the English were dislodged from Leghorn and Corsica; Genoa gave in; Piedmont was quieted. When Wurmser came down into Italy with 40,000 Austrians from the armies of the Rhine, these unwilling friends of France at once turned against her; it might have well appalled a man of slighter nerve. But Bonaparte at once made head against his new foes. He was a man who never failed to see the critical point in a campaign or in a battle; and at Lonato, Castiglione, Bassano, and Saint George he drove the old marshal, with his ancient ways of warfare, completely out of Italy with vast loss. The whole series of operations had taken but a week (July 30 to August 5). He hoped next to penetrate, according to

Foreign wars.

Bonaparte in command in Italy.

1796-1797. Carnot's plan, through Tyrol into Bavaria, and there to unite with Moreau. He had, however, underrated the Austrian obstinacy; for Wurmser, gathering fresh forces, resumed the offensive, hoping to free Mantua, and to repulse the small French army. Bonaparte, who had won the battles of Roveredo and Calliano, and had reached Trent on his way for Innsbrück, at once hastened back, defeated Wurmser at Bassano and drove him towards Mantua, in which place he shut him up by the middle of September. In vain did whole German armies, released from the campaigns elsewhere, pour from the mountains down into Italy; the incredible swiftness, clearness of insight, vivacity of genius, ascendency over the soldierly mind, which mark the great commander, saved Bonaparte from being crushed. Seconded by his admirable captains, he won the fields of Arcola and Rivoli, of La Favorita and Corona, in which he utterly paralyzed the Austrians, secured the fall of Mantua, the prize for which the antagonists were striving, and led to the capitulation of Marshal Wurmser himself. Bonaparte instantly set out to reduce the feeble pope, who, scared by his approach, signed (19th February, 1797) the treaty of Tolentino, under which he paid a heavy subsidy, and ceded Avignon and the Venaissin to France, and the Romagna, with Bologna and Ferrara, to the friends of France in the Milanese; Bonaparte also extorted from him a hundred of the chief works of art at Rome, which were sent as spoils of war to Paris. It was believed in France that the last hour of the papacy had struck. The young conqueror, in the midst of his most active movements, had found time to sketch out a future for Italy, and to frame his Cispadane and Lombard republics; he also signed a treaty of peace with Spain. In all things he acted promptly and resolutely, awaiting no man's orders, with perfect confidence in himself and his army The Directory at Paris could but look on in amazement, and, by seeming to advise and approve, endeavored to associate itself with his dreaded triumphs.

Bonaparte subdues the papacy.

The campaign in Germany.

The campaign of 1796 in another way was favored by fortune, so far as Bonaparte's interests were concerned; for the Rhine armies, ill-supplied, and under two commands, were opposed by the archduke Charles, and were not strong enough to carry out the great and dangerous plans of Carnot. Jourdan was repelled, and Moreau, who had penetrated into Bavaria, seeing himself almost cut off and isolated, with Jourdan on the Rhine, and the Tyrolese Alps between him and Bonaparte, was forced to retreat, and late in October was back again in Alsace. A great expedition to Ireland under Hoche also failed completely; and by the beginning of 1797 Bonaparte seemed to the eyes of all Frenchmen their only great and successful captain.

Bonaparte's plans for 1797.

Now he startled all Europe by his audacious plan for the campaign of 1797. He saw his way to achieve that which Louis XIV. had attempted in vain, the overthrow of Austria by a march on Vienna. His army was strengthened, and those on the Rhine ordered to begin active operations, in order to occupy their opponents; quite early in the spring Bonaparte began his great campaign by driving the archduke Charles away from his defences. In spite of the vehement resistance of the Tyrolese and the threatening attitude of Venice in their rear, the French advanced always, and Bonaparte, crossing the Noric Alps, penetrated in April as far as Leoben in Styria; his outposts were pushed to within easy reach of Vienna. Then the Austrian court fell into panic; the Austrian armies were either beaten and scattered or were far off; there was no resisting this terrible and swift advance. The emperor gladly signed with Bonaparte (who had no authority to do it, only the power), "the Preliminaries of Leoben" (18th April) ceding to France Belgium and the left bank of the Rhine from Basel to Andernach, as well as Lombardy, which was to be an independent state. The successful outset of the Rhine campaign, in which Hoche and Moreau had already thrust the Austrians back into the Black Forest, was early arrested by the tidings of Leoben. In Italy fortune again favored Bonaparte. A Venetian insurrection gave him the opportunity of finally overthrowing the ancient republic of Saint Mark. The Venetian citizens were in the main favorable to France, while the oligarchical senate and the peasantry detested the "deliverers." A democratic government, centred in the people of Venice, replaced the rule of the senate. Genoa, under the 1797. grand title of the Ligurian Republic, became the submissive ally of France. The amazement of all Europe, the sympathy of the peoples everywhere, the embarrassments of the Governments, forced even Pitt to make serious proposals for peace.

The Preliminaries of Leoben.

Fall of Venice.

Yet at home affairs looked ill. In spite of the glorious success of the armies abroad, paper money,—which, as La Vallée says, "had done its work, had conquered Europe, had in five years subdivided property far beyond all that had been done in that direction by centuries of feudalism," because it was with paper that the thriftier peasants had been able to purchase the lands of the crown, the church, and the nobles,—these assignats had become almost worthless, and a field for gamblers, who scandalized even Paris with their sham wealth and real dissipation. Republican manners and institutions were alike corrupted and tottering to their fall. It was thought that the elections of the year V., which renewed one-third of the two councils (May, 1797), would reverse the political position, for they showed clearly that the country was returning to royalist opinions. In some departments a "White Terror," the usual accompaniment of the rising spirits of royalists, broke out. A reaction at one began in the Directory, of which three members were still firmly republican, while two, Carnot and Barthélemy, were with the new majority, the "Clichy" party. The Directory was censured for the war against Venice, and the new alliances in Italy; the exiled and depressed party were favored; it was openly said that the councils would reorganize the national guard, overthrow the Directory, and proclaim Louis XVIII. "While Europe was learning to speak with terror-born respect of the name of Republican," says Thibaudeau, "it had become at home a term of contempt, a title to proscription." Napoleon Bonaparte, with his devoted and Jacobin army, had won that respect for France abroad; how would he presently face the difficulties at home? The Directory, finding itself menaced, and its very existence at stake, recalled Hoche, the most single-minded of republicans, with his army from the Rhine, and asked Bonaparte for one of his generals. He sent them Augereau, whom he could trust both to do the work well, and not to stand afterwards in the way of his own ambition. With these the Directory carried out the "Coup d'État" of the 18th Fructidor (4th September, 1797); with cries of "Long live the Republic" the soldiers occupied Paris; the three directors, who had the stroke in hand, Barras, Rewbel, and Laréveilliere, arrested their fourth colleague Barthélemy, while Carnot, the fifth, escaped. The majority in the Councils was overthrown, fifty-three of them condemned to exile, and a kind of Reign of Terror ensued, without much bloodshed. The liberty of the press was suspended, the laws favorable to the royalists repealed, the party of the old régime crushed. Hoche, who had received the command of both the Rhine armies on the suspension of Moreau, suddenly died (it was said of poison), at the age of twenty-nine; he left behind him an untarnished name—that of a peasant-hero of purest and noblest character.

Royalist reaction in France.

The Coup d'État of the 18th Fructidor.

Treaty of Campo Formio.

The Directory, though it breathed again, felt that it lived only by the grace of the army; and so, while it signed the treaty of Campo Formio (Oct. 18, 1797), which embodied the Preliminaries of Leoben, it broke off negotiations with England. Bonaparte's work in Italy done, he was named general of the "army of England," and at the end of 1797 returned in triumph to Paris. In him men saw a new development of Revolution principles, a man of genius under whom those principles were to bring happiness and glory to France, while he taught them by force to the unwilling nations of Europe. He too saw before him an open field for his ambition; he would destroy the kings of the earth by the agency of his Jacobin army; and then, "head of the army," he would become master of France. His Italian blood and tastes taught him how the Roman republic had passed into empire; he would tread the same path, and reach the same splendid goal. The *coup d'état* of the 18th Fructidor had destroyed the authority of the elective body over the Government; when the departments had sent up royalists, the Directory put them down; and, by a natural consequence, the press was at once coerced, lest public opinion, never strong in French history, should gain too much power. The result of all was the weakening of the

1798.

Directory, and the gradual preparation of France for the coming of a real master.

The Directory becomes unpopular.

For the republican party was by no means content with the five Directors,—the "five tyrants of the Luxembourg;" it was a Government without splendor, or principles, or virtue. Consequently, the elections of the year VI. showed a decided majority in favor of republican principles. The Directory did not hesitate to make a second *coup d'état,* this time against the republicans. They also put a lawyer instead of a general into the vacant place in the Directory itself, as if to show that they could do without the army now. Yet, at the same time, they had refused the advantageous terms offered them by Pitt at Lille, and were eager for war; they proposed to remodel all Europe on democratic lines, and rejoiced to have a hand in the overthrow of the papal government, which was replaced by a Roman republic (February, 1798), and in April of a Helvetic republic which replaced the old aristocratic government of Bern. By the former France defied the oldest institution in the world; by the latter she destroyed the ancient neutrality of Switzerland, a step which afterwards turned to her own loss.

Threat of war with England.

War with England was now the chief affair for France; she made preparations on the western coasts, and set a considerable fleet afloat. The state of Ireland, which was thoroughly hostile to England, invited the Directory in one direction; the appeal of Tippoo Sahib in Mysore was heard at the same moment. Should they listen to either? Should they not rather strike at the heart of the enemy by an invasion of England? Bonaparte, who was now at Paris, standing aloof from parties, advising the Directory, living tranquilly with his wife Josephine, interested in his new membership of the Institute, was destined to answer this question for them. Afraid of dropping out of sight, anxious to strike the imagination of France by some singular and distant success, attracted by that love of wide combinations which characterized him, Bonaparte now proposed to the Directory to conquer Egypt. The conquest itself would be easy, for the Ottoman power was all but gone. Egypt would be a splendid colony for France, assuring her on the one hand of the Mediterranean, and on the other hand rendering the trade and mastery of England precarious, if it did not at once prove fatal to it. The thought had been presented to Louis XIV. by Descartes, and approved by Colbert. Choiseul had not rejected it in his day. "We can destroy England in Egypt," was Bonaparte's belief. On the other hand the Directory, after much doubt, adopted the project, partly because of its dimensions and startling boldness, partly because the Five could thereby, for a time certainly, probably for ever, be delivered from the terrible young general whose ambition was clear to them, and whom they feared. And so, in spite of all whisperings of prudence, and in spite of the threatening state of Europe, and the precarious condition of their power at home, the Directory sanctioned Bonaparte's plan, and furnished him with a fine fleet and army for the purpose. That able negotiator Talleyrand set out for Constantinople charged to endeavor to satisfy the Ottoman Porte as to the objects of the expedition.

Bonaparte's position.

The reasons for the Egyptian expedition.

The Egyptian expedition.

Bonaparte sailed from Toulon (19th May, 1798) for Malta, which, by good will of some of the knights, and the idleness and decadence of the Order of St. John, he took at once; thence to Alexandria, having escaped the English fleet under Nelson. He landed, and sent Kléber forward to capture Alexandria; then leaving him to garrison that city, he marched on Cairo, threw off the gallant attacks of the Mamelukes on the way, showed to his soldiers the "forty centuries looking down on them from the Pyramids," defeated Mourad Bey, who endeavored to defend Cairo, and entered that city in triumph. The whole of Egypt was thus subdued with one blow; and Bonaparte was already, with his wonted energy, making plans for the permanent occupation and government of the country, was setting out with his savants to explore the wealth and wonders of the land, was writing home bulletins of glory, when there spread through the camp the news of the battle of the Nile, and one great disaster ruined all. Brueys, after receiving orders either to enter the port of Alexandria or to withdraw to Corfu, had lingered near Aboukir, and was there caught by Nelson. The battle had lasted all the night of August 1; by the morning the English fleet was much shattered, but it had destroyed its enemy, with the exception of four ships which escaped to Malta. It was the ruin of the French navy; and how should the victorious army at Cairo ever get reinforcements or escape from Egypt? Was the fate of St. Louis in store for these new crusaders, who, unlike him, affected Mahometan ways and customs, and issued proclamations which the pious Mussulman might have thought written by a true believer?

1798.

Second coalition against France.

The Ottoman Porte, far from being appeased by French explanations (indeed Talleyrand, shrewd man, saw that it was hopeless, and never went to Constantinople), declared war on France, and allied itself with England and Russia,—it was the beginning of the new politics of the Mahometans in Europe, the beginning of the end for them. A second coalition was at once organized against France. Russia, under Paul I., entered warmly into it, and constituted herself the special patron and protector of the emigrant royalists; the court of Vienna made its preparations to shake off the yoke of Campo Formio; the five republics round about had learnt already that republicanism under French patronage was very like servitude,—the French having an unhappy knack of always alienating those they patronize as liberators,—and seemed weary of seeing their finest works of art sent to Paris, as if to the world's centre. They were already listening to the court of Naples which hotly urged on war. France, on the other hand, was very unfit to fight. She had lost all control of the Mediterranean; the army was weaker in itself, and much weaker by the absence of Bonaparte in Egypt; finance was still amiss, with a terrible deficit; the Directory inspired little confidence. The only ally of France was Spain, and her navy had been destroyed the year before off Cape St. Vincent by Admiral Jervis.

The conscription.

The Directory raised money as it could, and passed the great law of the "conscription," by which every Frenchman was compelled to be a soldier from the age of twenty to twenty-five, and ordered an immediate levy of 200,000 men. War began at once in Italy; before the end of the year the whole peninsula from Piedmont to Sicily was at the feet of France.

Operations in war.

The Directory, having destroyed the neutrality of Switzerland, thought it now necessary to occupy that country, in order to protect the frontiers of France on that side; they also spread their forces along their whole line, from Brune who commanded in Holland, to Macdonald who was at Naples. The army of Masséna formed the centre of the whole; he was instructed to enter Switzerland, seize the central Alps and the Vorarlberg and Tyrol, and thence to threaten Venice. It was an entirely new combination in European warfare, thanks to the new Helvetic Republic. Masséna pushed forward into Tyrol, but was arrested there by the ill-success of his colleagues in Bavaria, and in Italy on the Po. Jourdan had been twice defeated by the archduke Charles on the Danube, while Scherer, in Italy, after some successes, had been obliged to fall back after a disastrous campaign. The Helvetic strategy had proved a failure, and Masséna had to abandon his enterprise. The news of French reverses reaching Rastadt, where France was still trying to intimidate the feeble princes of the empire, the French envoys were told to leave the town, and were murdered on the road by Austrian hussars. The news of this barbarous insult to the sacrosanct persons of a nation's envoys roused immense excitement in France, and entirely did away the depression which had crept over the country. The ranks of the army filled with amazing speed. The Helvetic plan of advance was abandoned; Masséna had command of his old army and that of the Rhine, with his centre from the Lake of Constance to Basel; Macdonald was withdrawn from Naples; the army of Italy was commanded by Moreau, whom the Directory had restored to favor after eighteen months of inaction, consequent on his ambiguous dealings with Pichegru.

The campaign on the upper Rhine showed that the French were not strong enough to defend so long a line; they were pushed back as far as to Zurich, where Masséna defended himself for two days against the archduke Charles, and though in the end successful, he still found it better to fall back again. The Austrians occupied the chief part of Switzerland, and waited for the Russians to come up. In

Campaign in Italy.

Italy Moreau was also overpowered; his great ability as a captain alone saved his army from terrible disasters after the defeat of Cassano, in which Suwarrof treated him very roughly, driving him back and entering Milan. He took up a good position near Alessandria, and waited for Macdonald, who was coming up from Naples. After a very difficult campaign, in which Moreau showed great vigor and devotion, and Macdonald had done his best, and the French soldiers had displayed all their old bravery, the two armies, after terrible losses, united at Genoa. The Directory dismissed Macdonald, gave Moreau the command of a new force on the Rhine, and sent Joubert to command the army of Italy. In attempting to save Alessandria, he was met by Suwarrof, who defeated him completely (15th August, 1799), at Novi, after a very hard-fought battle. This defeat ended the French resistance in Italy; Naples, Rome, the valley of the Po, were all in the hands of the allies. From all sides news of disaster reached Paris; the Dutch fleet passed over to the English; an expeditionary force reached Ireland, only in time to be taken prisoners; the English took Minorca and blockaded Malta; the Russians became masters of the Ionian Islands; Bonaparte even, with the army of Egypt, had suffered defeat from Sir Sidney Smith at St. Jean d'Acre on the Syrian shore, in May, after having taken Gaza and Jaffa. In India the friend of France, Tippoo Sahib, lay dead in the breach of Seringapatam (4th May, 1799). No wonder if after this the position of the Directory became very critical. It was loudly declared, in spite of facts, that the Five had intentionally sacrificed Bonaparte; the public feeling in his favor grew with men's sympathy and indignation. The Government was, with exception of Barras, one of honest mediocrity, a dangerous type in France; Sieyès, who entered the Directory in the year VII. (1799), was regarded as its enemy, and men rallied round him; Lucien Bonaparte, who was one of the Five Hundred, led the opposition, which declared the councils to be in permanent session; and thus the legislative power once more asserted its authority over the executive (18th June, 1799). It was a republican revival; the constitution of the year III. seemed to be set aside; the character of the Directory was changed by new appointments; things fell into confusion. It was clear that a head was wanted.

Bonaparte's return.

Tidings of this state of things at last reached Bonaparte, who had been completely cut off from France by the disaster of the fleet. It is said that he learnt it from a packet of gazettes forwarded to him by Sir Sidney Smith. Turkish armies had been gathering force against him, and baffled in Syria, he had now to fight for existence in Egypt. The battle of Aboukir (24th July, 1799), which destroyed one of their armies, set him free. Not without lies and deceptions he stole away, leaving his army under command of Kléber, whose independent temper troubled him; for as he had failed to conquer Syria, and to win an Oriental empire, he must now hasten home to push his fortunes in France. About the time that he reached Paris (October, 1799) in a kind of triumph, as the hero of the brilliant success of Aboukir, the anxious country also received tidings of the splendid campaign of Masséna in Switzerland, the victory of Zurich (24th September, 1799), the quarrels of Russia and Austria, the retreat of Suwarrof into Bavaria, and of the lesser successes with which Brune defeated the duke of York in Holland, and forced him to sign the capitulation of Alkmaar (18th October, 1799). France, relieved rather than triumphant, welcomed Bonaparte with enthusiastic transports. No one cared to inquire what he had done with his army; he was there, and that sufficed; he was there, and the reign of order was about to begin. To this, then, had the reign of Reason, the rights of men, the republican propaganda, fallen; men yearned only for a strong man, a stable government under which they might have equal peace. And Bonaparte was willing enough to accept the part thus pressed on him; he called to himself the moderate party, by far the largest in France, and prepared to seize on a dictatorship. On the 18th and 19th of Brumaire (9th and 10th November, 1799), Bonaparte, who had allied himself with Sieyès, and had round him a powerful group of friends and generals, carried out his plans in spite of the resistance of the patriots, the hostility of the Five Hundred, the uncertain temper of the troops. It was a moment of immense peril for Bonaparte and his brother Lucien, until, in reply to an appeal to the soldiers, in which nothing was spared that could rouse them, the grenadiers rallied to their hero, and ejected the council then sitting at St. Cloud. The Directory was suppressed, and in their place were three consuls, appointed provisionally. These were Napoleon Bonaparte, Sieyès, and Roger-Ducos. Two commissions were named to revise the constitution. The three consuls took oath to the Republic.

The Coup d'État of 18th and 19th Brumaire.

The last stage of the Revolution.

Thus the Revolution passed into its last stage. It had tried to live with a king, had tried to govern by democratic severities, had also been moderate; it now became military. The despot, who, according to Aristotle, haunts like a dark spectre the steps of democracy, had now, at ten years' end, overtaken and destroyed its forerunner. "Eadem magistratuum nomina," no doubt; also, as in the case of imperial Rome, a new dynasty founded on the sword.

Bonaparte's position.

Bonaparte had no sooner secured his revolution than he set himself with his wonted vigor and sagacity to consolidate it. He saw that France was weary at heart of the struggles and changes of parties; he wished to sweep away all remembrance that he too had been, in profession at least, an ardent partisan; he felt that he, supported by his bayonets, was strong enough to treat faction with contempt. Therefore he said, "Let there be no more Jacobins, nor moderates, nor royalists; let all be Frenchmen;" and as he said it, all France recognized that this was the equality they sought, and hailed him as their master. When the consuls sentenced fifty-nine democrats to exile, the popular feeling showed itself so completely in favor of an amnesty for all that they were compelled to recall the order. Parties were now insignificant, because Bonaparte was great.

Constitution of the year VIII.

On the 13th of December, 1799, the "Constitution of the year VIII.," chiefly the work of Sieyès, was put forth. There were to be three consuls, first, second, and third, not equal as at Rome, named for ten years, and re-eligible. Of these the first consul had in fact all the power; he alone could promulgate laws, name ministers, ambassadors, and officers generally, while the second and third had only a consultative voice, which could not be of great avail; their two voices could not out-vote that of their so-called colleague. A council of state was to be charged with the drawing of all laws, its members to be named by the first consul; laws thus framed should be presented to a tribunate of a hundred members; this body, after discussion of the project, was to pass it on, in the hands of three orators, who should discuss it against three counsellors of state nominated by the Government, in the presence of the legislative body, which finally adopted or rejected the law by a secret ballot without debate. This legislative body was composed of three hundred members. Lastly, there was to be a senate of eighty life-members, who should confirm or annul all acts which might be referred to it, on grounds of their constitutional character. They also were to name the consuls, tribunes, and the legislative body, choosing them from a list of 5000 names, which were to be chosen by 50,000 persons, who themselves should be elected by 500,000 electors, who in their turn were to be named by universal suffrage. Senators were to be elected to vacancies by co-optation, from a list of three candidates presented by the legislative body, the tribunate, and the first council. Bonaparte had modified this elaborate structure before it saw the light, by significantly cutting out all the poor guarantees for liberty it contained. As it stood, it was merely the decent robe which shrouded the naked dictatorship of the first consul. The people, by an enthusiastic plébiscite, adopted it almost unanimously. Bonaparte having accepted the post he had arranged for himself, two new men were associated with him; Cambacères, a distinguished lawyer, and not a politician, as second consul; and Lebrun, an elderly man, good at the bureau, the type and representative of French officiality, as third consul. The senate was filled with the most distinguished names in France—men great in science and arts, as well as in arms or politics; the legislative body whom they selected, after the decimal system explained above had reduced the candidates to 5000, were certain to be quiet obsequious people. Finally, lest public opinion should be disturbed in its happy unanimity, the freedom of the press came suddenly to an end; for the First Consul thought that thirteen journals were enough for France,

The three consuls.

The First Consul and his ministers.

The new despotism.

and these were all duly submissive to the Government. Thus did dictatorial power usurp the place of liberty, and a system began, based on falsehood and illegal force, yet so splendid and so well-suited to the needs of fainting France that she has only in our day at last escaped from the glamour of it, and from the worship of the Napoleonic idea. The First Consul took up his abode, early in 1800, at the Tuileries, and at once formed a ministry:—his brother Lucien for the home office; Gaudin for finance; Berthier for the army; Talleyrand, ex-bishop, for foreign affairs; and Fouché, lord of spies, for police,—the last two the only politicians in the company; they both had abandoned holy orders. Without a portfolio, in close relation with Bonaparte, was Maret, better known by his later title of duke of Bassano, the first founder of the *Moniteur Universel*, a man of upright character and unwearied industry. The spirit of system, visible in the constitution, and in the tastes and character of Bonaparte, was at once indelibly impressed on the administration of the country. All sprang from one centre, the First Consul; a prefect was set over each department, with sub-prefects under him; it was a more perfect development of the intendant's office under the old régime; the prefects named the local mayors, and thus the whole machine received all its impulses from headquarters, and formed a perfectly compact and easy-going government. Local law and local finance were also organized in a similar way; and by a simple edict as to the method of tax-gathering, joined to the new confidence all France felt in her ruler, the crushing difficulty of the deficit was at once got rid of. Peculation became impossible; taxpayers were equally and fairly charged; none were allowed to fall into arrears; and the country, being really rich, speedily rose into prosperity. Salaried officials covered the whole land with a network, each for his daily bread interested in the stability of government. The principle of the new government, in general administration, in finance, in the church, in the law, was that of absolute subservience of all officials to the head; and the love of France for bureaucracy, which has made her the chosen land of an official hierarchy, made this organization the most complete and successful that the world had hitherto ever seen. The disturbances in the west, caused by the monarchists, were put down without difficulty.

Proposals to George III.

Bonaparte had promised peace to France; and he at once wrote a letter to George III., with characteristic indifference to the English constitution, offering to make peace directly with him. Pitt, as minister, replied by refusing to negotiate till France should replace on the throne her ancient dynasty. The terms of the refusal offended the French people, and strengthened Bonaparte's position. Russia made peace; Prussia stood neutral. Austria and England, with Bavaria, Würtemberg, and Mainz, determined to continue the contest.

Campaigns of 1800.

The battle of Marengo.

Peace of Lunéville.

The campaigns of 1800 were thus planned by Bonaparte. Masséna with a weak army was left to defend the Riviera from Nice to Genoa, and there to employ as much as possible the Austrians in Italy. The Rhine army, led by Moreau, should threaten Bavaria, after finally grasping the all-important strategic position of the corner of the Black Forest, between Rhine and Danube; meanwhile Bonaparte himself, quietly and with scrupulous secrecy, collected a third great army for himself, destined for the Po. Masséna's army was driven back and suffered considerable reverses; the Austrians under Melas penetrated across the frontier; Bonaparte, however, knew that Provence was not the heart of France, and that with Masséna holding out at Genoa, no very serious attack could be made in the south. Moreau's army of the Rhine penetrated into Bavaria, drove the Austrians back to Ulm, and prepared to send a part of its right flank across the Alps to join the main central movement of Bonaparte. His army of the centre, collected rapidly at Geneva, made its famous passage of the St. Bernard, while his right went over the Mont Cenis, and the right flank of Moreau's army, now his left, crossed the St. Gotthard. To the amazement of all, the Austrians saw Bonaparte returning to the scene of his old triumphs, and entering Milan in triumph. They hastily drew themselves together; the fall of Genoa, after a splendid defence by Masséna, freed a large force. The astounding battle of Marengo (14th June, 1800) decided the campaign; "in it the Austrians lost all they had gained in eighteen months and by twenty victories." The armistice of Alexandria followed at once; for Marengo had given Bonaparte the command of all the upper valley of the Po, and the Austrians withdrew behind the Mincio. Meanwhile Moreau, with the army of the Rhine, was doing excellent work in Bavaria, and had taken the ascendant all along his line, when tidings of the convention of Alexandria brought his campaign to an end. Peace, however, did not follow; the English Government eagerly urged the Austrians to hold on, and hostilities began again, late in the year, in the valley of the upper Danube, where Moreau, supported by Ney, won the splendid victory of Hohenlinden not far from Munich (2d December, 1800), and after a series of brilliant combats drove the Austrians back, till Vienna was in terror. Then an armistice was signed at Steyer, by which Austria ceded her strong places in Tyrol and those of Bavaria to the French army. The army of Italy also won great advantages, and compelled Austria to sign an armistice, by which France occupied a number of important points in north Italy. In concert with Pius VII., lately elected pope, Murat menaced the kingdom of Naples, and a third armistice, which closed the Neapolitan harbors to England, ended the war. The peace of Lunéville was concluded on February 9, 1801, between France and Austria. It was drawn on the basis of the treaty of Campo Formio; France secured the left bank of the Rhine and the Belgian provinces; the independence of the four republics was recognized; the pope was replaced in his states; Tuscany was ceded to France, and became the heart of a new kingdom of Etruria. The king of Naples also made his peace with France, on the terms of his armistice.

The opposition of England.

England alone stood out against the First Consul, who seemed able to impose his will on Europe. It is impossible, at this distance of time, to realize completely the combination of causes which led to the determined resistance of England; the most prominent and least defensible cause was the "dominium maris," asserted in opposition to the principles of the armed neutrality of 1780. At the end of the 18th century the English navy had risen to very great proportions, and the interests of the country, as was then thought, were hostile to the claims of neutral commerce. Consequently, the northern powers, irritated and insulted by English claims carried out with the strong hand, formed a great coalition at the end of 1800, in which Denmark and Sweden, Russia and Prussia, set themselves to secure the liberty of the seas. They invited the First Consul to join them, and he desired nothing better; it seemed as if the national hatred of France against Pitt and England would now find vent, and would overthrow that persistent enemy. It seemed, too, as if Bonaparte, as he consolidated his power at home, would be able to assert himself also as the protector of the liberties of Europe abroad. On the other side, the English Government did not waste time. Parker and Nelson were sent into the Baltic, to break up the coalition, if possible. As Denmark had the most ready fleet, and was in fact the most active member of the coalition, Nelson determined to strike hard at Copenhagen. The hard-fought battle of Copenhagen, in which the Danes made heroic resistance to the English forces, led to an armistice; and the assassination of the emperor Paul I., which reversed the policy of Russia, brought the great coalition to an end. By the summer of 1801 the northern powers were all again the friends and allies of England. It was in vain that Bonaparte threatened the English shores with invasion; he felt that his great plan had broken down, and wanted a little breathing time. He made peace with Portugal, occupying with French troops two of its provinces. On the other hand, the army Bonaparte had left in Egypt, after the refusal of England to allow it to return to Europe, had lost its general Kléber, who had been assassinated by a Turk; all the efforts made to reinforce the army from France failed; an English force from Minorca, and 7000 Sepoys from India, as well as a Turkish army, now converged on Egypt. Abercromby, at Aboukir, repulsed the attack of the French under Menou; the French army after a short time had to capitulate (27th June, 1801), and was carried over to France in English ships.

At the same time war between France and England was drawing to an end; the negotiations were concluded in March, 1802, by the peace of Amiens. The principles of the armed neutrality had failed to establish themselves, and Eng-

The peace of Amiens.

Bonaparte's organizing power.

The Code Napoléon.

land secured not only her command of the sea, but her lordship over India. She had also freed Portugal, the kingdom of Naples, the States of the Church, from French control; Egypt was restored to the Sublime Porte. On the other hand, the authority of France in central Europe remained unbroken; the great campaigns on the Po and the Danube had secured this result. The brilliant successes of the French arms, and the treaties of Lunéville and Amiens, prepared the way for the next forward movement of the First Consul. Meanwhile France at home was prosperous and productive; Bonaparte's splendid gifts of organization continued to work wonders; he made the income of the country meet all the outgoings, and created a real surplus, a thing unknown throughout the previous century. On every side fresh energy was evoked, new enterprise stimulated; all things were felt to proceed from one centre,—a centre not, as in the old monarchy, of selfishness and waste, but of active and beneficent influence. Too little was left for private and spontaneous effort, that being the weak side of the development of France; yet considering the state of the country, the rule of a beneficent despot was welcome and most successful. The greatest work of this period was the construction of the civil code, on which Bonaparte himself worked with amazing zeal, clearness, and ability. It was issued in January, 1804. In other domestic matters his ascendency displayed itself more and more; the attempts made against his life enabled him to crush and terrorize the extremer republicans. The system of *senatus-consultes*, by which he veiled his arbitrary edicts under the authority of an obsequious senate, enabled him by degrees to crush the remnant of free discussion still possessed by France in the tribunate of the constitution. He got rid of constitutional opposition as readily as he had freed himself from the attempts of conspiracy, and reduced the legislative assembly to a nullity. The age of the Revolution seemed to be past; the grand organizing faculty of the First Consul was doing what the destructive forces of the republic could not do,—was reconstructing society on a basis partly new and partly old, was centralizing authority, was creating a despotism adapted to the phraseology of a "Republic one and indivisible," and giving to France a new position among the nations. For the autocracy of Napoleon was the direct outcome of republicanism, as it allied itself with military organization, and slowly attracted to itself many of the relics of the old order of things. Though essentially hostile to real liberty, the coming empire sprang out of a great and generous effort made by France in that direction; it was not till our own days that she succeeded, if even now she has succeeded, in shaking off the iron trammels of imperialism, and ruling herself with constitutional freedom and calmness under the republic of her choice.

The reconstruction of society.

The Concordat.

1804.

Return of the émigrés.

In these years (1800–1804) the First Consul not only crushed the spirit of the two chambers and the tribunate, but also passed on boldly to reconstruct French society, a much harder task. Directly after the peace of Amiens, when France was in the first flush of an unwonted tranquillity, Bonaparte made terms with the papacy, and by the Concordat reconstructed the Church of France. All the old divisions were swept away; ten archbishoprics and fifty bishoprics were newly mapped out by First Consul and Pope; and in 1802 the will of Bonaparte and Pius VII. peremptorily put an end to the schism between refractory and constitutional clergy, and so cut away from the ancient monarchy its chief support. The traditional life of the church was rudely cut off; the authority of the state was displayed in full; the constitutional priests were sacrificed to the political needs of the First Consul, who saw that, if he would have firm hold of power, he must first win over the royalist clergy. The chief opponents of the Revolution got the chief rewards; the constitutionalists were mortified. From this moment dates the friendship between the Napoleonic dynasty and the Church of Rome; from this dates also that secret hostility between the clergy and the army, which has often since that period produced results none the less striking because their origin was concealed. For the time, however, the paramount authority of Bonaparte over the army made resistance impossible. The weak point in the arrangement was the certainty that in their hearts the courtier-like clergy would always prefer a Bourbon to a Napoleon; and of this, too, history has provided more than one proof. Still, for the time, in church as in army, the step was successful, and gave strength to Bonaparte's position. The emigrants also returned, thanks to an armistice, and in large numbers took oath to respect the new government. It was a bold and hazardous step, which the First Consul afterwards saw good reason to regret. An exiled adherent of a lost cause never changes, never learns prudence, never is satisfied with the *de facto* ruler of his people; his mind is warped, his moral sense, in matters political, vitiated; the existing government has in him a secret enemy, a plotter and intriguer, a fierce fanatic, outwardly subdued, inwardly smouldering, and ready to burst forth in flame whenever the breath of a royal whisper fans the embers.

The university of France.

The Legion of Honor.

The constitution of the year X.

In restoring the Catholic clergy and the ancient nobles to France, Bonaparte affirmed a principle hostile to the revolution, necessary for a despotism. He must have classes of society "intermediate," as he said, "between the people and the powers;" "to settle the bases of the Republic, one must throw on the sand some masses of granite," an apt illustration of the way in which this despot of an iron will determined to crush all liberty in France. Unfortunately for him his heavy "masses of granite" after all, while they crushed the people, formed but an insecure foundation for himself. The same motive led him to reorganize education and to establish the university—in his hands a mere creature of power, a machine to turn out public officers, and to centralize and unify all education in France; public schools or *lycées* throughout France were all dependent on this central university. Education, as is always the way under a despot, took a mathematical and scientific bias; moral sciences and history found no place; theology was left for the clergy in their seminaries; the dead languages held a secondary position. To this new organization France owes, in large part, her unpractical ignorance of modern languages, geography, political economy; she has not yet entirely shaken off the load thus imposed on her shoulders. Next, the institution of the Legion of Honor was the beginning of a new aristocracy, and was meant to supply another blank in the new hierarchy of this growing military despotism. Finally, the First Consul constructed a new constitution, that of the year X., which strengthened his own position, and weakened still further all the elements of republican and constitutional opposition. It was adopted with obsequious unanimity (4th August, 1802). During this period the influence of the First Consul was also dominant across a large part of Europe: the four republics rested on him, and were much modified at his demand; the lesser states of Germany allowed him to interfere in their affairs; he was able to overcome, at least for a while, the suspicion and ill-will of Russia. On the seas also his activity was felt: he was anxious to restore the colonial power of France, shattered by the war; he interfered in the affairs of Hayti, and hoped also to recover his influence over Egypt and the Mediterranean. England, seeing her special province of the seas thus invaded, and never very well pleased with Bonaparte and the peace of Amiens, declared war against France in the spring of 1803.

Second war with England.

The Empire.

Bonaparte at once occupied on the one hand Hanover, on the other Naples, made friendly overtures to the United States, and threatened the English shores with invasion. Europe was divided into two hostile camps, and a great and stubborn war impended. Russia at once sided with England; the court of Vienna, though unable at once to go to war, warmly sympathized with the opposition to France; Prussia held aloof; England also seconded the underground resistance of the old royalists in France. This was the period of the conspiracy which led to the seizure by Bonaparte of the duke of Enghien, a seizure on the soil of Baden, excusable on no plea of international law or sudden necessity, his military and violent mockery of a trial, and his peremptory execution. Moreau, whom the First Consul was glad to be rid of, for he alone could be a rival in the affections of the army, was exiled to the United States; Pichegru committed suicide in prison; a handful of others were executed; and the First Consul, taking advantage of the excitement and indignation of all France, had himself proclaimed Emperor of the French (18th May, 1804). A new constitution, of imperial texture, was woven for the occasion. Hereditary succession was affirmed; six great dignitaries, with high sounding imperial titles and no power, were established; the military splendors of the marshalate reappeared; the council of state and the senate were charged with all legislative functions; the older bodies, the tribunate and the legislative body, were a mere appendage; and thus began the imperial age.

VI. The Empire.

Imperialism.

Imperialism is an overlordship over nations. It is more than this; it is, strictly speaking, the representation of both the empire of old Rome and the Holy Roman Empire, with all the high claims involved therein. In this sense, imperialism claims temporal lordship over all the earth, and rears its head side by side with the papacy, which asserts a spiritual headship as wide and as complete. The full theory of neither has ever been realized; and as time has gone on, both ideas have grown weaker, and pale images of both have sprung up. As the world has become wider, it has become clear that neither the principle of nationality nor that of independence of thought was compatible with either empire or papacy. And, as time has gone on, the imperial name itself has undergone large modifications. We have seen an empress of India, an emperor of Austria, an emperor of China, an emperor of Mexico,—all names completely wide of the true imperial idea. And the title of "Empereur des Français," which Bonaparte now assumed, with acclamation of France, carried in itself a reversal of old ideas, for it affirmed a personal lordship, based on the sovereignty of the people, as expressed by a plébiscite. Be this as it may be, the power was real, and was wielded with iron will and unscrupulous genius.

The third coalition.

The strength of England on the seas soon compelled Napoleon to make his chief attack on Austria, while England and Russia once more drew together against him. In 1805 his grand army penetrated into the valley of the Danube, took Ulm, and in spite of the king of Prussia's accession to the coalition, pushed on as far as to Vienna. Napoleon occupied all the upper and middle Danube valley, and then marched northwards in pursuit of the emperor Francis of Austria, who had fled into Moravia. On the 2d of December, 1805, he won the great battle of Austerlitz, which for the time reduced the allies to impotence. Peace followed at Presburg (26th December, 1805), between France and Austria, by which that ancient power was parted out among its neighbors.

Peace of Presburg.

Battle of Trafalgar.

Two months before this the decisive battle of Trafalgar had finally disposed of the remaining naval force of France and Spain (21st October, 1805), and, leaving England in complete security, enabled her to continue without fear her task of obstinate resistance, at the very moment when France seemed to have completely triumphed over the united hostility of continental Europe.

Napoleon's Confederacy of the Rhine.

The emperor at once, characteristically guided by his love of grand conceptions and far-reaching combinations, set himself to surround France with a great system of "federative states of the empire," in "three compact nations of Italians, Germans, Spaniards." But if he overrated his own constructive genius, he underrated the obstinacy of his enemies, and soon found himself met by a fourth coalition, against which he proposed to build up the Confederacy of the Rhine, and to restore the dependence of the lesser German princes on France, and so to carry out the ideas of Henry IV., of Richelieu and Mazarin. War, however, broke out in a different quarter. The restoration by France of Hanover to England, a part of the series of negotiations which followed the peace of Presburg and the death of Pitt, roused the utmost anger in Prussia, and led to new combinations, as a consequence of which the king of Prussia, without waiting for help from England or Russia, rushed on war (September, 1806). The battle of Jena (14th October, 1806), and Auerstadt completely overthrew the Prussian power, and the conquest of Prussia was completed before the end of the year, and before the Russians had time to come up to the succor of their allies. A winter campaign followed, in which the sufferings of the troops and the obstinate resistance of the Russians at Pultusk and Eylau (8th February, 1807), arrested the triumphant movement of the emperor for a time. In the summer of 1807, having secured the line of the Vistula, he defeated the Russians at Friedland (14th June), and took Königsberg. The treaty of Tilsit (7th July, 1807) followed; for Russia needed rest, and Napoleon was not sorry to pause. It is the highest point of the emperor's renown. His hand was felt throughout all Europe; it seemed as if England alone was beyond his power.

War with Prussia.

The treaty of Tilsit.

The Spanish War.

The determination of the emperor to rearrange the whole map of Europe, and to assert his power in every quarter, led him to that Spanish war whence sprang the resistance which at last overthrew him. For he decided on subduing the whole Peninsula, including Portugal; the Portuguese court took flight to Brazil on the approach of Junot, and Charles IV. of Spain abdicated when Murat threatened Madrid. Napoleon at once placed Joseph Bonaparte, a very incompetent person, on the Spanish throne; and when the Spaniards showed their irritation with him, he too abdicated, and gave place to Murat, who had married Caroline, sister of the emperor. Then the Spaniards rose in revolt, and that wearing guerilla warfare began which opened the way for the successful arms of England. The capitulation of Baylen ruined for the time the French power in Spain; Dupont and Vedel were compelled to lay down their arms; in Portugal England now began to appear, and on 21st August, 1808, Sir Arthur Wellesley won the battle of Vimiera. When Napoleon found that, as thus in Spain, the peoples rose against him, he ought to have recognized the hollowness of his friendships with the kings. He longed, however, to be one of their comity, as well as to have vassal kings and princes under himself; to this end he had created a new and high-sounding aristocracy around his throne; for this end when Germany, led by Austria, now began again to move against him, Napoleon drew towards Russia, and was completely duped by the emperor Alexander. Having, as he thought, made all safe on that side, he turned his attention to Spain, and, in spite of guerilla warfare, entered Madrid (4th December, 1808). Sir John Moore, who from the west coast had penetrated as far as to Salamanca, was driven back by Soult supported by the emperor, and after the battle of Corunna (14th January, 1809), in which he fought at bay and lost his life, the English had to embark and withdraw. The siege of Saragossa, however, contested with all the tenacity and devotion of the Spanish character, wore out the strength of the French forces, and their tenure of Spain was felt to be most precarious.

Fifth coalition.

Now followed a fifth coalition against Napoleon, whose subjects at home were beginning to show signs of exhaustion. Still, when his army marched into Bavaria it seemed as strong, as enthusiastic, as well commanded as ever. By splendid combinations and a series of victories, Napoleon swept down the Danube valley, and took Vienna. Ere long he was checked by the terrible battle of Gross Aspern or Essling (21st and 22d May, 1809) just below Vienna, in which his victory was purchased at a price he could ill afford. He had to pause, while the Austrian court gathered itself together in Moravia. When he saw this, and felt that all Europe was beginning to move behind him, he too gathered his strength up, and marching against the Austrians defeated them, under the command of the archduke Charles, in the decisive battle of Wagram (5th and 6th July, 1809),—a victory which, while it ruined for the time the military power of Austria, also weakened him to a dangerous point. It was therefore at once followed by the armistice of Znaim, which led in a short time to the hollow peace of Vienna. This agreement broke up the coalition, handed over to Napoleon the Illyrian provinces with a part of Tyrol, and gave him an imperial bride in Maria Louisa, daughter of the Austrian emperor. Napoleon at once returned to Paris, to celebrate his marriage, and to organize afresh his vast empire. Nothing escaped his care; he coerced the press, rearranged finance, which had grown to be a very heavy burden, saw that the church was duly submissive and duly paid, and held the pope in honorable bondage at Savona. In other parts things went not amiss: the foolish Walcheren expedition mouldered away; in Spain Wellington with difficulty held out against Spanish indolence and corruption, and the genius of Marshal Soult. The lines of Torres Vedras (1810–1811), which the English gen-

Battle of Wagram.

Peace of Vienna.

1811–1812.

eral defended against Masséna, form the turning-point of the history of Napoleon's triumphs. His last great victory was Essling; henceforward his successes will bring no lasting good; his failures will draw him toward his fall. The successful winter in the Torres Vedras lines was followed by Wellington's famous campaign of Almeida, Badajoz, and Ciudad Rodrigo (1811–1812), in which the English general separated Soult and Masséna, while he secured for himself a splendid base of operations for the future.

The war with Russia.

Sixth coalition.

But before this, the flattering friendship of Russia had turned to gall. Ever since the end of 1809 Napoleon had seen how hollow all was in the north, and at last, early in 1812, war broke out. Napoleon, misled by brilliant schemes, and ever trustful in his star, determined at once to crush the resistance of Russia; as he had entered Berlin, Madrid, and Vienna, so he would also enter Moscow, and thence at last dictate peace to all the world. He seemed to think he had two things only to do, "conscrire et prescire,"—to summon up and sacrifice the whole youth of France as conscripts, and then to prescribe his own terms to Europe. This terrible blunder cost him his throne. He left his soldiers in Spain to take care of themselves; though he must have seen that they were almost as much in want of help as that army had been which he so selfishly left behind him in Egypt. With this difficulty in his rear, and the vast distances, huge armies, and terrible climate of Russia before him, he set forth in the spring of 1812 on his famous and fatal march to Moscow. He crossed the Niemen and reaching Wilna, the capital of Lithuania, halted there to recruit his troops (June, 1812), which were in unusual disorder. Here he proclaimed his sympathy for Poland, while he tried not to offend the Austrians or to unsettle their share of the dismembered kingdom. Negotiations also went on; the emperor of Russia offered terms, which were refused at once; Bernadotte, now by election prince-royal of Sweden (21st August, 1810), who knew the character of his late master, also had dealings with Napoleon, while at the same time he made alliance with the czar, and began a sixth coalition against France; England joined the new league, and Turkey made peace with Russia. Still Napoleon persevered; he won the hard-fought battle of Smolensk (17th August, 1812), though he did not succeed in cutting off the retreat of the Russians, who burnt everything as they withdrew, leaving a desert for the French. The terrible battle of Borodino, one of the hardest struggles in history, gave Napoleon a victory, though the Russians again withdrew in good order (7th September). They did not attempt to defend Moscow, retiring thence, and leaving the capital as "a snare in which the ruin of the foe was inevitable." And so it proved; the French army entered Moscow in triumph, and Napoleon established himself at the Kremlin (15th September); the next day the whole town burst into flames; after five days nothing was standing save the churches, and perhaps a tenth of the city. It was savage as it was heroic; at any rate, it was completely successful. The emperor Alexander spurned all overtures for peace; his armies grew more threatening; the French communications were clearly unsafe; the winter was not far off; it looked as if Napoleon might even be shut up in Moscow. The great retreat was inevitable. In the middle of October the French army began to pour out of the gates of Moscow, and then began a running battle at every point. The army bled at every pore, and Ney with the utmost heroism protected the rear. At last Napoleon reached Wilna; there the worst of the pursuit seemed to be over, and there were both food and raiment; there he, leaving Murat in command, abandoned the shattered remnants of the grand army, and took flight to France (5th December, 1812). The remainder of the retreat was even more ruinous than what had gone before; it was but a handful out of so great a host that reached the frontiers of France again. Of 450,000 men who set forth, probably not 100,000 returned.

The war in Spain.

In Spain affairs had been almost as bad for France. Early in 1812 Wellington had taken Ciudad Rodrigo and Badajoz, and then advancing into Spain, defeated Marmont and the French at Salamanca (22d July, 1812), and occupied Madrid. In the autumn Soult, by able dispositions and a stronger force, compelled him to retreat again to Ciudad Rodrigo. The campaign had shown the weakness of the French occupation, while it had greatly lessened their resources and the part of the Spanish territory at their disposal.

1813.

War with Prussia.

The battle of Leipsic.

France still worshipped her chief. The new and severe conscription gave him another vast army; and he set forth to punish Prussia, which had declared war against him, in concert with Russia. The Germans always have honored this period of their history as a great resurrection, and as the birthtime of their true national life. The emperor passed through Mainz to Erfurt, and fought his first battle, a severe one, on the plain of Lützen; the defeated Prussians and Russians fell back in good order through Dresden, Napoleon following them hard, defeating them, and driving them out of their intrenched camp at Bautzen (20th and 21st May, 1813), whence they retreated again in perfect order. It was evident that the temper of Germany had entirely changed since Jena. An armistice, which followed, led to much negotiation at Dresden, where Napoleon's headquarters lay. The upshot of it all was that Austria joined Russia and Prussia, and the war went on. The attack of the allies on Dresden, which lasted two days (26th and 27th August), ended in their repulse and defeat; Russian supports came up in October, and it was plain that they were going to cut the French communications, and coop Napoleon up in Dresden for the winter. The king of Bavaria at this moment joined the allies, and made the emperor's position still more precarious. He now withdrew from Dresden, and near Leipsic came into collision with his enemies, who were waiting for him there. On the 16th of October, 1813, began one of the decisive battles in the world's history. Napoleon's forces were far outnumbered by those of the allies; and some of his German troops deserted in the thick of the fight. The battle raged on the 16th and the 18th; on the 19th Napoleon, completely defeated, began to withdraw. At Hanau he overthrew Wrede, and cut a passage for his army; the victorious emperors followed closely on his heels, and barely half his men reached home. The campaign had broken to pieces the dominance of France in Europe; and all the imperial creations, the confederation of the Rhine, the kingdom of Westphalia, the Batavian republic, came to an end. George III. resumed the electorate of Hanover; Austria recovered her lost provinces; in Spain the throne of Joseph Bonaparte fell, for the battle of Vittoria (21st June, 1813) had utterly destroyed the power of the French in the peninsula. Wellington drove them out of Spain, and in spite of the vigor and ability of Soult, the two great frontier fortresses of Pampeluna and St. Sebastian fell. Wellington entered southern France, and in November threatened Bayonne. Napoleon could only complain, with the tone of an irritated master, that he had been defeated by the treason of his servants, that is, of his German subjects.

The invasion of France.

On his return to Paris, the emperor found the tone of feeling very much changed. In the legislative body men ventured to denounce his rule; such outspoken words had not been heard for years. He angrily replied with his "l'état, c'est moi," "to attack me is to attack the nation," and abruptly closed their session. Henceforth he would rule alone, and alone with the ruins of his armies face the terrible invasion that was coming on. The whole conditions of his warfare changed; he must now act on the defensive, and bear to see France trodden under foot, even as France till now had trodden all Europe under her feet. The allies came in almost without resistance in three armies,—the Austrians from Basel advancing to Langres; Blücher with the Prussians crossed the Vosges to Nancy; the army of the north, Russians and Prussians, came down to Namur, and thence to Laon. In all there were full 200,000 of them, a force quite double that at the emperor's disposal. They all sat on the inner slopes of the mountains which form the northern, north-eastern, and eastern defences of France, awaiting the moment to advance. Napoleon had the one great advantage of the inner line. But after fighting the severe battle of Arcis-sur-Aube, he tried to paralyze the allies by striking at their communications, and so lost his one advantage; for they, instead of hesitating, marched boldly on for Paris, defeated Mortier and Marmont in the very suburbs, and forced the proud capital to surrender before Napoleon could come up to its defence. The allied emperors were received with cries of "Long live the king," "Long live the emperor Alexander." A provisional gov-

1814-1815. ernment of senators decreed the downfall of Napoleon; the other constituted bodies followed; the imperial government was swept away as in an instant. The emperor, amazed at this sudden impulse of the country, abdicated (6th April, 1814) on behalf of his son, and finally (11th April) he abdicated completely, offering himself, as he said, a "personal sacrifice" to France. His titles, honors, an ample income, and the island of Elba in full sovereignty, were left to him.

Louis XVIII.

The restoration of the Bourbons followed at once. Louis XVIII. appeared in Paris, the protégé of foreign bayonets, and not ashamed to own that he owed his return to English help. Peace followed at once; France shrank back to her old dimensions, as she had been in 1792, with some slight modifications. Louis XVIII. lastly promulgated a new charter, granting some constitutional rights to his subjects. The document was dated as of the 19th year of his reign, as though Napoleon and the Revolution had never been. The peerage was restored, its numbers now unlimited except by the king's will, who alone could appoint peers; a chamber of deputies, elected by a limited suffrage, had really but little power, as the king reserved to himself the initiative of all laws; the Roman Catholic religion was declared the faith of the state, and full toleration granted to all dissidents. This was the constitutionalism of the reaction. It showed how far France had travelled from the days of the old régime. There was no question of ancient privileges or of feudal usages; the very name of States-General had disappeared. No reaction, however severe, ever brings things back to the point from which they had drifted; France could never again be what she had been under Louis XIV.

The return of Napoleon.

A congress at once assembled at Vienna, under Metternich's presidency, with a view to a peaceful resettlement of Europe. It was, however, suddenly turned to warlike thoughts by the startling news that Napoleon, leaving Elba, had landed near Cannes (1st March, 1815). He appealed to citizens and soldiers alike; he appealed to the people; he spoke only of peace and liberty, and a popular constitution.

The Hundred Days.

The army at once saluted him again as its emperor; France with a spontaneous plébiscite restored him to his throne, and Louis XVIII. fled to Ghent. Napoleon entered Paris amidst delirious transports of delight. Cooler reflections soon followed, when the declaration of the allied sovereigns was heard, and troubles began in the old royalist districts. Nor were men better pleased when it was seen that Napoleon returned at once to his old despotic manner of governing; signs of alienation showed themselves; the allied armies drew towards the frontiers of France. Blücher, with his Prussians, came down to join Wellington, who had landed in Flanders, and Napoleon hastened up to prevent their union. He sent Ney to encounter and check the English, while he himself tried to destroy the Prussians. He found them at Ligny, where, on June 16, 1815, he defeated them, though Ney was unable to force Quatre Bras, so as to be ready to fall on their flank and complete the rout. The consequence was that Blücher drew off his army unbroken to Wavre; and Wellington, to keep near him, also fell back to the village of Waterloo, where he could both cover Brussels and await the Prussians. There, on the 18th of June, 1815, took place the battle of Waterloo, in which Napoleon and Ney made their final effort for the empire. The object of Wellington was to hold his ground till Blücher could come up; the object of Napoleon was, by detaching Grouchy towards Wavre, to hinder the Prussians, till he could crush the English. Grouchy, however, let himself be deluded by a single Prussian corps, while Blücher slowly made his way towards Waterloo: and Wellington's Englishmen and Germans, with heroic tenacity, had held their ground against all attacks. In the afternoon the Prussians began to come up, and after the repulse of the French guards towards evening, Napoleon knew that all was lost. He entrusted his shattered army to Soult, and fled headlong to Paris. There, finding hope all gone, he once more abdicated, on behalf of his son. He withdrew to Rochefort, hoping to find means of escaping to America; but the English cruisers rendered this impossible, and he threw himself on the generosity of his hated foes. He was taken on board the Bellerophon, and conveyed as a state prisoner to the island of St. Helena, where he lived, the mere shadow of his former self, in a hated and inglorious ease, till death released him in 1821, at the age of fifty-two. 1815.

The character of Napoleon.

There is a saying attributed to Talleyrand, which hits the prominent characteristics of Napoleon's nature: — "What a pity that so great a man was so ill brought up!" For he had genius and no breeding; he never shook off the adventurer-element in his life; nor had he that high sense of honor, truthfulness, and gentleness, which go with true nobility of soul. With a frame of iron, Napoleon could endure any hardships; and in war, in artillery especially and engineering, he stands unrivalled in the world's history. His quick intelligence was altogether scientific in the colder and harder aspects of scientific knowledge. He took no interest in moral sciences or history, or the brighter works of imagination. Throughout we discern in him the precisian, the despot on exact principles. Even when he unbent among his intimate friends, his was "a tyrant's familiarity," with a touch of Oriental ferocity under it. He was ever on the watch against rivals, ever full of distrust, treating great men with a false and feline grace of manner, which seemed to be expecting a surprise. No one was ever so naturally untrue as he; he never hesitated to lie and to deceive; the most important despatches he would readily falsify, if he thought there was anything to be gained by it. There was in him a swiftness of intelligence which answered to his hot and passionate nature; the true and solid balance was wanting. He could not rest, and knew not when he had achieved success. And this was immediately connected with another Oriental quality, his vast and unmeasured ambition, and the schemes and dreams of a visionary, which led him to the greatest errors of his life,—his expedition to Egypt and his hopes of an Eastern empire, and his terrible attack on Russia. The same largeness of vision showed itself in his endeavors to reconstruct the map of Europe, and to organize anew the whole of society in France. He could have in his mouth the phrases and cries of the 18th century, and with them he knew how to charm mankind. Yet with this gift, and with his amazing power of influencing his soldiers, who sacrificed themselves in myriads for him with enthusiasm, there was a coldness of moral character which enabled him to abandon those who had given up all for him, and made him show shameless ingratitude towards those who had done him the greatest services. We can gauge a man's character by his complaints against others, for those complaints are always the reflection of his own characteristics. Napoleon was ever inveighing against the deceit of Alexander, the treachery of the Germans, the perfidy of Pitt, the warfare of savages which he had to face; and the phrases represent the worst elements in his own character. He was, in fact, the successor and representative of the "18th century despots," the military follower of the Pombals, the Arandas, the Struenzees of the past. He had their unbalanced energies, their fierce resistance to feudalism and the older world, their ready use of benevolent and enlightened phraseology, their willingness to wade through blood and ruin to their goal, their undying ambition, their restlessness and revolutionary eagerness to reorganize society. Like them, with well-sounding professions, he succeeded in alienating the peoples of Europe, in whose behalf he pretended to be acting. And when they learnt by bitter experience that he had absolutely no love for liberty, and encouraged equality only so long as it was an equality of subjects under his rule, they soon began to war against what was in fact a world-destroying military despotism. When the popular feeling was thoroughly aroused against him in Spain, in Germany, in England, his wonderful career was at last brought to an end.

VII. The Restoration.

The royalist reaction.

While Napoleon had held together the enthusiasm of the French army, and had flattered the national vanity, and had raised a bulwark between the peasant tiller of the soil and his ancient oppressor, the Bourbons came back, having learnt nothing, and under auspices painful to French feeling. The peasant suspected them of wishing to restore noble privilege with the ancient throne; the army was suspicious if not hostile; the national feeling was vexed by the patronage of the victorious hosts of Russia, England, and Germany. Paris was treated by them as a conquered capital, the whole country was garrisoned by their armies, and Louis XVIII. was little but their instrument and dependant. The royalist reac-

1815-1824.

The Holy Alliance.

tion was violent, though not cruel; the new legislative chambers proved vehemently Legitimist; Fouché, who had hitherto successfully held his ground, come who might, in his dangerous department of the police, now fell and was exiled; Talleyrand also was got rid of; and the duke of Richelieu, grandson of that hoary old sinner who had been at the right hand of Louis XV., became chief minister. Meanwhile, the congress of Vienna had at last (20th November, 1815) dictated its terms of peace to France. The "Holy Alliance," of the emperors of Russia and Austria and the king of Prussia, that league of monarchs against the liberties of Europe, compelled France to pay a huge indemnity, to surrender her Rhine fortresses of Philippeville, Sarrelouis, Marienburg, Landau, and Huningen; the frontier of France was to be garrisoned for five years by a foreign army commanded by a foreign general, and paid by France; this period was cut short in 1818 at the Congress of Aix-la-Chapelle.

Louis XVIII., who was no mere reactionary, allowed little blood to be shed; Labédoyère, who had led the army in its rally round Napoleon in 1814, and Marshal Ney were the only victims. Murat, taken in an attempt to recover his throne of Naples, was shot by the Italians.

New arrangement of parties.

As the chamber of deputies seemed determined to push the reaction to its utmost limits, Louis XVIII. dissolved it, and, declaring that he would rule constitutionally in accordance with the charter, rallied round himself all the moderate party, headed by the duke Decazes. Power came now into the hands of the middle classes, and in 1818 the burgher party ruled. It was supported by the newly-risen *Doctrinaires*, men who wrote for the press, and began the modern career of French journalism. The chief of these were De Barante, Guizot, and Villemain; on one side of them were the extremer royalists, headed by the count of Artois; on the other side stood the new party of the *Independents*, from whom sprang the men of the "three days of July." Between these Decazes kept up the new "système de bascule," the balance-system, as it was called, allowing now this side and now that to taste the sweets of power, and to make some pretence to party-government. In 1820, however, the murder of the duke of Berri, second son of the count of Artois, gave the ultra-royalists an excuse for freeing themselves from a man who kept them somewhat in order.

The efforts of the reactionists.

Using the excitement caused by the assassination, they compelled the king to dismiss his favorite minister, and seized the reins of power. They at once modified the constitution in such a way as to secure their majority in the chambers, and prepared to carry matters with a high hand.

Just at this time the extravagant conduct of the reactionary Bourbon princes of Spain and Italy had aroused insurrection and armed resistance everywhere. The people of Spain and Naples declared against arbitrary government, and were at once attacked by those "champions of order," the sovereigns of the Holy Alliance. At their bidding Louis XVIII. also declared war against Spain; the French Government, being now entirely guided by the count of Artois, was thoroughly in harmony with all that was repressive and reactionary in Europe. In the spring of 1823 the French army, commanded by the duke of Angoulême, the eldest son of the count of Artois, crossed the Bidassoa and entered Spain. No serious resistance was met with except at Cadiz, and the triumph of the French arms was mercilessly used to crush the Spanish liberties. Ferdinand VII. of Spain returned to Madrid, and ruled henceforth as most absolute, most Catholic sovereign. The duke of Angoulême was thought by his success and personal bravery to have aroused in the French army an enthusiasm for its old Bourbon masters; reaction ruled supreme in France; the Jesuits were conspicuous in their delight; and the system of influences, corruption, and manœuvres, so long the disgrace of French elections, sprang at once into full bloom.

Character of Louis XVIII.

In September, 1824, Louis XVIII. died, with his last breath urging the count of Artois to rule prudently and in accordance with the charter. He was one of the best of the Bourbons, a man of ability and learning, fond of literature and science, moderate and loyal in opinion and act,—a far better man than those who surrounded his old age, and drove him into reactionary courses which he could not approve. His successor, the count of Artois, was a very different man. He had been the chief cause of the misfortunes of the monarchy in the Revolution, and had both the fine manners and the faults of the old régime. He was the fourth son of the dauphin, and brother of Louis XVI. and Louis XVIII., and now became king under the title of Charles X. It was speedily seen that now the ultra-royalists would have none to check them; the new monarch was bigoted, stupid, ignorant; from the scandals of his early life to the devotion of his later days there had been but a step; the sublime is not so near the ridiculous as superstition is to immorality. He was regarded as a mere tool of the Jesuits, and his reign was but a struggle against the more liberal instincts of his country. Now, if ever, it was seen that the old Bourbons "could never learn and never forget." In 1827, the national guard, which had shown itself too free in its cries, was disbanded; a new chamber of deputies was, in spite of all efforts, strongly opposed to the policy of the king's Government; a more moderate cabinet followed.

1824-1830.
Charles X.

War with Turkey.

In this year England, France, and Russia joined to put a stop to the quarrel between Turks and Greeks, and their combined fleet under Sir Edward Codrington won the battle of Navarino, and ruined the maritime power of Turkey (20th October, 1827). Early in 1828 the French occupied the Morea, and ere long the independence of Greece was accepted by the Ottoman Porte, and a new national life began in Europe.

The reactionary attempts of Charles X.

In 1829, finding the new ministry too moderate for him, Charles X. dismissed it, and gave the seals to Prince Polignac. This meant war to the knife against all constitutional liberties in France, and was the return to power of all that Frenchmen most feared and disliked. The chambers, supported by popular feeling, stood firm, and carried an address to the throne, which declared that the new ministry did not enjoy their confidence. Thereupon the chambers were dissolved, and the fresh elections which followed were a decisive struggle between liberty and despotism. The success of the expedition to Algiers, in which France vindicated her honor by the capture of the robber-city and the complete defeat of the dey, while she acquired for herself her most flourishing and important colony, brought no relief to the Government in its contest against the people. The new chamber was stronger against the ministry than the late chamber had been. Then Charles X. suddenly attempted the usual *coup d'état*, and assumed a kind of provisional dictatorship, which produced at once the five famous ordinances of St. Cloud (25th July, 1830). These were—(1) the suspension of the liberty of the press; (2) the dissolution of the new chamber of deputies; (3) a new system of election, so as to secure absolute power to the king; (4) the convocation of a new chamber; (5) some ultra-royalist appointments to the council of state. At this time a young journalist from Marseilles, Thiers, was editor of the *National;* under his fearless leadership the "fourth estate" made its first collective revolt against illegal power, and signed a vigorous protest against the ordinances. It is the beginning of that wholesome influence of the press on modern politics of which the history has yet to be written, because its limits have not yet been reached. Men waited breathlessly to see what steps would follow such an insurrection of opinion against power. On the 27th of July it was announced that Marshal Marmont, although he disapproved of the measures agreed on, and did not sympathize with the five ordinances, had been charged with the defence of the capital. Then insurrection broke out at once, and the "Revolution of the three days of July" began. On the 27th the barricades raised by the citizens were forced and the streets cleared; on the 28th the insurgents, not abashed by their defeat, seized the Hôtel de Ville, and hoisted the tricolor. Marmont, who urged pacification, was ordered by Charles, who kept out of the way, to crush all opposition ruthlessly; before evening his troops had retaken the Hôtel de Ville, and most of the important positions. Again he urged moderation on the king, and the leaders of the revolt offered to lay down arms if the ministers were dismissed and the five ordinances withdrawn. Charles, however, would listen to nothing, and sent orders to Marmont to persevere. On the 29th, however, two regiments fraternized with the people; and Marmont, paralyzed by their defection, and by suspicions as to the fidelity of

The three days of July.

1830.

other troops, gave way. The populace rushed into the Louvre and the Tuileries, sacking and destroying the insignia of Bourbon power. They neither stole nor murdered. Charles X. at St. Cloud now offered all he had refused the day before; of course it was a day too late. Paris had triumphed over the reaction, and the unteachable older Bourbons had to go. The veteran Lafayette was once more named chief of the national guard;—how much had France seen and done since he had first girded on that same sword! The tricolor flag and cockade reappeared everywhere. Thiers and Mignet issued a proclamation, urging the Parisians to transfer the crown of France to the duke of Orleans, who came up to the capital at once, and declared his ready acceptance of the office of lieutenant-general of the realm. In his first address he assured France that thenceforward the charter should be a reality.

Charles X. abdicates.

On the 2d of August, 1830, Charles X., finding that the army had deserted his cause, and that necessity was on him, abdicated in favor of his young grandson Henry duke of Bordeaux, son of the duke of Berri; the dauphin, who was childless, also renounced his own claims on behalf of his nephew, who was then ten years old.

The count of Chambord.

This last representative of the older Bourbons, the last hope of the legitimists of France, lives still, cherishing his claims, and known to modern history as Henry, count of Chambord. Charles withdrew to England, where he died in 1836.

Louis Philippe succeeds.

The day after his abdication Louis Philippe, duke of Orleans, the representative of the Orleans branch of the Bourbons, son of Philippe Égalité, and great-great-grandson of the Regent Philip, opened the session of the chambers as lieutenant-general of the realm. The charter was carefully revised in a liberal direction, and the crown was offered to the duke and his heirs-male with the title of "King of the French." On the 9th of August, 1830, the new constitutional monarch, ruling, not by divine right, nor by territorial possession, but by the will of the sovereign people, "king of the French," not "king of France,"[1] king of the tricolor, not of the lilies and the white cockade, took oath faithfully to observe the amended charter. The era of constitutional monarchy seemed at last to have begun in France; men thought that the fires of the Revolution had died down, that republicanism was discredited, while the follies of the older Bourbons, on the other hand, had been shown to be no longer possible.

The new constitutional government.

"The days of July" were hailed as heralding a new epoch of moderate politics; the "citizen-king," who had carefully shunned the reactionary party, and was by family tradition head of the liberal branch of the Bourbons, should lead France along a new course of decorum and material prosperity. It should be the reign, not of noble and priest, nor of grim artisan and sans-culotte, but of broadcloth burgher, a rule of common-sense and constitutional use. Lafayette, who in these later days had sided much with carbonari and republicans, was greatly blamed for lending the support of his name to any monarchical system of government. His excuse lay in his belief that, for the time at least, the republicans were but a small minority of the people. The events of subsequent years seemed to prove him right; yet in the end the stronger beliefs and energies of republicanism were fatal to the throne. Peace at home and abroad, and a constitutional government, allied with such countries as also enjoyed the blessings of a moderate form of polity, especially with England,—these were the chief aims of the reign, as it was worked out by the two antagonistic statesmen, the rivals Thiers and Guizot.

Changes in Europe.

This revolution of the "three glorious days of July" was a part of a general movement throughout a large part of Europe; for men were weary of the triumphs of reaction. In England these were the days of the Reform agitation which is indissolubly connected with the name of Earl Russell. In Belgium the news of the three days led to a violent insurrection, and the Belgians, who hated the union with the Dutch, threw them off and declared themselves independent; they bestowed a constitutional crown on Prince Leopold of Saxe-Coburg. When the Dutch refused to deliver up Antwerp and let the Scheldt run free, England and France combined to help the young kingdom; a strong French army soon forced the Dutch to evacuate Antwerp citadel.

1830-1840.

Disturbances in France.

At home the country was still uneasy; both legitimists and republicans were anxious to embarrass the Government. There were troubles in Paris, at Lyons, at Grenoble, and in La Vendée, where the romantic duchess of Berri kept up the hopes of the old Bourbon party. After a time the Government succeeded in capturing her, and then it came out that she had been for some time secretly married to an Italian gentleman; this, and the birth of a daughter, discredited the legitimist cause completely; the duchess was allowed to retire in peace to Palermo. The disturbances at Paris and Lyons were also put down, and their chief instigators punished. After this the efforts of the dissatisfied took the form of attempts at assassination, and this in turn led in 1836 to the passing of the Laws of September, which treated press offences with severity, and regulated strictly the procedure of the law-courts.

Two parties in French politics.

In this period could be seen a more marked divergence of parties, even among the Orleanists themselves. On the one hand there were the more conservative or reactionary men; on the other the upholders of the English theory that "the king reigns, but does not govern." At first Louis Philippe had chosen his Government from the former party, which, at the beginning of the reign, had embraced not only Casimir Périer, the head of the Government, but Guizot, Thiers, and other men of name in politics and literature. Casimir Périer, vigorous in combat, but not a large-minded statesman, was carried off in 1832 by cholera, then raging fearfully in Paris; and soon after that time the life-long feud between Guizot and Thiers began.

Thiers and Guizot.

A series of Governments followed one another in quick succession, and without stability; at last the cabinet, headed by Marshal Soult, having proved unable to hold its own, a new ministry followed, of which Thiers was the head (February, 1836). The ambitious little statesman, with the fire and heat of the south in him, advocate, newspaper editor, historian, and politician, seemed now to have reached his goal. His ministry, however, lasted but a very few months. He wanted to interfere in the affairs of Spain, while the king refused to change his policy of non-intervention; the cabinet broke up, and Count Molé, with Guizot as minister of public instruction, succeeded. The new Government had to face the anger of France at the failure of French troops in Algeria before the hill-fort of Constantine, and the agitation which succeeded the strange attempt (October, 1836), of Prince Louis Napoleon to arouse imperialist echoes among the troops at Strasburg. Though, when he showed himself and read a proclamation to the soldiers, many replied with shouts of "Vive l'Empereur," the bulk of the troops refused to listen, and he was arrested with his companion, a M. Persigny, and sent on to Paris. The Government treated him leniently, and allowed him to leave France for New York. In 1838 Count Molé, finding the state of parties very uneasy, dissolved the chambers, and fresh elections followed.

Parties in the Assembly.

There had been four chief parties in the Assembly,—the Right, led by the famous conservative lawyer Berryer; the Right Centre, under guidance of Guizot; the Left Centre, headed by Thiers; and the Left, led by Odillon-Barrot, formerly president of the society "Aide toi, le ciel t'aidera," an association formed to advance purity and freedom of elections, and a chief motive-power in the revolution of July. This last party, till 1840, was in constant opposition to Government. It was felt that the king, who was obstinate in his opinions, and not very scrupulous, had for some time past been interfering more than was wholesome in electioneering matters; the system of help to official candidates, the snare of French politics, took large development under him. The elections resulted in a majority for Molé and the Government. The other parties, however, made a coalition against him, which, under the leading of Thiers and Guizot, overthrew the ministry in 1839. The parties, however, did not agree well after their victory; the king was not cordial with them, and chose his ministers so as to exclude the three victorious leaders. In 1840 the king's friends were again defeated. Thiers again became chief minister, and Guizot was sent as ambassador to St. James's, where he had a very difficult part to play, in consequence of the state of the Eastern question. The rebellion of Mehemet Ali, the

Eastern affairs.

---

[1] It is a mistake to lay stress on this change of style. In the *Acta Pacis Westphalicæ* (1648) even Louis XIV. is actually styled "Roi des François," not "Roi de France."

able viceroy of Egypt, against the sultan had aroused no small excitement in Europe. Mehemet was well known in France, where his adventurous career had attracted much attention. Though the French and their allies had destroyed his fleet at Navarino in 1827, he had since (1831–1833) acquired the government of Syria as well as that of Egypt, by the energy of his son Ibrahim Pasha. When the sultan in 1837 endeavored to reduce his power, he again declared war against him, and Ibrahim once more defeated the Turks, securing Syria for his father. Now arose a great difference between France and England. The French Government wished that both Egypt and Syria should be finally guaranteed to Mehemet; the English Government declaring that such a step would be fatal to the Turkish empire, insisted that Syria should be, with some small exceptions, restored to the Porte. In July, 1840, England formed a quadruple alliance with Russia, Austria, and Prussia, without communicating at all with Guizot till after the treaty had been actually signed. Napier speedily bombarded and took Beyrout, while Stopford blockaded Alexandria. In one short campaign the Egyptians were easily cleared out of Syria, and Mehemet Ali, acquiescing in the power of the stronger, secured his position in Egypt, while he finally restored Syria to the Porte.

Irritation in France.

In France the irritation was extreme. The nation had watched Mehemet's regeneration of Egypt, a country in which, ever since Bonaparte's expedition, France had seemed to have a special interest; it was a great shock to her to see her diplomacy rudely foiled, her sympathies neglected, her strength unemployed. The restoration to France in 1840 of the ashes of Napoleon, a rash act due to Louis Philippe himself, woke many a slumbering echo of the old national pride; Napoleon, it was urged, had never let his country fall, as the present Government had done, out of the foremost place in the councils of Europe. The second attempt of Louis Bonaparte to win over the garrison of Boulogne, in spite of the absurdities of the tame eagle, and the utter failure of the venture, added not a little to the popular uneasiness. By shutting up the adventurer in the castle of Ham, the Government made him a martyr, and roused much dormant sympathy for him. The ministry accordingly fell, and Guizot, under the nominal presidency of Marshal Soult, became the real head of the new Government. The step was far from allaying the strong feeling in France; men accused Guizot of having played the country false while in London; his bitter antagonism to Thiers seemed to them to be the cause of the humiliation of France. For the moment, however, the only result was the fortification of Paris, which was begun in 1841.

Fortification of Paris.

The Pritchard affair.

The annals of France were now tranquil, under the cold administration of Guizot; party spirit seemed to have died down; the "Pritchard affair," arising out of the occupation by France of Otaheite, in accordance with a treaty in 1842, aroused again the slumbering irritation between France and England. The English Government had not objected to the treaty between Queen Pomare of Otaheite and the French Government; Mr. Pritchard, however, consul, missionary, and medical man to the queen, believing that the treaty was bad for the natives, had succeeded in persuading Queen Pomare to repudiate it, and to call on England to support her. Thereon in 1844 the French arrested him, sent him back to England, and occupied the island as its protector. The success of the French arms in Africa also angered the English; Marshal Bugeaud had vigorously attacked and punished the emperor of Morocco for giving refuge and support to Abd-el-Kader, and the defeated emperor was obliged to sue for peace (September, 1846). In 1847 Lamoricière succeeded in capturing the picturesque chieftain who had caused France so much trouble, and sent him as a prisoner to France. Lastly, the vexed question of the Spanish marriages, in 1846, in which Louis Philippe succeeded in reallying the Bourbons of France and Spain by a double marriage, caused very strong feeling in England; it was felt that Guizot had broken his word in the matter, and that France was taking unfair means of avenging herself for the affront of the quadruple alliance of 1840.

The gloomy outlook in 1847.

So things stood when 1847 opened with gloomy aspects for the French Government: irritation, want, the feeling that the Government had done little to lessen the commercial and agricultural distress; the desire of a more popular and perhaps more brilliant rule; the distrust of Guizot's policy, as shown in the risks of the Spanish marriages, by which he had endangered the peace of France for the sake of illusory dynastic advantages; the consciousness that the king's feelings were not friendly to the people, that his government was selfish, and that he did not hesitate to use corruption and influence in elections,—these things all made affairs seem unsettled and precarious. Guizot's policy in the affair of the marriages, in his support of the Swiss Sonderbund, which was the resistance of reactionary against popular principles in Switzerland, his appeals to the treaties of 1815, his friendly attitude towards Metternich and Austria, his divergence from the liberal views of Lord Palmerston, his dislike for the patriots of Italy, shocked and alienated all liberal opinion in France, and made the minister completely unpopular. The rôle of prudence at home and peace abroad, never an heroic one, had been abandoned by Guizot for a system which endangered peace with the neighbors of France and irritated the passions of party at home. Trickery and subterfuge seemed to rule in high places.

Guizot's unpopularity.

VIII. The Second Revolution.

The agitation of the country at first was seen chiefly in speeches made at fervid banquets. When the session of 1848 opened, the opposition, led by Odillon-Barrot, showed itself strong and resolute; the interference of Government against a popular banquet in Paris led to the outbreak of the Revolution (22d February, 1848). On the 23d the national guard took part with the populace against the troops, and the soldiers, unwilling to attack them, hesitated, and the day passed by. Guizot now yielded, and sent in his resignation; it was, however, too late; that evening, the troops having fired on and killed some of the mob, a ghastly procession with the bodies of the slain passed through the streets. The excitement redoubled; the troops refused to act; Louis Philippe even called on Thiers to form a liberal ministry with Odillon-Barrot. A proclamation was issued stating that the troops were ordered to withdraw. Forthwith the regular soldiers laid down their arms, and the people with the national guards marched on the Tuileries. Louis Philippe now abdicated in favor of his grandson the count of Paris, and, assuming the name of Mr. William Smith, closed an inglorious reign by an inglorious flight in a hackney cab. He reached England, and died there in peace some two years later. Writers have called the Revolution of 1848 a mere trick, and have wondered how so mean an effort could have overthrown a constitutional and organized government. The truth is that France was weary of such a rule, that Paris wanted a republic, and that in the country generally the citizen-king was unpopular. In the chamber of deputies the republican party at once took the command, and established a provisional Government, which immediately proclaimed a republic, to be ratified by a popular vote; to be based on the sovereignty of the people; to re-echo the old watchwords, "liberty, equality, fraternity;" to secure a pure and liberal administration. The presidency of the new Government was given to Dupont de l'Eure; Lamartine had the portfolio of foreign affairs; Cremieux, justice; Ledru-Rollin, the home-office; Arago, the admiralty; Bédeau, the army; Carnot, education; Bethmont, trade; Garnier-Pagès was named mayor of Paris; Louis Blanc, and three others, were first named as secretaries, and soon after became actual members of the Government. The decree which established the tricolor flag, with a red rosette, indicated, as trifles often will do, the position taken up by the new administration. They would not accept the red flag of the Parisian communists, which Louis Blanc wished to take as symbol of a thorough republicanism; they added the red rosette to express a certain sympathy with that side; they kept the tricolor as the flag of the old Revolution. One step—and it was a great blunder—they did make under the influence of Louis Blanc: they issued a decree promising to provide work for all,—promising in fact to suspend the first laws of political economy on behalf of the working man.

The revolution of 1848.

The republic of 1848.

The republic at once established.

Though the revolution had been a thorough Parisian surprise at the moment, all France was ready to accept it. From every side cheerful acquiescence came in; the army approved; the clergy were guided by the liberal archbishop of Paris, M.

1848-1852.

Affre, who three months later lost his life in the sacred attempt to stay bloodshed in the streets of the capital; politicians either were silent or joined the Government; the adventurer of Strasburg and Boulogne, who had escaped from Ham in 1846, offered his services to France, and was politely sent back to England.

Louis Bonaparte.

In April the elections to the new constituent assembly took place. They returned a body of, on the whole, moderate republicans, not favorable to the extremer views of Paris, and appointed an executive commission of five members, Lamartine, Arago, Garnier-Pagès, Marie, and Ledru-Rollin. A serious outbreak was easily quelled in May; in June, however, things took a more alarming turn. The reaction, which had already begun in France, was supported by the conviction of moderate men that the "national workshop" system, a practical socialism, was too burdensome for the finances of the state, and that the country generally would not long subsidize the Parisian artisan. A decree ordering a portion of the working men to be enrolled in the army led to the terrible revolt of eastern Paris.

The revolt of Paris.

The Government declared the town to be in a state of siege, and entrusted General Cavaignac with a dictatorship. For four days the battle of the barricades raged; the artisans did not yield till the last barricade of the Faubourg St. Antoine had been stormed. Then Cavaignac laid down his dictatorship and was named president of the council, with right of naming the ministers. The national workshops were absolutely closed on the 3d of July, and thus the republic freed itself from the dictation of Paris. After the May disturbance the leaders of reaction had begun to pluck up courage, and to offer themselves for the elections; Thiers was returned for the Lower Seine, and became its political leader; Changarnier was its military chief. Louis Bonaparte was also among the elected. He veiled his ambition under popular phrases, and, as had been seen before, a Bonaparte made ready to pass into absolute power by an alliance with the people and a seeming deference to its sovereignty. "My name," he said, "is the symbol of order, nationality, and glory."

The new constitution.

The Assembly next proceeded to do its work as a constitutional body, and organized the Government thus:—A president of the republic, elected for four years, and then not re-eligible till after four years more; a council of state, named by the assembly for six years, and charged with the drafting of all public acts, and other honorable functions; a legislative assembly of 750 members. The date of election of a president was fixed for the 10th of December. The true republicans failed to support their man, General Cavaignac; they also left Lamartine entirely out, in spite of his honorable services.

Louis Bonaparte elected president.

The instincts of the nation turned towards one who bore the charmed name of Bonaparte, and the prince-adventurer was elected by a vast majority of votes, nearly five millions and a half supporting him against less than one million and a half who voted for Cavaignac. Thus the "Napoleonic idea," strong in the country-places, prevailed over the moderate republicanism of the Assembly, and the wishes of the chief towns of France. The new president was formally proclaimed, and took oath of office on December 20, 1848.

His first acts.

The first act of the new Government was the overthrow of the republic of Rome, and the military restoration of Pius IX. By this the president declared himself hostile to all the liberal movements of Europe, and won the firm gratitude and allegiance of the Catholic clergy of France. Before Louis Bonaparte had been in office a year, it was seen that he was preparing to move in the direction of absolute power. Stormy debates in the Assembly took place; a law was passed limiting the suffrage, as it was seen that in the existing temper of the country the ignorant peasant-vote was at the mercy of adventurers. Discussion also followed as to a revision of the constitution of 1848. At last, on December, 2, 1851, the prince-president, guided by a group of friends and brother-conspirators, ventured on his famous *coup d'état*, and swept away the whole existing fabric of the constitution.

The *coup d'état* of 2d Dec., 1851.

In the most lawless manner sixteen prominent members of the Assembly were arrested, among them Cavaignac and Thiers; the Assembly itself was forcibly dissolved, universal suffrage restored, and a *plébiscite* on the new form of government was appointed to follow at once; the capital was placed in a state of siege; the council of state dismissed. A new ministry was also formed of the chief members of the successful conspiracy,—Morny for the home-office; St. Arnaud for war; Fould, finance; Rouher, justice.

1852.

Constitution of 1852.

A project for a tenure of the presidency for ten years, with ministers responsible only to the president, a council of state to draft and prepare laws, a legislative body, and a conservative senate,—this was the new constitution of 1852. It was clearly a reminiscence of that form of government which led to the first empire. Outbursts of despairing resistance in Paris were sternly put down, with brutal severities, which aimed at striking terror into the capital; the men round Louis Bonaparte did not want for vigor; they had won power by conspiracy, and did not hesitate to keep it by a massacre. The new constitution was accepted by an overwhelming majority; it seemed as if the Napoleonic idea was omnipotent in France. The new government was, like that of the great Napoleon, the union of strong and arbitrary rule with an appeal to the ignorant passions of the populace. The burgher world acceded to it, because it was strong, and promised order and hopes of material prosperity, and because it was scared and puzzled by the fitful appearances of the "red spectre" of eastern Paris.

Napoleon III.

Little trouble did the successful party take about the remaining step. The high tide of the popularity of Louis Bonaparte was still running up in flood; and in November, 1852, an almost unanimous vote (7,824,129 against 253,149) accepted him as hereditary emperor of the French under the name of Napoleon III. Before the end of the year he made solemn entry into Paris.

IX. The Second Empire.

The second empire.

The second empire lasted from November 4, 1852, to September 4, 1870, a period of nearly 18 years. It was openly modelled on the first empire, and Napoleon III. never forgot that he was his uncle's nephew. His mother, the ex-queen of Holland, was Hortense Eugénie de Beauharnais, daughter of the empress Josephine by her first husband, the viscount Alexandre de Beauharnais; the emperor married her to his brother Louis Bonaparte in 1802; and her son Louis was born in 1808.

Character of Napoleon III. and of his reign.

He was now forty-four years of age, a man of no dignity of moral character, ambitious and unscrupulous, but somewhat wanting in nerve; far better than the adventurers who surrounded him; a man of very considerable clearness of vision, who did his utmost to develop the home-prosperity of France, by sweeping away the barriers which wrong-headed Governments had placed on commerce, and by introducing the new doctrines, strange to French ears, of free trade, which he had learnt to admire by seeing their applications in England. His government was frequently, almost incessantly, involved in wars; yet the emperor himself was doubtless sincere in proclaiming his wish for peace. "The empire," he said, "menaces no one; it desires to develop in peace and full independence the vast resources it has received from heaven." It is but one of the inevitable results of a bad tradition that he, like his predecessors, hoped to succeed in securing prosperity to France by constant interference, and by making the nation feel the presence at its head of an irresponsible yet beneficent master. At the same time this ostentatious activity assured labor to the restless artisans of the great cities; towns were half rebuilt; Paris especially, felt this malign benevolence, which, while it fed the workman, made him destroy his own means of resistance to government,—for the rebuilding of Paris by Haussmann was planned so as to drive great and straight military roads through all the disaffected quarters of the north and east. Railways, canals, harbors, public buildings, above all, new churches and old, owned the imperial hand. If, as must be granted, this lower empire was based on popular ignorance and plentiful bloodshed and terrorism, both in Paris and in the provinces, it must also be conceded that the emperor himself, dreamer as he was, was heartily anxious for the welfare of France. He was unfortunate in his associates, and perhaps also in the beautiful lady he chose as empress.

When the second empire began, the sovereigns of Europe thought that republicanism was gone for ever; they recognized the new government of France with some cordiality. England came first—for in England the unmistakable ex-

Marriage of the emperor.

pression of the popular will was regarded just as the result of a general election at home might have been; the vote of the people had expressed their wishes clearly, and England was ready to accept their views as to their own affairs. It was noticed that Prussia was unfriendly towards the new government; and when the emperor, anxious to secure the hereditary succession promised to him by France, looked round him for a wife, his proposal to wed a Hohenzollern princess met with a marked rebuff. He had before failed to win a Swedish princess; he finally chose for himself the handsome Eugénie de Téba, a Spanish lady, who had already been conspicuous for her beauty at his court. France was divided in mind respecting her; her appearance won men's hearts; the national vanity was vexed at the rebuffs, while it was pleased to say that the emperor had disdained royal and formal alliances in order to choose the lady after his own heart; and lastly, there were not a few who grumbled that he ought not to have slighted the ladies of France by selecting a Spaniard. Anyhow, the young empress bore him a son, the prince imperial, on whom rested all the hopes of the new dynasty. For the rest, her extravagant and frivolous tastes in dress and habits set a very bad example to a nation far too willing to copy it; and her influence and advice were invariably on the unlucky side. She was a devoted Catholic, and to her counsels are due some of the worst mishaps of the reign.

The Crimean War.

In 1854 began the first war of the second empire,—the first denial to the famous utterance of Bordeaux in 1852, "L'empire, c'est la paix," which had enlisted the warm partisanship of commerce and finance. The large and ambitious schemes of the czar Nicholas against Turkey, "the sick man" of that day, alarmed all Europe; the dispute between Russia and the Porte as to the holy places was referred to a conference at Vienna, which proposed to solve the difficulty on the lines of the treaty of 1841, which had placed Turkey under the guarantee of the five great powers. Before diplomacy had got to work the Russians had invaded the Turkish territory; the Anglo-French fleet had moved up to Besika Bay, to be within call of Constantinople, and the Russian fleet (30th November, 1853) had destroyed the Turkish ships at Sinope. War, however, did not openly break out till the next spring. In April a treaty of alliance was signed between France and England, who were afterwards joined by the king of Sardinia, while Austria and Prussia also guaranteed the possessions of each other; the imperial guard was re-established, and an army of 60,000 men, one-third English, two-thirds French, set sail for the Black Sea. After halting first at Gallipoli, then at Varna, the allied fleets and armies set sail for the Crimea, and landed under protection of the ships near the mouth of the river Alma. Thence they marched along the coast towards Sebastopol, and came on the Russians strongly posted on the left bank of the Alma; on the 20th of September, 1854, the allies defeated the Russians there and took their position. Mentschikoff, who commanded them, withdrew into Sebastopol, round which the allies marched, taking up their quarters not far from Balaclava, to the south-east of the great fortress. Then began a siege which lasted through the winter; on October 25 the Russians were repulsed at Balaclava itself, by the wild charge of the English cavalry; on November 5 the allied armies won the battle of Inkermann, in which the English, who were defending the points attacked, bore the chief brunt of the fighting. It was not till June that the bombardment of the allies was effectual in producing the fall of some of the outworks. Sebastopol eventually fell on the 10th of September, in consequence of the storm of the Malakoff tower by the French troops. The French and Russians had now done enough, and the war speedily came to an end. The English would willingly have gone on till they had ruined the Russian navy; the emperor of the French was glad to be done with it. In 1856 the czar Alexander, who had succeeded Nicholas in the winter of the great siege, signed a treaty of peace, the terms of which had been agreed on at the Congress of Paris. The Black Sea and the Danube were neutralized; the Danubian principalities taken, in part at least, from under Russian protection; the sultan was admitted to the council-board of Europe. The peace did little for the real good of France, created a cold feeling between her and England, annoyed Prussia, and did not satisfy Austria. The war had not been very brilliant; the losses had been heavy; the appearance of Count Cavour at the congress had forecast the coming events of 1859.

The peace of Paris.

1858–1859.

The Orsini attempt.

The attempt of Orsini on the emperor's life in January, 1858, led the way. A man who had been among the carbonari, and had handled the explosive substances which lay like torpedoes in all the water ways of European politics, ought not to have been astonished that Italians, smarting under their country's wrongs, should try to avenge themselves on him for the expedition to Rome and the restoration of the papacy. To them Napoleon III. seemed to be a traitor, and the chief cause of their subjection to hateful and foreign masters. And Orsini's attempt was by no means the first. The French journals spoke gratefully of the fact that no Frenchmen were compromised in these attempts at assassination; the emperor himself, alarmed for his personal safety, and also sympathizing to some degree with the aspirations of Italy, began to think that he could secure himself from these secret and successive attacks only by satisfying the irritated feelings of Italy. The first result of it, however, was a period of terrorism at home, and of swaggering menace on the part of the army, unchecked by the Government, against England, that "lair of these monsters who are sheltered by its laws." England, disabused since the peace of its admiration for the imperial rule, replied by the volunteer movement, and the construction of defences on the coast. But the emperor's mind was not set on war with England. New Year's Day, 1859, disclosed to the diplomatic world his schemes against Austria, and showed that Italy would be the scene of warfare and change. The empress was known to be averse to a war which must be against the instincts of Catholicism. Prince Napoleon, who in January, 1859, married the princess Clotilde, daughter of Victor Emmanuel, king of Sardinia, was known to be in favor of an alliance with the Piedmontese for the liberation of Italy. The emperor, hoped to steer between the two; hoped to satisfy the Italians and to escape the alarms of conspiracy, and at the same time to satisfy the empress and the Catholic party by constructing an Italian federation of states under presidency of the pope. The current of affairs, the strength of the "doctrine of nationalities," the definite and heroic attitude of Italy herself, proved too strong for him. A federation in Italy, a federation in Switzerland, and a third in Germany, would have left France in the centre of the world, compact and powerful among weak and divided neighbors on every hand. This was the imperial policy; united Italy and united Germany destroyed the plan, and brought the empire with it to the ground.

The Italian War.

In July, 1858, Cavour and Napoleon had agreed on the terms of an alliance; Victor Emmanuel should be king of Italy, with possession of the north; Nice and Savoy, the cradle of his race, he agreed to surrender to France. With this understanding war began, after delusive talk respecting a congress, in April, 1859, Austria at the last moment forcing it on by ordering the cabinet of Turin to reduce its army and dismiss the volunteers. On the 3d of May the French Government also declared war, amidst the plaudits of Paris, and the enthusiasm of the army. The French at once entered Italy, by the Mont Cenis pass, and by sea, landing at Genoa. The emperor himself took the command in chief; King Victor Emmanuel placed himself under his orders. The affairs of Montebello and Palestro, in which the Piedmontese fought well, secured for France the safe passage of the Po. On June 4, the battle of Magenta, fought to open the passage of the Ticino, was won, after a very doubtful struggle, by the arrival of MacMahon, whom the emperor named marshal of France and duke of Magenta. The Austrians fell back, and the allies at once entered Milan. Baraguay-d'Hilliers pushed the Germans out of Marignano; and Garibaldi, with his chasseurs of the Alps, dislodging the Austrians from their positions round the Lago Maggiore, threatened their communications with Tyrol, their only sure line of retreat in case of ultimate disaster. Giulay, who commanded the Austrians, drew back within the Quadrilateral, as it was called, formed by the great fortresses of Peschiera, Mantua, Legnano, and Verona, a square within which, ever since 1815, the Austrians had been accumulating all their means of resistance. This Quadrilateral, well held, could effectually block the passage through North Italy; for Legnano stands on the Lago di Garda, which runs up into Switzerland, while Mantua is not far from the Po; an enemy venturing down southwards could never leave these great strongholds on his flank; their siege and reduction would give their holders time to recover from any disasters. To the attack of this strong position the allies now advanced; and on June 24 they met the Austrians to the west of the Mincio, and, therefore, just in advance of Peschiera and Mantua, in the broken ground which lies about the town of Solferino. The battle which then took place was fought with great gallantry by the allies, and some tenacity by the Austrians, who were on the defensive, and had the great advantage of the position, and of a thorough knowledge of the ground. French historians themselves allow that there was little strategy shown on either side: "At Solferino, as throughout the campaign, the command-in-chief was below its proper level." The defeat of the Austrians, without being crushing, was complete; they fell back to the neighborhood of Verona, the rally-point of the Quadrilateral, and the allies laid siege to Peschiera.

Battle of Solferino.

The treaty of Zurich.

These successive victories, and the release of the Milanese from Austria domination, had an immediate effect on the rest of Italy. The duke of Tuscany had fled, and his territories were occupied by French troops under Prince Napoleon. The duke of Modena, after Magenta, also made his escape, and his duchy proclaimed Victor Emmanuel in his stead. The same took place in Parma. The "Legations," the northern portion of the States of the Church, threw off the papal government, and joyfully proclaimed their adhesion to the national cause. A French fleet in July appeared before Venice, and the queen of the Adriatic was burning to throw off the Austrian yoke. Still, every one thought that the war was scarcely begun, and, considering the strength of the Quadrilateral and the proverbial tenacity of the Austrians under defeat, it seemed not unlikely that changes in the fortune of war might yet favor the reactionary cause, when Europe was astonished to hear that the two emperors, in a conference at Villafranca, had agreed on the bases of a peace. There should be an Italian confederation under presidency of the pope; Lombardy (with exception of Peschiera and Mantua) should be surrendered to Napoleon, who should present it to the king of Sardinia; Venice should be allowed to enter the Italian confederacy, though it was still to be an Austrian possession; the dukes of Tuscany and Modena were to be replaced; reforms to be introduced into the papal states; not a word about the south of Italy. These terms agreed on, *viva voce,* between the emperors without a single witness on either side, were ratified in October, in the treaty of Zurich. The result, for the moment, satisfied no one. Austria was humiliated by it; Italy disappointed, in the very moment of hope and triumph; Germany and England deemed both the war and the peace a high-handed proceeding; and France herself, in spite of the successes of her army, wished that the high-sounding promise of her emperor, "Italy free, from the Alps to the Apennines," had been more nearly fulfilled. Finally, military critics noted that the generalship of the war left much to be desired, and that the organization of the army was very far from perfect. Further changes, results as much of the force of ideas as of diplomacy or of war, were sure to follow before long. Ominous utterances and influences of the Ultramontanes in France heralded coming difficulties even before the conclusion of the peace of Zurich. The pope, Pius IX., guided by the Jesuits, threw himself into the arms of the reactionary party; and Napoleon saw good reason to give up his chimerical scheme for an Italian federation under papal presidency. He declared his intention of founding a great kingdom of Northern Italy, and announced that Savoy and Nice were to be united to France by way of counterpoise. The forms of a plébiscite were duly gone through in those districts; and the transfer took place shortly afterwards.

Garibaldi in Sicily and Italy.

Even this change of attitude on the emperor's part, coupled as it was with the continuance of the French garrison at Rome, and the cession of Nice and Savoy, was offensive to Italian independence. Garibaldi, with his noble band of volunteers, amidst the warm sympathy of all liberal Europe, landed in Sicily, and soon defeated the half-hearted supporters of the wretched Neapolitan Government; Naples and Sicily were at once united to the Italian kingdom. Piedmontese troops entered the papal territories, and won the battle of Castelfidardo; general Lamoricière, who commanded the Papalini in the battle, was soon after taken, when Ancona surrendered, and was sent back to France by the Italian Government. The victorious troops, leaving Rome and its French garrison on one side, joined the triumphant volunteer-army of Garibaldi. In February, 1861, Francis II. king of Naples, who was besieged in Gaeta, capitulated, and a new Italian parliament in the same month proclaimed Victor Emmanuel king of Italy. Rome alone was left out, the natural capital of the kingdom, defended from herself and from Italy by French bayonets. The political situation was indefensible.

Distant expeditions.

During these years France had also been engaged in distant expeditions; a Chinese war, in alliance with England, occupied her from 1858 to 1860; the capture of Pekin brought this war to an end. In Cochin-China, also, France had Spain as an ally, and closed an obscure if successful war with a treaty of peace in 1862. The Syrian expedition of 1860, undertaken in harmony with the other Christian powers, speedily reduced the sultan to reason, and a French occupation, which lasted till June, 1861, did much to relieve the oppressed Christians of that part of the Turkish dominions. Lastly, the affairs of Mexico, in which the empress, guided by her clerical tastes, took an active part, led to the intervention of the emperor on behalf of the archduke Maximilian of Austria; at first England and Spain, which also had grievances against the revolutionary Government of Mexico, joined with France. England, however, had little real interest at stake; Spain wanted to place a prince of her own on the Mexican throne; when it came to the point, France was left to carry out her schemes as she could. The whole affair ended in a terrible disaster for the archduke in 1867, and discredit and loss to the imperial Government. It was seen by the elections of 1863 that, while the peasant-vote remained true to Napoleon III., the towns, following the leading of Paris, and in spite of all official efforts, sent up a strong minority to the opposition. It was clear that the educated and thinking part of France was already weary of the second empire.

The Danish war.

Now broke out the Danish war, which was the beginning of the consolidation of Germany. In 1852 the conference of London had settled the succession to the Danish crown on the duke of Glücksburg, who had married a Danish princess; when Frederick VII. died in 1863 and Christian IX. succeeded to the throne, the Germanic confederation, which had never agreed to the arrangement, protested against the union of Schleswig and Holstein to the Danish kingdom. Holstein had always been a German duchy, and vigorous colonization had made South Schleswig in large part German in population. The Danish Government allowed the federal forces, commanded by Baron Halkett, a Hanoverian general, to occupy Holstein provisionally, while it refused them possession of Schleswig; Prussia and Austria, acting in concert, early in 1864 invaded Schleswig, drove the Danes back, and stormed their lines at Düppel; after which they quietly occupied all the disputed territory. When England, with Russia and Sweden, pressed for a conference to settle the dispute by international arbitration, France held back, and refused to oppose Prussia and Austria. The emperor suggested, as a middle course, that a plébiscite, his favorite idea when nationalities were in question, should be taken in the two duchies. The conference admitted this for Holstein, and refused it for Schleswig, and on this point the negotiations were broken off. The allied Germans speedily brought the war to an end by their overwhelming strength, and in October, 1864, it was agreed, after some difficulties, that Austria should take charge of Holstein, and Prussia of Schleswig. The confederation gained nothing; and it was obvious that Austria, too, could gain nothing by the occupation of so distant a province. France, which had so much to lose, according to the "doctrine of nationalities," had placed on record her firm belief in that idea, and had helped Prussia to become the champion of it for Germany; the foolish Mexican war, and the state of feeling at home, had in fact hampered France so much as to render her almost powerless at this moment.

The growth of Prussian power.

The jealousy between north and south Germany, which has existed ever since the time of the Reformation, now passed into a new phase. Prussia stood forward again as the champion of

1866-1867.

The treaty of Prague.

German unity, which had failed in 1848, though it had never ceased to be the desire of the nation; and the convention of Gastein, by which Austria retained Holstein, provided a starting-point for a new war in 1866, the "Seven Weeks' War." A visit of Count Bismarck to Napoleon in 1865 had shown that great statesman that he had nothing to fear from France; the second empire seemed paralyzed; Italy hastened to treat at Berlin for the completion of her unity, for north Germany and she had the same aims and the same enemies. They both wanted their national life to be completed; both were struggling, in large part, against the Catholic Church; both had Austria as their chief foe. Thus secured, Bismarck went boldly to war; and in an incredibly short time had crushed the resistance of Hanover, while he destroyed the Austrian power at Sadowa. The treaty of Prague, under the mediation of Napoleon III., soon followed. Though the Italians had been defeated at Custozza in the end of June, Sadowa had stricken such a blow at the heart of Austria that she abandoned all thought of further resistance, delivered Venetia over to Napoleon, who restored it at once to Italy, and signed the peace of Prague in August, 1866. By this document the old German Confederation was dissolved; Prussia took full possession of Holstein, and also of Schleswig, under the promise that if the northern or Danish-speaking part of that duchy desired to return to Denmark, it might say so. Up to the present time, Prussia, true to her ancient tradition of never letting go, has quietly retained the whole of the duchy. A new confederacy of the north of Germany was established under the headship of the king of Prussia, and that kingdom also received considerable additions. It was agreed that the river Main, which runs across that narrowest part of Germany, that hilly and wooded country which has seen so many struggles for mastery, and which for centuries has been, roughly speaking, the dividing-line between Low and High Germany, should now once more separate the northern from the southern confederacy. This arrangement, however, came to naught; Baden at once placed itself under the command of Prussia, and Würtemberg and Bavaria before long did the same. Austria was left alone, and almost excluded from Germany, while Prussia became at once the strongest power in Europe. France, which had welcomed with enthusiasm the restoration of Venetia to Italy, looked with less glad eyes at this growth of German strength across the Rhine. Thiers, with clear foresight, in 1866 predicted the coming empire of Germany; M. Magne, addressing Napoleon, did not hesitate to say that "the national feelings would be profoundly wounded if the final result should be that France has only gained by her intervention the establishment on her two flanks of two neighbors of abnormally increased strength. Greatness is after all a relative affair; and a country which in itself is no weaker than it was may be diminished by the accumulation of new forces around it."

French troops withdraw from Rome.

Discontent in France.

1868-1870.

M. Gambetta appears.

In 1866, after a convention with Italy, the French troops withdrew from Rome, while Victor Emmanuel promised not to molest the pope. There came, however, to Rome a French legion, composed of volunteers, chiefly old Bourbon partisans, commanded by a French general and officers of the French army. The presence of these troops was naturally regarded by Italy as a violation of the convention; so that when Garibaldi with his volunteers, in 1867, attempted to raise patriotic feelings in the territory round Rome, and in concert with the citizens to gain entrance into the Eternal City, the Italian Government took no steps to prevent him. The emperor, however, with unlucky zeal, after much hesitation, despatched General de Failly with a strong force to succor the pope, and thus placed himself openly in antagonism with Italy. The French and papal troops defeated the Garibaldians at Mentana (3d November, 1867); and Italy regarded herself as thenceforward free from all obligation of gratitude towards imperial France. On the other hand, the clerical party loudly complained that the emperor had but half done his work, and grumbled because he had not used his victory to restore to the papacy its lost territory. Thus Napoleon III. lost the favor of both sides, and left on men's minds the impression that he was a weak and irresolute ruler. Nor did his efforts to purchase the duchy of Luxembourg from Holland add to his reputation (1866-1867). For the intervention of Prussia defeated all his plans; and although the fortifications of Luxembourg were demolished, and the Prussian garrison withdrawn, it was felt that the emperor's attempt to strengthen his north-eastern frontier had completely failed, and that the antagonism between France and Prussia must one day lead to troubles. The boldness of the opposition increased; each slight advantage yielded by the Government in these days gave it fresh strength; Thiers was listened to with great interest when he demonstrated in 1868 the hollowness of imperial finance, the terrible burden of debt, the growing dimensions of the army expenditure, which was not accompanied by any real increase in the fighting-strength of the nation. The elections of 1869 showed the quick growth of the opposition; far from the old unanimity, the imperial Government did not obtain quite three-fifths of the votes; and again the large towns returned republican candidates. In this assembly M. Gambetta made his first public appearance among the "irreconcilables." In January, 1870, a quasi-liberal cabinet, headed by M. Ollivier, who had been won over by the emperor and empress in a private interview, endeavored to face the growing dissatisfaction; to reconcile the "irreconcilables," without endangering the imperial position. After many liberal professions, the emperor once more appealed to the country for a vote of confidence in himself, and in the hereditary character of his government. The reply of France seemed to be overwhelming and decisive,—7,358,786 Yes, against 1,571,939 No. This vote was taken on the 8th of May, 1870; within two months the Hohenzollern question had begun its ominous course.

The Hohenzollern question.

In 1868 the Spanish insurrection of September had dislodged Queen Isabella. She took refuge in France, with a crowd of partisans, and became at once the favored guest of the emperor and his Spanish spouse. In the provisional Government of Madrid General Prim in 1869 became president of the council of ministers, and began almost at once to search about Europe for an eligible king. In the course of his inquiries he happened on Prince Leopold of Hohenzollern-Sigmaringen, to whom he offered the crown of Spain without first announcing his intentions to the court of France. The intimacy existing between the empress and the ex-queen of Spain was no doubt a sufficient reason for this reticence. Prince Leopold at once informed the head of his house, the king of Prussia, of the fact, and the king authorized him to accept the offer. So stood affairs when the French cabinet thought it necessary to intervene. The two nations had regarded one another with distrust for years; in the beginning of the imperial rule the Prussians had stood aloof; the irritation which France felt at the Danish war passed into alarm after Sadowa. The failure of Benedetti's negotiation in 1870 with Bismarck as to Belgium added to the tension. The French Government was also uneasy at the evident signs of opposition at home, the decay of its popularity, the penalty of its corruption and extravagance; finally, there existed two courts, that of the empress and a more patriotic one, which dimly reflected the ancient antagonism between a Spanish party in high place and the true interests of the country. The emperor of the French, worn-out and more irresolute than ever, became the prey and victim of a faction. When Prince Leopold, on learning the objections of France, withdrew his candidature, the French Government, instead of accepting the act in a conciliatory spirit, seemed to be inspired by the temper of the duke of Grammont's speech in the Assembly at the time. "We cannot allow the actual balance of power in Europe to be deranged, and the interest and honor of France to be imperilled. We firmly hope this may not happen; against it we count on both the prudence of Germany and the friendship of Spain. Were it to be otherwise, strong in your support and in that of the nation, we should know how to do our duty, without hesitation and without weakness;"—brave words and menacing, but words which required real strength behind them, the very thing which was lacking. The empress and her friends wanted war; and consequently the king of Prussia was pressed, as a further step, to give assurances that he never would support Prince Leopold in any future candidature for the Spanish throne. This was equivalent to saying that war was determined on; and the Prussian cabinet made no further effort for peace. Steps were taken in Paris for a fresh *coup d'état* against the liberals, if they proved too obstructive; the empress was eager to secure, by a successful war, the throne for her son, and to appear as the champion of Catholic and Ultramontane principles in Europe. While the liberal party in the chamber and the country, headed by Thiers, persistently opposed the war, the Bonapartists fiercely pushed matters on; they refused the good offices of the other states of Europe; in shameful ignorance of the truth, they declared that everything was ready—"five times ready," "ready to the last gaiter-button"—and were only eager to begin. The ruffians of Paris, intoxicated after their sort by the brilliancy of an imperial policy, mobbed Thiers, attacked his house, and filled the streets with yells of *à Berlin*.

War with Germany.

The ignorance in France.

The battle of Sedan.

And thus war began, with the emperor as commander-in-chief and the empress as regent at Paris. France had no allies; her appeal to South Germany failed; Austria, however friendly, was paralyzed by Russia; for it was known that if Austria moved against Prussia, Russia would at once attack her; and the people of the lesser German states, whatever their Governments might think, were favorable to Prussia; for she seemed to them to be upholding a national cause. At Paris, the profoundest ignorance reigned. Nothing was known of the state of feeling in Germany, or of the real condition of the Prussian preparations for war. As little was known of the fitness of their own army for a great war; it was thought that it was strong and ready, whereas it was ill-organized, ill-supplied, and without proper reserves, while the incapacity of its leaders was appalling. No one knew anything of strategy; maps and plans were bad; even the employment of railways in war had never been properly studied; bravery there was in plenty, but leading and management were absolutely wanting. The French army was stretched across the frontier-line looking towards Germany from Strasburg to Metz; Metz became the French quarters-general, Mainz the German. By the 2d of August the hostile armies came into collision; the emperor's reconnaissance drove the Germans out of Sarrebruck on that day, and the prince imperial there underwent his "*Baptême de Feu*," a baptism into misfortune. This was the one and only success of the French arms across the German frontier; for on that same day General Douay was attacked and defeated at Wissembourg, and his position forced. Attacks followed sharply; on the 6th MacMahon was driven in at Wörth, and on the same day Frossard was defeated at the other end of the line. Before Paris had recovered from her delight at the trivial success of Sarrebruck, the ominous telegram, "Tout peut se retablir," awoke her to a true view of the state of things. It was soon seen that the emperor was unfit to command, and was a mere encumbrance; there was neither strategy in detail nor a definite plan of campaign; having let in the invasion, he resigned the post of commander-in-chief into the hands of Marshal Bazaine, and withdrew into Metz. The forward movement of the Germans soon alarmed both him and Paris, and then he decided (August 14) to retire to the camp at Chalons, where Marshal MacMahon was in command. The emperor's slow retreat, with a long train of useless followers, blocked the roads, and stopped the movement of troops and supplies. At this very time the Prussians and their allies were closing in on Metz; on the 14th at Borney, the 16th at Gravelotte, the 18th at Saint Privat, tremendous battles, in which the attacking Germans did not always get the best of it, hemmed the French in, and Bazaine withdrew with his large army into Metz. The French view of his conduct is that he meant to keep this army intact in order that afterwards, in conjunction with the Germans as his accomplices, he might secure, with a fresh military *coup d'état*, the imperial rule over France. Whatever he may have meant, the Germans had no intention of intrusting the fortunes of France to him. At this time General Trochu, an able soldier, whom the empress did not like, was appointed governor of Paris; the army of MacMahon was at Chalons intact, and a prudent ruler would have made these two strong forces act in concert. The empress, on the contrary, refused to hear of the emperor's return to Paris, and ordered MacMahon to march to the Belgian frontier, to take the Prussians on the flank, and to relieve Bazaine at Metz,—a plan excellent with a strong force able to march fast, fatal with an imperial army, disorganized, doubtful, and slow. The northward movement ended speedily in the great catastrophe of Sedan (1st September, 1870). On the 2d the emperor, with an army of more than 80,000 men, was the prisoner of war of the king of Prussia.

X. The Third Republic.

The third Republic.

The first siege of Paris.

In spite of all precautions the news oozed out at Paris all too soon for the dismayed imperialists. On September 4, 1870, the third Republic was proclaimed, with a Government of national defence, of which the chief members were Thiers, Jules Favre, Jules Simon, and Gambetta; General Trochu was its military head. Gradually the Germans closed in on Paris; no serious resistance in the field being attempted, or indeed being possible, at a moment when one half of the available army of France lay in Metz and the other half was either destroyed or prisoners at Sedan. The first siege of Paris lasted from September 19, 1870, to January 30, 1871, during which period also the temporal power of the papacy came to an end (September, 1870), for it fell with the imperial cause, which alone had held it up; and in December, 1870, at Versailles, the king of Prussia was proclaimed head of a new empire of Germany. With a German emperor, and Victor Emmanuel at Rome, and France in extremities, it was clear that great changes had come, and must lead eventually to broad rearrangements of the political world. While Paris held out bravely enough, if not very wisely, Gambetta at Tours used incredible efforts to raise fresh armies for France; the old hero of Italy, Garibaldi, also appeared, now that imperialism was gone, and placed his sword at the disposal of the struggling republic. Before the end of October the capitulation of Metz had released a whole German army, which protected the operations of the besieging hosts; at last, on January 28th, 1871, an armistice was announced, which brought the despairing resistance of Paris to an end. The war elsewhere died out almost at once; the Germans occupied all the forts round Paris.

The Assembly of Bordeaux.

The second siege of Paris.

On 8th February elections took place for a National Assembly to be held at Bordeaux, to deliberate on the question of peace or war, or rather, to arrange the terms of peace,—for the country returned the Assembly with that intention. It was a body nominally republican, with strong monarchical leanings, as yet unexpressed; hardly half a dozen Bonapartists were returned to it. Garibaldi was among the deputies elected, though he declined the honor of acting as a Frenchman. The new republican Government of France now had M. Grévy as president, and Thiers as chief of the executive power; and it was decided that the Assembly should sit at Versailles. The fierce outbreak of the hot republicans of Paris interfered sorely with their peaceful labors. On 18th March the commune of Paris declared itself in opposition to the Versailles republic; the old grudges of artisan Paris once more asserted their unpleasant existence; and Marshal MacMahon was instructed by the Versailles Assembly to reduce the insurgent capital. Then followed the second siege of Paris, from April 2 to May 21, with its accompanying horrors, and the gloomy spectacle of street-fighting and the burning and ruin of the public buildings of the town.

The treaty of Frankfort.

Meanwhile M. Thiers, with infinite toil, and with journeys from court to court of Europe, had at last, by his unwearying activity, succeeded in getting terms of peace agreed to. The treaty of Frankfort was signed on the 10th of May, 1871; by it Alsace and a large part of Lorraine were ceded back to Germany, while Belfort was restored to France; a huge money indemnity was to be paid to Germany for the costs of the war.

The reactionary Versailles Assembly.

The parties in it.

The reactionary measures of the Versailles Assembly soon began,—timidly at first, to push forward with boldness, if the first steps succeeded. Thus, it suppressed the national guard, in spite of the moderate opposition of M. Thiers; it allowed Orleanist princes and members of the Bonapartist family to enter the Assembly; it strengthened its position at Versailles, though it had not the courage to move the Government offices thither. Early in 1872 the opposition of the Assembly to his financial proposals led to a first resignation of M. Thiers; only on its earnest and almost unanimous petition did he consent to hold office any longer. Meanwhile, the attempts at a fusion between the legitimists and Orleanists failed completely; the efforts of the Bonapartists, led by M.

Rouher, were redoubled; a great organized propaganda was set afoot; newspapers, pamphlets, photographs, bribes for the army and for Government officials, intrigues of every kind, were in motion, in order to create a public opinion on behalf of the emperor and the young prince imperial, as he was still persistently called. The three parties agreed in one thing, at least,—that they would before long put an end to the republic. At the end of 1872 a commission of thirty was appointed to regulate the arrangement of public powers and duties, and to settle the vexed question of ministerial responsibility. It was composed of a majority of the Right, the members of the different anti-republican parties in the Assembly. From it sprang the attempts of the Assembly to postpone the day of its dissolution, and to frame the government of France in such a way as to secure the defeat of the republic. The weakness of the majority lay in the fact that their union was only negative; and that if they did agree, it was only till they could rid themselves of the republic.

Death of Napoleon III.

The death of Napoleon III. at Chiselhurst in January, 1873, created little or no feeling in France, and showed that imperialism had small hold on the popular mind. The Assembly now decided that it would remove the president from the chamber, because of the great influence which Thiers could always exert on a debate; and, secondly, that it would push back its own dissolution as far as possible. These proposals Thiers accepted, rather than run the risk of a collision. When, however, it was announced that, thanks chiefly to the president's exertion, the evacuation of France by the Prussian troops would take place two years sooner than had been originally stipulated, and that the last foreign soldier would march off in September, 1873, the parties of the majority became seriously alarmed; for the life of the Assembly had been, by their own admission, connected with the period of continuance of German troops in France. Early in April, 1873, on the resignation of M. Grévy, president of the chamber, they carried their candidate M. Buffet, against the Thiers Government; in May they came to close quarters, and brandishing their favorite weapon, the "red spectre," these three reactionary parties defeated Thiers by a majority of 16 (360 against 344). Then the old minister resigned, and the parties, which had arranged their plans beforehand, at once elected as president Marshal MacMahon, the "honnête homme et soldat," as he styled himself. With him they associated a cabinet of which the head was M. de Broglie. Immediately the functionaries were changed throughout France, and everywhere old imperialists were put in. At the beginning of 1875 it was agreed that the presidency should be for seven years, and a new constitution, with the republican element as much as possible effaced, was set up in February, 1875. Before this M. de Broglie had fallen under the ill-will of the monarchical parties, and had been compelled by an adverse vote of the chamber to send in his resignation. He was succeeded by General de Cissey, with what was called, by an inopportune invention, "a business cabinet." The new constitution provided a president with a cabinet, a body which, by being thus styled "a business cabinet," seemed to make the president's personality all the stronger; then there was a senate of 300 members, of whom 75 were life-holders, and the rest elected for nine years, renewable by triennial elections of a third at a time; and, lastly, a chamber of deputies, to be elected by the country in the usual way.

Fall of M. Thiers.

A reactionary constitution.

The dissolution of the Assembly.

The time came at last when the chamber, which had been elected to decide on peace or war, and had taken to itself the functions of a constituent assembly, and had framed a new constitution, and had defied the public opinion of France expressed at almost every bye-election, must bring its half-usurped functions to an end. The successive triumphs of the republicans in bye-elections had strengthened them so much that they could now hold their own in the chamber. The president, aware that his strength was going, got rid of the cabinet of Dufaure and Jules Simon, and, trusting to official pressure at a new election, hoping also to work on the old fears respecting the extremer party, the "irreconcilables," took advantage of an adverse vote, and after having in May, 1877, adjourned the chamber for a month, eventually dissolved it on June 25, 1877. The republican party showed extraordinary prudence and moderation under excessive provocation; the influence of the great jurists, Dufaure and Grévy, made itself felt, neutralizing all the plots of the reaction, and quietly prolonging the crisis, until the country could speak; the "Opportunists," as the followers of Thiers and Gambetta were now styled, united with the "irreconcilables" in opposition to the "party of order," as the intriguers of the three reactionary groups, legitimists, Orleanists, imperialists, loved to call themselves. In spite of shameless interferences with the election, in spite of the unseemly appeal of the president himself, in spite of threats and all the ancient weapons of reaction, the country was so decidedly republican that even the death of Thiers (3d September, 1877) could not for a moment check the fortunes of his party. His death perhaps even strengthened it, for he became the saint instead of being the leader of it. His chequered political career, so long past, was quite forgotten; his memory was revered as that of the statesman who in his old age saved Belfort to France, brought peace, secured the payment of the war indemnity, and relieved the country from the German occupation. All France felt that under his guidance tranquillity had returned, and the timid middle classes had learned to couple prosperity with the republic. And so the elections of 1877 returned a decisive majority for the republicans, now headed by MM. Grévy and Gambetta; the "irreconcilables" were not strong in the new chamber; the reactionary parties lost ground; and M. Grévy was at once re-elected president of the chamber. Consequently, the marshal president, after France had been deeply agitated by rumors of a new *coup d'état*, and by ominous movements of troops, at last gave way, and, honestly if reluctantly, accepted the verdict of the country. The reactionary "Ministry of May 16" fell, and, after a new attempt at a "business ministry," a republican cabinet was formed at last (14th December, 1877), under the presidency of M. Dufaure. By degrees, as the shameless behavior of officials at election after election came to light, the bureaucracy of France began to resume a republican color, by removals of reactionary prefects, by opportune changes of political views, and acquiescence in the loudly pronounced opinion of the nation. The army, which was far from satisfied with the late Government, showed signs of content under the new. In the senate only did the three reactionary parties still possess any power; and even there their majority was so small that they could not venture on serious resistance. The Orleanist section, which, though very weak in numbers, still held the balance, and could give the majority to either side, was timid and moderate, and averse to heroic measures. Their refusal to prolong the crisis by consenting to a second dissolution of the chamber of deputies gave time for the moderate republic to consolidate its powers. The elections of 5th January, 1879, in which, according to the present constitution of France, one-third of the senate has undergone re-election, have happily brought that body into harmony with the chamber of deputies and the country. Fresh rumors of trouble had been industriously circulated; the temper of France is, however, so thoroughly tranquil, and so decided in favor of a constitutional republic, that the hopes of the reactionary parties have all been frustrated.

Death of Thiers.

The Assembly of 1877.

Conclusion.

It is always absurd to indulge in historical prophecy; and forecasts as to the future of France, thanks to the quick movement of opinion, the general ignorance of the country people, the vehemence in the towns, the long succession of changes in government and constitution, must be specially precarious. Still, it is clear that, for a time at least, the reaction, however strong elsewhere, has been defeated in France; above all it is clear that imperialism has received a heavy if not a fatal blow. This is no little matter. We live in days in which the growth of a modern imperialism, based on huge armaments and destructive of small states, had become a standing menace to the well-being of the world; it is a ground for hope and thankfulness that France, the central state of Europe, has definitely and calmly abandoned her imperialist traditions, and set herself to live the temperate life of a constitutional republic.

Each race has its own special function in the general polity of nations; France seems called to lead in the propagation of wholesome political ideas. Even in her most violent moods, her principles have been right, her theories humane and noble. It is true that she is deficient in many practical gifts; religion with her has ever held a very secondary place; her ideas on economical questions are narrow, and in many points her sympathies are not enlisted on behalf of what seems to us to be best. Still, her present position is an incalculable gain to Europe, and a promise of good for the future. With France as a prudent republic, the resistance of the peoples of Europe to arbitrary power and crushing armies will gradually be strengthened; and constitutional life, already developing itself throughout the Latin races, will find its best guarantee of stability. The movements of Europe have often taken their rise from France; the union of a strong government with a vigorous national life may also come to date from her; if England has striven to impress the practical rendering of her constitutional principles and her tongue on half the world, France can also boast that she has provided her part by enunciating, with the most admirable clearness of speech and thought, those general ideas as to the relations between man and man which lie at the basis of any wholesome system of government. (G. W. K.)

PART III.—FRENCH LANGUAGE.

I. *Geography.*—French is the general name of the north-north-western group of Romanic dialects, the modern Latin of northern Gaul (carried by emigration to some places—as Lower Canada—out of France). In a restricted sense it is that variety of the Parisian dialect which is spoken by the educated, and is the general literary language of France. The region in which the native language is termed French consists of the northern half of France (including Lorraine) and parts of Belgium and Switzerland; its boundaries on the west are the Atlantic Ocean and the Celtic dialects of Brittany; on the north-west and north, the English Channel; on the north-east and east the Teutonic dialects of Belgium, Germany, and Switzerland. In the south-east and south the boundary is to a great extent conventional and ill-defined, there being originally no linguistic break between the southern French dialects and the northern Provençal dialects of southern France, north-western Italy, and south-western Switzerland. It is formed partly by spaces of intermediate dialects (some of whose features are French, others Provençal), partly by spaces of mixed dialects resulting from the invasion of the space by more northern and more southern settlers, partly by lines where the intermediate dialects have been suppressed by more northern (French) and more southern (Provençal) dialects without these having mixed. Starting in the west at the mouth of the Gironde, the boundary runs nearly north soon after passing Bordeaux; a little north of Angoulême it turns to the east, and runs in this direction into Switzerland to the north of Geneva.

II. *External History.*—(*a*) *Political.*—By the Roman conquests the language of Rome was spread over the greater part of southern and western Europe, and gradually supplanted the native tongues. The language introduced was at first nearly uniform over the whole empire, Latin provincialisms and many more or less general features of the older vulgar language being suppressed by the preponderating influence of the educated speech of the capital. As legions became stationary, as colonies were formed, and as the natives adopted the language of their conquerors, this language split up into local dialects, the distinguishing features of which are due, as far as can be ascertained (except, to some extent, as to the vocabulary), not to speakers of different nationalities misspeaking Latin, each with the peculiarities of his native language, but to the fact that linguistic changes, which are ever occurring, are not perfectly uniform over a large area, however homogeneous the speakers. As Gaul was not conquered by Cæsar till the middle of the first century before our era, its Latin cannot have begun to differ from that of Rome till after that date; but the artificial retention of classical Latin as the literary and official language after the popular spoken language had diverged from it, often renders the chronology of the earlier periods of the Romanic languages obscure. It is, however, certain that the popular Latin of Gaul had become differentiated from that of central Italy before the Teutonic conquest of Gaul, which was not completed till the latter half of the 5th century; the invaders gradually adopted the language of their more civilized subjects, which remained unaffected, except in its vocabulary. Probably by this time it had diverged so widely from the artificially preserved literary language that it could no longer be regarded merely as mispronounced Latin; the Latin documents of the next following centuries contain many clearly popular words and forms, and the literary and popular languages are distinguished as *latina* and *romana*. The term *gallica*, at first denoting the native Celtic language of Gaul, is found applied to its supplanter before the end of the 9th century, and survives in the Breton *gallek*, the regular term for "French." After the Franks in Gaul had abandoned their native Teutonic language, the term *francisca*, by which this was denoted, came to be applied to the Romanic one they adopted, and, under the form *française*, remains its native name to this day; but this name was confined to the Romanic of northern Gaul, which makes it probable that this, at the time of the adoption of the name *francisca*, had become distinct from the Romanic of southern Gaul. *Francisca* is the Teutonic adjective *frankisk*, which occurs in Old English in the form *frencisc*; this word, with its umlauted *e* from *a* with following *i*, survives under the form *French*, which, though purely Teutonic in origin and form, has long been exclusively applied to the Romanic language and inhabitants of Gaul. The German name *franzose*, with its accent on, and *o* in, the second syllable, comes from *françois*, a native French form older than *français*, but later than the Early Old French *franceis*. The Scandinavian settlers on the north-west coast of France early in the 10th century quickly lost their native speech, which left no trace except in some contributions to the vocabulary of the language they adopted. The main feature since is the growth of the political supremacy of Paris, carrying with it that of its dialect; in 1539 Francis I. ordered that all public documents should be in French (of Paris), which then became the official language of the whole kingdom, though it is still foreign to nearly half its population.

The conquest of England in 1066 by William, duke of Normandy, introduced into England, as the language of the rulers and (for a time) most of the writers, the dialects spoken in Normandy. Confined in their native country to definite areas, these dialects, following their speakers, became mixed in England, so that their forms were used to some extent indifferently; and the constant communication with Normandy maintained during several reigns introduced also later forms of Continental Norman. As the conquerors learned the language of the conquered, and as the more cultured of the latter learned that of the former, the Norman of England (including that of the English-speaking Lowlands of Scotland) became anglicized; instead of following the changes of the Norman of France, it followed those of English. The accession in 1154 of Henry II. of Anjou disturbed the Norman character of Anglo-French, and the loss of Normandy under John in 1204 gave full play to the literary importance of the French of Paris, many of whose forms afterwards penetrated to England. At the same time English, with a large French addition to its vocabulary, was steadily recovering its supremacy, and is officially employed (for the first time since the Conquest) in the Proclamation of Henry III., 1258. The semi-artificial result of this mixture of French of different dialects and of different periods, more or less anglicized according to the date or education of the speaker or writer, is generally termed "the Anglo-Norman dialect;" very misleadingly for a great part of its existence, because, while the French of Normandy was not a single dialect, the later French of England came from other French provinces besides Normandy, and being to a considerable extent in artificial conditions, was checked in the natural development implied by the term "dialect." The disuse of Anglo-French as a natural language is evidenced by English being substituted for it in legal proceedings in 1362, and in schools in 1387; but law reports were written in it up to 1600, and converted into modern literary French, it remains in official use for giving the royal assent to bills of parliament.

(*b*) *Literary.*—Doubtless because the popular Latin of northern Gaul changed more rapidly than that of any other part of the empire, French was, of all the Romanic dialects, the first to be recognized as a distinct language, and the first to be used in literature; and though the oldest specimen now extant is probably not the first, it is considerably earlier than any existing documents of the allied languages. In 813 the council of Tours ordered certain homilies to be translated into Rustic Roman or into German; and in 842 Louis the German, Charles the Bald, and their armies confirmed their engagements by taking oaths in both languages at Strasburg. These have been preserved to us by the historian Nithard (who died in 853); and though, in consequence of the only existing manuscript (at Rome) being more than a century later than the time of the author, certain alterations have occurred in the text of the French oaths, they present more archaic forms (probably of North-Eastern French) than any other document. The next memorials are a short poem, probably North-Eastern, on St. Eulalia, preserved in a manuscript of the 10th century at Valenciennes, and some autograph fragments (also at Valenciennes) of a homily on the prophet Jonah, in mixed Latin and Eastern French, of the same period. To the same century belong a poem on Christ's Passion, apparently in a mixed (not intermediate) language of French and Provençal, and one, probably in South-Eastern French, on St. Leger; both are preserved, in different handwritings, in a MS. at Clermont-Ferrand, whose scribes have introduced many Provençal forms. After the middle of the 11th century literary remains are comparatively numerous; the chief early representatives of the main dialects are the following, some of them preserved in several MSS., the earliest of which, however (the only ones here mentioned), are in several cases a generation or two later than the works themselves. In Western French are a verse life of St. Alexius (Alexis), probably Norman, in an Anglo-Norman MS. at Hildesheim; the epic poem of Roland, possibly also Norman, in an A.-N. MS. at Oxford; a Norman verbal translation of the Psalms, in an A.-N. MS. also at Oxford; another later one in an A.-N. MS. at Cambridge; a Norman translation of the Four Books of Kings, in a native MS. at Paris. The earliest work in the Parisian dialect is probably the Travels of Charlemagne, preserved in a late Anglo-Norman MS. with much-altered forms. In Eastern French, of rather later date, there are translations of the Dialogues of Pope Gregory, in a MS. at Paris, containing also fragments of Gregory's Moralities, and (still later) of some Sermons of St. Bernard, in a MS. also at Paris. From the end of the 12th century literary and official documents, often including local charters, abound in almost every dialect, until the growing influence of Paris caused its language to supersede in writing the other local ones. This influence, occasionally apparent in the 12th century, was overpowering in the 15th, when authors, though often displaying provincialisms, almost all wrote in the dialect of the capital; the last dialect to lose its literary independence was the North-Eastern, which, being the Romanic language of Flanders, had a political life of its own, and (modified by Parisian) was used in literature after 1400.

III. *Internal History.*—So little has been done until recently, and so much remains to be done, in the scientific investigation of the sounds, inflexions, and syntax of the older stages and dialects of French, that what follows cannot claim to be more than a fragmentary sketch, mainly of the dialects—that which is now literary modern French, and those which were imported into England by the Normans—in which English readers will probably take most interest, and especially of the features which explain the forms of English words of French origin. Dates and places are only approximations, and many statements are liable to be modified by further researches; want of space obliges many exceptions and limitations to the general laws, and many points of hardly inferior importance to those here noticed, to be passed over in silence. The primitive Latin forms given are often not classical Latin words, but derivatives from these; and reference is generally made to the Middle English (Chaucerian) pronunciation of English words, not the modern.

(*a*) *Vocabulary.*—The fundamental part of the vocabulary of French is the Latin imported into Gaul, the French words being simply the Latin words themselves, with the natural changes undergone by all living speech, or derivatives formed at various dates. Comparatively few words were introduced from the Celtic language of the native inhabitants (*bec lieue* from the Celtic words given by Latin writers as *beccus, leuca*), but the number adopted from the language of the Teutonic conquerors of Gaul is large (*guerre* = *werra; laid* = *laidh; choisir* = *kausjan*). The words were imported at different periods of the Teutonic supremacy, and consequently show chronological differences in their sounds (*haïr* = *hatan; français* = *frankisk; écrevisse* = *krebiz; échine* = *skina*). Small separate importations of Teutonic words resulted from the Scandinavian settlement in France, and the commercial intercourse with the Low German nations on the North Sea (*friper* = Norse *hripa; chaloupe* = Dutch *sloop; est* = Old English *eást*). In the mean time, as Latin (with considerable alterations in pronunciation, vocabulary, etc.) continued in literary, official, and ecclesiastical use, the popular language borrowed from time to time various more or less altered classical Latin words; and when the popular language came to be used in literature, especially in that of the church, these importations largely increased (*virginitet* Eulalia = *virginitātem; imagena* Alexis = *imāginem*—the popular forms would probably have been *vernedet, emain*). At the Renaissance they became very abundant, and have continued since, stifling to some extent the developmental power of the language. Imported words, whether Teutonic, classical Latin, or other, often receive some modification at their importation, and always take part in all subsequent natural phonetic changes in the language (Early old French *adversarie*, modern French *adversaire*). Those French words which appear to contradict the phonetic laws were mostly introduced into the language after the taking place (in words already existing in the language) of the changes formulated by the laws in question; compare the late imported *laïque* with the inherited *lai*, both from Latin *laicum*. In this and many other cases the language possesses two forms of the same Latin words, one descended from it, the other borrowed (*meuble* and *mobile* from *mōbilem*). Some Oriental and other foreign words were brought in by the crusaders (*amiral* from *amir*); in the 16th century, wars, royal marriages, and literature caused a large number of Italian words (*soldat* = *soldato; brave* = *bravo; caresser* = *carezzare*) to be introduced, and many Spanish ones (*alcôve* = *alcoba; hâbler* = *hablar*). A few words have been furnished by Provençal (*abeille, cadenas*), and several have been adopted from other dialects into the French of Paris (*esquiver* Norman or Picard for the Paris French *eschiver*). German has contributed a few (*blocus* = *blochūs; choucroute* = *sūrkrūt*); and recently a considerable number have been imported from England (*drain, comfortable, flirter*). In Old French, new words are freely formed by derivation, and to a less extent by composition; in Modern French, borrowing from Latin or other foreign languages is the more usual course. Of the French words now obsolete some have disappeared because the things they express are obsolete; others have been replaced by words of native formation, and many have been superseded by foreign words generally of literary origin; of those which survive, many have undergone considerable alterations in meaning. A large number of Old French words and meanings, now extinct in the language of Paris, were introduced into English after the Norman Conquest; and though some have perished, many have survived—*strife* from Old French *estrif* (Teutonic *strīt*); *quaint* from *cointe* (*cognitum*); *remember* from *remembrer* (*rememorāre*); *chaplet* (garland) from *chapelet* (Modern French "chaplet of beads"); *appointment* (rendezvous) from *appointement* (now "salary"). Many also survive in other French dialects.

(*b*) *Dialects.*—The history of the French language from the period of its earliest extant literary memorials is that of the dialects composing it. But as the popular notion of a dialect as the speech of a definite era, possessing certain peculiarities confined to and extending throughout that era, is far from correct, it will be advisable to drop the misleading divisions into "Norman dialect," "Picard dialect," and the like, and take instead each important feature in the chronological order (as far as can be ascertained) of its development, pointing out roughly the area in which it exists, and its present state. The local terms used are intentionally vague, and it does not, for instance, at all follow that because "Eastern" and "Western" are used to denote the localities of more than one dialectal feature, the boundary line between the two divisions is the same in each case. It is, indeed, because dialectal differences as they arise do not follow the same boundary lines (much less the political divisions of provinces), but cross one another to any extent, that to speak of the dialect of a large area as an individual whole, unless that area is cut off by physical or alien linguistic boundaries, creates only confusion. Thus the Central French of Paris the ancestor of classical Modern French, belongs to the South in having *ts*, not *tsh*, for Latin *k* (*c*) before *i* and *e; tsh*, not *k*, for *k* (*c*) before *a;* and *gu*, not *w*, for Teutonic *w;* while it belongs to the East in having *oi* for earlier *ei;* and to the West in having *é*, not *ei*, for Latin *a;* and *i*, not *ei*, from Latin ĕ + *i*. It may be well to note that Southern *French* does not correspond to southern *France*, whose native language is Provençal. "Modern French" means ordinary educated Parisian French.

(c) *Phonology*.—The history of the sounds of a language is, to a considerable extent, that of its inflexions, which, no less than the body of a word, are composed of sounds. This fact, and the fact that unconscious changes are much more reducible to law than conscious ones, render the phonology of a language by far the surest and widest foundation for its dialectology, the importance of the sound-changes in this respect depending, not on their prominence, but on the earliness of their date. For several centuries after the divergence between spoken and written Latin, the history of these changes has to be determined mainly by reasoning, aided by a little direct evidence in the misspellings of inscriptions, the semi-popular forms in glossaries, and the warnings of Latin grammarians against vulgarities. With the rise of Romanic literature the materials for tracing the changes become abundant, though as they do not give us the sounds themselves, but only their written representations, much difficulty, and some uncertainty, often attach to deciphering the evidence. Fortunately, early Romanic orthography, that of Old French included (for which see next section), was phonetic, as Italian orthography still is; the alphabet was imperfect, as many new sounds had to be represented which were not provided for in the Roman alphabet from which it arose, but writers aimed at representing the sounds they uttered, not at using a fixed combination of letters for each word, however they pronounced it,

The characteristics of French as distinguished from the allied languages and from Latin, and the relations of its sounds, inflexions, and syntax to those of the last-named language, belong to the general subject of the Romanic languages. It will be well, however, to mention here some of the features in which it agrees with the closely related Provençal, and some in which it differs. As to the latter, it has already been pointed out that the two languages glide insensibly into one another, there being a belt of dialects which possess some of the features of each. French and Provençal of the 10th century—the earliest date at which documents exist in both—agree to a great extent in the treatment of Latin final consonants and the vowels preceding them, a matter of great importance for inflexions (numerous French examples occur in this section.) (1) They reject all vowels, except *a*, of Latin final (unaccented) syllables, unless preceded by certain consonant combinations or followed by *nt* (here, as elsewhere, certain exceptions cannot be noticed); (2) they do not reject *a* similarly situated; (3) they reject final (unaccented) *m*; (4) they retain final *s*. French and Northern Provençal also agree in changing Latin *ū* from a labio-guttural to a labio-palatal vowel; the modern sound (German *ü*) of the accented vowel of French *lune*, Provençal *luna*, contrasting with that in Italian and Spanish *luna*, appears to have existed before the earliest extant documents. The final vowel laws generally apply to the unaccented vowel preceding the accented syllable, if it is preceded by another syllable, and followed by a single consonant—*matin* (*mātūtīnum*), *dortoir* (*dormītōrium*), with vowel dropped; *canevas* (*cannabāceum*), *armedure* later *armëure*, now *armure* (*armātūram*), with *e*=ə, as explained below.

On the other hand, French differs from Provençal:—(1) in uniformly preserving (in Early Old French) Latin final *t*, which is generally rejected in Provençal—French *aimet* (Latin *amat*), Provençal *ama; aiment* (*amant*), *aman;* (2) in always rejecting, absorbing, or consonantizing the vowel of the last syllable but one, if unaccented; in such words as *angele* (often spelt *angle*), the *e* after the *g* only serves to show its soft sound—French *veintre* (*vaincre*, Latin *viñcere*), Provençal *vencer*, with accent on first syllable; French *esclandre* (*scandalum*), Provençal *escandol;* French *olie* (dissyllabic, *i*=*y* consonant, now *huile*), Provençal *oli* (*oleum*); (3) in changing accented *a* not in position into *ai* before nasals and gutturals and not after a palatal, and elsewhere into *é* (West French) or *ei* (East French), which develops an *i* before it when preceded by a palatal—French *main* (Latin *manum*), Provençal *man; aigre* (*ācrem*), *agre; ele* (*ālam*), East French *eile, ala; meitié* (*medietātem*), East French *moitieit, meitat;* (4) in changing *a* in unaccented final syllables into the vowel ə, intermediate to *a* and *e;* this vowel is written *a* in one or two of the older documents, elsewhere *e*—French *aime* (Latin *amā*), Provençal *ama; aimes* (*amās*), *amas; aimet* (*amat*), *ama;* (5) in changing original *au* into ò—French *or* (*aurum*), Provençal *aur; rober* (Teutonic *raubōn*), *raubar;* (6) in changing general Romanic *é*, from accented *ē* and *ĭ* not in position, into *ei*—French *veine* (*vēnam*), Provençal *vena; peil* (*pilum*), *pel*.

As some of the dialectal differences were in existence at the date of the earliest extant documents, and as the existing materials, till the latter half of the 11th century, are scanty and of uncertain locality, the chronological order (here adopted) of the earlier sound-changes is only tentative.

(1.) Northern French has *tsh* (written *c* or *ch*) for Latin *k* (*c*) and *t* before palatal vowels, where Central and Southern French have *ts* (written *c* or *z*)—North Norman and Picard *chire* (*cēram*), *brach* (*brāchium*), *plache* (*plateam*); Parisian, South Norman, etc., *cire, braz, place*. Before the close of the Early Old French period (12th century) *ts* loses its initial consonant, and the same happened to *tsh* a century or two later; with this change the old distinction is maintained—Modern Guernsey and Picard *chire*, Modern Picard *plache* (in ordinary Modern French spelling); usual French *cire, place*. English, having borrowed from North and South Norman (and later Parisian), has instances of both *tsh* and *s*, the former in comparatively small number—*chisel* (Modern French *ciseau*=(?) *caesellum*), *escutcheon* (*écusson, scūtiōnem*); *city* (*cité, cīvitātem*), *place*. (2.) Initial Teutonic *w* is retained in the north-east and along the north coast; elsewhere, as in the other Romance languages, *g* was prefixed—Picard, etc., *warde* (Teutonic *warda*), *werre* (*werra*); Parisian, etc., *guarde, guerre*. In the 12th century the *u* or *w* of *gu* dropped, giving the Modern French *garde, guerre* (with *gu*=*g*); *w* remains in Picard and Walloon, but in North Normandy it becomes *v*—Modern Guernsey *vâson*, Walloon *wazon*, Modern French *gazon* (Teutonic *wason*). English has both forms, sometimes in words originally the same—*wage* and *gage* (Modern French *gage*, Teutonic *wadi*); *warden* and *guardian* (*gardien, warding*). (3.) Latin *b* after accented *a* in the imperfect of the first conjugation, which becomes *v* in Eastern French, in Western French further changes to *w*, and forms the diphthong òu with the preceding vowel—Norman *amowe* (*amābam*), *portout* (*portābat*); Burgundian *ameve, portevet*. *Eve* is still retained in some places, but generally the imperfect of the first conjugation is assimilated to that of the others—*amoit*, like *avoit* (*habēbat*). (4.) The palatalization of every then existing *k* and *g* (hard) when followed by *a, i*, or *e*, after having caused the development of *i* before the *e* (East French *ei*) derived from *a* not in position, is abandoned in the north, the consonants returning to ordinary *k* or *g*, while in the centre and south they are assibilated to *tsh* or *dzh*—North Norman and Picard *cachier* (*captiāre*), *kier* (*cārum*), *cose* (*causam*), *eskiver* (Teutonic *skiuhan*), *wiket* (Teutonic *wik*+*ittum*), *gal* (*gallum*), *gardin* (from Teutonic *gard*); South Norman and Parisian *chacier, chier, chose, eschiver, guichet, jal, jardin*. Probably in the 14th century the initial consonant of *tsh, dzh* disappeared, giving the modern French *chasser, jardin* with *ch*=*sh* and *j*=*zh*; but *tsh* is retained in Walloon, and *dzh* in Lorraine. The Northern forms survive—Modern Guernsey *cachier, gardin;* Picard *cacher, gardin*. English possesses numerous examples of both forms, sometimes in related words—*catch* and *chase; wicket, eschew; garden, jaundice* (*jaunisse*, from *galbanum*). (5.) For Latin accented *a* not in position Western French usually has *é*, Eastern French *ei*, both of which take an *i* before them when a palatal precedes—Norman and Parisian *per* (*parem*), *oiez* (*audiātis*); Lorraine *pier, oieis*. In the 17th and 18th centuries close *é* changed to open *è*, except when final or before a silent consonant—*amer* (*amārum*) now having *è*, *aimer* (*amāre*) retaining *é*. English shows the Western close *é*—*peer* (Modern French *pair*, Old French *per*), *chief* (*chef, caput*); Middle High German the Eastern *ei*—*lameir* (Modern French *l'amer, l'aimer, la mer*=Latin *mare*). (6.) Latin accented *e* not in position, when it came to be followed in Old French by *i*, unites with this to form *i* in the Western dialects, while the Eastern have the diphthong *ei*—Picard, Norman, and Parisian *pire* (*pejor*), *piz* (*pectus*); Burgundian *peire, peiz*. The distinction is still preserved—Modern French *pire, pis;* Modern Burgundian *peire, pei*. English words show always *i*—*price* (*prix, pretium*), *spite* (*dépit, dēspectum*). (7.) The nasalization of vowels followed by a nasal consonant did not take place simultaneously with all the vowels. *A* and *e* before ṅ (guttural *n*, as in *sing*), ñ (palatal *n*), *n*, and *m* were nasal in the 11th century, such words as *tant* (*tantum*) and *gent* (*gentem*) forming in the Alexis assonances to themselves, distinct from the assonances with *a* and *e* before non-nasal consonants. In the Roland *umbre* (*ombre, umbram*) and *culchet* (*couche, collocat*), *fier* (*ferum*) and *chiens* (*canēs*), *dit* (*dictum*) and *vint* (*vēnit*), *ceinte* (*ciñctam*) and *veie* (*voie, viam*), *brun* (Teutonic *brūn*) and *fut* (*fuit*) assonate freely, though *o* (*u*) before nasals shows a tendency to separation. The nasalization of *i* and *u* (=Modern French *u*) did not take place till the 16th century; and in all cases the loss of the following nasal consonant is quite modern, the older pronunciation of *tant, ombre* being *tãnt, ombrə*, not as now *tã, õbrh*. The nasalization took place whether the nasal consonant was or was not followed by a vowel, *femme* (*fēminam*), *honneur* (*honōrem*) being pronounced with nasal vowels in the first syllable till after the 16th century, as indicated by the doubling of the nasal consonant in the spelling, and by the phonetic change (in *femme* and other words) next to be mentioned. English generally has *au* (now often reduced to *a*) for Old French *ã*—*vaunt* (*vanter, vānitāre*), *tawny* (*tanné*, (?) Celtic). (8.) The assimilation of *ẽ* (nasal *e*) to *ã* (nasal *a*) did not begin till the middle of the 11th century, and is not yet universal in France, though generally a century later. In the Alexis nasal *a* (as in *tant*) is never confounded with nasal *e* (as in *gent*) in the assonances, though the copyist (a century later) often writes *a* for nasal *e* in unaccented syllables, as in *amfant* (*enfant, infantem*); in the Roland there are several cases of mixture in the assonances, *gent*, for instance, occurring in *ant* stanzas, *tant* in *ent* ones. English has several words with *a* for *e* before nasals—*rank* (*rang*, Old French *renc*, Teutonic *hringa*), *pansy* (*pensée, pēnsātam*); but the majority show *e*—*enter* (*entrer, intrāre*), *fleam* (*flamme*, Old French *fleme, phlebotomum*). The distinction is still preserved in the Norman of Guernsey, where *an* and *en*, though both nasal, have different sounds—*lànchier* (*lancer, lañceāre*), but *mèntrie* (Old French *menterie*, from *mentīrī*). (9.) The loss of *s*, or rather *z*, before voiced consonants began early, *s* being often omitted or wrongly inserted in 12th century MSS.—Earliest Old French *masle* (*masculum*), *sisdre* (*sīceram*); Modern French *mâle, cidre*. In English it has everywhere disappeared—*male, cider;* except in two words, where it appears, as occasionally in Old French, as *d*—*meddle* (*mêler, misculāre*), *medlar* (*néflier*, Old French also *meslier, mespilārium*). The loss of *s* before voiceless consonants (except *f*) is about two centuries later, and it is not universal even in Parisian—Early Old French *feste* (*festam*), *escuier* (*scūtārium*); Modern French *fête, écuyer*, but *espérer* (*spērāre*). In the north-east *s* before *t* is still retained—Walloon *chestai* (*château, castellum*), *fiess* (*fête*). English shows *s* regularly—*feast, esquire*. (10.) Medial *dh* (soft *th*, as in *then*), and final *th* from Latin *t* or *d* between vowels, do not begin to disappear till the latter half of the 11th century. In native French MSS. *dh* is generally written *d*, and *th* written *t*; but the German scribe of the Oaths writes *adjudha* (*adjūtam*), *cadhuna* (Greek *katá* and *ūnam*); and the English one of the Alexis *cuntretha* (*contrātam*), *lothet* (*laudātum*), and that of the Cambridge Psalter *heriteth* (*hērēditātem*). Medial *dh* often drops even in the last-named MSS., and soon disappears; the same is true for final *th* in Western French—Modern French *contrée, loué*. But in Eastern French final *th*, to which Latin *t* between vowels had probably been reduced through *d* and *dh*, appears in the 12th century and later as *t*, rhyming on ordinary French final *t*—Picard and Burgundian *pechiet* (*peccātum*), *apeleit* (*appellātum*). In Western French some final *ths* were saved by being changed to *f*—Modern French *soif* (*sitim*), *mœuf* (obsolete, *modum*). English has one or two instances of final *th*, none of medial *dh*—*faith* (*foi, fidem*); middle English *caritep* (*charité, caritātem*), *druð* (Old French *dru*, Teutonic *drūd*); generally the consonant is lost—*country, charity*. Middle High German shows the Eastern French final consonant—*moraliteit* (*moralité, mōrālitātem*). (11.) *T* from Latin final *t*, if in an Old French unaccented syllable, begins to disappear in the Roland, where sometimes *aimet* (*amat*), sometimes *aime*, is required by the metre, and soon drops in all dialects. The Modern French *t* of *aime-t-il* and similar forms is an analogical insertion from such forms as *dort-il* (*dormit*), where the *t* has always existed. (12.) The change of the diphthong *ai* to *èi* and afterwards to *èè* (the doubling indicates length) had not taken place in the earliest French documents, words with *ai* assonating only on words with *a*; in the Roland such assonances occur, but those of *ai* on *è* are more frequent—*faire* (*facere*) assonating on *parastre* (*patraster*) and on *estes* (*estis*); and the MS. (half a century later than the poem) occasionally has *ei* and *e* for *ai*—*recleimet* (*reclāmat*), *desfere* (*disfacere*), the latter agreeing with the Modern French sound. Before nasals (as in *laine* = *lānam*) and *ié* (as in *payé* = *pācātum*), *ai* remained a diphthong up to the 16th century, being apparently *ei*, whose fate in this situation it has followed. English shows *ai* regularly before nasals and when final, and in a few other words—*vain* (*vain, vānum*), *pay* (*payer, pācāre*), *wait* (*guetter*, Teutonic *wahtēn*); but before most consonants it has usually *èè*—*peace* (*pais, pācem*), *feat* (*fait, factum*). (13.) The loss or transposition of *i* (= *y*-consonant) following the consonant ending an accented syllable begins in the 12th century—Early Old French *glorie* (*glōriam*), *estudie* (*studium*), *olie* (*olium*); Modern French *gloire, étude, huile*. English sometimes shows the earlier form—*glory, study;* sometimes the later—*dower* (*douaire*, Early Old French *doarie, dōtārium*), *oil* (*huile*). (14.) The vocalization of *l* preceded by a vowel and followed by a consonant becomes frequent at the end of the 12th century; when preceded by open *è*, an *a* developed before the *l* while this was a consonant—11th century *salse* (*salsa*), *beltet* (*bellitātem*), *solder* (*solidāre*): Modern French *sauce, beauté, souder*. In Parisian, final *èl* followed the fate of *èl* before a consonant, becoming the triphthong *èau*, but in Norman the vocalization did not take place, and the *l* was afterwards rejected—Modern French *ruisseau*, Modern Guernsey *russé* (*rīvicellum*). English words of French origin sometimes show *l* before a consonant, but the general form is *u*—*scald* (*échauder, excalidāre*), *Walter* (*Gautier*, Teutonic *Waldhari*); *sauce, beauty, soder*. Final *èl* is kept—*veal* (*veau, vitellum*), *seal* (*sceau, sigillum*). (15.) In the east and centre *éi* changes to *òi*, while the older sound is retained in the north-west and west—Norman *estreit* (*étroit, strictum*), *preie* (*proie, praedam*), 12th century Picard, Parisian, etc., *estroit, proie*. But the earliest (10th century) specimens of the latter group of dialects have *éi*—*pleier* (*ployer, plicāre*) Eulalia, *mettreiet* (*mettrait, mittere, habēbat*) Jonah. Parisian *òi*, whether from *ei* or from Old French *òi, ói*, became in the 15th century *uè* (spellings with *oue* or *oe* are not uncommon—*mirouer* for *miroir, mīrātōrium*), and in the following, in certain words, *è*, now writted *ai*—*française, connaître*, from *françois* (*franceis, frañciscum*), *conoistre* (*conuistre, cognōscere*); where it did not undergo the latter change it is now *ua* or *wa*—*roi* (*rei, rēgem*), *croix* (*cruis, crūcem*). Before nasals and palatal *l*, *ei* (now = *è*) was kept—*veine* (*vēna*), *veille* (*vigilā*), and it everywhere survives unlabialized in Modern Norman—Guernsey *ételle* (*étoile, stēlla*) with *é*, *ser* (*soir, sērum*) with *è*. English shows generally *ei* (or *ai*) for original *ei*—*strait* (*estreit*), *prey* (*preie*); but in several words the later Parisian *oi*—*coy* (*coi, qviētum*), *loyal* (*loyal, lēgālem*). (16.) The splitting of the vowel-sound from accented Latin *ō* or *u* not in position, represented in Old French by *o* and *u* indifferently, into *u*, *o* (before nasals), and *eu* (the latter at first a diphthong, now = German *ö*), is unknown to Western French till the 12th century, and is not general in the east. The sound in 11th century Norman was much nearer to *u* (Modern French *ou*) than to *ó* (Modern French *ô*), as the words borrowed by English show *uu* (at first written *u*, afterwards *ou* or *ow*), never *óó*; but was probably not quite *u*, as Modern Norman shows the same splitting of the sound as Parisian. Examples are—Early Old French *espose* or *espuse* (*spōnsam*), *nom* or *num* (*nōmen*), *flor* or *flur* (*flōrem*); Modern French *épouse, nom, fleur;* Modern Guernsey *goule* (*gueule, gulam*), *nom, flleur*. Modern Picard also shows *u*, which is the regular sound before *r*—*flour;* but Modern Burgundian often keeps the original Old French *ó*—*vo* (*vous, vōs*). English shows almost always *uu*—*spouse, noun, flower* (Early Middle English *spuse, nun, flur*); but *nephew* with *éu* (*neveu, nepōtem*). (17.) The loss of the *u* (or *w*) of *qu* dates from the end of the 12th century—Old French *quart* (*qvartum*), *quitier* (*qviētāre*) with *qu* = *kw*, Modern French *quart, quitter* with *qu* = *k*. In Walloon the *w* is preserved—*couâr* (*quart*), *cuitter;* as is the case in English—*quart, quit*. The *w* of *gw* seems to have been lost rather earlier, English having simple *g*—*gage* (*gaye*, older *guage*, Teutonic *wadi*), *guise* (*guise*, Teutonic *wīsa*). (18.) The change of the diphthong *òu* to *uu* did not take place till after the 12th century, such words as *Anjou* (*Andegāvum*) assonating in the Roland on *fort* (*fortem*); and did not occur in Picardy, where *òu* became *au*—*caus* from older *còus, còls* (*cous, collōs*) coinciding with *caus* from *calz* (*chauds, calidōs*). English keeps *òu* distinct from *uu*—*vault* for *vaut* (Modern French *voûte, volvitam*), *soder* (*souder, solidāre*). (19.) The change of the diphthong *ié* to simple *é* is specially Anglo-Norman; in Old French of the Continent these sounds never rhyme, in that of England they constantly do, and English words show, with rare exceptions, the simple vowel—*fierce* (Old French *fiers, ferus*), *chief* (*chief, caput*), with *ie* = *ee*; but *pannier* (*panier, panārium*). At the beginning of the modern period, Parisian dropped the *i* of *ie* when preceded by *ch* or *j*—*chef, abréger* (Old French *abregier, abbreviāre*); elsewhere (except in verbs) *ie* is retained—*fier* (*ferum*), *pitié* (*pietātem*). Modern Guernsey retains *ie* after *ch*—*ap'rchier* (*approcher, adpropeāre*). (20.) Some of the Modern French changes have found their places under older ones; those remaining to be noticed are so recent that English examples of the older forms are superfluous. In the 16th century the diphthong *au* changed to *ao* and then to *ó*, its present sound, rendering, for instance, *maux* (Old French *mals, malōs*) identical with *mots* (*muttōs*). The *au* of *eau* underwent the same change, but its *e* was still sounded as *ə* (the *e* of *que*); in the next century this was dropped, making *veaux* (Old French *vëels, vitellōs*) identical with *vaux* (*vals, vallēs*). (21.) A more general and very important change began much earlier than the last; this is the loss of many final consonants. In Early Old French every consonant was pronounced as written; by degrees many of them disappeared when followed by another consonant, whether in the same word (in which case they were generally omitted in writing) or in a following one. This was the state of things in the 16th century; those final consonants which are usually silent in Modern French were still sounded, if before a vowel or at the end of a sentence or a line of poetry, but generally not elsewhere. Thus a large number of French words had two forms; the Old French *fort* appeared as *fòr* (though still written *fort*) before a consonant, *fòrt* elsewhere. At a later period final consonants were lost (with certain exceptions) when the word stood at the end of a sentence or of a line of poetry; but they are generally kept when followed by a word beginning with a vowel. (22.) A still later change is the general loss of the vowel (written *e*) of unaccented final syllables; this vowel preserved in the 16th century the sound *ə*, which it appears to have had in Early Old French. In later Anglo-Norman final *ə* (like every other sound) was treated exactly as the same sound in Middle English; that is, it came to be omitted or retained at pleasure, and in the 15th century disappeared. In Old French the loss of final ə is confined to a few words and forms; the 10th century *saveiet* (*sapēbat* for *sapiēbat*) became in the 11th *saveit*, and *ore* (*ad hōram*) *ele* (*illam*) develop the abbreviated *or*, *el*. In the 15th century ə before a vowel generally disappears—*mûr*, Old French *mëur* (*mātūrum*); and in the 16th, though still written, ə after an unaccented vowel, and in the syllable *ent* after a vowel, does the same—*vraiment*, Old French *vraiement* (*vērācā mente*); *avoient* two syllables, as now (*avaient*), in Old French three syllables (as *habēbant*). These phenomena occur much earlier in the anglicized French of England—14th century *aveynt* (Old French *aveient*). But the universal loss of final *e*, which has clipped a syllable from half the French vocabulary, did not take place till the 18th century, after the general loss of final consonants; *fort* and *forte*, distinguished at the end of a sentence or line in the 16th century as *fòrt* and *fòrtə*, remain distinguished, but as *fòr* and *fòrt*. The metre of poetry is still constructed on the obsolete pronunciation, which is even revived in singing; "dîtes, la jeune belle," actually four syllables (*dit, la zhœn bèl*), is considered as seven, fitted with music accordingly, and sung to fit the music (*ditə, la zhœnə bèlə*). (23.) In Old French, as in the other Romanic languages, the stress (force, accent) is on the syllable which was accented in Latin; compare the treatment of the accented and unaccented vowels in *latrō*, *amās*, giving *lére*, *áime*, and in *latrōnem*, *amātis*, giving *larón*, *améz*, the accented vowels being those which rhyme or assonate. At present, stress in French is much less marked than in English, German, or Italian, and is to a certain extent variable; which is partly the reason why most native French scholars find no difficulty in maintaining that the stress in living Modern French is on the same syllable as in Old French. The fact that stress in the French of to-day is independent of length (quantity) and pitch (tone) largely aids the confusion; for though the final and originally accented syllable (not counting the silent *e* as a syllable) is now generally pronounced with less force, it very often has a long vowel with raised pitch. In actual pronunciation the chief stress is usually on the first syllable (counting according to the sounds, not the spelling), but in many polysyllables it is on the last but one; thus in *caution* the accented (strong) syllable is *cau*, in *occasion* it is *ca*. Poetry is still written according to the original place of the stress; the rhyme-syllables of *larron*, *aimez* are still *ron* and *mez*, which when set to music receive an accented (strong) note, and are sung accordingly, though in speech the *la* and *ai* generally have the principal stress. In reading poetry, as distinguished from singing, the modern pronunciation is used, both as to the loss of the final ə and the displacement of the stress, the result being that the theoretical metre in which the poetry is written disappears. (24.) In certain cases accented vowels were lengthened in Old French, as before a lost *s*; this was indicated in the 16th century by a circumflex—*bête*, Old French *beste* (*bestiam*), *âme*, Old French *anme* (*anima*). The same occurred in the plural of many nouns, where a consonant was lost before the *s* of the flexion; thus singular *coc* with short vowel, plural *cos* with long. The plural *cos*, though spelt *coqs* instead of *cô* (=*kóó*), is still sometimes to be heard, but, like other similar ones, is generally refashioned after the singular, becoming *kòk*. In present French, except where a difference of quality has resulted, as in *côte* (Old French *coste*, *costam*) with ó and *cotte* (Old French *cote*) with ò, short and long vowels generally run together, quantity being now variable and uncertain; but at the beginning of this century the Early Modern distinctions appear to have been generally preserved.

(*d*) *Orthography*.—The history of French spellings is based on that of French sounds; as already stated, the former (apart from a few Latinisms in the earliest documents) for several centuries faithfully followed the latter. When the popular Latin of Gaul was first written, its sounds were represented by the letters of the Roman alphabet; but these were employed, not in the values they had in the time of Cæsar, but in those they had acquired in consequence of the phonetic changes that had meantime taken place. Thus, as the Latin sound *u* had become *ó* (close *o*) and *ū* had become *y* (French *u*, German *ü*), the letter *u* was used sometimes to denote the sound *ó*, sometimes the sound *y*; as Latin *k* (written *c*) had become *tsh* or *ts*, according to dialect, before *e* and *i*, *c* was used to represent those sounds as well as that of *k*. The chief features of early French orthography (apart from the specialties of individual MSS., especially the earliest) are therefore these:—*c* stood for *k* and *tsh* or *ts*; *d* for *d* and *dh* (soft *th*); *e* for *é*, *è*, and ə; *g* for *g* and *dzh*; *h* was often written in words of Latin origin where not sounded; *i* (*j*) stood for *i*, *y* consonant, and *dzh*; *o* for *ó* (Anglo-Norman *u*) and *ò*; *s* for *s* and *z*; *t* for *t* and *th*; *u* (*v*) for *ó* (Anglo-Norman *u*), *y*, and *v*; *y* (rare) for *i*; *z* for *dz* and *ts*. Some new sounds had also to be provided for: where *tsh* had to be distinguished from non-final *ts*, *ch*,—at first, as in Italian, denoting *k* before *i* and *e* (*chi*=*ki* from *qvī*)—was used for it; palatal *l* was represented by *ill*, which when final usually lost one *l*, and after *i* dropped its *i*; palatal *n* by *gn*, *ng*, or *ngn*, to which *i* was often prefixed; and the new letter *w*, originally *uu* (*vv*), and sometimes representing merely *uv* or *vu*, was employed for the consonant-sound still denoted by it in English. All combinations of vowel-letters represented diphthongs; thus *ai* denoted *a* followed by *i*, *ou* either *óu* or *òu*, *ui* either *ói* (Anglo-Norman *ui*) or *yi*, and similarly with the others—*ei*, *eu*, *oi*, *iu*, *ie*, *ue* (and *oe*), and the triphthong *ieu*. Silent letters, except initial *h* in Latin words, are very rare; though MSS. copied from older ones often retain letters whose sounds, though existing in the language of the author, had disappeared from that of the more modern scribe. The subsequent changes in orthography are due mainly to changes of sound, and find their explanation in the phonology. Thus, as Old French progresses, *s*, having become silent before voiced consonants, indicates only the length of the preceding vowel; *e* before nasals, from the change of *ẽ* (nasal *e*) to *ã* (nasal *a*), represents *ã*; *c*, from the change of *ts* to *s*, represents *s*; *qu* and *gu*, from the loss of the *w* of *kw* and *gw*, represent *k* and *g* (hard); *ai*, from the change of *ai* to *è*, represents *è*; *ou*, from the change of *òu* and *óu* to *u*, represents *u*; *ch* and *g*, from the change of *tsh* and *dzh* to *sh* and *zh*, represent *sh* and *zh*; *eu* and *ue*, originally representing diphthongs, represent *œ* (German *ö*); *z*, from the change of *ts* and *dz* to *s* and *z*, represents *s* and *z*. The new values of some of these letters were applied to words not originally spelt with them: Old French *k* before *i* and *e* was replaced by *qu* (*evesque*, *eveske*, Latin *episcopum*); Old French *u* and *o* for *ó*, after this sound had split into *eu* and *u*, were replaced in the latter case by *ou* (*rous*, for *ros* or *rus*, Latin *russum*); *s* was inserted to mark a long vowel (*pasle*, *pale*, Latin *pallidum*); *eu* replaced *ue* and *oe* (*neuf*, *nuef*, Latin *novum* and *novem*); *z* replaced *s* after *é* (*nez*, *nes*, *nāsum*). The use of *x* for final *s* is due to an orthographical mistake; the MS. contraction of *us* being something like *x* was at last confused with it (*iex* for *ieus*, *oculōs*), and, its meaning being forgotten, *u* was inserted before the *x* (*yeux*), which thus meant no more than *s*, and was used for it after other vowels (*voix* for *vois*, *vōcem*). As literature came to be extensively cultivated, traditional as distinct from phonetic spelling, began to be influential; and in the 14th century, the close of the Old French period, this influence, though not overpowering, was strong—stronger than in England at that time. About the same period there arose etymological as distinct from traditional spelling. This practice, the alteration of traditional spelling by the insertion or substitution of letters which occurred (or were supposed to occur) in the Latin (or supposed Latin) originals of the French words, became very prevalent in the three following centuries, when such forms as *debvoir* (*dēbēre*) for *devoir*, *faulx* (*falsum*) for *faus*, *autheur* (*auctōrem*, supposed to be *authōrem*) for *auteur*, *poids* (supposed to be from *pondus*, really from *pēnsum*) for *pois*, were the rule. But besides the etymological, there was a phonetic school of spelling (Ramus, for instance, writes, *èime*, *èimatẹs*—with *e*=*é*, *è*=*è*, and *ẹ*=ə—for *aimai*, *aimastes*), which, though unsuccessful on the whole, had some effect in correcting the excesses of the other, so that in the 17th century most of these inserted letters began to drop; of those which remain, some (*flegme* for *flemme* or *fleume*, Latin *phlegma*) have corrupted the pronunciation. Some important reforms—as the dropping of silent *s*, and its replacement by a circumflex over the vowel when this was long; the frequent distinction of close and open *e* by acute and grave accents; the restriction of *i* and *u* to the vowel sound of *j* and *v* to the consonant; and the introduction from Spain of the cedilla to distinguish *ç*=*s* from *c*=*k* before *a*, *u*, and *o*—are due to the 16th century. The replacement of *oi*, where it had assumed the value *è*, by *ai*, did not begin till the last century, and was not the rule till the present one. Indeed, since the 16th century the changes in French spelling have been very small, compared with the changes of the sounds; final consonants and final *e* (unaccented) are still written, though the sounds they represent have disappeared. French orthography is now quite as traditional and unphonetic as English, and gives an even falser notion than this of the actual state of the language it is supposed to represent. Many of the features of Old French orthography, early and late, are preserved in English orthography; to it we owe the use of *c* for *s* (Old English *c*=*k* only), of *j* (*i*) for *dzh*, of *v* (*u*) for *v* (in Old English written *f*), and probably of *ch* for *tsh*. The English *w* is purely French, the Old English letter being the runic ƿ. When French was introduced into England, *kw* had not lost its *w*, and the French *qu*, with that value, replaced the Old English cƿ (*queen* for cƿen). In Norman, Old French *ó* had become very like *u*, and in England went entirely into it; *o*, which was one of its French signs, thus came to be often used for *u* in English (*come* for *cume*). *U*, having often in Old French its Modern French value, was so used in England, and replaced the Old English *y* (*busy* for *bysi*, Middle English *brud* for *bryd*), and *y* was often used for *i* (*day* for *dai*). In the 13th century, when *ou* had come to represent *u* in France, it was borrowed by English, and used for the long sound of that vowel (*sour* for *sūr*); and *gu*, which had come to mean simply *g* (hard), was occasionally used to represent the sound *g* before *i* and *e* (*guess for gesse*). Some of the Early Modern etymological spellings were imitated in England; *fleum* and *autour* were replaced by *phlegm* and *authour*, the latter spelling having corrupted the pronunciation.

(*e*) *Inflexions.*—In the earliest Old French extant, the influence of analogy, especially in verbal forms, is very marked when these are compared with Latin (thus the present participles of all conjugations take *ant*, the ending of the first, Latin *antem*), and becomes stronger as the language progresses. Such isolated inflexional changes as *saveit* into *savoit*, which are cases of regular phonetic changes, are not noticed here.

i. *Verbs.*—(1.) In the oldest French texts the Latin pluperfect (with the sense of the perfect) occasionally occurs—*avret* (*habuerat*), *roveret* (*rogāverat*); it disappears early in the 12th century. (2.) The *u* of the ending of the 1st pers. plur. *mus* drops in Old French, except in the perfect, where its presence (as ə) is not yet satisfactorily explained—*amoms* (*amāmus*), but *amames* (*amāvimus*). In Picard the ending *mes* is extended to all tenses, giving *amomes*, etc. (3.) The replacement of the 2d plur. ending *eiz* (Latin *ētis*) by the *ez* (Latin *ātis*) of the first conjugation begins early in Norman; in the Roland both forms occur, *portereiz* (*portāre habētis*) assonating on *rei* (*roi*, *rēgem*), and the younger *porterez* on *citet* (*cité*, *cīvitātem*). In Eastern French, where *ez*, in accordance with phonetic laws, appears as *eiz*, *eiz* for the same reason becomes *oiz* and *ois*, and is found in the 13th century—*avois* and *avroiz* corresponding to *aveiz* (*habētis*) and *avreiz*, but *ameiz* to *amez* (*amātis*). (4.) In Eastern French the 1st plur., when preceded by *i*, has *e*, not *o*, before the nasal, while Western French has *u* (or *o*), as in the present; *posciomes* (*posseāmus*) in the Jonah homily makes it probable that the latter is the older form—Picard *aviemes*, Burgundian *avieus*, Norman *aviums* (*habēbāmus*). (5.) The subjunctive of the first conjugation has at first in the singular no final *e*, in accordance with the final vowel laws—*plur*, *plurs*, *plurt* (*plōrem*, *plōrēs*, *plōret*). The forms are gradually assimilated to those of the other conjugations, which, deriving from Latin *am*, *as*, *at*, have *e*, *es*, *e*(*t*); Modern French *pleure*, *pleures*, *pleure*, like *perde*, *perdes*, *perde* (*perdam*, *perdās*, *perdat*). (6.) In Old French the present subjunctive and the 1st sing. pres. ind. generally show the influence of the *i* or *e* of the Latin *iam*, *eam*, *iō*, *eō*—Old French *muire* or *moerge* (*moriat* for *moriātur*), *tiegne* or *tienge* (*teneat*), *muir* or *moerc* (*moriō* for *morior*), *tieng* or *tienc* (*teneō*). By degrees these forms are levelled under the other present forms—Modern French *meuer* and *meurs* following *meurt* (*morit* for *morītur*), *tienne* and *tiens* following *tient* (*tenet*). A few of the older forms remain—the vowel of *aie* (*habeam*) and *ai* (*habeō*) contrasting with that of *a* (*habet*). (7.) A levelling of which instances occur in the 11th century, but which is not yet complete, is that of the accented and unaccented stem-syllables of verbs. In Old French many verb-stems with shifting accent vary in accordance with phonetic laws—*parler* (*parabolāre*), *amer* (*amāre*) have in the present indicative *parol* (*parabolō*), *paroles* (*parabolās*), *parolet* (*parabolat*), *parlums* (*parabolāmus*), *parlez* (*parabolātis*), *parolent* (*parabolant*); *aim* (*amō*), *aimes* (*amās*), *aimet* (*amat*), *amums* (*amāmus*), *amez* (*amātis*), *aiment* (*amant*). In the first case the unaccented, in the second the accented form has prevailed—Modern French *parle*, *parler*; *aime*, *aimer*. In several verbs, as *tenir* (*tenēre*), the distinction is retained—*tiens*, *tiens*, *tient*, *tenons*, *tenez*, *tiennent*. (8.) In Old French, as stated above, *ié* instead of *é* from *a* occurs after a palatal (which, if a consonant, often split into *i* with a dental); the diphthong thus appears in several forms of many verbs of the 1st conjugation—*preier* (= *prei-ier*, *precāre*), *vengier* (*vindicāre*), *laissier* (*laxāre*), *aidier* (*adjūtāre*). At the close of the Old French period, those verbs in which the stem ends in a dental replace *ie* by the *e* of other verbs—Old French *laissier*, *aidier*, *laissiez* (*laxātis*), *aidiez* (*adjūtātis*); Modern French *laisser*, *aider*, *laissez*, *aidez*, by analogy of *aimer*, *aimez*. The older forms generally remain in Picard—*laissier*, *aidier*. (9.) The addition of *e* to the 1st sing. pres. ind. of all verbs of the first conjugation is rare before the 13th century, but is usual in the 15th; it is probably due to the analogy of the third person—Old French *chant* (*cantō*), *aim* (*amō*); Modern French *chante*, *aime*. (10.) In the 13th century *s* is occasionally added to the 1st pers. sing., except those ending in *e* (= ə) and *ai*, and to the 2d sing. of imperatives; at the close of the 16th century this becomes the rule, and extends to imperfects and conditionals in *oie* after the loss of their *e*. It appears to be due to the influence of the 2d pers. sing.—Old French *vend* (*vendō* and *vende*), *vendoie* (*vendēbam*), *parti* (*partīvī*), *ting* (*tenuī*); Modern French *vends*, *vendais*, *partis*, *tins*; and *donne* (*dōnā*) in certain cases becomes *donnes*. (11.) The 1st and 2d plur. of the pres. subj., which in Old French were generally similar to those of the indicative, gradually take an *i* before them, which is the rule after the 16th century—Old French *perdons* (*perdāmus*), *perdez* (*perdātis*); Modern French *perdions*, *perdiez*, apparently by analogy of the imp. ind. (12.) The loss in Late Old French of final *s*, *t*, etc., when preceding another consonant, caused many words to have in reality (though often concealed by orthography) double forms of inflexion—one without termination, the other with. Thus in the 16th century the 2d sing. pres. ind. *dors* (*dormīs*) and the 3d *dort* (*dormit*) were distinguished as *dòrz* and *dòrt* when before a vowel, as *dòrs* and *dòrt* at the end of a sentence or line of poetry, but ran together as *dòr* when followed by a consonant. Still later, the loss of the final consonant when not followed by a vowel further reduced the cases in which the forms were distinguished, so that the actual French conjugation is considerably simpler than is shown by the customary spellings, except when, in consequence of an immediately following vowel, the old terminations occasionally appear. Even here the antiquity is to a considerable extent artificial or delusive, some of the insertions being due to analogy, and the popular language often omitting the traditional consonant or inserting a different one. (13.) The subsequent general loss of *e* = ə in unaccented final syllables has still further reduced the inflexions, but not the distinctive forms—*perd* (*perdit*) and *perde* (*perdat*) being generally distinguished as *pèr* and *pèrd*, and before a vowel as *pèrt* and *pèrd*.

ii. *Substantives.*—(1.) In Early Old French (as in Provençal) there are two main declensions, the masculine and the feminine; with a few exceptions the former distinguishes nominative and accusative in both numbers, the latter in neither. The nom. and acc. sing. and acc. plur. mas. correspond to those of the Latin 2d or 3d declension, the nom. plur. to that of the 2d declension. The sing. fem. corresponds to the nom. and acc. of the Latin 1st declension, or to the acc. of the 3d; the plur. fem. to the acc. of the 1st declension, or to the nom. and acc. of the 3d. Thus masc. *tors* (*taurus*), *lere* (*latrō*); *tor* (*taurum*), *laron* (*latrōnem*); *tor* (*taurī*), *laron* (*latrōnī* for *-nēs*); *tors* (*taurōs*), *larons* (*latrōnēs*); but fem. only *ele* (*āla* and *ālam*), *flor* (*flōrem*); *eles* (*ālās*), *flores* (*flōrēs* nom. and acc.). At the end of the 11th century feminines not ending in *e* = ə take, by analogy of the masculines, *s* in the nom. sing., thus distinguishing nom. *flors* from acc. *flor*. A century later, masculines without *s* in the nom. sing. takes this consonant by analogy of the other masculines, giving *leres* as nom. similar to *tores*. In Anglo-Norman the accusative forms very early begin to replace the nominative, and soon supersede them, the language following the tendency of contemporaneous English. In Continental French the declension-system was preserved much longer, and did not break up till the 14th century, though acc. forms are occasionally substituted for nom. (rarely nom. for acc.) before that date. In the 15th century the modern system of one case is fully established; the form kept is almost always the accusative (sing. without *s*, plural with *s*), but in a few words, such as *fils* (*fīlius*), *sœur* (*soror*), the nom. survives in the sing., and occasionally both forms exist, in different senses—*sire* (*senior*) and *seigneur* (*seniōrem*), *on* (*homō*) and *homme* (*hominem*). (2.) Latin neuters are generally masculine in Old French, and inflected according to their analogy, as *ciels* (*caelus* for *caelum* nom.) *ciel* (*caelum* acc.), *ciel* (*caelī* for *caela* nom.), *ciels* (*caelōs* for *caela* acc.); but early cases of nom. sing. without *s* occur, which, if not due to substitution of acc. for nom., are the older forms (*ciel* = *caelum* nominative). Many neuters lose their singular form and treat the plural as a feminine singular, as in the related languages—*merveille* (*mīrābilia*), *feule* (*folia*). But in a few words the neuter plural termination is used, as in Italian, in its primitive sense—*carre* (*carra*, which exists as well as *carrī*), *deie*, later *doie* (*digita* for *digitī*); Modern French *chars*, *doigts*. This form became extinct after the 13th century—*paire* (Latin *paria*), in Old French both fem. sing. and neut. plur. (as Italian *paja* is fem. plur.), being now only the former. (3.) In Old French the inflexional *s* often causes phonetic changes in the stem; thus palatal *l* before *s* takes *t* after it, and becomes dental *l*, which afterwards changes to *u* or drops—*fil* (*fīlium* and *fīliī*) with palatal *l*, *filz* (*fīlius* and *fīliōs*), afterwards *fiz*, with *z* = *ts* (preserved in English *Fitz*), and then *fis*, as now (spelt *fils*). Many consonants before *s*, as the *t* of *fiz*, disappear, and *l* is vocalized—*vif* (*vīvum*), *mal* (*malum*), nominative sing. and acc. plur. *vis*, *maus* (earlier *mals*). These forms of the plural are retained in the 16th century, though often etymologically spelt with the consonant of the singular, as in *vifs*, pronounced *vis;* but in Late Modern French many of them disappear, *vifs*, with *f* sounded as in the singular, being the plural of *vif*, *bals* (formerly *baux*) that of *bal*. In many words, as *chant* (*cantūs*) and *champs* (*campōs*) with silent *t* and *p* (Old French *chans* in both cases), *maux* (Old French *mals*, sing. *mal*), *yeux* (*oculōs*, Old French *oelz*, sing. *oeil*) the old change in the stem is kept. Sometimes, as in *cieux* (*caelōs*) and *ciels*, the old traditional and the modern analogical forms coexist, with different meanings. (4.) The modern loss of final *s* (except when kept as *z* before a vowel) has seriously modified the French declension, the singulars *fort* (*fòr*) and *forte* (*fòrt*) being generally undistinguishable from their plurals *forts* and *fortes*. The subsequent loss of ə in finals has not affected the relation between sing. and plur. forms; but with the frequent recoining of the plural forms on the singular present Modern French has very often no distinction between sing. and plur., except before a vowel. Such plurals as *maux* have always been distinct from their singular *mal;* in those whose singular ends in *s* there never was any distinction, Old French *laz* (now spelt *lacs*) corresponding to *laqveus*, *laqveum*, *laqveī*, and *laqveōs*.

iii. *Adjectives.*—(1) The terminations of the cases and numbers of adjectives are the same as those of substantives, and are treated in the preceding paragraph. The feminine generally takes no *e* if the masc. has none, and if there is no distinction in Latin—fem. sing. *fort* (*fortem*), *grant* (*grandem*), fem. plur. *forz* (*fortēs*), *granz* (*grandēs*), like the acc. masc. Certain adjectives, which in Provençal take an *a* not existing in Latin, take the corresponding *e* in Old French—fem. *dulce* (*douce*, *dulcium* for *dulcem*, Provençal *dolza*), masc. *dulz* (*dulcem*). In the 11th century some other feminines, originally without *e*, begin in Norman to take this termination—*grande* (in a feminine assonance in the Alexis), plur. *grandes;* but other dialects generally preserve the original form till the 14th century. In the 16th century the *e* is general in the feminine, and is now universal, except in a few expressions—*grand' mère* (with erroneous apostrophe, *grandem mātrem*), *lettres royaux* (*līterās rēgālēs*), and most adverbs from adjectives in *-ant*, *-ent*—*couramment* (*currante* for *-ente mente*), *sciemment* (*sciente mente*). (2.) Several adjectives have in Modern French replaced the masc. by the feminine—Old French masc. *roit* (*rigidum*), fem. *roide* (*rigidam*); Modern French *roide* for both genders. (3.) In Old French several Latin simple comparatives are preserved—*maiur* (*majōrem*), nom. *maire* (*major*); *graignur* (*grandiōrem*), nom. *graindre* (*grandior*); only a few of these now survive—*pire* (*pejor*), *meilleur* (*meliōrem*), with their adverbial neuters *pis* (*pejus*), *mieux* (*melius*). The few simple superlatives found in Old French, as *merme* (*minimum*), *proisme* (*proximum*), *haltisme* (*altissimum*), are now extinct. (4.) The modern loss of many final consonants when not before vowels, and the subsequent loss of final ə, have greatly affected the distinction between the masc. and fem. of adjectives—*fort* and *forte* are still distinguished as *fòr* and *fòrt*, but *amer* (*amārum*) and *amère* (*amāram*), with their plurals *amers* and *amères*, have run together.

(*f*) *Derivation.*—Most of the Old French prefixes and suffixes are descendants of Latin ones, but a few are Celtic (*et*=*ittum*) or Teutonic (*ard*=*hard*), and some are later borrowings from Latin (*arie*, afterwards *aire*, from *ārium*). In Modern French many old affixes are hardly used for forming new words; the inherited *ier* (*ārium*) is yielding to the borrowed *aire*, the popular *contre* (*contrā*) to the learned *anti* (Greek), and the native *ée* (*ātam*) to the Italian *ade*. The suffixes of many words have been assimilated to more common ones; thus *sengler* (*siñgulārem*) is now *sanglier*.

(*g*) *Syntax.*—Old French syntax, gradually changing from the 10th to the 14th century, has a character of its own, distinct from that of Modern French; though when compared with Latin syntax it appears decidedly modern.

(1.) The general formal distinction between nominative and accusative is the chief feature which causes French syntax to resemble that of Latin and differ from that of the modern language; and as the distinction had to be replaced by a comparatively fixed word-order, a serious loss of freedom ensued. If the forms are modernized while the word-order is kept, the Old French *l'archevesque ne puet flechir li reis Henris* (Latin *archiepiscopum nōn potest flectere rēx Henrīcus*) assumes a totally different meaning—*l'archevêque ne puet fléchir le roi Henri*. (2.) The replacement of the nominative form of nouns by the accusative is itself a syntactical feature, though treated above under inflection. A more modern instance is exhibited by the personal pronouns, which, when not immediately the subject of a verb, occasionally take even in Old French, and regularly in the 16th century, the accusative form; the Old French *je qui sui* (*ego qvī sum*) becomes *moi qui suis*, though the older usage survives in the legal phrase *je, soussigné*. . . . (3.) The definite article is now required in many cases where Old French dispenses with it—*jo cunquis Engleterre*, *suffrir mort* (as Modern French *avoir faim*); Modern French *l'Angleterre*, *la mort*. (4.) Old French had distinct pronouns for "this" and "that"—*cest* (*ecce istum*) and *cel* (*ecce illum*), with their cases. Both exist in the 16th century, but the present language employs *cet* as adjective, *cel* as substantive, in both meanings, marking the old distinction by affixing the adverbs *ci* and *là*—*cet homme-ci*, *cet homme-là; celui-ci*, *celui-là*. (5.) In Old French, the verbal terminations being clear, the subject pronoun is usually not expressed—*si ferai* (*sīc facere habeō*), *est durs* (*dūrus est*), *que feras* (*qvid facere habēs*)? In the 16th century the use of the pronoun is general, and is now universal, except in one or two impersonal phrases, as *n'importe*, *peu s'en faut*. (6.) The present participle in Old French in its uninflected form coincided with the gerund (*amant*=*amantem* and *amandō*), and in the modern language has been replaced by the latter, except where it has become adjectival; the Old French *complaingnans leur dolours* (Latin *plañgentēs*) is now *plaignant leurs douleurs* (Latin *plañgendō*). The now extinct use of *estre* with the participle present for the simple verb is not uncommon in Old French down to the 16th century —*sont disanz* (*sunt dīcentēs*) = Modern French *ils disent* (as English *they are saying*). (7.) In present Modern French the preterite participle when used with *avoir* to form verb-tenses is invariable, except when the object precedes (an exception now unknown to the conversational language)—*j'ai écrit les lettres*, *les lettres que j'ai écrites*. In Old French down to the 16th century, formal concord was more common (though by no means necessary), partly because the object preceded the participle much oftener than now—*ad la culur muée* (*habet colōrem mūtātam*), *ad faite sa venjance*, *les turs ad rendues*. (8.) The sentences just quoted will serve as specimens of the freedom of Old French word-order,—the object standing either before verb and participle, between them, or after both. The predicative adjective can stand before or after the verb—*halt sunt li pui* (Latin *podia*), *e tenebrus e grant*. (9.) In Old French *ne* (Early Old French *nen*, Latin *nōn*) suffices for the negation without *pas* (*passum*), *point* (*puñctum*) or *mie* (*mīcam*, now obsolete), though these are frequently used—*jo ne sui tis sire* (*je ne suis pas ton seigneur*), *autre feme nen ara* (*il n'aura pas autre femme*). In principal sentences Modern French uses *ne* by itself only in certain cases—*je ne puis marcher*, *je n'ai rien*. The slight weight as a negation usually attached to *ne* has caused several originally positive words to take a negative meaning,—*rien* (Latin *rem*) now meaning "nothing" as well as "something." (10.) In Old French interrogation was expressed with substantives as with pronouns by putting them after the verb—*est Saul entre les prophetes?* In Modern French the pronominal inversion (the substantive being prefixed) or a verbal periphrasis must be used—*Saul est-il*, or *est-ce que Saul est*.

(*h*) *Summary.*—Looking at the internal history of the French language as a whole, there is no such strongly marked division as exists between Old and Middle English, or even between Middle and Modern English. Some of the most important changes are quite modern, and are concealed by the traditional orthography; but, even making allowance for this, the difference between French of the 11th century and that of the 19th is less than that between English of the same dates. The most important change in itself and for its effects is probably that which is usually made the division between Old and Modern French, the loss of the formal distinction between nominative and accusative; next to this are perhaps the gradual loss of many final consonants, the still recent loss of the vowel of unaccented final syllables, and the extension of analogy in conjugation and declension. In its construction Old French is distinguished by a freedom strongly contrasting with the strictness of the modern language, and bears, as might be expected, a much stronger resemblance than the latter to the other Romanic dialects. In many features, indeed, both positive and negative, Modern French forms a class by itself, distinct in character from the other modern representatives of Latin.

IV. *Bibliography.*—The few works which treat of French philology as a whole are now in many respects antiquated, and the important discoveries of the last few years, which have revolutionized our ideas of Old French phonology and dialectology, are scattered in various editions, periodicals, and separate treatises. For many things Diez's *Grammatik der Romanischen Sprachen* (4th edition—a reprint of the 3d—Bonn, 1876–77; a French translation, Paris, 1872–75, is to be followed by a supplementary volume by G. Paris) is still very valuable; Burguy's *Grammaire de la Langue d'oïl* (2d edition—a reprint of the 1st—Berlin, 1869–70) is useful only as a collection of examples. G. Paris's edition of *La Vie de S. Alexis* (Paris, 1872) was the pioneer of, and retains an important place among, the recent original works on Old French; Darmesteter and Hatzfeld's *Le Seizième Siècle* (Paris, 1878) contains the first good account of Early Modern French. The leading periodicals now in existence are the *Romania* (Paris), founded (in 1872) and edited by P. Meyer and G. Paris; and the *Zeitschrift für Romanische Philologie* (Halle), founded (in 1877) and edited by G. Gröber. To these reference should be made for information as to the very numerous articles, treatises, and editions, by the many and often distinguished scholars who, especially in France and Germany, now prosecute the scientific study of the language. It may be well to mention that, Old French phonology especially being complicated, and as yet incompletely investigated, these publications, the views in which are of various degrees of value, require not mere acquiescent reading, but critical study. (H. N.)

PART IV.—FRENCH LITERATURE.

Origins.—The history of French literature in the proper sense of the term can hardly be said to extend further back than the 11th century. The actual manuscripts which we possess are seldom of older date than the century subsequent to this. But there is no doubt that by the end at least of the 11th century the French language, as a completely organized medium of literary expression, was in full, varied, and constant use. For many centuries previous to this literature had been composed in France, or by natives of that country, using the term France in its full modern acceptation; but until the 9th century, if not later, the written language of France, as far as we know, was Latin; and despite the practice of not a few literary historians, it does not seem reasonable to notice Latin writings in a history of French literature. Such a history properly busies itself only with the monuments of the French language from the time when the so-called Lingua Romana Rustica assumed a sufficiently independent form to deserve to be called a new language. This time it is indeed impossible exactly to determine, and the period at which literary compositions, as distinguished from mere conversation, began to employ the new tongue is entirely unknown, although much ingenuity has been spent on the effort approximately to discover it. The beginnings of literary composition come most naturally from the priest and the poet. As early as the 7th century the Lingua Romana, as distinguished from Latin and from Teutonic dialects, is mentioned, and this Lingua Romana would be of necessity used for purposes of clerical admonition, especially in the country districts, though we need not suppose that such addresses had a very literary character. On the other hand, the mention at early dates of certain *cantilenæ* or songs composed in the vulgar language has served for basis to a superstructure of much ingenious argument, not merely in reference to the chronological question, but also with regard to the highly interesting problem of the origin of the chansons de gestes, the earliest and one of the greatest literary developments of northern French. It is sufficient in this article, where speculation would be out of place, to mention that only two such cantilenæ have been traced, and that neither is French. One of the 9th century, the "Lay of Saucourt," is in a Teutonic dialect; the other, the "Song of St. Faron," is of the 7th century, but exists only in Latin prose, the construction and style of which present traces of translation from a poetical and vernacular original.

Early monuments.

As far as facts go, the most ancient monuments of the written French language consist of a few documents of very various character, ranging in date from the 9th to the 11th century. The oldest gives us the oaths interchanged at Strasburg in 842 between Charles the Bald and Louis the German. The next probably in date and the first in literary merit is a short song celebrating the martyrdom of St. Eulalia. The discussion indeed of these short and fragmentary pieces is of more philological than literary interest, and belongs rather to the head of French language. They are, however, evidence of the progress which, continuing for at least four centuries, built up a literary instrument out of the decomposed and reconstructed Latin of the Roman conquerors, blended with a certain limited amount of contributions from the Celtic and Iberian dialects of the original inhabitants, the Teutonic speech of the Franks, and the Oriental tongue of the Moors who pressed upwards from Spain. All these foreign elements, however, bear a very small proportion to the element of Latin; and as Latin furnished the greater part of the vocabulary and the grammar, so did it also furnish the principal models and helps to literary composition. The earliest French versification is evidently inherited from that of the Latin hymns of the church, and for a certain time Latin originals were followed in the choice of literary forms. But the original impulses of the new nation were too strong to content themselves with mere imitation, and it soon began to create afresh. By the 11th century it is tolerably certain that dramatic attempts were already being made, that lyric poetry was largely cultivated, that laws, charters, and such like documents were written in the vernacular, and that commentators and translators busied themselves with religious subjects and texts. But the most important development of the 11th century, and the one of which we are most certain, is that of which we have evidence remaining in the famous *Chanson de Roland*, so long hidden except in obscure allusions, and discovered in a manuscript at Oxford some forty years ago. This poem represents the first and greatest development of French literature, the chansons de gestes. The origin of these poems has been hotly debated, and it is only recently that the importance which they really possess has been accorded to them,—a fact the less remarkable in that, until the last half century, the hundred epics of ancient France were unknown, or known only through late and disfigured prose versions. There has long been a vague idea that Provençal literature preceded the literature which is properly called French, and this idea was helped by the natural prepossessions of Fauriel and Raynouard, the earliest authorities on old French who obtained a wide hearing. The attribution of the chansons de gestes to a Provençal origin necessitates indeed suppositions of the most extravagant character. We possess in round numbers a hundred of these chansons. Three only of them are in Provençal. Two of these, *Ferabras* and *Betonnet d'Hanstonne*, are obviously adaptations of French originals. The third, *Girartz de Rossilho* (Gerard de Roussillon), is undoubtedly Provençal, and is a work of great merit and originality, but its dialect is strongly tinged with the characteristics of the Langue d'Oil, and its author seems to have been a native of the debatable land between the two districts. To suppose under these circumstances that the Provençal originals of the hundred others, or even such Provençal originals as served for models to the trouvères, were completely and by a process of laborious selection destroyed in the Albigensian crusade, seems one of the most gratuitous hypotheses ever put forward, and would hardly require notice here were it not that it has found some credence in England. It is sufficient to say that not only is the chanson de geste the unquestionable property of northern France, but that it is in all probability older than the oldest troubadour whose works we possess. Nor is there much more authority for another widely entertained supposition that the early French poets merely versified with amplifications the stories of chroniclers. On the contrary, chroniclers like Philippe Mouskés and Alberic des Trois Fontaines draw largely from the chansons, and the question of priority between *Roland* and the pseudo-Turpin, though a hard one to determine, seems to resolve itself in favor of the former.

Epic poetry.

Chansons de Gestes.—Early French narrative poetry was divided by one of its own writers under three heads,—poems relating to French history, poems relating to ancient history, and poems of the Arthurian cycle. To the first only is the term chansons de gestes in strictness applicable. The definition of it goes partly by form and partly by matter. A chanson de geste must be written in verses either of ten or twelve syllables, the former being the earlier. These verses have a regular cæsura, which, like the end of a line, carries with it the license of a mute *e*. The lines are arranged, not in couplets or in stanzas of equal length, but in *laisses* or *tirades*, consisting of any number of lines from half a dozen to some hundreds. The lines are, in the earlier examples, assonanced,—that is to say, the vowel sound of the last syllables is identical, but the consonants need not agree. Thus, for instance, the final words of a tirade of *Amis et Amiles* (l. 199–206) are *erbe, nouvelle, selles, nouvelles, traversent, arrestent, guerre, cortége.* Sometimes the tirade is completed by a shorter line, and the later chansons are regularly rhymed. As to the subject, a chanson de geste must be concerned with some event which is, or is supposed to be, historical and French. The tendency of the trouvères was constantly to affiliate their heroes on a particular *geste* or family. The three chief *gestes* are those of Charlemagne himself, of Doon de Mayence, and of Garin de Monglane; but there are not a few chansons, notably those concerning the Lorrainers, and the remarkable series sometimes called the Chevalier au Cygne, and dealing with the crusades, which lie outside these groups. By this joint definition of form and subject the chansons de gestes are separated from the romances of antiquity, from the romances of the Round

Chansons de gestes.

Table, which are written in octosyllabic couplets, and from the Romans d'aventures or later fictitious tales, some of which, such as *Brun de la Montaigne*, are written in pure chanson form.

Volume and changes of early epics.

Not the least remarkable point about the chansons de gestes is their vast extent. Their number, according to the strictest definition, exceeds 100, and the length of each chanson varies from 1000 lines, or thereabouts, to 20,000 or even 30,000. The entire mass, including, it may be supposed, the various versions and extensions of each chanson, is said to amount to between two and three million lines; and when some twenty years ago the publication of the Carlovingian cycle was projected, it was estimated, taking the earliest versions alone, at over 300,000. The successive developments of the chansons de gestes may be illustrated by the fortunes of *Huon de Bordeaux*, one of the most lively, varied, and romantic of the older epics, and one which is interesting from the use made of it by Shakespeare, Wieland, and Weber. In the oldest form now extant, though even this is probably not the original, *Huon* consists of over 10,000 lines. A subsequent version contains 4000 more; and lastly, in the 14th century, a later poet has amplified the legend to the extent of 30,000 lines. When this point had been reached, *Huon* began to be turned into prose, and with many of his fellows was published and republished during the 15th and subsequent centuries, and retains, in the form of a roughly printed chap-book, the favor of the country districts of France to the present day. It is not, however, in the later versions that the special characteristics of the chansons de gestes are to be looked for. Of those which we possess, one and one only, the *Chanson de Roland*, belongs in its present form to the 11th century. Their date of production extends, speaking roughly, from the 11th to the 14th century, their palmy days from the 11th to the 12th. After this latter period the Arthurian romances, with more complex attractions, became their rivals, and induced their authors to make great changes in their style and subject. But for a time they reigned supreme, and no better instance of their popularity can be given than the fact that manuscripts of them exist, not merely in every French dialect, but in many cases in a strange macaronic jargon of mingled French and Italian. Two classes of persons were concerned in them. There was the trouvère who composed them, and the jongleur who carried them about in manuscript or in his memory from castle to castle and sang them, intermixing frequent appeals to his auditory for silence, declarations of the novelty and the strict copyright character of the chanson, revilings of rival minstrels, and frequently requests for money in plain words. Not a few of the manuscripts which we now possess appear to have been actually used by the jongleur. But the names of the authors, the trouvères who actually composed them, are in very few cases known, those of copyists, continuators, and mere possessors of manuscripts having been often mistaken for them.

The moral and poetical peculiarities of the older and more authentic of these chansons are strongly marked, though perhaps not quite so strongly as some of their encomiasts have contended, and as may appear to a reader of the most famous of them, the *Chanson de Roland*, alone. In that poem, indeed, war and religion are the sole motives employed, and its motto might be two lines from another of the finest chansons (*Aliscans*, 161–2):—

> "Dist à Bertran: 'N'avons mais nul losir
> Tant ke vivons alons paiens ferir.'"

In Roland there is no love-making whatever, and the hero's betrothed "la belle Aude" appears only in a casual gibe of her brother Oliver, and in the incident of her sudden death at the news of Roland's fall. M. Léon Gautier and others have drawn the conclusion that this stern and masculine character was a feature of all the older chansons, and that imitation of the Arthurian romance is the cause of its disappearance. This seems rather a hasty inference. In *Amis et Amile*, admittedly a poem of old date, the parts of Bellicent and Lubias are prominent, and the former is demonstrative enough. In *Aliscans* the part of the Countess Guibourc is both prominent and heroic, and is seconded by that of Queen Blancheflor and her daughter Aelis. We might also mention Oriabel in *Jourdans de Blaivies* and others. But it may be admitted that the sex which fights and counsels plays the principal part, that love adventures are not introduced at any great length, and that the lady usually spares her knight the trouble and possible indignities of wooing. The characters of a chanson of the older style are somewhat uniform. There is the hero who is unjustly suspected of guilt or sore beset by Saracens, the heroine who falls in love with him, the traitor who accuses him or delays help, who is almost always of the lineage of Ganelon, and whose ways form a very curious study. There are friendly paladins and subordinate traitors; there is Charlemagne (who bears throughout the marks of the epic king common to Arthur and Agamemnon, but is not in the earlier chanson the incapable and venal dotard which he becomes in the later), and with Charlemagne generally the duke Naimes of Bavaria, the one figure who is invariably wise, brave, loyal, and generous. In a few chansons there is to be added to these a very interesting class of personages who, though of low birth or condition, yet rescue the high-born knights from their enemies. Such are Rainoart in *Aliscans*, Gautier in *Gaydon*, Robastre in *Gaufrey*, Varocher in *Macaire*. These subjects, uniform rather than monotonous, are handled with great uniformity if not monotony of style. There are constant repetitions, and it sometimes seems, and may sometimes be the case, that the text is a mere cento of different and repeated versions. But the verse is generally harmonious and often stately. The recurrent assonances of the endless tirade soon impress the ear with a grateful music, and occasionally, and far more frequently than might be thought, passages of high poetry, such as the magnificent *Granz doel por la mort de Rollant*, appear to diversify the course of the story. The most remarkable of the chansons are *Roland*, *Aliscans*, *Gerard de Roussillon*, *Amis et Amile*, *Raoul de Cambrai*, *Garin le Loherain* and its sequel, *Les quatre Fils Aymon*, *Les Saisnes* (recounting the war of Charlemagne with Witekind), and lastly, *Le Chevalier au Cygne*, which is not a single poem but a series, dealing with the earlier crusades. It is remarkable that one chanson and one only, *Floovant*, deals with Merovingian times. But the chronology, geography, and historic facts of nearly all are, it is hardly necessary to say, mainly arbitrary.

Arthurian Romances.—The second class of early French epics consists of the Arthurian cycle, the earliest compositions of which are at least a century junior to the earliest chanson de geste, but which soon succeeded the chansons in popular favor, and obtained a vogue both wider and far more enduring. It is not easy to conceive a greater contrast in form, style, subject, and sentiment than is presented by the two classes. In both the religious sentiment is prominent, but the religion of the chansons is of the simplest, not to say of the most savage character. To pray to God and to kill his enemies constitutes the whole duty of man. In the romances the mystical element becomes on the contrary prominent, and furnishes in the Holy Grail one of the most important features. In the Carlovingian knight the courtesy and clemency which we have learnt to associate with chivalry are almost entirely absent. The *gentix bèr* contradicts, jeers at, and execrates his sovereign and his fellows with the utmost freedom. He thinks nothing of striking his *cortoise moullier* so that the blood runs down her *cler vis*. If a servant or even an equal offends him, he will throw the offender into the fire, knock his brains out, or set his whiskers ablaze. The Arthurian knight is far more of the modern model in these respects. But his chief difference from his predecessor is undoubtedly in his amorous devotion to his beloved, who, if not morally superior to Bellicent, Floripas, Esclairmonde, and the other Carlovingian heroines, is somewhat less forward. Even in minute details the difference is strongly marked. The romances are in octosyllabic couplets or in prose, and their language is different from that of the chansons, and contains much fewer of the usual epic repetitions and stock phrases. A voluminous controversy has been held respecting the origin of these differences, and of the story or stories which were destined to receive such remarkable attention. It is sufficient to say here that the attempted production of early Breton originals is open to the gravest suspicion, and that Geoffrey of Monmouth's account of his Armorican text-book meets with little credence. M. Paulin Paris seems to have clearly proved that nothing older than Nennius can be produced, and that this and nothing else was Geoffrey's authority, so far as he had any. What we are at present concerned with, however, is a body of verse and prose composed in the latter part of the 12th century and later. The

Manners in early epics.

earliest romances bear the names of Walter Map and Robert de Borron, which are undoubtedly authentic. Later, we have the names of Helie de Borron, Luce de Gast, etc., which are probably fictitious. Walter Map is responsible for the *Saint Graal* and the *Quête du Saint Graal*, Robert de Borron for *Joseph d'Arimathie* and *Merlin*. *Artus* and part at least of *Lancelot du Lac* (the whole of which has been attributed to Walter Map) appear to be due to unknown authors. *Tristan* came later and has a stronger mixture of Celtic tradition. Latest of all came the great Arthurian miscellany of *Giron le Courtois*. Most of these works, though not all, are in prose. At the same time as Walter Map, or a little later, Chrétien de Troyes threw the legends of the Round Table into octosyllabic verse of a singularly spirited and picturesque character. The chief poems attributed to him are the *Chevalier au Lyon* (Sir Ewain of Wales), the *Chevalier à la Charette* (one of the episodes of *Lancelot*), *Eric et Enide*, *Tristan*, and *Percivale*. These poems, independently of their merit, which is great, had an extensive literary influence. They were translated by the German minnesingers, Wolfram von Eschenbach, Gottfried of Strasburg, and others. With the romances already referred to, which were mostly written in England and at the English court, Chrétien's poems complete the early forms of the Arthurian story, and supply the matter of it as it is best known to English readers in Malory's book. Nor does that book, though far later than the original forms, convey a very false impression of the characteristics of the older romances. Indeed, the Arthurian knight, his character and adventures, are so much better known than the heroes of the Carlovingian chanson that there is less need to dwell upon them. They had, however, as has been already pointed out, great influence upon their rivals, and their comparative fertility of invention, the much larger number of their *dramatis personæ*, and the greater variety of interests to which they appealed, sufficiently explain their increased popularity. The ordinary attractions of poetry are also more largely present in them than in the chansons; there is more description, more life, and less of the mere chronicle. They have been accused of relaxing morality, and there is perhaps some truth in the charge. But the change is after all one rather of manners than of morals, and what is lost in simplicity is gained in refinement. *Doon de Mayence* is a late chanson, and *Lancelot du Lac* is an early romance. But the two beautiful scenes in the former between Doon and Nicolette, in the latter between Lancelot, Galahault, Guinevere, and the Lady of Malehaut, may be compared as instances of the attitude of the two classes of poets towards the same subject.

Romances of Antiquity.—There is yet a third class of early narrative poems, differing from the two former in subject, but agreeing sometimes with one sometimes with the other in form. These are the classical romances which are not much later than those of Charlemagne and Arthur. The chief subjects with which their authors busied themselves were the conquests of Alexander and the siege of Troy, though other classical stories come in. The most remarkable of all is the romance of *Alixandre* by Lambert the Short and Alexander of Bernay. It has been said that the excellence of the twelve-syllabled verse used in this romance was the origin of the term alexandrine. The Trojan romances, on the other hand, are chiefly in octosyllabic verse, and the principal poem which treats of them is the *Roman de Troie* of Benoit de Ste. More. Both this poem and *Alixandre* are attributed to the last quarter of the 12th century. The authorities consulted for these poems, were, as may be supposed, none of the best. Dares Phrygius, Dictys Cretensis, the pseudo-Callisthenes supplied most of them. But the inexhaustible invention of the trouvères themselves was the chief authority consulted. The adventures of Medea, the wanderings of Alexander and the Trojan horse, were quite sufficient to spur on to exertion the minds which had been accustomed to spin a chanson of some 10,000 lines out of a casual allusion in some preceding poem. It is needless to say that anachronisms did not disturb them. From first to last the writers of the chansons had not in the least troubled themselves with attention to any such matters. Charlemagne himself had his life and exploits accommodated to the need of every poet who treats of him, and the same is the case with the heroes of antiquity. Indeed, Alexander is made in many respects a prototype of Charlemagne. He is regularly knighted, he has twelve peers, he holds tournaments, he has relations with Arthur, and comes in contact with fairies, he takes flights in the air, and so forth. There is perhaps more avowed imagination in these classical stories than in either of the other divisions of French epic poetry. Some of their authors even confess to the practice of fiction, while the trouvères of the chansons invariably assert the historical character of their facts and personages, and the authors of the Arthurian romances at least start from facts vouched for partly by national tradition partly by the authority of religion and the church. The classical romances, however, are important in two different ways. In the first place, they connect the early literature of France, however loosely, and with links of however dubious authenticity, with the great history and literature of the past. They show a certain amount of scholarship in their authors, and in their hearers they show a capacity of taking an interest in subjects which are not merely those directly connected with the village or the tribe. The chansons de gestes had shown the creative power and independent character of French literature. There is, at least about the earlier ones, nothing borrowed, traditional, or scholarly. They smack of the soil, and they rank France among the very few countries which, in this matter of indigenous growth, have yielded more than folk-songs and fireside tales. The Arthurian romances, less independent in origin, exhibit a wider range of view, a greater knowledge of human nature, and a more extensive command of the sources of poetical and romantic interest. The classical epics superadd the only ingredient necessary to an accomplished literature,—that is to say, the knowledge of what has been done by other peoples and other literatures already, and the readiness to take advantage of the materials thus supplied.

Romans d'Aventures.—These are the three earliest developments of French literature on the great scale. They led, however, to a fourth, which, though later in date than all except their latest forms, is so closely connected with them by literary and social considerations that it had best be mentioned here. This is the *roman d'aventures*, a title given to those almost avowedly fictitious poems which connect themselves neither with French history, with the Round Table, nor with the heroes of antiquity. These began to be written in the 13th century, and continued until the prose form of fiction became generally preferred. The later forms of the chansons de gestes and the Arthurian poems might indeed be well called romans d'aventures themselves. *Hugues Capet*, for instance, a chanson in form and class of subject, is certainly one of this latter kind in treatment. But for convenience' sake the definition we have given is preferable. The style and subject of these romans d'aventures are naturally extremely various. *Guillaume de Palerme* deals with the adventures of a Sicilian prince, who is befriended by a were-wolf; *Le Roman de l'Escoufle*, with a heroine whose ring is carried off by a sparrow-hawk (Escoufle) like Prince Camaralzaman's talisman; *Guy of Warwick*, with the well-known slayer of the dun cow; *Meraugis de Portléguez* is a sort of branch or offshoot of the romances of the Round Table. There is, in short, no possibility of classifying their subjects. The habit of writing in gestes, or of necessarily connecting the new work with an older one, had ceased to be binding, and the instinct of fiction writing was free; yet these romans d'aventures do not rank quite as high in literary importance as the classes which preceded them. This undervaluation arises rather from a lack of originality and distinctness of savor than from any shortcomings in treatment. Their versification, usually octosyllabic, is pleasant enough; but there is not much distinctness of character about them, and their incidents, commonly taken from some preceding *fabliau* or *lai*, often strike the reader with something of the sameness but nothing of the naïveté of those of the older poems. Nevertheless some of them attain to a very high popularity, such, for instance, as *Partenopex de Blois*. With them may be connected a large number of early romances and fictions of various dates in prose and verse, such as *Aucassin et Nicolette*, *Le Chatelain de Coucy*, *Le Roman de la Violette*, and others. This class possesses representatives in Provençal as well as in northern French, some of which, for instance, *Flamenca* and *Jaufrey*, are full of interest. But none of those smaller stories in verse, prose, or the two combined, can vie in charm with *Aucassin et Nicolette* (13th century), an exquisite literary presentment of mediæval sentiment in its most delightful form.

General characteristics of early narrative.

Spread of literary taste.

In these four classes may be said to be summed up the literature of feudal chivalry in France. They were all, except perhaps the last, composed by one class of persons, the trouvères, and performed by another, the jongleurs. The latter, indeed, sometimes presumed to compose for himself, and was denounced as a *troveor batard* by the indignant members of the superior caste. They were all originally intended to be performed in the *palais marberin* of the baron to an audience of knights and ladies, and, when reading became more common, to be read by such persons. They dealt therefore chiefly, if not exclusively, with the class to whom they were addressed. The bourgeois and the villain, personages of political nonentity at the time of their early composition, come in for the slightest possible notice. Occasionally in the few curious instances we have mentioned, persons of a class inferior to the seigneur play an important part, but this is rare. The habit of private wars and of insurrection against the sovereign supply the motives of the chanson de geste, the love of gallantry, adventure, and foreign travel those of the romances Arthurian and miscellaneous. None of these motives much affected the lower classes, who were, with the early developed temper of the middle and lower class Frenchman, already apt to think and speak cynically enough of tournaments, courts, crusades, and the other occupations of the nobility. The communal system was springing up, the towns were receiving royal encouragement as a counterpoise to the authority of the nobles. The corruptions and maladministration of the church attracted the satire rather of the citizens and peasantry who suffered by them, than of the nobles who had less to fear and even something to gain. On the other hand, the gradual spread of learning, inaccurate and ill-digested perhaps, but still learning, not only opened up new classes of subjects, but opened them to new classes of persons. The thousands of students who flocked to the schools of Paris were not all princes or nobles. Hence there arose two new classes of literature, one consisting of the embodiment of learning of one kind or other in the vulgar tongue, and ranging from the half-fabulous histories of the Jerseyman Wace, the Roman de Brut, and the Roman de Rou, to bestiaries such as that of Philippe de Thaun and popular treatises on science and morality. The other, one of the most remarkable developments of sportive literature which the world has seen, produced the second indigenous literary growth of which France can boast, namely, the fabliaux, and the almost more remarkable work which is an immense conglomerate of fabliaux, the great beast-epic of the Roman du Renart.

Fabliaux.—There are few literary products which have more originality and at the same time more diversity than the fabliau. The epic and the drama, even when they are independently produced, are similar in their main characteristics all the world over. But there is nothing in previous literature which exactly corresponds to the fabliau. It comes nearest to the Æsopic fable and its Eastern origins or parallels. But it differs from these in being less allegorical, less obviously moral (though a moral of some sort is usually if not always enforced), and in having a much more direct personal interest. It is in many degrees further removed from the parable, and many degrees nearer to the novel. The story is the first thing, the moral the second, and the latter is never suffered to interfere with the former. These observations apply only to the fabliaux, properly so called, but the term has been used with considerable looseness. The collectors of those interesting pieces, Barbazan, Méon, Le Grand d'Aussy, have included in their collections large numbers of miscellaneous pieces such as *dits* (rhymed descriptions of various objects), and *débats* (discussions between two persons or contrasts of the attributes of two things), sometimes even short romances, farces, and mystery plays. The fabliau proper, according to the definition of its latest editor, is "the recital, generally comic, of a real or possible incident occurring in ordinary human life." The comedy, it may be added, is usually of a satiric kind, and occupies itself with every class and rank of men, from the king to the villain. There is no limit to the variety of these lively verse-tales, which are invariably written in eight-syllabled couplets. Now the subject is the misadventure of two Englishmen, whose ignorance of the French language makes them ask for some donkey instead of some lamb; now it is the fortunes of an exceedingly foolish knight, who has an amiable and ingenious mother-in-law; now the deserved sufferings of an avaricious or ill-behaved priest; now the bringing of an ungrateful son to a better mind by the wisdom of babes and sucklings. Not a few of the *Canterbury Tales* are taken directly from fabliaux; indeed, Chaucer, with the possible exception of Prior, is our nearest approach to a fabliau writer. At the other end of Europe the prose novels of Boccaccio and other Italian tale-tellers are largely based upon fabliaux. But their influence in their own country was the greatest. They were the first expression of the spirit which has since animated the most national and popular developments of French literature. Simple and unpretending as they are in form, the fabliaux announce not merely the *Cent Nouvelles Nouvelles* and the *Heptameron*, *L'Avocat Patelin*, and *Pantagruel*, but also *L'Avare* and the *Roman Comique*, *Gil Blas*, and *Candide*. They indeed do more than merely prophesy the spirit of these great performances,—they directly lead to them. The prose-tale and the farce are the direct outcomes of the fabliau, and the prose-tale and the farce once given, the novel and the comedy inevitably follow.

Social importance of fabliaux.

The special period of fabliau composition appears to have been the 12th and 13th centuries. It signifies on the one side the growth of a lighter and more sportive spirit than had yet prevailed, on another the rise in importance of other and lower orders of men than the priest and the noble, on yet another the consciousness on the part of these lower orders of the defects of the two privileged classes, and of the shortcomings of the system of polity under which these privileged classes enjoyed their privileges. There is, however, in the fabliau proper not so very much of direct satire, this being indeed excluded by the definition given above, and by the thoroughly artistic spirit in which that definition is observed. The fabliaux are so numerous and so various that it is difficult to select any as specially representative. We may, however, mention, both as good examples and as interesting from their subsequent history, *Le Vair Palfroi*, treated in English by Leigh Hunt and by Peacock; *Le Vilain Mire*, the original of *Le Médecin malgré lui*; *Le Roi d'Angleterre et le Jongleur d'Eli*; *La Houce Partie*; *Le Sot Chevalier*, an indecorous but extremely amusing story; and *Les Deux Bordeors Ribaus*, a piece of great literary interest, as containing allusions to the chansons de gestes and romances most in vogue.

Roman du Renart.—If the fabliaux are not remarkable for direct satire, that element is supplied in more than compensating quantity by an extraordinary composition which is closely related to them. *Le Roman du Renart*, or *History of Reynard the Fox*, is a poem, or rather series of poems, which, from the end of the 12th to the middle of the 14th century, served the citizen poets of northern France, not merely as an outlet for literary expression, but also as a vehicle of satirical comment,—now on the general vices and weaknesses of humanity, now on the usual corruptions in church and state, now on the various historical events which occupied public attention from time to time. The enormous popularity of the subject is shown by the long vogue which it had, and by the empire which it exercised over generations of writers who differed from each other widely in style and temper. Nothing can be farther from the allegorical erudition, the political diatribes, and the sermonizing moralities of the authors of *Rénart le Contre-fait* than the sly naïveté of the writers of the earlier branches. Yet these and a long and unknown series of intermediate bards the fox-king pressed into his service, and it is scarcely too much to say that, during the two centuries of his reign, there was hardly a thought in the popular mind which, as it rose to the surface, did not find expression in an addition to the huge cycle of *Renart*.

We shall not deal with the controversies which have been raised as to the origin of the poem and its central idea. The latter may have been a travestie of real persons and actual events, or it may (and much more probably) have been an expression of thoughts and experiences which recur in every generation. France, the Netherlands, and Germany have contended for the honor of producing Renart; French, Flemish, German, and Latin for the honor of first describing him. It is sufficient to say that the spirit of the work seems to be more that of the border-land between France and Flanders than of any other district, and that, wherever the idea may have originally arisen, it was incomparably more fruitful in France than in any other country. The French poems which we possess on the subject amount in all to nearly 100,000 lines, independently of mere variations, but including the two different versions of *Renart le Contre-fait.* This vast total is divided into four different poems. The most ancient and remarkable is that edited by Méon under the title of *Roman du Renart,* and containing, with some additions made by M. Chabaille, 37 branches and about 32,000 lines. It must not, however, be supposed that this total forms a continuous poem like the *Æneid* or *Paradise Lost.* On the contrary, the separate branches are the work of different authors, hardly any of whom are known, and, but for their community of subject and to some extent of treatment, might be regarded as separate poems. The history of Renart, his victories over Isengrim, Bruin, and his other unfortunate rivals, his family affection, his outwittings of King Noble the Lion, and all the rest, are too well known to need fresh description here. It is perhaps in the subsequent poems, which are far less known and much less amusing, that the hold which the idea of Renart had obtained on the mind of northern France, and the ingenious uses to which it was put, are best shown. The first of these is *Le Couronnement Renart,* a poem of between 3000 and 4000 lines, attributed, on no grounds whatever, to the poetess Marie de France, and describing how the hero by his ingenuity got himself crowned king. This poem already shows signs of direct moral application and generalizing. These are still more apparent in *Renart le Nouvel,* a composition of some 8000 lines, written in the year 1288 by the Fleming Jacquemart Giélée. Here the personification of which, in noticing the *Roman de la Rose,* we shall soon have to give extended mention, becomes evident. Instead of or at least beside the lively personal Renart who used to steal sausages, set Isengrim fishing with his tail, or make use of Chanticleer's comb for a purpose for which it was certainly never intended, we have *Renardie,* an abstraction of guile and hypocrisy, triumphantly prevailing over other and better qualities. Lastly, as the *Roman de la Rose* of William of Lorris is paralleled by *Renart le Nouvel,* so its continuation by Jean de Meung is paralleled by the great miscellany of *Renart le Contre-fait,* which, even in its two existing versions (Ménage seems to have known a third), extends to fully 50,000 lines. Here we have, besides floods of miscellaneous erudition and discourse, political argument of the most direct and important kind. The wrongs of the lower orders are bitterly urged. They are almost openly incited to revolt, and it is scarcely too much to say, as M. Lenient has said, that the closely following Jacquerie is but a practical carrying out of the doctrines of the anonymous satirists of *Renart le Contre-fait.*

Early Lyric Poetry.—Side by side with these two forms of literature, the epics and romances of the higher classes, and the fabliau, which, at least in its original, represented rather the feelings of the lower, there grew up a third kind, consisting of purely lyrical poetry. The song literature of mediæval France is extremely abundant and beautiful. From the 12th to the 15th century it received constant accessions, some signed, some anonymous, some purely popular in their character, some the work of more learned writers, others again produced by members of the aristocracy. Of the latter class it may fairly be said that the catalogue of royal and noble authors boasts few if any names superior to those of Thibaut de Champagne, king of Navarre, and Charles d'Orléans, the father of Louis XII. Although much of this lyric poetry is anonymous, the more popular part of it almost entirely so, yet M. Paulin Paris has been able to enumerate some hundreds of French chansonniers between the 11th and the 13th century. The earliest song literature, chiefly known in the delightful collection of Bartsch (*Alt-Französische Romanzen und Pastourellen*), is mainly sentimental in character. The collector divides it under the two heads of romances and pastourelles, the former being usually the celebration of the loves of a noble knight and maiden, and recounting how Belle Doette or Eglantine or Oriour sat at her windows or in the tourney gallery, or embroidering silk and samite in her chamber, with her thoughts on Gerard or Guy or Henry,—the latter somewhat monotonous but naïve recitals, very often in the first person, of the meeting of an errant knight or minstrel with a shepherdess, and his cavalier but not always successful wooing. With these, some of which date from the 12th century, may be contrasted, at the other end of the mediæval period, the more varied and popular collection dating in their present form from the 15th century, and published recently by M. Gaston Paris. In both alike, making allowance for the difference of their age and the state of the language, may be noticed a charming lyrical faculty and great skill in the elaboration of light and suitable metres, skill to which the hitherto usual preference of the Provençal poets as metrists has done but scant justice. Especially remarkable is the abundance of refrains of an admirably melodious kind. It is said that more than 500 of these exist. Among the lyric writers of these four centuries whose names are known may be mentioned Audefroi le Bastard, the author of the charming song of *Belle Idoine,* and others no way inferior, Quesnes de Bethune, the ancestor of Sully, whose song-writing inclines to a satirical cast in many instances, the Vidame de Chartres, Charles d'Anjou, King John of Brienne, etc. But none of them, except perhaps Audefroi, can compare with Thibaut IV., who united by his possessions and ancestry a connection with the north and the south, and who employed the methods of both districts, but used the language of the north only. Thibaut was supposed to be the lover of Blanche of Castile, the mother of St. Louis, and a great deal of his verse is concerned with his love for her. But while knights and nobles were thus employing lyric poetry in courtly and sentimental verse, lyric forms were being freely employed by others, both of high and low birth, for more general purposes. Blanche and Thibaut themselves came in for contemporary lampoons, and both at this time and in the times immediately following, a cloud of writers composed light verse, sometimes of a lyric sometimes of a narrative kind, and sometimes in a mixture of both. By far the most remarkable of these is Rutebœuf (born in 1230), the first of a long series of French poets to whom in recent days the title Bohemian has been applied, who passed their lives between gayety and misery, and celebrated their lot in both conditions with copious verse. Rutebœuf is among the earliest French writers who tell us their personal history and make personal appeals. But he does not confine himself to these. He discusses the history of his times, upbraids the nobles for their desertion of the Latin empire of Constantinople, considers the expediency of crusading, inveighs against the religious orders, and takes part in the disputes between the pope and the king. He composes pious poetry too, and in at least one poem takes care to distinguish between the church which he venerates and the corrupt churchmen whom he lampoons. Besides Rutebœuf the most characteristic figure of his class and time is Adam de la Halle (*cir.* 1240–1286), commonly called the Hunchback of Arras. The earlier poems of Adam are of a sentimental character, the later ones satirical and somewhat ill-tempered. Such, for instance, is his invective against his native city. But his chief importance consists in his *jeux,* the *Jeu de la Feuillie,* the *Jeu de Robin et Marion,* dramatic compositions which led the way to the regular dramatic form. Indeed the general tendency of the 13th century is to satire, fable, and farce, even more than to serious or sentimental poetry. We should perhaps except the *lais,* the chief of which are known under the name of Marie de France. These lays are exclusively Breton in origin, though not in application, and the term seems originally to have had reference rather to the music to which they were sung than to the manner or matter of the pieces. Some resemblance to these lays may perhaps be traced in the Breton songs (perfectly trustworthy, which cannot be said of some more famous ones) published by M. Luzel. The subjects of the lais are indifferently taken from the Arthurian cycle, from ancient story, and from popular tradition. The most famous of all is the *Lay of the Honeysuckle,* traditionally assigned to Sir Tristram.

Satiric and Didactic Works.—Among the direct satirists of the Middle Ages, one of the earliest and foremost is Guyot de Provins, whose *Bible,* as he calls it, contains an elaborate satire on the time. The same spirit soon betrayed itself in curious travesties of the romances of chivalry, and sometimes invades the later specimens of these romances themselves. One of the earliest examples of the travestie is the remarkable composition entitled *Audigier.* This poem, half fabliau and half romance, is not so much an instance of the heroi-comic poems which afterwards found so much favor in Italy and elsewhere, as a direct and ferocious parody of the Carlovingian epic. The hero Audigier is a model of cowardice and disloyalty; his father and mother, Turgibus and Rainberge, are deformed and repulsive. The exploits of the hero himself are coarse and hideous failures, and the whole poem can only be taken as a counterblast to the spirit of chivalry. Elsewhere a trouvère, prophetic of Rabelais, describes a vast battle between all the nations of the world, the quarrel being suddenly atoned by the arrival of a holy man bearing a huge flagon of wine. Again, we have the history of a solemn crusade undertaken by the citizens of a country town against the neighboring castle. As erudition and the fancy for allegory gained ground, satire naturally availed itself of the opportunity thus afforded it; the disputes of Philippe le Bel with the pope and the Templars had an immense literary influence, partly in the concluding portions of the *Renart*, partly in the *Roman de Rose*, still to be mentioned, and partly in other satiric allegories of which the chief is the romance of *Fauvel*. The hero of this is an allegorical personage, half man and half horse, signifying the union of bestial degradation with human ingenuity and cunning. Fauvel is a divinity in his way. All the personages of state, from kings and popes to mendicant friars, pay their court to him.

Baudouin de Sebourc.

But this serious and discontented spirit betrays itself also in compositions which are not parodies or travesties in form. One of the latest, if not absolutely the latest, and yet not one of the least remarkable of the chanson de gestes is *Baudouin de Sebourc*, one of the members of the great romance or cycle of romances dealing with the crusades, and entitled Le Chevalier au Cygne. *Baudouin de Sebourc* dates from the early years of the 14th century. It is strictly a chanson de geste in form, and also in the general run of its incidents. The hero is dispossessed of his inheritance by the agency of traitors, fights his battle with the world and its injustice, and at last prevails over his enemy Gaufrois, who has succeeded in obtaining the kingdom of Friesland and almost that of France. Gaufrois has as his assistants two personages who were very popular in the poetry of the time,—the devil, namely, and money. These two sinister figures pervade the fabliaux, tales, and fantastic literature generally of the time. M. Lenient, the historian of French satire, has well remarked that a romance as long as the *Renart* might be spun out of the separate short poems of this period which have the devil for hero, and many of which form a very interesting transition between the fabliau and the mystery. But the devil is in one respect a far inferior hero to Renart. He has an adversary in the Virgin who constantly upsets his best-laid schemes, and who does not always treat him quite fairly. The abuse of usury at the time, and the exactions of the Jews and Lombards, were severely felt, and money itself, as personified, figures largely in the popular literature of the time.

William of Lorris.

Jean de Meung.

Roman de la Rose.—A work of very different importance from all of these, though with seeming touches of the same spirit, a work which deserves to take rank among the most important of the Middle Ages, is the *Roman de la Rose*,—one of the few really remarkable books which is the work of two authors, and that not in collaboration but in continuation one of the other. The author of the earlier part was Guillaume de Lorris, who lived in the first half of the 13th century; the author of the later part was Jean de Meung, who did not die until 1320, and whose part in the *Roman* dates at least from the extreme end of the preceding century. This great poem, while it has perforce attracted much attention, has suffered from the disrespect with which all nations, and the French perhaps more than any, are wont to treat literature that is out of date. Yet the *Roman de la Rose* is a great deal more interesting merely as literature, and without any antiquarian considerations, than a very large number of so-called classics. It exhibits in its two parts very different characteristics, which yet go to make up a not inharmonious whole. It is a love poem, and yet it is satire. But both gallantry and raillery are treated in an entirely allegorical spirit; and this allegory, while it makes the poem tedious to hasty appetites of to-day, was exactly what gave it its charm in the eyes of the Middle Ages. It might be described as an *Ars Amoris* crossed with a *Quodlibeta*. This mixture exactly hit the taste of the time, and continued to hit it for two centuries and a half. When its obvious and gallant meaning was attacked by moralists and theologians, it was easy to quote the example of the Canticles, and to furnish esoteric explanations of the allegory. The writers of the 16th century were never tired of quoting and explaining it. Antoine de Baif, indeed, gave the simple and obvious meaning, and declared that "La rose c'est d'amours le guerdon gracieux;" but Marot, on the other hand, gives us the choice of four mystical interpretations,—the rose being either the state of wisdom, the state of grace, the state of eternal happiness, or the Virgin herself. We cannot here analyze this celebrated poem. It is sufficient to say that the lover meets all sorts of obstacles in his pursuit of the rose, though he has for a guide the metaphorical personage Bel-Accueil. The early part, which belongs to William of Lorris, is remarkable for its gracious and fanciful descriptions. Forty years after Lorris's death, Jean de Meung completed it in an entirely different spirit. He keeps the allegorical form, and, indeed, introduces two new personages of importance, Nature and Faux-semblant. In the mouths of these personages and of another, Raison, he puts the most extraordinary mixture of erudition and satire. At one time we have the history of classical heroes, at another theories against the hoarding of money, about astronomy, about the duty of mankind to increase and multiply. Accounts of the origin of loyalty, which would have cost the poet his head at some periods of history, and even communistic ideas, are also to be found here. In Faux-semblant we have a real creation of the theatrical hypocrite. All this miscellaneous and apparently incongruous material really explains the success of the poem. It has the one characteristic which has at all times secured the popularity of great works of literature. It holds the mirror up firmly and fully to its age. As we find in Rabelais the characteristics of the Renaissance, in Montaigne those of the sceptical reaction from Renaissance and reform alike, in Molière those of the society of France after Richelieu had tamed and levelled it, in Voltaire and Rousseau respectively the two aspects of the great revolt,—so there are to be found in the *Roman de la Rose* the characteristics of the later Middle Age, its gallantry, its mysticism, its economical and social troubles and problems, its scholastic methods of thought, its naïve acceptance as science of everything that is written, and at the same time its shrewd and indiscriminate criticism of much that the age of criticism has accepted without doubt or question. The *Roman de la Rose*, as might be supposed, set the example of an immense literature of allegorical poetry, which flourished more and more until the Renaissance. Some of these poems we have already mentioned, some will have to be considered under the head of the 15th century. But, as usually happens in such cases and was certain to happen in this case, the allegory which has seemed tedious to many, even in the original, became almost intolerable in the majority of the imitations. To a great extent, however, it held its ground in forms more or less disguised. The tradition of allegorizing and personifying found refuge especially in the French classical tragedy, where the heroes of the school of Racine talk about their passions and their flames in a style by no means alien from that of William of Lorris.

Early didactic verse.

We have observed that, at least in the later section of the *Roman de la Rose*, there is observable a tendency to import into the poem indiscriminate erudition. This tendency is now remote from our poetical habits; but in its own day it was only the natural result of the use of poetry for all literary purposes. It was many centuries before prose became recognized as the proper vehicle for instruction, and at a very early date verse was used as well for educational and moral as for recreative and artistic purposes. French verse was the first born of all literary mediums in Modern European speech, and the resources of ancient learning were certainly not less accessible in France than in any other country. Dante, in his *De Vulgari Eloquio*, acknowledges the excellence of the didactic writers of the Langue d'Oil. We have already alluded to the *Bestiary* of Philippe de Thaun, a Norman trouvère who lived and wrote in England during the reign of Henry Beauclerc. Besides the *Bestiary*, which from its dedication to Queen Adela has been conjectured to belong to the third decade of the 12th century, Philippe wrote also in French a *Liber de Creaturis*, both works being translated from the Latin. These works of mystical and apocryphal physics and zoology became extremely popular in the succeeding centuries, and were frequently imitated. A moralizing turn was also given to them, which was much helped by the importation of several miscellanies of Oriental origin, partly tales, partly didactic in character, the most celebrated of which is the *Roman des Sept Sages*, which, under that title and the variant of *Dolopathos*, received repeated treatment from French writers both in prose and verse. The Æsopic fable, a similar mixture of instruction and amusement, had many cultivators, of whom Marie de France is the most remarkable. Art, too, soon demanded exposition in verse, as well as science. The favorite pastime of the chase was repeatedly dealt with, notably in the *Roi Modus*, 1325, mixed prose and verse; the *Deduits de la Chasse* of Gaston de Foix, 1387, prose; and the *Tresor de Venerie* of Hardouin, 1394, verse. Very soon didactic verse extended itself to all the arts and sciences. Vegetius and his military precepts had found a home in French octosyllables as early as the 12th century; the end of the same age saw the ceremonies of knighthood solemnly versified, and *napes* (maps) *du monde* also soon appeared. Finally, in 1245, Gautier of Metz translated from various Latin works into French verse a sort of encyclopædia. Profane knowledge was not the only subject which exercised didactic poets at this time. Religious handbooks and commentaries on the scriptures were common in the 13th and following centuries, and, under the title of *Castoiements, Enseignements*, and *Doctrinaux*, moral treatises became common. In the 14th century the influence of the *Roman de la Rose* helped to render moral verse frequent and popular. The same century, moreover, which witnessed these developments of well-intentioned if not always judicious erudition witnessed also a considerable change in lyrical poetry. Hitherto such poetry had chiefly been composed in the melodious but unconstrained forms of the romance and the pastourelle. Advancing taste, and possibly some echo of the refinements of the troubadours, induced the writers of northern France in the 14th century to subject themselves to severer rules, which, however, present no trace of being directly borrowed from the south. In this age arose the forms which for so long a time were to occupy French singers,—the ballade, the rondeau, the rondel, the triolet, the chant royal, and others. These received considerable alterations as time went on. We possess not a few *Artes Poeticæ*, such as those of Eustache Deschamps at the end of the 14th century, of Henri de Croy at the end of the 15th, and of Thomas Sibilet in the 16th, giving particulars of them, and these particulars show considerable changes. Thus the term rondeau, which since Villon has been chiefly limited to a poem of 15 lines, in which the 9th and 15th repeat the first words of the first, was originally applied both to the rondel, a poem of 13 or 14 lines, where the first two are twice repeated integrally, and to the triolet, one of 8 only, where the first line occurs three times and the second twice. The last is an especially popular metre, and is found where we should least expect it, in the dialogue of the early farces, the speakers making up triolets between them. As these three forms are closely connected, so are the ballade and the chant royal, the latter being an extended and more stately and difficult version of the former, and the characteristic of both being the identity of rhyme and refrain in the several stanzas. It is quite uncertain at what time these fashions were first cultivated, but the earliest poets who appear to have practised them extensively were born at the close of the 13th and the beginning of the 14th century. Of these Guillaume Machaut (1282 or 1295–1380) is the oldest. He has left us 80,000 verses, few of which have ever been printed. Eustache Deschamps (1328–1415) was nearly as prolific, but more fortunate and more meritorious, though a complete edition of him is only now promised. Froissart the historian (1333–1410) was also an agreeable poet. Deschamps, the most famous as a poet of the three, has left us nearly 1200 ballades and nearly 200 rondeaux, besides much other verse, all manifesting very considerable poetical powers. Less known but not less noteworthy is Jehannot de Lescurel, most of whose works are lost, but whose fragments are full of grace. Froissart appears to have had many countrymen in Hainault and Brabant who devoted themselves to the art of versification; and the *Livre des cent Ballades* of the Marshal Boucicault and his friends —*cir.* 1390—shows that the French gentleman of the 14th century was as apt at the ballade as his Elizabethan peer in England was at the sonnet.

Artificial forms of verse.

Early Drama.—Before passing to the prose writers of the Middle Ages, we have to take some notice of the dramatic productions of those times,—productions of an extremely interesting character, but, like the immense majority of mediæval literature, poetic in form. The origin or the revival of dramatic composition in France has been hotly debated, and it has been sometimes contended that the tradition of Latin comedy was never entirely lost, but was handed on chiefly in the convents by adaptations of the Terentian plays, such as those of the nun Hroswitha. There is no doubt that the mysteries (subjects taken from the sacred writings) and miracle plays (subjects taken from the legends of the saints and the Virgin) are of very early date. The mystery of the *Foolish Virgins* (partly French partly Latin), that of *Adam*, of *Saint Nicolas*, and perhaps others, are of the 12th century. But the latter moralities, soties, and farces seem to be also in part a very probable development of the simpler and earlier forms of the fabliau and of the tenson or jeuparti, a poem in simple dialogue much used by both troubadours and trouvères. The fabliau has been sufficiently dealt with already. It chiefly supplied the subject; and some miracle-plays and farces are little more than fabliaux thrown into dialogue. Of the jeux-partis there are many examples, varying from very simple questions and answers to something like regular dramatic dialogue; even short romances, such as *Aucassin et Nicolette*, were easily susceptible of dramatization. But the *Jeu de la Feuillie* of Adam de la Halle seems to be the earliest piece, profane in subject, containing something more than mere dialogue. The poet has not indeed gone far for his subject, for he brings in his own wife, father, and friends, the interest being complicated by the introduction of stock characters (the doctor, the monk, the fool), and of certain fairies—personages already popular from the later romances of chivalry. Another piece of Adam's, *Le Jeu de Robin et Marion*, also already alluded to, is little more than a simple throwing into action of an ordinary pastourelle. Nevertheless later criticism has seen, and not unreasonably, in these two pieces the origin in the one case of farce, and thus indirectly of comedy proper, in the other of comic opera.

Mysteries and miracles.

For a long time, however, the mystery and miracle-plays remained the staple of theatrical performance, and until the 13th century actors as well as performers were more or less taken from the clergy. It has, indeed, been well pointed out that the offices of the church were themselves dramatic performances, and required little more than development at the hands of the mystery writers. The occasional festive outbursts, such as the Feast of Fools, that of the Boy Bishop, and the rest, helped on the development. The variety of mysteries and miracles was very great. A single manuscript, now in course of publication, contains forty miracles of the Virgin, averaging from 1200 to 1500 lines each, written in octosyllabic couplets, and at least as old as the 14th century, most of them perhaps much earlier. The mysteries proper, or plays taken from the scriptures, are older still. Many of these are exceedingly long. There is a *Mystère de l'Ancien Testament*, which extends to many volumes, and must have taken weeks to act in its entirety. The *Mystère de la Passion*, though not quite so long, took several days, and recounts the whole history of the gospels. But these performances, though they held their ground until the middle of the 16th century, were soon rivalled by the more profane performances of the moralities, the farces, and the soties. The palmy time of all these three kinds is the 15th century, while the Confrérie de la Passion itself, the special performers of the sacred drama, only obtained the license constituting it by an ordinance of Charles VI. in 1402. In order, however, to take in the whole of the mediæval theatre at a glance, we may anticipate a little. The Confraternity was not itself the author or performer of the profaner kind of dramatic performance. This latter was due to two other bodies, the clerks of the Bazoche and the Enfans sans Souci. As the Confraternity was chiefly composed of tradesmen and persons very similar to Peter Quince and his associates, so the clerks of the Bazoche were members of the legal profession of Paris, and the Enfans sans Souci were mostly young men of family. The morality was the special property of the first, the sotie of the second. But as the moralities were sometimes decidedly tedious plays, though by no means brief, they were varied by the introduction of farces, of which the jeux already mentioned were the early germ, and of which *L'Avocat Patelin*, 200 years

Profane drama.

subsequent to Adam de la Halle, is the most famous example.

Moralities.

The morality was on the stage the natural result of the immense literary popularity of allegory in the *Roman de la Rose* and its imitations. There is hardly an abstraction, a virtue, a vice, a disease, or anything else of the kind, which does not figure in these compositions. There is Bien Advisé and Mal Advisé, the good boy and the bad boy of nursery stories, who fall in respectively with Faith, Reason, and Humility, and with Rashness, Luxury, and Folly. There is the hero Mange-Tout, who is invited to dinner by Banquet, and meets after dinner very unpleasant company in Colique, Goutte, and Hydropisie. It is even said that Cheese and Tart figured among the *dramatis personæ*, while Honte-de-dire-ses-Péchés seems an anticipation of Puritan nomenclature. Some of these moralities possess distinct dramatic merit; among these is mentioned *Les Blasphémateurs*, an early and remarkable presentation of the Don Juan story. But their general character appears to be gravity, not to say dulness. The Enfans sans Souci, on the other hand, were definitely satirical, and nothing if not amusing.

Soties.

The chief of the society was entitled Prince des Sots, and his crown was a hood decorated with asses' ears. The sotie was directly satirical, and only assumed the guise of folly as a stalking-horse for shooting wit. It was more Aristophanic than any other modern form of comedy, and, like its predecessor, it perished as a result of its political application. Encouraged for a moment as a political engine at the beginning of the 16th century, it was soon absolutely forbidden and put down, and had to give place in one direction to the lampoon and the prose pamphlet, in another to forms of comic satire more general and vague in their scope. The farce, on the other hand, having neither moral purpose nor political intention, was a purer work of art, enjoyed a wider range of subject, and was in no danger of any permanent extinction. Farcical interludes were interpolated in the mysteries themselves; short farces introduced and rendered palatable the moralities, while the sotie was itself but a variety of farce. It was a short composition, 500 verses being considered sufficient, while the morality might run to at least 1000 verses, the miracle-play to nearly double that number, and the mystery to some 40,000 or 50,000, or indeed to any length that the author could find in his heart to bestow upon the audience, or the audience in their patience to suffer from the author. The number of persons and societies who acted these performances grew to be very large, being estimated at more than 5000 towards the end of the 15th century. Many fantastic personages came to join the Prince des Sots, such as the Empereur de Galilée, the Princes de l'Étrille and des Nouveaux Mariés, the Roi de l'Épinette, the Recteur des Fous. Of the pieces which these societies represented one only, that of *Maitre Patelin*, is now much known; but many are almost equally amusing. *Patelin* itself has an immense number of versions and editions. Other farces are too numerous to attempt to classify; they bear, however, in their subjects, as in their manner, a remarkable resemblance to the fabliaux, their source. Conjugal disagreements, the unpleasantness of mothers-in-law, the shifty or, in the earlier stages, clumsy valet and chambermaid, the mishaps of too loosely given ecclesiastics, the abuses of relics and pardons, the extortion, violence, and sometimes cowardice of the seigneur and the soldiery, the corruption of justice, its delays, and its pompous apparatus, supply the subjects. The treatment is rather narrative than dramatic in most cases, as might be expected, but makes up by the liveliness of the dialogue for the deficiency of elaborately planned action and interest. All these forms, it will be observed, are directly or indirectly comic. Tragedy in the Middle Ages is represented only by the religious drama, except for a brief period towards the decline of that form, when what were called profane mysteries, such as those of the *Siege of Troy* and the *Siege of Orleans*, came to be represented. These were, however, rather histories, in the Elizabethan sense, than tragedies proper.

Prose History.—In France, as in all other countries of whose literary developments we have any record, literature in prose is considerably later than literature in verse. We have certain glosses or vocabularies possibly dating as far back as the 8th or even the 7th century; we have the Strasburg oaths, already described, of the 9th, and a commentary on the prophet Jonas which is probably as early. In the 10th century there are some charters and muniments in the vernacular; of the 11th the laws of William the Conqueror are the most important document; while the *Assises de Jérusalem* of Godfrey of Bouillon date, though not in the form in which we now possess them, from the same age. The 12th century gives us certain translations of the Scriptures, and the remarkable Arthurian romances already alluded to; and thenceforward French prose, though long less favored than verse, begins to grow in importance. History, as is natural, was the first subject which gave it a really satisfactory opportunity of developing its powers. For a time the French chroniclers contented themselves with Latin prose or with French verse, after the fashion of Wace and Philippe Mouskés.

Early chronicles.

But soon chronicles, first translated then original, became common; the earliest of all is said to have been that of the Pseudo-Turpin, which thus recovered in prose the language which had originally clothed it in verse, and which to gain a false appearance of authenticity it had exchanged for Latin. Then came French selections and versions from the great series of historical compositions undertaken by the monks of St. Denys, the so-called *Grandes Chroniques de France.* But the first really remarkable author who used French prose as a vehicle of historical expression is Geoffroi de Villehardouin, marshal of Champagne, who was born towards the middle of the 12th century, and died in Greece in 1213.

Villehardouin.

Under the title of *Conquête de Constantinoble* Villehardouin has left us a history of the fourth crusade, which has been accepted by all competent judges as the best picture extant of feudal chivalry in its prime. The *Conquête de Constantinoble* has been well called a chanson de geste in prose, and indeed the surprising nature of the feats it celebrates, the abundance of detail, and the vivid and picturesque poetry of the narration, equal the very best of the chansons. Even the repetition of the same phrases which is characteristic of epic poetry repeats itself in this epic prose; and as in the chansons so in Villehardouin, few motives appear but religious fervor and the love of fighting, though neither of these excludes a lively appetite for booty and a constant tendency to disunion and disorder. Villehardouin was continued by Henri de Valenciennes, whose work is less remarkable, and has more the appearance of a rhymed chronicle thrown into prose, a process which is known to have been actually applied in some cases. Nor is the transition from Villehardouin to Joinville (considerable in point of time, for Joinville was not born till ten years after Villehardouin's death) in point of literary history immediate. The rhymed chronicles of Philippe Mouskés and Guillaume Guiart belong to this interval; and in prose the most remarkable works are the *Chronique de Reims*, a well-written history, having the interesting characteristic of taking the lay and popular side, and the great work (977–1209) attributed to Baudouin d'Avesnes, and written both in French and Latin.

Joinville.

Joinville, whose special subject is the Life of St. Louis, is far more modern than even the half-century which separates him from Villehardouin would lead us to suppose. There is nothing of the knight-errant about him personally, notwithstanding his devotion to his hero. Our Lady of the Broken Lances is far from being his favorite saint. He is an admirable writer, but far less simple than Villehardouin; the good King Louis tries in vain to make him share his own rather highflown devotion. Joinville is shrewd, practical, there is even a touch of the Voltairian about him; but he, unlike his predecessor, has political ideas and antiquarian curiosity, and his descriptions are often very creditable pieces of deliberate literature.

It is very remarkable that each of the three last centuries of feudalism should have had one specially and extraordinarily gifted chronicler to describe it. What Villehardouin is to the 12th and Joinville to the 13th century, that Froissart is to the 14th.

Froissart.

His picture is the most famous as it is the most varied of the three, but it has special drawbacks as well as special merits. French critics have indeed been scarcely fair to Froissart, because of his early partiality to our own nation in the great quarrel of the time, forgetting that there was really no reason why he as a Hainaulter should take the French side. But there is no doubt that if the duty of an historian is to take in all the political problems of his time, Froissart certainly comes short of it. Although the feudal state in which knights and churchmen were alone of estimation was at the point of death, and though new orders of society were becoming important, though the distress and confusion of a transition state were evident to all, Froissart takes no notice of them. Society is still to him all knights and ladies, tournaments, skirmishes, and feasts. He depicts these, not like Joinville still less like Villehardouin, as a sharer in them, but with the facile and picturesque pen of a sympathizing literary onlooker. As the comparison of the *Conquête de Constantinoble* with a chanson de geste is inevitable, so is that of Froissart's *Chronique* with a roman d'aventures.

Troubadours.

Provençal Literature.—No account of French mediæval literature would be complete without at least some reference to the literary products of the Langue d'Oc. Provençal literature will receive separate treatment elsewhere, and here our chief business is to contrast briefly its developments with those of the Langue d'Oil. The older belief of the antecedence and originality of the troubadours has indeed been shown of late years to be false, and all evidence goes to prove that trouvère and troubadour were in the main independent of each other; while the creations of the former, if less artistically elaborate, were more varied, more considerable, and more fertile in their developments. The chanson de geste, the Arthurian romance, the fabliau, the allegoric poems of the type of the *Renart* and the *Rose*, the prose chronicle, the mystery, the farce, belong to the north; and the first developments of the epic in particular appear to have actually preceded the composition of finished literature in the south. The earliest accents of the troubadours are only heard at the extreme end of the 11th century. By the end of the 14th, less in consequence of the Albigensian crusade than of the political changes which that crusade eventually caused, they ceased. The 300 years between these terms were occupied by a literature more rich than varied. It is, however, too often forgotten that the literature of the Langue d'Oc is by no means confined to the productions of these famous minstrels. Two centuries before William of Poitiers, the earliest singer of the class (fl. 1087–1127), was written the Provençal poem on Boetius, the oldest monument that we have. It was, moreover, long after the extinction of the troubadour class that Provençal ceased for a time, except at long intervals, to be used as a literary language. But though the identification of Provençal literature with the lyric products of the troubadours is not scientifically correct, it is at least not destitute of a certain excuse. In this poetry alone are found works of an individual savor and a lasting interest, and had it not been for this, Provençal would have run the risk of being regarded as a mere dialect, perhaps even a *patois*. A few romances and tales, and the metrical chronicle describing the Albigensian war, sum up the longer compositions of the troubadours. On the other hand, their lyrical fecundity was extremely great, and their versification was most elaborate and correct, but their subjects were very limited. Love, war, and satire almost exhaust the list. The satire, moreover, is for the most part of a purely personal character, and entirely lacks the diversified historical and social interest which distinguishes the satirical poems of the Langue d'Oil. Nor are the war songs of the troubadours extremely numerous, the chief writer of them being the famous Bertrand de Born. Certain moral or didactic poems of their authorship also exist, but the bulk of their compositions deals with the subject of love, and deals with it in a manner for which, while its sweetness and grace have been universally recognized, the most ardent champions of the literary achievements of Provence and Languedoc have not been able to claim variety, vigor, or even, in the majority of cases, passion and truth. The alba, the serena, the pastorela, are alike open to the charge of monotony which has been brought against the northern equivalent of the latter, the pastourelle. The planh or complaint is also somewhat of a monotonous and unreal character; the tenson or verse dialogue and the ensenhamen or didactic epistle are apt to be dull; and the sirventé or satirical poem, though spirited enough, is apt, as we have said, to degenerate into the mere lampoon. So much for the disadvantages of Provençal verse, disadvantages which would scarcely require notice but for the contrast they present to the corresponding advantages of northern poetry. On the other hand, in its peculiar and somewhat limited way, Provençal poetry and the spirit which it expresses surpass anything which can be paralleled with them in northern French up to the date of their disappearance. The latter, except in the 15th and 16th centuries, and in our own time, has always been deficient in impassioned amatory poetry, while, on the other hand, the anonymous alba, "En un vergier sotz folha d'albespi," which Mr. Swinburne has finely paraphrased, stands at the head of almost all poetry of this class; and many of the fancies of the troubadours, such as the love of Geoffroi Rudel for the Lady of Tripoli, have fixed themselves durably in the literary imagination of Europe. But the great glory of the troubadours was their strenuous and successful attention to the formal part of poetry. Assisted by the melodious if somewhat monotonous cadences and terminations of their language, they framed most intricate and elaborate systems of verse and rhyme, which undoubtedly served as a stimulus to the trouvères their neighbors, and were very probably models for the creations in poetical form of the 14th century, such as the virelai, the rondel, the rondeau, the ballade, and the chant royal. The beauty and grace of Provençal poetry, and the melancholy fate of the nation which produced it, have naturally attracted much interest. But it must be remembered that the Albigensian crusade by no means, as is sometimes held, stamped out the troubadours. They continued for nearly a century after it to be prolific; and their extinction, though partly traceable to political causes, was in all probability equally owing to the inherent defects of their poetry, especially its lack of range. Soon afterwards Provençal ceased for 300 years to be, except fitfully and at long intervals, a literary language. In our own time a band of zealous devotees have attempted to revive it in that character, with what permanent success remains to be seen.

15th Century.—The 15th century holds a peculiar and somewhat disputed position in the history of French literature. It has sometimes been regarded as the final stage of the mediæval period, sometimes as the earliest of the modern, the influence of the Renaissance in Italy already filtering through. Others again have taken the easy step of marking it as an age of transition. There is as usual truth in all these views. Feudality died with Froissart and Eustache Deschamps. The modern spirit can hardly be said to arise before Rabelais and Ronsard. Yet the 15th century, from the point of view of French literature, is much more remarkable than its historians have been wont to confess. It has not the strongly marked and compact originality of some periods, and it furnishes only one name of the highest order of literary interest; but it abounds in names of the second rank, and the very difference which exists between their styles and characters testifies to the existence of a large number of separate forces working in their different manners on different persons. Its theatre we have already treated by anticipation, and to it we shall afterwards recur. It was the palmy time of the early French stage, and all the dramatic styles which we have enumerated then came to perfection. Of no other kind of literature can the same be said. The century which witnessed the invention of printing naturally devoted itself at first more to the spreading of old literature than to the production of new. Yet as it perfected the early drama, so it produced the prose tale. Nor, as regards individual and single names, can the century of Charles d'Orléans, of Alain Chartier, of Christine de Pisan, of Coquillart, of Comines, and, above all, of Villon, be said to lack illustrations.

Christine de Pisan.

Alain Chartier.

First among the poets of the period falls to be mentioned the shadowy personality of Olivier Basselin. Modern criticism has attacked the identity of the jovial miller, who was once supposed to have written and perhaps invented the songs called vaux de vire, and to have also carried on a patriotic warfare against the English. But though Jean le Houx may have written the poems published under Basselin's name two centuries later, it does not seem unlikely that an actual Olivier wrote actual vaux de vire at the beginning of the 15th century. About Christine de Pisan (1363–1420) and Alain Chartier (1386–1458) there is no such doubt. Christine was the daughter of an Italian astrologer who was patronized by Charles V. She was born in Italy but brought up in France, and she enriched the literature of her adopted country with much learning, good sense, and patriotism. She wrote history, devotional works, and poetry; and though her literary merit is not of the highest, it is very far from despicable. Alain Chartier, best known to modern readers by the story of Margaret of Scotland's Kiss, was a writer of a somewhat similar character. In both Christine and Chartier there is a great deal of rather heavy moralizing, and a great deal of rather pedantic erudition. But it is only fair to remember that the intolerable political and social evils of the day called for a good deal of moralizing, and that it was the function of the writers of this time to fill up as well as they could the scantily filled vessels of mediæval science and learning.

Charles d'Orléans.

A very different person is Charles d'Orléans (1391–1465), one of the greatest of *grands seigneurs*, for he was the father of a king of France and heir to the duchies of Orléans and Milan. Charles, indeed, was not exactly a hero; captured at Agincourt, he endured his English captivity very patiently, and its chief effect on him was to make him write poems in English. He made little effort to secure or recover his Cisalpine heritage from the rough hands of Sforza, and he seems at no time to have exercised much political influence in France. But if he was not a Roland or a Bayard, he was an admirable poet. He is the best-known and perhaps the best writer of the graceful poems in which an artificial versification is strictly observed, and helps by its recurrent lines and modulated rhymes to give to poetry something of a musical accompaniment even without the addition of music properly so called. His ballades are certainly inferior to those of Villon, but his rondels are unequalled. For full a century and a half these forms engrossed the attention of French lyrical poets. Exercises in them were produced in enormous numbers, and of an excellence which has only recently obtained full recognition even in France. Charles d'Orléans is himself sufficient proof of what can be done in them in the way of elegance, sweetness, and grace. On the other hand, his writings and the exercises to which he was addicted lay him open to a certain charge of effeminacy, which, though it has been much exaggerated, cannot be altogether denied. But that this effeminacy was no natural or inevitable fault of the ballades and the rondeaux was fully proved by the most remarkable literary figure of the 15th century in France.

Villon.

To François Villon (1431–1500), as to other great single writers, no attempt can be made to do justice in this place. His remarkable life and character especially lie outside our subject. But he is universally recognized as the most important single figure of French literature before the Renaissance. His work is very strange in form, the undoubtedly genuine part of it consisting merely of two compositions, known as the great and little testament, written in stanzas of eight lines of eight syllables each, with lyrical compositions in ballade and rondeau form interspersed. Nothing in old French literature can compare with the best of these, such as "the Ballade des dames du Temps Jadis," the "Ballade pour sa Mère," "La Grosse Margot," "Les Regrets de la belle Heaulmiere," and others; while the whole composition is full of poetical traits of the most extraordinary vigor, picturesqueness, and pathos. Besides these more remarkable names, a crowd of minor poets hastened to copy the compositions we have described. Towards the end of the century the poetical production of the time became very large. The artificial measures already alluded to, and others far more artificial and infinitely less beautiful, were largely practised. The typical poet of the end of the 15th century is Guillaume Crétin, who distinguished himself by writing verses with punning rhymes, verses ending with double or treble repetitions of the same sound, and many other tasteless absurdities, in which, as Pasquier remarks, "il perdit toute la grace et la liberté de la composition."

Crétin.

Crétin, who had hundreds of imitators, was held up by Rabelais to the ridicule of his readers under the name of Raminagrobis. The other favorite direction of the poetry of the time was a vein of allegorical moralizing drawn from the *Roman de la Rose* through the medium of Chartier and Christine, which produced "Castles of Love," "Temples of Honor," and such like; yet some of the minor poets of the time are not to be despised. Such are Baude (1430–1490), Martial d'Auvergne (1420–1508), and others, many of whom proceeded from the poetical court which Charles d'Orléans kept up at Blois after his release.

While the serious poetry of the age took this turn, there was no lack of lighter and satirical verse. Villon, indeed, were it not for the depth and pathos of his poetical sentiment, might be claimed as a poet of the lighter order, and the patriotic diatribes against the English to which we have alluded easily passed into satire. The political quarrels of the latter part of the century also provoked much satirical composition. The disputes of the Bien Public and those between Louis XI. and Charles of Burgundy employed many pens. The most remarkable piece of the light literature of the first is "Les Ânes Volants," a ballad on some of the early favorites of Louis. The battles of France and Burgundy were waged on paper between Gilles des Ormes and George Chastelain, typical representatives of the two styles of 15th century poetry already alluded to—Des Ormes being the lighter and more graceful writer, Chastelain a pompous and learned allegorist.

Coquillart.

The most remarkable representative of purely light poetry outside the theatre is Guillaume Coquillart, a lawyer of Champagne, who resided for the greater part of his life in Rheims. This city like others suffered from the pitiless tyranny of Louis XI. The beginnings of the standing army which Charles VII. had started were extremely unpopular, and the use to which his son put them by no means removed this unpopularity. Coquillart described the military man of the period in his *Monologue du Gendarme Cassé.* Again, when the king entertained the idea of unifying the taxes and laws of the different provinces, Coquillart, who was named commissioner for this purpose, wrote on the occasion a satire called *Les Droits Nouveaux.* A certain kind of satire, much less good-tempered than the earlier satire, became indeed common at this epoch. M. Lenient has well pointed out that a new satirical personification dominates this literature. It is no longer Renart with his cynical gayety, or the curiously travestied and almost amiable Devil of the Middle Ages. Now it is Death as an incident ever present to the imagination, celebrated in the thousand repetitions of the Danse Macabre, sculptured all over the buildings of the time, even frequently performed on holidays and in public. All through the century, too, anonymous verse of the lighter kind was written, some of it of great merit. The folk-songs already alluded to, published by M. G. Paris, show one side of this composition, and many of the pieces contained in M. de Montaiglon's extensive *Recueil des Anciennes Poésies Françaises* exhibit others.

The 15th century was perhaps more remarkable for its achievements in prose than in poetry. It produced, indeed, no prose writer of great distinction, except perhaps Comines; but it witnessed serious, if not extremely successful efforts at prose composition. The invention of printing finally substituted the reader for the listener, and when this substitution has been effected, the main inducement to treat unsuitable subjects in verse is gone. The study of the classics at first hand contributed to the same end. As early as 1458 the university of Paris had a Greek professor. But before this time translations in prose had been made. Nicholas Oresme, the tutor of Charles V., gave a version of certain Aristotelian works, which enriched the language with a large number of terms, then strange enough, now familiar. Raoul de Presles turned into French the *De Civitate Dei* of St. Augustine. These writers and Charles himself composed *Le Songe du Vergier*, an elaborate discussion of the power of the pope. The famous chancellor, Jean Gerson (1363–1429), to whom the *Imitation* has among so many others been attributed, spoke constantly and wrote often in the vulgar tongue. Christine de Pisan and Alain Chartier were at least as much prose writers as poets; and the latter, while he, like Gerson, dealt much with the reform of the church, used in his *Quadriloge Invective* really forcible language for the purpose of spurring on the nobles of France to put an end to her sufferings and evils. These moral and didactic treatises were but continuations of others, which for convenience' sake we have hitherto left unnoticed. Though verse was in the centuries prior to the 15th the favorite medium for literary composition, it was by no means the only one; and moral and educational treatises—some referred to above—already existed in pedestrian phrase. Certain household books (*Livres de Raison*) have been preserved, some of which date as far back as the 13th century. These contain not merely accounts but family chronicles, receipts, and the like. Of the 14th century, we have a *Menagier de Paris*, intended for the instruction of a young wife, and a large number of miscellaneous treatises of art, science, and morality, while private letters, mostly as yet unpublished, exist in considerable numbers, and are generally of the moralizing character; books of devotion, too, are naturally frequent.

But the most important divisions of mediæval energy in prose composition are the spoken exercises of the pulpit and the bar. The latter has been hitherto somewhat neglected, though the recent history of M. Aubertin devotes special attention to it. The beginnings, however, of French sermons have been much discussed, especially the question whether St. Bernard, whose discourses we possess in ancient but doubtfully contemporary French, pronounced them in that language or in Latin.

Early sermon writers.

Towards the end of the 12th century, however, the sermons of Maurice de Sully (died 1196) present the first undoubted examples of homiletics in the vernacular, and they are followed by many others—so many indeed that the 13th century alone counts 261 sermon writers, besides a large body of anonymous work. These sermons were, as might indeed be expected, chiefly cast in a somewhat scholastic form—theme, exordium, development, example, and peroration following in regular order. The 14th century sermons, on the other hand, are little known, probably because no one has yet taken the trouble to investigate the manuscripts. It must, however, be remembered that this age, as the most famous of all for its scholastic illustrations, and for the early vigor of the Dominican and Franciscan orders, ought to yield favorable returns. With the end of the century and the beginning of the 15th, the importance of the pulpit begins to revive. The early years of the new age have Gerson for their representative, while the end of the century sees the still more famous names of Menot (1450–1518), Maillard (1440–1502), and Raulin (1443–1514), all remarkable for the practice of a vigorous and homely style of oratory, recoiling before no aid of what we should now-a-days style buffoonery, and manifesting a creditable indifference to the indignation of principalities and powers. Louis XI. is said to have threatened to throw Maillard into the Seine, and many instances of the boldness of these preachers and the rough vigor of their oratory have been preserved. Froissart had been followed as a chronicler by Monstrelet, and by the historiographers of the Burgundian court, Chastelain, already mentioned, and Olivier de la Marche. The memoir and chronicle writers, who were to be of so much importance in French literature, also begin to be numerous at this period. Juvenal des Ursins (1388–1473), an anonymous bourgeois de Paris (two such indeed), and the author of the *Chronique Scandaleuse*, may be mentioned as presenting the character of minute observation and record which has distinguished the class ever since.

Comines.

But Comines (1445–1509) is no imitator of Froissart or of any one else. The last of the quartette of great French mediæval historians, he does not yield to any of his three predecessors in originality or merit, but he is very different from them. He fully represents the mania of the time for statecraft, and his book has long ranked with that of Macchiavelli as a manual of the art. He is a painter of character rather than of scenes or events; he has very few prejudices or predilections; he gives us an early example of those Renaissance statesmen who looked at politics chiefly as a game in which means are connected with ends, without much, if any, reference to the goodness or badness of the one or the other. But he has not the absolutely non-moral character of the Italian, and he is sincerely religious in his way. His memoirs, considered merely as literature, show a style well suited to their purport,—not, indeed, brilliant or picturesque, but clear, terse, and thoroughly well suited to the expression of the acuteness, observation, and common sense of their author.

But prose was not content with the domain of serious literature. It had already long possessed a respectable position as a vehicle of romance, and the end of the 14th and the beginning of the 15th centuries were pre-eminently the times when the epics of chivalry were re-edited and extended in prose. Few, however, of these extensions offer much literary interest. On the other hand, the best prose of the century, and almost the earliest which deserves the title of a satisfactory literary medium, was employed for the telling of romances in miniature. The *Cent Nouvelles Nouvelles* is undoubtedly the first work of literary prose in French, and the first, moreover, of a long and most remarkable series of literary works, in which French writers may challenge all comers with the certainty of victory. The short prose tale of a comic character is the one French literary product the pre-eminence and perfection of which it is impossible to dispute, and the prose tale first appears to advantage in the *Cent Nouvelles Nouvelles*.

The Cent Nouvelles Nouvelles.

This remarkable work has usually been attributed, like the somewhat similar but later *Heptameron*, to a knot of literary courtiers gathered round a royal personage, in this case the dauphin Louis, afterwards Louis XI. Some evidence has recently been produced which seems to show that this tradition, which attributed some of the tales to Louis himself, is erroneous, but the question is still undecided. The subjects of the *Cent Nouvelles Nouvelles* are by no means new. They are simply the old themes of the fabliaux treated in the old way. The novelty is in the application of prose to such a purpose, and in the crispness, the fluency, and the elegance of the prose used.

Antoine de la Salle.

The fortunate author to whom these admirable tales have of late been attributed is Antoine de la Salle (1398–1461), who, if this attribution and certain others be correct, must be allowed to be one of the most original and fertile authors of early French literature. La Salle's one acknowledged work is the story of *Petit Jehan de Saintré*, a short romance exhibiting great command of character and abundance of delicate draughtsmanship. To this it is now proposed to add the *Cent Nouvelles Nouvelles;* and the still more famous and important work of *L'Avocat Patelin* has been assigned by respectable authority to the same paternity. The generosity of critics towards La Salle has not even stopped here. A fourth masterpiece of the period, *Les Quinze Joies du Mariage*, has also been assigned to him. This last work, like the other three, is satirical in subject, and shows for the time a wonderful mastery of the language. Of the fifteen joys of marriage, or, in other words, the fifteen miseries of husbands, each has a chapter assigned to it, and each is treated with the peculiar mixture of gravity and ridicule which it requires. All who have read the book confess its infinite wit and the grace of its style. It is true that it has been reproached with cruelty and with a lack of the moral sentiment. But humanity and morality were not the strong point of the 15th century. There is, it must be admitted, about most of its productions a lack of poetry and a lack of imagination. The hideous disorders of the Hundred Years' War had exasperated men's minds, and had at the same time accustomed them to suffer, to witness, and in too many cases to perpetrate outrage and injustice of all kinds. The glaring disregard of anything but their own private interest which actuated almost all those of the higher orders, from the great crown vassals and princes of the blood to the leaders of free companions and the owners of petty fortresses, disgusted the people.

Influence of the Renaissance.

The great schism of the West, and the scandals which accompanied it, shook their confidence, not merely in individual ecclesiastics, but in the whole theory and government of the church. The old forms of literature had lost their interest, and new ones possessing strength to last and power to develop themselves had not yet appeared. It was impossible, even if the taste for it had survived, to spin out any longer the old themes. The new learning was slowly soaking in; the discoveries of the navigators of the Iberian peninsula were opening up entirely new regions for speculation and inquiry; and, above all, the decay of scholasticism was dismissing the most active minds of the time from the old mill-horse round, and setting them free to speculate, at once with all the ardor of reaction and with the vigor, the acuteness, and the trained logical skill which scholasticism itself had given them. But all these new forces required some time to set to work and to avail themselves of the tremendous weapon which the press had put into their hands. Even from a strictly material point of view, the horrible devastation occasioned by the English wars required a long time of reparation and recovery. The time actually accorded was not very long, and much of it might have been far better spent than under the influence of such a monarch as Louis XI. This period of brief and disturbed repose was, moreover, followed by the Italian wars, in which the French meted to another and weaker nation much the same measure as the English had meted to them. But these wars, little justifiable in themselves, completed the good effect which the equally unjustifiable violence and treachery of Louis XI. had begun. They consolidated the nation, they gave it a common hope, object, and spirit; they opened the way to deeds of daring in which it took pride, in place of the indiscriminate, brutal, and irrational savagery which had begun with the Jacquerie, and hardly ended with the quarrels of the Burgundians and Armagnacs. Not only did the lower orders gain in wealth, position, intelligence, and culture by the disasters of their superiors, but there arose a new chivalry, not, indeed, more moral than the old, but more polished, more learned, and more disposed to produce and enjoy literature. Under all these circumstances, literature of a varied and vigorous kind became once more possible and, indeed, necessary, nor did it take long to make its appearance.

16th Century.—In no country was the literary result of the Renaissance more striking and more manifold than in France. The double effect of the study of antiquity and the religious movement produced an outburst of literary developments of the most diverse kinds, which even the fierce and sanguinary civil dissensions to which the Reformation gave rise did not succeed in checking. While the Renaissance in Italy had mainly exhausted its effects by the beginning of the 16th century, while in Germany those effects only paved the way for a national literature, and did not themselves greatly contribute thereto, while in England it was not till the extreme end of the period that a great literature was forthcoming,—in France almost the whole century was marked by the production of capital works in every branch of literary effort. Not even the 17th century, and certainly no other till our own day, can show such a group of prose writers and poets as is formed by Calvin, St. Francis de Sales, Montaigne, Du Vair, Bodin, D'Aubigné, the authors of the *Satire Menippée*, Monluc, Brantôme, Pasquier, Rabelais, Des Periers, Herberay des Essarts, Amyot, Garnier, Marot, Ronsard and the rest of the Pléiade, and finally Regnier. These great writers are not merely remarkable for the vigor and originality of their thoughts, the freshness, variety, and grace of their fancy, the abundance of their learning, and the solidity of their arguments in the cases where argument is required. Their great merit is the creation of a language and a style able to give expression to these good gifts. The foregoing account of the mediæval literature of France will have shown sufficiently that it is not lawful to despise the literary capacities and achievements of the older French. But the old language, with all its merits, was ill-suited to be a vehicle for any but the simpler forms of literary composition. Pleasant or affecting tales could be told in it with interest and pathos. Songs of charming naïveté and grace could be sung; the requirements of the epic and the chronicle were suitably furnished. But its vocabulary was limited, not to say poor; it was barren of the terms of art and science; it did not readily lend itself to sustained eloquence, to impassioned poetry, or to logical discussion. It had been too long accustomed to leave these things to Latin as their natural and legitimate exponent, and it bore marks of its original character as a *lingua rustica*, a tongue suited for homely conversation, for folk-lore and for ballads, rather than for the business of the forum and the court, the speculations of the study, and the declamation of the theatre. Efforts had indeed been made, culminating in the heavy and tasteless erudition of the schools of Chartier and Crétin, to supply the defect; but it was reserved for the 16th century completely to efface it. The series of prose writers from Calvin to Montaigne, of poets from Marot to Regnier, elaborated a language yielding to no modern tongue in beauty, richness, flexibility, and strength,—a language which the reactionary purism of succeeding generations defaced rather than improved, and the merits of which have in our own time been triumphantly vindicated by the confession and the practice of all the greatest writers of modern France.

Marot.

Ronsard.

The Pléiade.

16th Century Poetry.—The first few years of the 16th century were naturally occupied rather with the last developments of the mediæval forms than with the production of the new model. The clerks of the Bazoche and the Confraternity of the Passion still produced and acted mysteries, moralities, and farces. Crétin, Le Maire, and Meschinot wrote elaborate allegorical and rhetorical poetry. Chansons de gestes, rhymed romances, and fabliaux had long ceased to be written. But the press was multiplying the contents of the former in the prose form which they had finally assumed, and in the *Cent Nouvelles Nouvelles* there already existed admirable specimens of the short prose tale. The first note of the new literature was sounded by Clément Marot (1497–1544). The son of an elder poet Jehan des Mares called Marot, Clément at first wrote, like his father's contemporaries, allegorical and mythological poetry, afterwards collected in a volume with a charming title, *L'Adolescence Clémentine.* Born in 1497, it was not till he was nearly thirty years old that his work became really remarkable. From that time forward till his death, about twenty years afterwards, he was much involved in the troubles and persecutions of the Huguenot party to which he belonged; nor was the protection of Marguerite d'Angoulême, the chief patroness of Huguenots and men of letters always efficient. But his troubles, so far from harming, helped his literary faculties; and his epistles, epigrams, *blasons* (descendants of the mediæval *dits*), and *coq-à-l'âne* became remarkable for their easy and polished style, their light and graceful wit, and a certain elegance which had not as yet been even attempted in any modern tongue, though the Italian humanists had not been far from it in some of their Latin compositions. Around Marot arose a whole school of disciples and imitators, such as Roger de Collerye, Brodeau (died 1540), the great authority on rondeaux, Scève, a fertile author of blasons, Salel, Marguerite herself (1492–1549), of whom more hereafter, and Melin de St. Gelais (1486–1558), of whom the first and the last are the most remarkable. Collerye is a poet of poverty, like so many other French bards from Rutebœuf downwards; St. Gelais, son of a poetic bishop of the same name (Octavien de St. Gelais, 1465–1502), is a courtly writer of occasional pieces, who sustained as well as he could the *style Marotique* against Ronsard, and who has the credit of introducing the regular sonnet into French. But the inventive vigor of the age was so great that one school had hardly become popular before another pushed it from its stool. Pierre de Ronsard (1524–1585) was the chief of this latter. At first a courtier and a diplomatist, physical disqualification made him change his career. He began to study the classics under Daurat, and with his master and five other writers, Jodelle, Belleau, Dubellay, Baif, and Pontus de Tyard, composed the famous "Pléiade." The object of this band was to bring the French language, in vocabulary, constructions, and application, on a level with the classical tongues by unlimited borrowings from the latter. They were not far from turning the whole Latin dictionary into the French tongue. They would have imported the Greek license of compound words, though the genius of the French language is but little adapted thereto; and they wished to reproduce in French the regular tragedy, the Pindaric and Horatian ode, the Virgilian epic, etc. Being all men of the highest talent, and not a few of them men of great genius, they achieved much that they designed, and even where they failed exactly to achieve it, they very often indirectly produced results as important and more beneficial than those which they intended. Their ideal of a separate poetical language distinct from that intended for prose use was indeed a doubtful if not a dangerous one, and the wholesale Latinizing and Hellenizing of their mother tongue, by which they aimed at it, was still more dangerous and doubtful. But it is certain that Marot, while setting an example of elegance and grace not easily to be imitated, set also an example of trivial and, so to speak, pedestrian language which was only too imitable. If France was ever to possess a literature containing something besides fabliaux and farces, the tongue must be enriched and strengthened. This accession of wealth and vigor it received from Ronsard and the Ronsardists. Doubtless they went too far, and provoked to some extent the reaction which Malherbe led. Their importations were indiscriminate, and sometimes unnecessary. It is almost impossible to read the *Franciade* of Ronsard, and not too easy to read the tragedies of Jodelle and Garnier, fine as the latter are in parts. But the best of Ronsard's sonnets and odes, the finest of Dubellay's *Antiquités de Rome* (translated into English by Spenser), the exquisite *Vanneur* of the same author, and the *Avril* of Belleau, even the finer passages of D'Aubigné and Du Bartas, are not only admirable in themselves, and of a kind not previously found in French literature, but are also such things as could not have been previously found, for the simple reason that the medium of expression was wanting. They constructed that medium for themselves, and no force of the reaction which they provoked was able to undo their work. Adverse criticism and the natural course of time rejected much that they had added. The charming diminutives they loved so much went out of fashion; their compounds (for the most part, it must be confessed, justly) had their letters of naturalization promptly cancelled; many a gorgeous adjective, including some which could trace their pedigree to the earliest ages of French literature, but which bore an unfortunate likeness to the new comers, was proscribed. But for all that no language has ever had its destiny influenced more powerfully and more beneficially by a small literary clique than the language of France was influenced by the example and disciples of that Ronsard whom for two centuries it was the fashion for the Malherbes and the Boileaux, and those who took their cue from them, to deride and decry.

The Ronsardists.

Du Bartas.

D'Aubigné.

In a sketch such as the present it is impossible to give a separate account of individual writers, the more important of whom will be found treated under their own names. The effort of the Pléiade proper was continued and partaken by a considerable number of minor poets. Olivier de Magny (d. 1560) and Louise Labé (b. 1526) were poets and lovers, the lady deserving far the higher rank in literature. There is more depth of passion in the writings of "La Belle Cordière," as this Lyonnese poetess was called, than in almost any of her contemporaries. Jacques Tahureau (1527–1555) scarcely deserves to be called a minor poet. There is less than the usual hyperbole in the contemporary comparison of him to Catullus, and he reminds an Englishman of the school represented nearly a century later by Carew, Randolph, and Suckling, though he possesses a sincerity and truth superior to anything to be found in those poets. The title of a part of his poems—*Mignardises de l'Admirée*—is characteristic both of the style and of the time. Doublet, Jamyn (1540–1605), and Delataille (1528–1590) deserve mention at least as poets, but two other writers require a longer allusion. Du Bartas (1544–1590) whom Sylvester's translation, Milton's imitation, and the copious citations of Southey's *Doctor*, have made known if not familiar in England, was partly a disciple and partly a rival of Ronsard. His poem of *Judith* was eclipsed by his better known *La Divine Sepmaine* or epic of the Creation. Du Bartas was a great user and abuser of the double compounds alluded to above, but his style possesses much stateliness, and has a peculiar solemn eloquence which he shared with the other French Calvinists, and which was derived from the study partly of Calvin and partly of the Bible. D'Aubigné (1550–1630), like Du Bartas, was a Calvinist. His genius was of a more varied character. He wrote sonnets and odes as became a Ronsardist, but his chief poetical work is the satirical poem of *Les Tragiques*, in which the author brands the factions, corruptions, and persecutions of the time, and in which there are to be found alexandrines of a strength, vigor, and original cadence hardly to be discovered elsewhere save in Corneille and Victor Hugo. Towards the end of the century Desportes (1546–1606) and Bertaut (1552–1611), with much enfeebled strength, but with a certain grace, continue the Ronsardizing tradition. Among their contemporaries must be noticed Passerat (1534–1602), a writer of much wit and vigor and rather resembling Marot than Ronsard, and Vauquelin de la Fresnaye (1536–1606), the author of a valuable *Ars Poetica* and of the first French satires which actually bear that title. Jean le Houx (fl. *cir.* 1600) continued, re-wrote, or invented the vaux de vire, commonly known as the work of Olivier Basselin, and already alluded to. A curious poetical trio is also formed at this time by Guy du Faur de Pibrac (1529–1584), Antoine Faure (1557–1624), and Pierre Mathieu (b. 1563), all authors of moral quatrains, which were learnt by heart in the schools of the time, replacing the distichs of the grammarian Cato, which, translated into French, had served the same purpose in the Middle Ages.

Regnier.

The nephew of Desportes, Mathurin Regnier, marks the end, and at the same time perhaps the climax, of the poetry of the century. A descendant at once of the older Gallic spirit of Villon and Marot, in virtue of his consummate acuteness, terseness, and wit, of the school of Ronsard by his erudition, his command of language, and his scholarship, Regnier is perhaps the best representative of French poetry at the critical time when it had got together all its materials, had lost none of its native vigor and force, and had not yet submitted to the cramping and numbing rules and restrictions which the next century introduced. The satirical poems of Regnier, and especially the admirable epistle to Rapin, in which he denounces and rebuts the critical dogmas of Malherbe, are models of nervous strength, while some of the elegies and odes contain expression not easily to be surpassed of the softer feelings of affection and regret. No poet has had more influence on the revival of French poetry in the last half-century than Regnier.

Regular tragedy and comedy.

Garnier.

16th Century Drama.—The change which dramatic poetry underwent during the 16th century was at least as remarkable as that undergone by poetry proper. The first half of the period saw the end of the religious mysteries, the license of which had irritated both the parliament and the clergy. Louis XII., at the beginning of the century, was far from discouraging the disorderly but popular and powerful theatre in which the Confraternity of the Passion, the clerks of the Bazoche, and the Enfans sans Souci enacted mysteries, moralities, soties, and farces. He made them, indeed, an instrument in his quarrel with the papacy, just as Philippe le Bel had made use of the allegorical poems of Jehan de Meung and his fellows. Under his patronage were produced the chief works of Gringore (1474–1534), by far the most remarkable writer of this class of composition. His *Prince des Sots* and his *Mystère de St. Louis* are among the best of their kind. An enormous volume of composition of this class was produced between 1500 and 1550. One morality by itself, *L'homme juste et l'homme mondain*, contains some 36,000 lines. But in 1548, when the Confraternity was formally established at the Hôtel de Bourgogne, leave to play sacred subjects was expressly refused it. Moralities and soties dragged on under difficulties till the end of the century, and the farce is immortal. But the effect of the Renaissance was to sweep away all other vestiges of the mediæval drama, at least in the capital. An entirely new class of subjects, entirely new modes of treatment, and a different kind of performers were introduced. The change naturally came from Italy. In the close relationship with that country which France had during the early years of the century, Italian translations of the classical masterpieces were easily imported. Soon French translations were made afresh of the *Electra*, the *Hecuba*, the *Iphigenia in Aulis*, and the French humanists hastened to compose original tragedies on the classic model. It was impossible that the Pléiade should not eagerly seize such an opportunity of carrying out its principles, and one of its members, Jodelle (1532–1573), devoting himself mainly to dramatic composition, fashioned at once the first tragedy, *Cléopatre*, and the first comedy, *Eugène*, thus setting the example of the style of composition which for two centuries and a half Frenchmen were to regard as the highest effort of literary ambition. The amateur performance of these dramas by Jodelle and his friends was followed by a Bacchic procession after the manner of the ancients, which caused a great deal of scandal, and was represented by both Catholics and Protestants as a pagan orgie. The *Cléopatre* is remarkable as being the first French tragedy, nor is it destitute of merit. It is curious that in this first instance the curt antithetic στιχομυθία, which was so long characteristic of French plays and plays imitated from them, and which Butler ridicules in his *Dialogue of Cat and Puss*, already appears. There appears also the grandiose and smooth but stilted declamation which came rather from the imitation of Seneca than of Sophocles, and the tradition of which was never to be lost. *Cléopatre* was followed by *Didon*, which, unlike its predecessor, is entirely in alexandrines, and observes the regular alternation of masculine and feminine rhymes. Jodelle was followed by Grévin (1540–1570) with a *Mort de César*, which shows an improvement in dramatic art, by Jacques de la Taille and others, such as Pierre Mathieu, who is strongly moral, and Jean de la Taille brother of Jacques. A very different poet from all these is Robert Garnier (1545–1601). Garnier is the first tragedian who deserves a place not too far below Rotrou, Corneille, Racine, Voltaire, and Hugo, and who may be placed in the same class with them. He chose his subjects indifferently from classical, sacred, and mediæval literature. *Sédécie*, a play dealing with the capture of Jerusalem by Nebuchadnezzar, is held to be his masterpiece, and *Bradamante* deserves notice because it is the first tragi-comedy of merit in French, and because the famous confidant here makes his first appearance. Garnier's successor, Antoine de Monchrétien (d. 1621), set the example of dramatizing contemporary subjects. His masterpiece is *L'Écossaise*, the first of many dramas on the fate of Mary Queen of Scots. While tragedy thus clings closely to antique models, comedy, as might be expected in the country of the fabliaux, is more independent. Italy had already a comic school of some originality, and the French farce was too vigorous and lively a production to permit of its being entirely overlooked. The Pléiade and their imitators made en-

Larivey.

deavors, without much success, to write comedies on the classical model, but the first comic writer of great merit was Pierre Larivey (1540–1611) (Giunto), an Italian by descent. Most if not all of his plays are founded on Italian originals, but the adaptations are made with the greatest freedom, and deserve the title of original works. The style is admirable, and the skilful management of the action contrasts strongly with the languor, the awkward adjustment, and the lack of dramatic interest found in contemporary tragedians.

16th Century Prose Fiction.—Great as is the importance of the 16th century in the history of French poetry, its importance in the history of French prose is greater still. In poetry the Middle Ages could fairly hold their own with any of the ages that have succeeded them. The epics of chivalry whether of the cycles of Charlemagne, Arthur, or the classic heroes, not to mention the miscellaneous romans d'aventures, have indeed more than held their own. Both relatively and absolutely the *Franciade* of the 16th century, the *Pucelle* of the 17th, the *Henriade* of the 18th, cut a very poor figure beside *Roland* and *Percivale, Gerard de Roussillon*, and *Parthenopex de Blois*. The romances, ballads, and pastourelles, signed and unsigned, of mediæval France were not merely the origin, but in some respects the superiors, of the lyric poetry which succeeded them. Thibaut de Champagne, Charles d'Orléans, and Villon need not veil their crests in any society of bards. The charming forms of the rondel, the rondeau, and the ballade have won admiration from every competent poet and critic who has known them. The fabliaux give something more than promise of La Fontaine, and the two great compositions of the *Roman du Renart* and the *Roman de la Rose*, despite their faults and their alloy, will always command the admiration of all persons of taste and judgment who take the trouble to study them. But while poetry had in the Middle Ages no reason to blush for her French representatives, prose (always the younger and less forward sister) had far less to boast of. With the exception of chronicles and prose romances, no prose works of any real importance can be quoted before the end of the 15th century, and even then the chief if not the only place of importance must be assigned to the *Cent Nouvelles Nouvelles*, a work of admirable prose, but necessarily light in character, and not yet demonstrating the efficacy of the French language as a medium of expression for serious and weighty thought. Up to the time of the Renaissance and the consequent reformation, Latin had, as we have already remarked, been considered the sufficient and natural organ for this expression. In France as in other countries the disturbance in religious thought may undoubtedly claim the glory of having repaired this disgrace of the vulgar tongue, and of having fitted and taught it to express whatever thoughts the theologian, the historian, the philosopher, the politician, and the savant had occasion to utter. But the use of prose as a vehicle for lighter themes was more continuous with the literature that preceded, and serves as a natural transition from poetry and the drama to history and science. Among the prose writers, therefore, of the 16th century we shall give the first place to the novelists and romantic writers.

Rabelais.

Among these there can be no doubt of the precedence, in every sense of the word, of François Rabelais (1495?–1553). No detailed account can here be attempted of this extraordinary person, the one French writer whom critics the least inclined to appreciate the characteristics of French literature have agreed to place among the few great writers of the world, and not far from Shakespeare and Dante. Immense ingenuity and research have been spent on the task of determining the origin and indebtedness of *Gargantua* and *Pantagruel*. It is sufficient to say that their form is roughly that of a prose roman d'aventures, that *Gargantua* is taken in outline from a burlesque romance of the same name, and that Panurge, who rather than Pantagruel is the hero of the second part, has some resemblance to Cingar, a personage of the macaronic poem of the Italian, Merlinus Coccaius or Folengo. But the borrowings of Rabelais are of little more importance than the borrowings of Shakespeare. With an immense erudition representing almost the whole of the knowledge of his time, with an untiring faculty of invention, with the judgment of a philosopher, and the common sense of a man of the world, with an observation that let no characteristic of the time pass unobserved, and with a ten-fold portion of the special Gallic gift of good-humored satire, Rabelais united a height of speculation and depth of insight and a vein of poetical imagination rarely found in any writer, but altogether portentous when taken in conjunction with his other characteristics. His great work has been taken for an exercise of transcendental philosophy, for a concealed theological polemic, for an allegorical history of this and that personage of his time, for a merely literary utterance, for an attempt to tickle the popular ear and taste. It is all of these, and it is none,—all of them in parts, none of them in deliberate and exclusive intention. It may perhaps be called the exposition and commentary of all the thoughts, feelings, aspirations, and knowledge of a particular time and nation put forth in attractive literary form by a man who for once combined the practical and the literary spirit, the power of knowledge and the power of expression. The work of Rabelais is the mirror of the 16th century in France, reflecting at once its comeliness and its uncomeliness, its high aspirations, its voluptuous appetites, its political and religious dissensions, its keen criticism, its eager appetite and hasty digestion of learning, its gleams of poetry, and its ferocity of manners. In Rabelais we can divine the Pléiade and Marot, the *Cymbalum Mundi* and Montaigne, Amyot and the *Amadis*, even Calvin and Duperron; and if in this lengthy mention of the curate of Meudon we have broken through our principle of allotting only scanty notice to individual authors, his unique representative character must be pleaded in excuse.

Des Periers.

The Heptameron.

It was inevitable that such extraordinary works as *Gargantua* and *Pantagruel* should attract special imitators in the direction of their outward form. It was also inevitable that this imitation should frequently fix upon those Rabelaisian characteristics which are least deserving of imitation, and most likely to be depraved in the hands of imitators. It fell within the plan of the master to indulge in what has been called *fatrasie*, the huddling together, that is to say, of a medley of language and images which is best known to English readers in the not always successful following of Sterne. It pleased him also to disguise his naturally terse, strong, and nervous style in a burlesque envelope of redundant language, which is partly ironical, partly the result of superfluous erudition, and partly that of a certain childish wantonness and exuberance, which is one of his raciest and pleasantest characteristics. In both these points he was somewhat corruptly followed. But fortunately the romancical writers of the 16th century had not Rabelais for their sole model, but were also influenced by the simple and straightforward style of the *Cent Nouvelles Nouvelles* and the *Histoire des Sept Sages*. The joint influence gives us some admirable work. Nicholas of Troyes, a saddler of Champagne, came too early to copy Rabelais. But Noel du Fail (1520–1591), a judge at Rennes, shows the double influence in his *Propos Rustiques* and *Contes d'Eutrapel*, both of which are lively and well-written pictures of contemporary life and thought, as the country magistrate actually saw and dealt with them. In 1558, however, appeared two works of far higher literary and social interest. These are the *Heptameron* of the queen of Navarre, and the *Contes et Joyeux Devis* of Bonaventure des Periers (1500–1544). Des Periers, who was a courtier of Marguerite's, is thought to have had a good deal to do with the first-named work as well as with the second. Indeed, not merely the queen's prose works, but also the poems gracefully entitled *Les Marguerites de la Marguerite*, are often attributed to the literary men whom the sister of Francis I. gathered round her. However this may be, some single influence of power enough to give unity and distinctness of savor evidently presided over the composition of the *Heptameron*. Composed as it is on the model of Boccaccio, its tone and character are entirely different, and few works have a more individual charm. The *Tales* of Des Periers are shorter, simpler, and more homely; there is more wit in them and less refinement. But both works breathe more powerfully perhaps than any others the peculiar mixture of cultured and poetical voluptuousness with a certain religiosity and a vigorous spirit of action which characterizes the French Renaissance, and distinguishes it equally from the effeminate languor and mere bookishness of the earlier Italian movement and the more serious, sterner, and almost uncouth characteristics of the later poetical outburst in England. Later in time, but too closely connected with Rabelais in form and spirit to be here omitted, came the *Moyen de Parvenir* of Béroalde de Verville (1550–1612), a singular *fatrasie*, uniting wit, wisdom, learning, and indecency, and crammed with anecdotes which are always amusing though rarely decorous.

Amadis of Gaul.

At the same time a fresh vogue was given to the chivalric romance by Herberay's translation of *Amadis de Gaula*. French writers, relying partly on tradition and partly on a general assumption that the romance of chivalry is essentially French in origin, have supposed a French original for the *Amadis* in some lost roman d'aventures. It is of course impossible to say that this is not the case, but there is not one tittle of evidence to show that it is, and there seems no reason to doubt the accepted statement that Vasco de Lobeira wrote a lost Portuguese original in the 14th century, which Garciordoñez de Montalvo adapted in Spanish a century later. Montalvo found many continuators, and the adventures of Amadis were prolonged through generation after generation of his descendants. This vast work Herberay in 1540 undertook to translate or re-translate, but it was not without the assistance of several followers that the task was completed. Southey has charged Herberay with corrupting the simplicity of the original, a charge which does not concern us here. It is sufficient to say that the French *Amadis* is an excellent piece of literary work, and that Herberay deserves no mean place among the fathers of French prose. His book had an immense popularity; it was translated into many foreign languages, and for some time it served as a favorite reading book for foreigners studying French. Nor is it to be doubted that the romancers of the Scudéry and Calprenède type in the next century were much more influenced both for good and harm by these Amadis romances than by any of the earlier tales of chivalry.

16th Century Historians.—As in the case of the tale-tellers so in that of the historians, the writers of the 16th century had traditions to continue. It is doubtful indeed whether many of them can risk comparison as artists with the great names of Villehardouin and Joinville, Froissart and Comines. The 16th century, however, set the example of dividing the functions of the chronicler, setting those of the historian proper on one side, and of the anecdote-monger and biographer on the other. The efforts at regular history made in this century were not of the highest value. But on the other hand the practice of memoir-writing, in which the French were to excel every nation in the world, and of literary correspondence, in which they were to excel even their memoirs, was solidly founded.

One of the earliest historical writers of the century was Claude de Seyssel (1450–1520), whose history of Louis XII. aims not unsuccessfully at style. But it is not till close upon the end of the century that much effort was made at methodical history. Only one work falls properly to be mentioned here, and that is Du Haillan's (1537–1610) *Histoire de France*, a history composed on Thucydidean principles, but Thucydidean principles transmitted through the successive mediums of Polybius, Guicciardini, and Paulus Æmilius. The instance invariably quoted after Thierry of Du Haillan's method is his introduction, with appropriate speeches of two Merovingian statesmen, who argue out the relative merits of monarchy and oligarchy on the occasion of the election of Pharamond. Besides Du Haillan, La Popelinière (fl. 1580), who less ambitiously attempted a history of Europe during his own time, and expended immense labor on the collection of information and materials, deserves mention.

Brantôme.

There is no such poverty of writers of memoirs. La Mark Du Bellay, Marguerite d'Angoulême, Villars, Tavannes, La Tour d'Auvergne, and many others, composed commentaries and autobiographies. Vincent Carloix (fl. 1550), the secretary of the Marshal de Vielleville, composed some memoirs abounding in detail and incident. But there are four collections of memoirs concerning this time which far exceed all others in interest and importance. The turbulent dispositions of the time, the loose dependence of the nobles and even the smaller gentry on any single or central authority, the rapid changes of political situations, and the singularly active appetite, both for pleasure and for business, for learning and for war, which distinguished the French gentleman of the 16th century, place the memoirs of Lanoue (1531–1591), Monluc (1503–1577), D'Aubigné, and Brantôme (1540–1614) almost at the head of the literature of their class. The name of the latter, indeed, is known to all who have the least tincture of French literature, and the works of the others are not inferior in interest, and perhaps superior in spirit and conception, to the *Dames Galantes*, the *Grands Capitaines*, and the *Hommes Illustres*. The commentaries of Monluc, which Henri Quatre is said to have called the soldier's Bible, are exclusively military, and deal with affairs only. Monluc was governor in Guienne, where he repressed the savage Huguenots of the south with a savagery worse than their own. He was, however, a partisan of order, not of Catholicism. He hung and shot both parties with perfect impartiality, and refused to have anything to do with the massacre of St. Bartholomew. Though he was a man of no learning, his style is excellent, being vivid, flexible, and straightforward. Lanoue, who was a moderate in politics, has left his principles reflected in his memoirs. D'Aubigné, so often to be mentioned, gives the extreme Huguenot side as opposed to the royalist partisanship of Monluc and the *via media* of Lanoue. Brantôme, on the other hand, is quite free from any political or religious prepossessions, and, indeed, troubles himself very little about any such matters. He is the shrewd and somewhat cynical observer, moving through the crowd and taking note of its ways, its outward appearance, its heroisms, and its follies. It is really difficult to say whether the recital of a noble deed of arms or the telling of a scandalous story about a court lady gave him the most pleasure, and impossible to say which he did best. Certainly he had ample material for both exercises in the history of his time.

The branches of literature of which we have just given an account may be fairly connected, from the historical point of view, with work of the same kind that went before as well as with work of the same kind that followed them. It was not so with the literature of theology, law, politics, and erudition, which the 16th century also produced, and with which it for the first time enlarged the range of composition in the vulgar tongue. Not only had Latin been invariably adopted as the language of composition on such subjects, but the style of the treatises dealing with such matters had been traditional rather than original. In speculative philosophy or metaphysics proper, even this century did not witness a great development; perhaps, indeed, such a development was not to be expected until the minds of men had in some degree settled down from their agitation on more practical matters. It is not without significance that Calvin (1509–1564) is the great figure in serious French prose in the first half of the century, Montaigne the corresponding figure in the second half. After Calvin and Montaigne we expect Descartes.

Calvin.

16th Century Theologians.—In France, as in all other countries, the Reformation was an essentially popular movement, though from special causes, such as the absence of political homogeneity, the nobles took a more active part both with pen and sword in it than was the case in England. But the great text-book of the French Reformation was not the work of any noble. Calvin's *Institution of the Christian Religion* is a book equally remarkable in matter and in form, in circumstances and in result. It is the first really great composition in argumentative French prose. Its severe logic and careful arrangement had as much influence on the manner of future thought, both in France and the other regions whither its widespread popularity carried it, as its style had on the expression of such thought. It was the work of a man of only seven-and-twenty, and it is impossible to exaggerate the originality of its manner when we remember that hardly any models of French prose then existed except tales and chronicles, which required and exhibited totally different qualities of style. It is indeed probable that had not the *Institution* been first written by its author in Latin, and afterwards translated by him, it might have had less dignity and vigor; but it must at the same time be remembered that this process of composition was at least equally likely in the hands of any but a great genius to produce a heavy and pedantic style neither French nor Latin in character. Something like this result was actually produced in some of Calvin's minor works, and still more in the works of many of his followers, whose lumbering language gained for itself, in allusion to their exile from France, the title of "style refugié." Nevertheless, the use of the vulgar tongue on the Protestant side, and the possession of a work of such importance written therein, gave the Reformers an immense advantage which their adversaries were some time in neutralizing. Calvin was much helped by Pierre Viret (1511–

1571), who wrote a large number of small theological and moral dialogues, and of satirical pamphlets, destined to captivate as well as to instruct the lower people. The more famous Beza (1519–1605) wrote chiefly in Latin, but he composed in French an ecclesiastical history of the Reformed churches and some translations of the Psalms. Marnix de St. Aldegonde (1530–1593), a gentleman of Brabant, followed Viret as a satirical pamphleteer on the Protestant side. On the other hand, the Catholic champions at first affected to disdain the use of the vulgar tongue, and their pamphleteers, when they did attempt it, were unequal to the task. Towards the end of the century a more decent war was waged with Du Plessis Mornay (1549–1623) on the Protestant side, whose work is at least as much directed against freethinkers and enemies of Christianity in general as against the dogmas and discipline of Rome. His adversary, the redoubtable Cardinal du Perron (1556–1618), who, originally a Calvinist, went over to the other side, employed French most vigorously in controversial works, chiefly with reference to the eucharist. Du Perron was celebrated as the first controversialist of the time, and obtained dialectical victories over all comers. At the same time the bishop of Geneva, St. Francis of Sales (1568–1622), supported the Catholic side, partly by controversial works, but still more by his devotional writings. The *Introduction to a Devout Life*, which, though actually published early in the next century, had been written some time previously, shares with Calvin's *Institution* the position of the most important theological work of the period, and is in remarkable contrast with it in style and sentiment as well as in principles and plan. It has indeed been accused of a certain effeminacy, the appearance of which is in all probability mainly due to this very contrast. The 16th century does not, like the 17th, distinguish itself by literary exercises in the pulpit. The furious preachers of the League, and their equally violent opponents, have no literary value.

Montaigne.

16th Century Moralists and Political Writers.—The religious dissensions and political disturbances of the time could not fail to exert an influence on ethical and philosophical thought. Yet, as we have said, the century was not prolific of pure philosophical speculation. The scholastic tradition, though long sterile, still survived, and with it the habit of composing in Latin all works in any way connected with philosophy. The logic of Ramus in 1555 is cited as the first departure from this rule. Other philosophical works are few, and chiefly express the doubt and the freethinking which were characteristic of the time. This doubt assumes the form of positive religious scepticism only in the *Cymbalum Mundi* of Bonaventure des Periers, a remarkable series of dialogues which excited a great storm, and ultimately drove the author to commit suicide. The *Cymbalum Mundi* is a curious anticipation of the 18th century. The literature of doubt, however, was to receive its principal accession in the famous essays of Montaigne (1533–1592). It would be a mistake to imagine the existence of any sceptical propaganda in this charming and popular book. Its principle is not scepticism but egotism; and as the author was profoundly sceptical, this quality necessarily rather than intentionally appears. We have here to deal only very superficially with this as with other famous books, but it cannot be doubted that it expresses the mental attitude of the latter part of the century as completely as Rabelais expresses the mental attitude of the early part. There is considerably less vigor and life in this attitude. Inquiry and protest have given way to a placid conviction that there is not much to be found out, and that it does not much matter; the erudition though abundant is less indiscriminate, and is taken in and given out with less gusto; exuberant drollery has given way to quiet irony; and though neither business nor pleasure is decried, they are regarded rather as useful pastimes incident to the life of man than with the eager appetite of the Renaissance. From the purely literary point of view, the style is remarkable from its absence of pedantry in construction, and yet for its rich vocabulary and picturesque brilliancy. The follower and imitator of Montaigne, Pierre Charron (1541–1603), carried his master's scepticism to a somewhat more positive degree. His principal book, *De la Sagesse*, scarcely deserves the comparative praise which Pope has given it. On the other hand Du Vair (1556–1621), a lawyer and orator, takes the positive rather than the negative side in morality, and regards the vicissitudes in human affairs from the religious and teleological point of view in a series of works written in a style less diffuse than that of Montaigne, and characterized by the special merits which the style of great orators often though not always has when they betake themselves to literary composition.

The revolutionary and innovating instinct which showed itself in the 16th century with reference to church government and doctrine, and even in some respects with regard to religious principles generally, spread naturally enough to political matters. The intolerable misgovernment which prevailed during the greater part of the century in France in consequence of religious dissensions, naturally set the thinkers of the age speculating on the doctrines of government in general. The favorite and general study of antiquity helped this tendency, and the great accession of royal power in all the monarchies of Europe invited a speculative if not a practical reaction. The persecutions of the Protestants naturally provoked a republican spirit among them, and the violent antipathy of the League to the houses of Valois and Bourbon made its partisans adopt almost openly the principles of democracy and tyrannicide.

Bodin.

The greatest political writer of the age is Jean Bodin (1550–1596), whose *République* is founded partly on speculative considerations like the political theories of the ancients, and partly on an extended historical inquiry. Bodin, like most lawyers who have taken the royalist side, is for unlimited monarchy, but notwithstanding this, he condemns religious persecution and discourages slavery. In his speculations on the connection between forms of government and natural causes, he serves as a link between Aristotle and Montesquieu. On the other hand, the causes which we have mentioned made a large number of writers adopt opposite conclusions. Étienne de la Boétie (1530–1563), the friend of Montaigne's youth, composed the *Contre Un* or *Discours de la Servitude Volontaire*, a protest against the monarchical theory. The boldness of the protest and the affectionate admiration of Montaigne, have given La Boétie a much higher reputation than any extant work of his actually deserves. The *Contre Un* is a kind of prize essay, full of empty declamation borrowed from the ancients, and showing no grasp of the practical conditions of politics. Not much more historically based, but far more vigorous and original, is the *Franco-Gallia* of Hotmann, a work which appeared both in Latin and French, which extols the authority of the states-general, and represents them as direct successors of the political institutions of Gauls and Franks. In the last quarter of the century political animosity knew no bounds. The Protestants beheld a divine instrument in Poltrot de Méré, the Catholics in Jacques Clément. The Latin treatises of Languet and Buchanan formally vindicated the first the right of rebellion, the second the right of tyrannicide. Indeed, as Montaigne confesses, divine authorization for political violence was claimed and denied by both parties according as the possession or the expectancy of power belonged to each, and the excesses of the preachers and pamphleteers knew no bounds.

Satire Menippée.

Every one, however, was not carried away. The literary merits of the Chancellor l'Hôpital (1503–1575) are not very great, but his efforts to promote peace and moderation were unceasing. On the other side Lanoue, with far greater literary gifts, pursued the same ends, and pointed out the ruinous consequences of continued dissension. Du Plessis Mornay took a part in political discussion even more important than that which he bore in religious polemics, and was of the utmost service to Henri Quatre in defending his cause against the League, as was also Hurault, another author of state papers. Du Vair, already mentioned, powerfully assisted the same cause by his successful defence of the Salic law, the disregard of which by the Leaguer states-general was intended to lead to the admission of the Spanish claim to the crown. But the foremost work against the League was the famous *Satire Menippée*, in a literary point of view one of the most remarkable of political works. The *Menippée* was the work of no single author, but was due, it is said, to the collaboration of five, Leroi, Gillot, Chrétien, Rapin, and Pithou, with some assistance in verse from Passerat. The book is a kind of burlesque report of the meeting of the states-general, called for the purpose of supporting the views of the League in 1593. It gives an account of the procession of opening, and then we have the supposed speeches of the principal characters,—the Duc de Mayenne, the papal legate, the rector of the university (a ferocious Leaguer), and others. But by far the most remarkable is that attributed to Claude d'Aubray, the leader of the *Tiers État*, in which all the evils of the time and the malpractices of the leaders of the League are exposed and branded. The satire is extraordinarily bitter and yet perfectly good-humored. It resembles in character rather that of Butler, who unquestionably imitated it, than any other. The style is perfectly suited to the purpose, having got rid of almost all vestiges of the cumbrousness of the older tongue without losing its picturesque quaintness. It is no wonder that, as we are told by contemporaries, it did more for Henri Quatre than all other writings in his cause. In connection with politics some mention of legal orators and writers may be necessary. In 1539 the ordinance of Villers-Cotterets enjoined the exclusive use of the French language in legal procedure. The bar and bench of France during the century produced, however, besides those names already mentioned in other connections, only one deserving of special notice, that of Étienne Pasquier, author of a celebrated speech against the right of the Jesuits to take part in public teaching. This he inserted in his great work, *Recherches de la France*, a work dealing with almost every aspect of French history whether political, antiquarian, or literary.

16th Century Savants.—One more division, and only one, that of scientific and learned writers pure and simple, remains. Much of the work of this kind during the period was naturally done in Latin, the vulgar tongue of the learned. But in France, as in other countries, the study of the classics led to a vast number of translations, and it so happened that one of the translators deserves as a prose writer a rank among the highest. Many of the authors already mentioned contributed to the literature of translation. Des Periers translated the Platonic dialogue *Lysis*, La Boétie some works of Xenophon and Plutarch, Du Vair the *De Corona*, the *In Ctesiphontem*, and the *Pro Milone*. Salel attempted the *Iliad*, Belleau the false *Anacreon*, Baif some plays of Plautus and Terence. Besides these Lefevre gave a version of the Bible, Saliat one of Herodotus, and Louis Leroi, not to be confounded with the part author of the Menippée, many works of Plato, Aristotle, and other Greek writers. But while most if not all of these translators owed the merits of their work to their originals, and deserved, much more deserve, to be read only by those to whom those originals are sealed, Jacques Amyot (1513–1591), bishop of Auxerre, takes rank as a French classic by his translations of Plutarch, Longus, and Heliodorus. The admiration which Amyot excited in his own time was immense. Montaigne declares that it was thanks to him that his contemporaries knew how to speak and to write, and the Academy in the next age, though not too much inclined to honor its predecessors, ranked him as a model. His Plutarch, which had an enormous influence at the time, and colored perhaps more than any classic the thoughts and writings of the 16th century, both in French and English, was then considered his masterpiece. Now-a-days perhaps, and from the purely literary standpoint, that position would be assigned to his exquisite version of the exquisite story of Daphnis and Chloe. It is needless to say that absolute fidelity and exact scholarship are not the pre-eminent merits of these versions. They are not philological exercises, but works of art. We have already had occasion to mention Jean le Maire des Belges. His *Illustrations des Gaules* is an antiquarian rather than an historical work, which assembles or invents a mass of fables about the origin of Franks and Gauls, and a group of antiquarian writers of the history of different provinces followed his lead. On the other hand, Claude Fauchet, in two antiquarian works *Antiquités Gauloises et Françoises* and *L'Origine de la Langue et de la Poésie Française*, displays a remarkable critical faculty in sweeping away these fables. Fauchet had the (for his time) wonderful habit of consulting manuscripts, and we owe to him literary notices of many of the trouvères. At the same time La Croix du Maine and Duverdier founded the study of bibliography in France. Pasquier's *Recherches*, already alluded to, carries out the principles of Fauchet independently, and besides treating the history of the past in a true critical spirit, supplies us with voluminous and invaluable information on contemporary politics and literature. He has, moreover, the merit which Fauchet had not, of being an excellent writer. Henri Étienne also deserves notice in this place, both for certain treatises on the French language, full of critical crotchets, and also for his curious *Apologie pour Hérodote*, a remarkable book not particularly easy to class. It consists partly of a defence of its nominal subject, partly of satirical polemics on the Protestant side, and is filled almost equally with erudition and with the buffoonery and *fatrasie* of the time. The book, indeed, was much too Rabelaisian to suit the tastes of those in whose defence it was composed.

Amyot.

The 16th century is somewhat too early for us to speak of science, and such science as was then composed falls for the most part outside French literature. The famous potter, Palissy (1510–1589), however, was not much less skilful as a fashioner of words than as a fashioner of pots, and his description of the difficulties of his experiments in enamelling, which lasted sixteen years, is well known. The great surgeon Ambrose Paré (1510–1590) was also a writer, and his descriptions of his military experiences at Turin, Metz, and elsewhere have all the charm of the 16th century memoir. The only other writer who requires special mention is Olivier de Serres (1539-1619), an author who treated on agriculture, and composed, under the title of *Théâtre d'Agriculture*, a complete treatise on the various operations of rural economy, which became extremely popular, and was frequently reprinted up to the present century.

17th Century Poetry.—It is not always easy or possible to make the end or the beginning of a literary epoch synchronize exactly with historical dates. It happens, however, that for once the beginning of the 17th century coincides almost exactly with an entire revolution in French literature. The change of direction and of critical standard given by Malherbe (1556–1628) to poetry was to last for two whole centuries, and to determine, not merely the language and complexion, but also the form of French verse during the whole of that time. Accidentally, or as a matter of logical consequence (it would not be proper here to attempt to decide the question), poetry became almost synonymous with drama. It is true, as we shall have to point out, that there were, in the early part of the 17th century at least, poets, properly so called, of no contemptible merit. But their merit, in itself respectable, sank in comparison with the far greater merit of their dramatic rivals. Théophile de Viau and Racan, Voiture and St. Amand, cannot for a moment be mentioned in the same rank with Rotrou, still less with Corneille. It is certainly curious, if it is not something more than curious, that this decline in poetry proper should have coincided with the so-called reforms of Malherbe. The tradition of respect for this elder and more gifted Boileau was at one time all-powerful in France, and, notwithstanding the romantic movement, is still strong. In rejecting a large number of the importations of the Ronsardists, he certainly did good service. But it is difficult to avoid ascribing in great measure to his influence the origin of the chief faults of modern French poetry, and modern French in general, as compared with the older language. Like Pope, he sacrified everything to "correctness," and, unluckily for French, the sacrifice was made at a time when no writer of an absolutely supreme order had yet appeared in the language. With Shakespeare and Milton, not to mention scores of writers only inferior to them, safely garnered, Pope and his followers could do us little harm. Corneille and Molière unfortunately came after Malherbe. Yet it would be unfair to this writer, however badly we may think of his influence, to deny him talent, and even a certain amount of poetical inspiration. He had not felt his own influence, and the very influences which he despised and proscribed produced in him much tolerable and some admirable verse, though he is not to be named as a poet with Regnier, who had the courage, the sense, and the good taste to oppose and ridicule his innovations. Of Malherbe's school which was numerous, Racan (1589–1670) and Maynard (1582–1646) were the most remarkable. The former was a true poet, though not a very strong one. Like his master, he is best when he follows the models whom that master contemned. Perhaps more than any other poet, he set the example of the classical alexandrine, the smooth and melodious but monotonous and rather effeminate measure which Racine was to bring to the highest perfection, and which his successors, while they could not improve its smoothness, were to make more and more monotonous until the genius of Victor Hugo once more broke up its facile polish, suppled its stiff uniformity, and introduced vigor, variety, color, and distinctness in the place of its feeble-

Malherbe.

sameness and its pale indecision. But the vigor, not to say the license, of the 16th century could not thus die all at once. In Théophile de Viau (1590–1626) the early years of the 17th century had their Villon. The later poet was almost as unfortunate as the earlier, and almost as disreputable, but he had a great share of poetical power. The *étoile enragée* under which he complains that he was born, was at least kind to him in this respect; and his readers, after he had been forgotten for two centuries, have once more done him justice. Racan and Théophile were followed in the second quarter of the century by two schools which sufficiently well represented the tendencies of each. The first was that of Voiture (1598–1648), Benserade (1612–1691), and other poets who were connected more or less with the famous literary coterie of the Hôtel de Rambouillet. Théophile was less worthily succeeded by a class, it can hardly be called a school, of poets, some of whom, like St. Amand (1594–1660), chiefly wrote drinking songs and such like productions; others, like Scarron (1610–1660) and Sarrasin (1603–1654), devoted themselves rather to burlesque of serious verse. Most of the great dramatic authors of the time also wrote miscellaneous poetry, and there was even an epic school of the most singular kind, in ridiculing and discrediting which Boileau for once did undoubtedly good service. The *Pucelle* of Chapelain (1595–1674), the unfortunate author who was deliberately trained and educated for a poet, who enjoyed for some time a sort of dictatorship in French literature on the strength of his forthcoming work, and at whom from the day of its publication every critic of French literature has agreed to laugh, was the most famous and perhaps the worst of these. But Scudéry (1601–1667) wrote an *Alaric*, the Père le Moyne (1602–1671) a *St. Louis*, and St. Amand a *Moïse*, which are not much better, though Théophile Gautier in his *Grotesques* has valiantly defended these and other contemporary versifiers. St. Amand, indeed, was capable of writing excellent poetry in other styles, and not seldom actually produced such. Some of the lighter poets and classes of poetry just alluded to also produced some remarkable verse. The Précieuses of the Hôtel Rambouillet, with all their absurdities, encouraged if they did not produce good literary work. In their society there is no doubt that a great reformation of manners took place, if not of morals, and that the tendency to literature elegant and polished, yet not destitute of vigor, which marks the 17th century, was largely developed side by side with much scandalmongering and anecdotage. Many of the authors whom these influences inspired, such as Voiture, St. Evremond, and others, have been or will be noticed. But even such poets and wits as Sénecé (1643–1737), Segrais (1624–1701), Charleval, Godeau (1605–1672), Gombaud (1570–1666), are not without interest in the history of literature; while if Cotin (1604–1682) sinks below this level, Ménage (1630–1692) certainly rises above it, notwithstanding Molière's satire. Ménage's name naturally suggests the *Ana* which arose at this time and were long fashionable, stores of endless gossip, sometimes providing instruction and often amusement. The *Guirlande de Julie*, in which most of the poets of the time celebrated Julie d'Angennes, daughter of the Marquise, is perhaps the best of all such albums, and Voiture, the typical poet of the coterie, was certainly the best writer of *vers de société* who is known to us. The poetical war which arose between the Uranistes, the followers of Voiture, and the Jobistes, those of Benserade, produced reams of sonnets, epigrams, and similar verses. This habit of occasional versification continued long. It led as a less important consequence to the rhymed *Gazettes* of Loret, which recount in octosyllabic verse of a light and lively kind the festivals and court events of the early years of Louis XIV. It led also to perhaps the most remarkable non-dramatic poetry of the century, the *Contes* and *Fables* of La Fontaine (1621–1695). No French writer is better known than La Fontaine, and there is no need to dilate on his merits. It has been well said that he completes Molière, and that the two together give something to French literature which no other literature possesses. Yet La Fontaine is after all only a writer of fabliaux, in the language and with the manners of his own century.

Boileau.

All the writers we have mentioned belong more or less to the first half of the century, and so do Conrart, Furetière, Chapelle, Desmarets, and others not worth special mention. The latter half of the century is far less productive, and the poetical quality of its production is even lower than the quantity. In it Boileau (1636–1711) is the chief poetical figure. Next to him can only be mentioned Madame Deshoulières (1638–1694), Brébeuf, the translator of Lucan, Quinault (1655–1688), the composer of opera libretti. It is almost impossible to call either of these writers poets, with the doubtful exception of Quinault. The denunciation of Boileau as a versifier whose best verses are those of a promising sixth-form boy, and his worst those of an unpromising boy in the third form, is not epigram or exaggeration. His satire, where it has much merit, is usually borrowed direct from Horace. He had a certain faculty as a critic of the slashing order, and might have profitably used it if he had written in prose. But of his poetry it must be said, not so much that it is bad, as that it is not poetry at all, and the same is generally true of all those who followed him, with the possible exception of J. B. Rousseau, from Chaulieu (1639–1720) and La Fare (1644–1712) to Delille (1738–1813) and Le Brun (1729–1807).

Hardy.

Rotrou.

17th Century Drama.—We have already seen how the mediæval theatre was formed, and how in the second half of the 16th century it met with a formidable rival in the classical drama of Jodelle and Garnier. In 1588 mysteries had been prohibited, and with the prohibition of the mysteries the Confraternity of the Passion lost the principal part of its reason for existence. The other bodies and societies of amateur actors had already perished, and at length the Hôtel de Bourgogne itself, the home of the confraternity, had been handed over to a regular troop of actors, while companies of strollers, whose life has been vividly depicted in the *Roman Comique* of Scarron and the *Capitaine Fracasse* of Théophile Gautier, wandered all about the provinces. The old farce was for a time maintained or revived by Tabarin, a remarkable figure in dramatic history, of whom but little is known. The great dramatic author of the first quarter of the 17th century was Alexandre Hardy (1560–1631), who surpassed even Heywood in fecundity, and very nearly approached the portentous productiveness of Lope de Vega. Seven hundred is put down as the modest total of Hardy's pieces, but not much more than a twentieth of these exist in print. From these latter we can judge Hardy. They are hardly up to the level of the worst specimens of the contemporary Elizabethan theatre, to which, however, they bear a certain resemblance. Marston's *Insatiate Countess* and the worst parts of Chapman's *Bussy d'Ambois* may give English readers some notion of them. Yet Hardy was not totally devoid of merit. He imitated and adapted Spanish literature, which was at this time to France what Italian was in the century before and English in the century after, in the most indiscriminate manner. But he had a considerable command of grandiloquent and melodramatic expression, a sound theory if not a sound practice of tragic writing, and that peculiar knowledge of theatrical art and of the taste of the theatrical public which since his time has been the special possession of the French playwright. It is instructive to compare the influence of his irregular and faulty genius with that of the regular and precise Malherbe. From Hardy to Rotrou is, in point of literary interest, a great step, and from Rotrou to Corneille a greater. Yet the theory of Hardy only wanted the genius of Rotrou and Corneille to produce the latter. Rotrou (1609–1650) has been called the French Marlowe, and there is a curious likeness and yet a curious contrast between the two poets. The best parts of Rotrou's two best plays, *Venceslas* and of *Genest*, are quite beyond comparison in respect of anything that preceded them, and the central speech of the last-named play will rank with anything in French dramatic poetry. We must, despite the necessity of excluding personal details from this article, add that the noble personal character of this little known French dramatist, his generous acknowledgment of Corneille, who succeeded and surpassed him, and the devotion with which he sacrificed his life to his official duty, are almost as admirable as his works. Contemporary with Rotrou were other dramatic writers of considerable dramatic importance, most of them distinguished by the faults of the Spanish school, its declamatory rhodomontade, its conceits, and its occasionally preposterous action. Jean de Schélandre (d. 1635) has left us a remarkable work in *Tyr et Sidon*. Théophile de Viau in *Pyrame et Thisbé* and in *Pasiphaé* produced a singular mixture of the classicism of Garnier and the extravagances of Hardy. Scudéry in *L'Amour Tyrannique* and other plays achieved a considerable success. The *Marianne* of Tristan (1601–1655) and the *Sophonisbe* of Mairet (1604–1688) are the chief pieces of their authors. Mairet resembles Marston in something more than his choice of subject. Another dramatic writer of some eminence is Du Ryer (1605–1648). But the fertility of France at this moment in dramatic authors was immense; nearly 100 are enumerated in the first quarter of the century. **Corneille.** The early plays of Corneille (1606–1684) showed all the faults of his contemporaries combined with merits to which none of them except Rotrou, and Rotrou himself only in part, could lay claim. His first play was *Mélite*, a comedy, and in *Clitandre*, a tragedy, he soon produced what may perhaps be not inconveniently taken as the typical piece of the school of Hardy. A full account of Corneille may be found elsewhere. It is sufficient to say here that his importance in French literature is quite as great in the way of influence and example as in the way of intellectual excellence. The *Cid* and the *Menteur* are respectively the first examples of French tragedy and comedy which can be called modern. But this influence and example did not at first find many imitators. Corneille was a member of Richelieu's band of five poets. Of the other four Rotrou alone deserves the title; the remaining three, Boisrobert, Colletet, and Lestoile, are as dramatists worthy of no notice, nor were they soon followed by others more worthy. Yet before many years had passed the examples which Corneille had set in tragedy and in comedy were followed up by unquestionably the greatest comic writer, and by one who long held the position of the greatest tragic writer of France. **Molière.** Beginning with mere farces of the Italian type, and passing from these to comedies still of an Italian character, it was in *Les Précieuses Ridicules*, acted in 1659, that Molière (1622-1673), in the words of a spectator, hit at last on "la bonne comédie." The next fifteen years comprise the whole of his best known work, the finest expression beyond doubt of a certain class of comedy that any literature has produced. **Racine.** The tragic masterpieces of Racine (1639–1699) were not far from coinciding with the comic masterpieces of Molière, for with the exception of the remarkable aftergrowth of *Esther* and *Athalie*, they were produced chiefly between 1667 and 1677. Both Racine and Molière fall into the class of writers who require separate mention. Here we can only remark that both to a certain extent committed, and, which is still more to our purpose, set the example of a fault which distinguished much subsequent French dramatic literature. This was the too great individualizing of one point in a character, and the making the man or woman nothing but a blunderer, a lover, a coxcomb, a tyrant, and the like. The very titles of French plays show this influence,—they are "Le Grondeur," "Le Joueur," etc. The complexity of human character is ignored. This fault distinguishes both Molière and Racine from writers of the very highest order; and in especial it distinguishes the comedy of Molière and the tragedy of Racine from the comedy and tragedy of Shakespeare. In all probability this and other defects of the French drama, which are not wholly apparent in the work of Molière and Corneille, are shown in their most favorable light in those of Racine, and appear in all their deformity in the successors of the latter, arise from the rigid adoption of the Aristotelian theory of the drama with its unities and other restrictions, especially as transmitted by Horace through Boileau. **The Academy.** This adoption was very much due to the influence of the French Academy, which was founded in 1629, and which continued the tradition of Malherbe in attempting constantly to school and correct, as the phrase went, the somewhat disorderly instincts of the early French stage. It is difficult to say whether the subordination of all other classes of composition to the drama which has ever since been characteristic of French literature was or was not due to the predilection of Richelieu, the main protector, if not exactly the founder of the Academy, for the theatre. Among the immediate successors and later contemporaries of the three great dramatists we do not find any who deserve high rank as tragedians, though there are some whose comedies are more than respectable. It is at least significant that the restrictions imposed by the academic theory on the comic drama were far less severe than those which tragedy had to undergo. The latter was practically confined in respect of sources of attraction to the dexterous manipulation of the unities; the interest of a plot attenuated as much as possible, and intended to produce, instead of pity a mild sympathy, and instead of terror a mild alarm (for the purists decided against Corneille that "admiration was not a tragic passion"); and lastly the composition of long tirades of smooth but monotonous verses arranged in couplets tipped with delicately careful rhymes. Only Thomas Corneille (1625–1706), the inheritor of an elder tradition and of a great name, deserves to be excepted from the condemnation to be passed on the lesser tragedians of this period. He was unfortunate in possessing his brother's name, and in being, like him, too voluminous in his compositions; but *Camma, Ariane, Le Comte d'Essex*, are not tragedies to be despised. On the other hand the names of Campistron (1656–1737) and Pradon (1632–1698) only serve to point injurious comparisons; Duché (1660–1704) and La Fosse (1653–1708) are of still less importance, and Quinault's tragedies are chiefly remarkable because he had the good sense to give up writing them and to take to opera. The general excellence of French comedy, on the other hand, was sufficiently vindicated. Besides the splendid sum of Molière's work, the two great tragedians had each, in *Le Menteur* and *Les Plaideurs*, set a capital example to their successors, which was fairly followed. Brueys (1640–1723) and Palaprat (1650–1721) brought out once more the ever new *Advocat Patelin*. Quinault and Campistron wrote fair comedies. Dancourt (1661–1726), Dufresny (1684–1721), Boursault (1638–1701), were all comic writers of considerable merit. But the chief comic dramatist of the latter period of the 17th century was Regnard (1655–1709), whose *Joueur* and *Légataire* are comedies almost of the first rank.

17th Century Fiction.—In the department of literature which comes between poetry and prose, that of romance writing, the 17th century, excepting one remarkable development, was not very fertile. It devoted itself to so many new or changed forms of literature that it had no time to anticipate the modern novel. **Heroic romances.** Yet at the beginning of the century one very curious form of romance writing was diligently cultivated, and its popularity, for the time immense, perhaps prevented the introduction of any stronger style, to which at the same time the poetical trifles of the literary coteries, the memoirs of the Fronde, and the dramas of the epoch of Louis XIV. were unfavorable. It is perhaps curious that, as the first quarter of the 17th century was preeminently the epoch of Spanish influence in France, the distinctive satire of Cervantes should have been less imitated than the models which Cervantes satirized. However this may be, the romances of 1600 to 1650 form a class of literature vast, isolated, and, perhaps of all such classes of literature, most utterly obsolete and extinct. Taste, affectation, or antiquarian diligence has, at one time or another, restored to a just, and sometimes a more than just, measure of reputation most of the literary relics of the past. Romances of chivalry, fabliaux, early drama, Provençal poetry, prose chronicles, have all had, and deservedly, their rehabilitators. But *Polexandre* and *Cléopatre*, *Clélie* and the *Grand Cyrus*, have been too heavy for all the industry and energy of literary antiquarians. As we have already hinted, the nearest ancestry which can be found for them is the romances of the *Amadis* type. But the *Amadis*, and in a less degree its followers, although long, are long in virtue of incident. The romances of the *Clélie* type are long in virtue of interminable discourse, moralizing, and description. Their manner is not unlike that of the *Arcadia* and the *Euphues* which preceded them in England; and they express in point of style the tendency which simultaneously manifested itself all over Europe at this period, and whose chief exponents were Gongora in Spain, Marini in Italy, and Lyly in England. Everybody knows the *Carte de Tendre* which originally appeared in *Clélie*, and most people have heard of the shepherds and shepherdesses who figure in the *Astrée* of D'Urfé (1567–1625), on the borders of the Lignon; but here general knowledge ends, and there is perhaps no reason why it should go much further. It is sufficient to say that Mademoiselle de Scudéry (1607–1701) principally devotes herself to laborious gallantry and heroism, La Calprénède (1610–1663) to something which might have been the historical novel if it had been constructed on a less preposterous scale, and Gomberville (1600–1647) to moralizings and theological discussions on Jansenist principles. In the latter part of the century, the example of La Fontaine, though he himself wrote in poetry, helped to recall the tale-tellers of France to an occupation more worthy of them, more suitable to the genius of the literature, and more likely to last. The reaction against the *Clélie* school produced first Madame de Villedieu (Catherine Desjardins) (1631–1683), a fluent and facile novelist, who enjoyed great but not enduring popularity. The form which the prose tale took at this period was that of the fairy story. Perrault (1628–1703) and Madame d'Aulnoy (d. 1705) composed specimens of this kind which have never ceased to be popular since. Hamilton (1646–1720), the author of the well-known *Mémoires de Grammont*, wrote similar stories of extraordinary merit in style and ingenuity. There is yet a third class of prose writing which deserves to be mentioned. It also may probably be traced to Spanish influence, that is to say, to the picaroon romances which the 16th and 17th centuries produced in Spain in large numbers. The most remarkable example of this is the *Roman Comique* of the burlesque writer Scarron. The *Roman Bourgeois* of Furetière also deserves mention as a collection of pictures of the life of the time, arranged in the most desultory manner, but drawn with great vividness, observation, and skill. A remarkable writer who had great influence on Molière, has also to be mentioned in this connection rather than in any other. This is Cyrano de Bergerac (1620–1655), who, besides composing doubtful comedies and tragedies, writing political pamphlets, and exercising the task of literary criticism in objecting to Scarron's burlesques, produced *Voyages à la Lune et au Soleil*, half romantic and half satirical compositions, in which some have seen the original of *Gulliver's Travels*, in which others have discovered only a not very successful imitation of Rabelais, and which, without attempting to decide these questions, may fairly be ranked in the same class of fiction with the masterpieces of Swift and Rabelais, though of course at an immense distance below them. One other work, and in literary influence perhaps the most remarkable of its kind in the century, remains. Madame de Lafayette, the friend of La Rochefoucauld and of Madame de Sévigné, though she did not exactly anticipate the modern novel, showed the way to it in her stories, the principal of which are *Zaïde* and still more *La Princesse de Clèves*. The latter, though a long way from *Manon Lescaut*, *Clarissa*, or *Tom Jones*, is a longer way still from *Polexandre* or the *Arcadia*. The novel becomes in it no longer a more or less fictitious chronicle, but an attempt at least at the display of character. *La Princesse de Clèves* has never been one of the works widely popular out of their own country, nor perhaps does it deserve such popularity, for it has more grace than strength; but as an original effort in an important direction its historical value is considerable. But with this exception, the art of fictitious prose composition, except on a small scale, is certainly not one in which the century excelled, nor are any of the masterpieces which it produced to be ranked in this class.

Balzac and modern French prose.

17th Century Prose.—If, however, this was the case, it cannot be said that French prose as a whole was unproductive at this time. On the contrary, it was now, and only now, that it attained the strength and perfection for which it has been so long renowned, and which has perhaps, by a curious process of compensation, somewhat deteriorated since the restoration of poetry proper in France. The prose Malherbe of French literature was Balzac (1594–1654). The writers of the 17th century had practically created the literary language of prose, but they had not created a prose style. The charm of Rabelais, of Amyot, of Montaigne, and of the numerous writers of tales and memoirs whom we have noticed, was a charm of exuberance, of naïveté, of picturesque effect,—in short, of a mixture of poetry and prose, rather than of prose proper. Sixteenth century French prose is a delightful instrument in the hands of men and women of genius, but in the hands of those who have not genius it is full of defects, and indeed is nearly unreadable. Now, prose is essentially an instrument of all work. The poet who has not genius had better not write at all; the prose writer often may and sometimes must dispense with this qualification. He has need, therefore, of a suitable machine to help him to perform his task, and this machine it is the glory of Balzac to have done more than any other person to create. He produced himself no great work, his principal writings being letters, a few discourses and dissertations, and a work entitled *Le Socrate Chrétien*, a sort of treatise on political theology. But if the matter of his work is not of the first importance, its manner is of a very different value. Instead of the endless diffuseness of the preceding century, its ill-formed or rather unformed sentences, and its haphazard periods, we find clauses, sentences, and paragraphs distinctly planned, shaped, and balanced, a cadence introduced which is rhythmical but not metrical, and, in short, prose which is written knowingly instead of the prose which is unwittingly talked. It has been well said of him that he "écrit pour écrire;" and such a man, it is evident, if he does nothing else, sets a valuable example to those who write because they have something to say. He has time which they have not to make technical discoveries in his art, and his technical discoveries are in turn at their service, while they are almost compelled to make use of them by the appetite for such refinements which his works have created in the public. Voiture seconded Balzac without much intending to do so. His prose style, also chiefly contained in letters, is lighter than that of his contemporary, and helped to gain for French prose the tradition of vivacity and sparkle which it has always possessed, as well as that of correctness and grace.

17th Century History.—In historical composition, especially in the department of memoirs, this period was exceedingly rich, yet the first and perhaps the greatest of its historical works was not composed in French. The *Thuana*, or history of De Thou, was written in Latin, and only translated into French more than a century after its author's death. But, also at the beginning of the century, another writer composed on a larger plan an entire history of France. This was Mézeray (1610–1685), whose work, though not exhibiting the perfection of style at which some of his contemporaries had already arrived, and though still more or less uncritical, yet deserves the title of history. The example of Mézeray and De Thou was followed by a large number of writers, some of extended works, some of histories in part. Mézeray himself is said to have had a considerable share in the *Histoire du Roi Henri le Grand* by the Archbishop Péréfixe (1605–1670); Maimbourg wrote histories of the Crusades and of the League; Pellisson (1624–1693) gave a history of Louis XIV. Still later in the century, or at the beginning of the next, many lengthy historical works were composed. The Père d'Orléans (1644–1698) wrote a history of the revolutions of England, the Père Daniel (1649–1728), like d'Orléans a Jesuit, composed a lengthy history of France and a shorter one on the French military forces. Finally, at the end of the period, comes the great ecclesiastical history of Fleury (1640–1723), a work which perhaps belongs more to the section of erudition than to that of history proper. Three small treatises, however, composed by different authors towards the middle part of the century, supply remarkable instances of prose style in its application to history. These are the *Conjurations du Comte de Fiesque*, written by the famous Cardinal de Retz (1614–1679), the *Conspiration de Walstein* of Sarrasin, and the *Conjuration des Espagnols contre Venise*, composed in 1672 by the Abbé de St. Réal, the author of various historical and critical works deserving less notice. These three works, whose similarity of subject and successive composition at short intervals leave little doubt that a certain amount of intentional rivalry animated the two later authors, are among the earliest and best examples of the monographs for which French, in point of grace of style and lucidity of exposition, has long been the most successful vehicle of expression among European languages. Among other writers of history, as distinguished from memoirs, need only be noticed Agrippa d'Aubigné, whose *Histoire Universelle* closed his long and varied list of works, and Varillas (1624–1696), an historian chiefly remarkable for his extreme untrustworthiness. In point of memoirs and correspondence the period is hardly less fruitful than that which preceded it. The *Régistres-Journaux* of Pierre de l'Étoile (1540–1611), only now being published as a whole, consist of a diary something of the Pepys character, kept for nearly forty years by a person in high official employment. The memoirs of Sully (1560–1641), published under a curious title too long to quote, date also from this time, as do the *Letters* of Cardinal d'Ossat (1536–1604), much and deservedly praised by Lord Chesterfield as models of business writing, and the *Négociations* of the President Jeannin (1544–1622), who conducted the affairs of Henry IV. in Holland. The king himself has left a considerable correspondence, which is not destitute of literary merit, though not equal to the memoirs of his wife. The rule of Richelieu was scarcely favorable to memoir writing; but both this and earlier times found chronicle in the singular *Historiettes* of Tallemant des Réaux (1619– ?), a collection of anecdotes, frequently scandalous, reaching from the times of Henry IV. to those of Louis XIV., to which may be joined the *Letters* of Guy Patin (1602–1676). The early years of the latter monarch and the period of the Fronde had the Cardinal de Retz himself, than whom no one was certainly better qualified for historian, not to mention a crowd of others, of whom Madame de Motteville (1621–1689) is perhaps the principal. From this time memoirs and memoir writers went ever multiplying. The queen of them all is Madame de Sévigné (1627–1696), on whom, as on most of the great and better-known writers whom we have had and shall have to mention, it is impossible here to dwell at length. The last half of the century produced crowds of similar but inferior writers. The memoirs of the Duchesse d'Orléans, of Fouquet, of Bussy-Rabutin (author of a kind of scandalous chronicle called *Histoire Amoureuse des Gaules*), and of Madame de Maintenon, perhaps deserve notice above the others. But this was in truth the style of composition in which the age most excelled. Memoir writing became the occupation not so much of persons who made history, as was the case from Comines to De Retz, as of those who, having culture, leisure, and opportunity of observation, devoted themselves to the task of recording the deeds of others, and still more of regarding the incidents of the busy, splendid, and cultivated if somewhat frivolous world of the court, in which, from the time of Louis XIV.'s majority, the political life of the nation and almost its whole history were centred. Many, if not most, of these writers were women, who thus founded the celebrity of the French lady for managing her mother-tongue, and justified by results the taste and tendencies of the blue-stockings and précieuses of the Hôtel Rambouillet and similar coteries. The life which these writers saw before them furnished them with a subject to be handled with the minuteness and care to which they had been accustomed in the ponderous romances of the *Clélie* type, but also with the wit and terseness hereditary in France, and only temporarily absent in those ponderous compositions. The efforts of Balzac and the Academy supplied a suitable language and style, and the increasing tendency towards epigrammatic moralizing, which reached its acme in La Rochefoucauld (1663–1680) and La Bruyère (1639-1696), added in most cases point and attractiveness to their writings.

17th Century Philosophers and Theologians.—To these moralists we might, perhaps, not inappropriately pass at once. But it seems better to consider first the philosophical and theological developments of the age, which must share with its historical experiences and studies the credit of producing these writers. Philosophy proper, as we have already had occasion to remark, had hitherto made no use of the vulgar tongue. The 16th century had contributed a few vernacular treatises on logic, a considerable body of political and ethical writing, and a good deal of sceptical speculation of a more or less vague character, continued into our present epoch by such writers as La Mothe le Vayer (1588–1672), the last representative of the orthodox doubt of Montaigne and Charron. But in metaphysics proper it had not dabbled. The 17th century, on the contrary, was to produce in Descartes (1596–1650) at once a master of prose style, the greatest of French philosophers, and one of the greatest metaphysicians, not merely of France and of the 17th century, but of all countries and times. Even before Descartes there had been considerable and important developments of metaphysical speculation in France. Early in the century, the Italian Lucilio Vanini was burnt at Toulouse, nominally, like Bruno, for atheism, but really for the adoption of the negative philosophy of Pomponatius and others. The first eminent philosopher of French birth was Pierre Gassendi (1592–1655). Gassendi devoted himself to the maintenance of a modernized form of the Epicurean doctrines, but he wrote mainly, if not entirely in Latin. Another sceptical philosopher of a less scientific character was the physicist Naudé, who like many others of the philosophers of the time, was accused of atheism. But as none of these could approach Descartes in philosophical power and originality, so also none has even a fraction of his importance in the history of French literature.

Descartes.

It is with this latter alone that we are here concerned. Descartes stands with Plato, and possibly Berkeley and Malebranche, at the head of all philosophers in respect of style; and in his case the excellence is far more remarkable than in others, inasmuch as he had absolutely no models, and was forced in a great degree to create the language which he used. The *Discours de la Méthode* is not only one of the epoch-making books of philosophy, it is also one of the epoch-making books of French style. Almost every page of it might have been written by a master of the language at the present day, while there is the greatest possible contrast between these pages and those of even the best French prose writers a few years previously. Nor was the influence of Descartes in literature less than his influence in philosophy. The tradition of his clear and perfect style was taken up, not merely by his philosophical disciples, but also by Pascal (1623–1662) and the school of Port Royal, who will be noticed presently. The very genius of the Cartesian philosophy was intimately connected with this clearness, distinctness, and severity of style; and there is something more than a fanciful contrast between these literary characteristics of Descartes, on the one hand, and the elaborate splendor of Bacon, the knotty and crabbed strength of Hobbes, and the commonplace and almost vulgar slovenliness of Locke. Of the followers of Descartes, putting aside the Port Royalists, by far the most distinguished, both in philosophy and in literature, is Malebranche (1631–1715).

Malebranche.

His *Recherche de la Vérité*, admirable as it is for its subtlety and its consecutiveness of thought, is equally admirable for its elegance of style. Malebranche cannot indeed, like his great master, claim absolute originality. But his excellence as a writer is as great as, if not greater than, that of Descartes, and the *Recherche* remains to this day the one philosophical treatise of great length and abstruseness which, merely as a book, is delightful to read,—not like the works of Plato and Berkeley, because of the adventitious graces of dialogue or description, but from the purity and grace of the language, and its admirable adjustment to the purposes of the argument. Yet, for all this, philosophy hardly flourished in France. It was too intimately connected with theological and ecclesiastical questions, and especially with Jansenism, to escape suspicion and persecution. Descartes himself was for much of his life an exile in Holland and Sweden; and though the unquestionable orthodoxy of Malebranche, the strongly religious cast of his works, and the remoteness of the abstruse region in which he sojourned from that of the controversies of the day protected him, other followers of Descartes were not so fortunate. Holland, indeed, became a kind of city of refuge for students of philosophy, though even in Holland itself they were by no means entirely safe from persecution.

Bayle.

By far the most remarkable of French philosophical sojourners in the Netherlands was Pierre Bayle (1647–1706), a name not perhaps of the first rank in respect of literary value, but certainly of the first as regards literary influence. Bayle, after oscillating between the two confessions, nominally remained a Protestant in religion. In philosophy he in the same manner oscillated between Descartes and Gassendi, finally resting in an equally nominal Cartesianism. Bayle was in fact, both in philosophy and in religion, merely a sceptic, with a scepticism at once like and unlike that of Montaigne, and differenced both by temperament and circumstance. The scepticism of Montaigne is mainly moral in character, and represents the good-humored but satiated indifference of the gentleman of the Renaissance, who has known both business and pleasure, and, though undervaluing neither, sees the drawbacks of both. That of Bayle is the scepticism of the mere student, exercised more or less in all histories, sciences, and philosophies, and intellectually unable or unwilling to take a side. His style is hardly to be called good, being diffuse and often inelegant. But his great dictionary, though one of the most heterogeneous and unmethodical of compositions, exercised an enormous influence both on the Continent and in England, especially on the Continent. It has been or might be called the Bible of the 18th century, and contains in the germ all the desultory philosophy, the ill-ordered scepticism, and the critical but negatively critical acuteness of the *Aufklärung*. Locke and Newton had indeed to be superadded to Bayle, and Voltaire in matter, though by no means in form, represents little more than the union of the three.

We have said that the philosophical, theological, and moral tendencies of the century, which produced, with the exception of its dramatic triumphs, all its greatest literary works, are almost inextricably intermingled. Its earliest years, however, bear in theological matters rather the complexion of the previous century. Du Perron and St. Francis of Sales survived until nearly the end of its first quarter, and the most remarkable works of the latter bear the dates of 1608 and later. It was not, however, till some years had passed, till the counter-Reformation had reconverted the largest and most powerful portion of the Huguenot party, and till the influence of Jansenius and Descartes had time to work, that the extraordinary outburst of Gallican theology, both in pulpit and press, took place.

The Jansenists.

The Jansenist controversy may perhaps be awarded the merit of provoking this, as far as writing was concerned. The extraordinary eloquence of contemporary pulpit oratory may be set down partly to the zeal for conversion of which Du Perron and De Sales had given the example, partly to the same taste of the time which encouraged dramatic performances, for the sermon and the tirade have much in common. Jansenius himself, though a Dutchman by birth, passed much time in France, and it was in France that he found most disciples. These disciples consisted in the first place of the members of the society of Port Royal des Champs, a coterie after the fashion of the time, but one which devoted itself not to sonnets or madrigals but to devotional exercises, study, and the teaching of youth.

Port Royal.

This coterie early adopted the Cartesian philosophy, and the Port Royal logic was the most remarkable popular hand-book of that school. In theology they adopted Jansenism, and were in consequence soon at daggers drawn with the Jesuits, according to the polemical habits of the time. The most distinguished champions on the Jansenist side were the Abbé de St. Cyran and Antoine Arnauld, but by far the most important literary results of the quarrel were the famous *Provinciales* of Pascal, or, to give them their proper title, *Lettres Écrites à un Provincial.* The original occasion of these remarkable letters was the condemnation of Arnauld at the Sorbonne. They produced an immense effect; their printers were subjected to vigorous police investigations, but in vain; and the incognito of the author was long preserved.

Pascal.

With their matter we have nothing to do here. Their literary importance consists, not merely in their grace of style, but in the application to serious discussion of the peculiarly polished and quiet irony of which Pascal is the greatest master the world has ever seen. Up to this time controversy had usually been conducted either in the mere bludgeon fashion of the Scaligers and Saumaises,—of which in the vernacular the Jesuit Garasse (1585–1631) had already contributed remarkable examples to literary and moral controversy,—or else in a dull and legal style, or lastly under an envelope of Rabelaisian buffoonery, such as survives to a considerable extent in the *Satire Ménippée.* Pascal set the example of combining the use of the most terribly effective weapons with good humor, good breeding, and a polished style. The example was largely followed, and the manner of Voltaire and his followers in the 18th century owes at least as much to Pascal as their method and manner do to Bayle. The Jansenists, attacked and persecuted by the civil power, which the Jesuits had contrived to interest, were finally suppressed. But the *Provinciales* had given them an unapproachable superiority in matter of argument and literature. Their other literary works were inferior, though still remarkable. Arnauld (1612–1694) and Nicole (1625–1695) managed their native language with vigor, if not exactly with grace. They maintained their orthodoxy by writings, not merely against the Jesuits, but also against the Protestants, such as the *Perpétuité de la Foi* due to both, and the *Apologie des Catholiques* written by Arnauld alone. The latter, besides being responsible for a good deal of the logic (*L'Art de Penser*) to which we have alluded, wrote also much of a *Grammaire Générale* composed by the Port Royalists for the use of their pupils; but his principal devotion was to theology and theological polemics. To the latter Nicole also contributed *Les Visionnaires, Les Imaginaires,* and other works. The studious recluses of Port Royal also produced a large quantity of miscellaneous literary work, to which full justice has been done in Sainte-Beuve's well-known volumes.

17th Century Preachers.—When we think of Gallican theology during the 17th century, it is always with the famous pulpit orators of the period that thought is most busied. Nor is this unjust, for though the most prominent of them all, Bossuet (1627–1704) was remarkable as a writer of matter intended to be read, not merely as a speaker of matter intended to be heard, this double character is not possessed by most of the orthodox theologians of the time; and even Bossuet, great as is his genius, is more of a rhetorician than of a philosopher or a theologian. In no quarter was the advance of culture more remarkable in France than in the pulpit. We have already had occasion to notice the characteristics of French pulpit eloquence in the 15th and 16th centuries. Though this was very far from destitute of vigor and imagination, the political frenzy of the preachers, and the habit of introducing anecdotic buffoonery, spoilt the eloquence of Maillard and of Raulin, of Boucher and of Rose. The powerful use which the Reformed ministers made of the pulpit stirred up their rivals; the advance in science and classical study added weight and dignity to the matter of their discourses. The improvement of prose style and language provided them with a suitable instrument, and the growth of taste and refinement purged their sermons of grossness and buffoonery, of personal allusions, and even, as the monarchy became more absolute, of direct political purpose. The earliest examples of this improved style were given by St. Francis de Sales and by Fenouillet, bishop of Marseilles (d. 1652); but it was not till the latter half of the century, when the troubles of the Fronde had completely subsided, and the church was established in the favor of Louis XIV., that the full efflorescence of theological eloquence took place. There were at the time pulpit orators of considerable excellence in England, and perhaps Jeremy Taylor, assisted by the genius of the language, has wrought a vein more precious than any which the somewhat academic methods and limitations of the French teachers allowed them to reach. But no country has ever been able to show a more magnificent concourse of orators, sacred or profane, than that formed by Bossuet, Fénelon (1651–1715), Fléchier (1632–1710), Mascaron (1634–1703) Bourdaloue (1632–1704), and Massillon (1663–1742) to whom may be justly added the Protestant divines Claude (1619–1687) and Saurin (1677–1730). The characteristics of all these were different.

Bossuet.

Bossuet, the earliest and certainly the greatest, was also the most universal. He was not merely a preacher; he was, as we have said, a controversialist,—indeed, somewhat too much of a controversialist, as his battle with Fénelon proved. He was a philosophical or at least a theological historian, and his *Discours sur l'Histoire Universelle* is equally remarkable from the point of view of theology, philosophy, history, and literature. Turning to theological politics, he wrote his *Politique tirée de l'Écriture Sainte,* to theology proper his *Méditations sur les Évangiles* and his *Élevations sur les Mystères.* But his principal work after all is his *Oraisons Funèbres.* The funeral sermon was the special oratorical exercise of the time. Its subject and character invited the gorgeous if somewhat theatrical commonplaces, the display of historical knowledge and parallel, and the moralizing analogies, in which the age specially rejoiced. It must also be noticed to the credit of the preachers that such occasions gave them opportunity, of which they rarely failed to avail themselves, of correcting the adulation which was but too frequently characteristic of the period. The spirit of these compositions is fairly reflected in the most famous and often quoted of their phrases, the opening "Mes frères, Dieu seul est grand" of Massillon's funeral discourse on Louis XIV.; and though panegyric is necessarily by no means absent, it is rarely carried beyond bounds. While Bossuet made himself chiefly remarkable in his sermons and in his writings by an almost Hebraic grandeur and rudeness, the more special characteristics of Christianity, largely alloyed with a Greek and Platonic spirit, displayed themselves in Fénelon.

Fénelon.

A successor of St. Francis de Sales, he found that even a previous canonization was not a safeguard for imitators. The *Maximes des Saints* of Fénelon, and later his *Mémoires Particuliers* and *Directions pour la Conscience d'un Roi,* were distinguished not only by a mystical theology which was not relished, but also by a very moderate admiration for despotic government. In pure literature Fénelon is not less remarkable than in theology, politics, and morals. His practice in matters of style was admirable, as the universally known *Télémaque* sufficiently shows to those who know nothing else of his writing. But his taste, both in its correctness and its audacity, is perhaps more admirable still. Despite of Malherbe, Balzac, Boileau, and the traditions of nearly a century, he dared to speak favorably of Ronsard, and plainly expressed his opinion that the practice of his own contemporaries and predecessors had cramped and impoverished the French language quite as much as they had polished or purified it. The other doctors whom we have mentioned were more purely theological than the accomplished archbishop of Cambray. Fléchier is somewhat more archaic in style than Bossuet or Fénelon, and he is also more definitely a rhetorician than either. Mascaron has the older fault of prodigal and somewhat indiscriminate erudition. But the two latest of the series, Bourdaloue and Massillon, had far the greatest repute in their own time purely as orators, and perhaps deserved this preference. The difference between the two repeated that between Du Perron and De Sales. Bourdaloue's great forte was vigorous argument and unsparing denunciation, but he is said to have been lacking in the power of influencing and affecting his hearers. His attraction was purely intellectual, and it is reflected in his style, which is clear and forcible, but destitute of warmth and color. Massillon, on the other hand, was remarkable for his pathos, and for his power of enlisting and influencing the sympathies of his hearers. The two Protestant ministers whom we have mentioned, though inferior to their rivals, yet deserve honorable mention among the ecclesiastical writers of the period. Claude engaged in a controversy with Bossuet, in which victory is claimed for the invincible eagle of Meaux. Saurin, by far the greater preacher of the two, long continued to occupy, and, indeed, still occupies, in the libraries of French Protestants the position given to Bossuet and Massillon on the other side.

17th Century Moralists.—It is not surprising that the works of Montaigne and Charron, with the immense popularity of the former, should have inclined the more thoughtful minds in France to moral reflection, especially as many other influences, both direct and indirect, contributed to produce the same result. The constant tendency of the refinements in French prose was towards clearness, succinctness, and precision, the qualities most necessary in the moralist. The characteristics of the prevailing philosophy, that of Descartes, pointed in the same direction. It so happened, too, that the times were more favorable to the thinker and writer on ethical subjects than to the speculator in philosophy proper, in theology, or in politics. Both the former subjects exposed their cultivators, as we have seen, to the suspicion of unorthodoxy; and to political speculation of any kind the rule of Richelieu, and still more that of Louis XIV., were in the highest degree unfavorable. No successors to Bodin and Du Vair appeared; and even in the domain of legal writings, which comes nearest to that of politics, but few names of eminence are to be found. The parliaments were rapidly becoming the submissive instruments of the monarch, and might be expected soon to degenerate into the assemblies which, in the next century, disgraced themselves for ever in the affairs of Calas and Sirven, La Barre and Lally. Only the name of Omer-Talon (1595–1657) really illustrates the legal annals of France at this period on the bench, and that of Patru (1604–1681) at the bar. Thus it happened that the interests of many different classes of persons were concentrated upon moralizings, which took indeed very different forms in the hands of Pascal and other grave and serious thinkers of the Jansenist complexion in theology, and in those of literary courtiers like St. Evremond (1613–1703) and La Rochefoucauld, whose chief object was to depict the motives and characters prominent in the brilliant and not altogether frivolous society in which they moved.

Pascal and pensée-writing.

Both classes, however, were more or less tempted by the cast of their thoughts and the genius of the language to adopt the tersest and most epigrammatic form of expression possible, and thus to originate the "*pensée*" in which, as its greatest writer of this century has said, "the ambition of the author is to put a book into a page, a page into a phrase, and a phrase into a word." The great genius and admirable style of Pascal are certainly not less shown in his *Pensées* than in his *Provinciales*, though perhaps the literary form of the former is less strikingly supreme than that of the latter. The author is more dominated by his subject, and dominates it less. The depth of his thought, of his doubt, of his belief, troubles sometimes the literary perfection of his style, but after all the excellence as literature of the *Pensées* is rather different from that of the *Provinciales* than inferior to it. Nicole, a far inferior writer as well as thinker, has also left a considerable number of *Pensées*, which have about them something more of the essay and less of the aphorism. They are, however, though not comparable to Pascal, excellent in matter and style, and go far to justify Bayle in calling their author "l'une des plus belles plumes de l'Europe." In sharp contrast with these thinkers, who are invariably not merely respecters of religion but ardently and avowedly religious, who treat morality from the point of view of the Bible and the church, there arose side by side with them, or only a little later, a very different group of moralists, whose writings have been as widely read, and who have had as great a practical and literary influence as perhaps any other class of authors.

St. Evremond.

The earliest to be born and the last to die of these was St. Evremond. St. Evremond was long known rather as a conversational wit, some of whose good things were handed about in manuscript, or surreptitiously printed in foreign lands, than as a writer, and this is still to a certain extent his reputation. He was at least as cynical as his still better known contemporary La Rochefoucauld, if not more so, and he had less intellectual force and less nobility of character. But his wit was very great, and it was not restrained by any inconvenient convictions or scruples. Presiding as he did in the society of Ninon de l'Enclos, and over a considerable number of lesser wits, he set the example of the brilliant societies of the next century. These in turn culminated in the Holbachian group which was to render such powerful assistance in the diffusion of philosophism, and to distinguish itself by the freedom, in every sense of the word, of its style of thought and conversation. Many of St. Evremond's printed works are nominally works of literary criticism, but the moralizing spirit pervades all of them. No writer had a greater influence on Voltaire, and through Voltaire on the whole course of French literature after him. In direct literary value, however, no comparison can be made between St. Evremond and the author of the *Sentences et Maximes Morales*.

La Rochefoucauld.

The Duc de la Rouchefoucauld has other literary claims besides those of this famous book. His *Mémoires* were very favorably judged by his contemporaries, and they are still held to deserve no little praise even among the numerous and excellent works of the kind which that age of memoir writers produced. But while the *Mémoires* thus invite comparison, the *Maximes et Sentences* stand alone. Even allowing that the mere publication of detached reflections in terse language was not absolutely new, it had never been carried, perhaps has never since been carried, to such a perfection. Beside La Rochefoucauld all other writers are diffuse, vacillating, unfinished, rough. A very large number of his maxims do not exceed two lines; many are contained in half a dozen words; and though he has no prudish or childish objection to more lengthy reflections, these lengthier sections are proportionately as much crammed and packed with thought as the shorter. The most remarkable thing, however, about them is not that there is never a word too much, but that, pregnant as they are, there is never a word too little. The thought is always fully expressed, not compressed. Frequently as the metaphor of minting or stamping coin has been applied to the art of managing words, it has never been applied so appropriately as to the maxims of La Rochefoucauld, each of which has the beauty, the value, and the clear-cut compactness of a medal. Such criticism as has been directed against them has invariably and necessarily busied itself with their matter, and with the supposed selfish and cynical character of their thought. The form of them is almost beyond praise, and its excellences, combined with their immense and enduring popularity, have had a very considerable share in influencing the character of subsequent French literature. Of hardly less importance in this respect, though of considerably less intellectual and literary individuality, was the translator of Theophrastus and author of the *Caractères*, La Bruyère.

La Bruyère.

La Bruyère, though frequently epigrammatic, did not aim at the same incredible terseness as the author of the *Maximes*. His plan did not, indeed, render it necessary. Both in England and in France there had been during the whole of the century a mania for character writing, both of the general and Theophrastic kind and of the historical and personal order. The latter, of which our own Clarendon is perhaps the greatest master, abound in the French memoirs of the period. The former, of which the naïve sketches of Earle and Overbury are English examples, culminated in those of La Bruyère. These sketches were made palatable originally, though they are perhaps rendered less attractive now, by the multitude of half-veiled allusions to contemporary characters. They do not contain any of the appalling and to some persons repulsive directness and ruthlessness of La Rochefoucauld. They are not only light and easy in manner and matter, but also in style, and in this respect, as in most others, the contrast is remarkable. The work of La Bruyère is essentially amusing, though it is instructive as well. It is the work of a man of great talent, acuteness, and observation, but tolerant to a certain extent of commonplaces and compromises. There is neither compromise nor commonplace in La Rochefoucauld. We have dwelt on these two remarkable books somewhat longer than on most single *chef d'œuvres* of French literature, because of their extraordinary and enduring effect on the literature which followed them—an effect perhaps superior to that exercised by any other single work except the *Roman de la Rose* and the *Essais* of Montaigne.

17th Century Savants.—Of the literature of the 17th century there only remains to be dealt with the section of those writers who devoted themselves to scientific pursuits or to antiquarian erudition of one form or another. It was in this century that literary criticism of French and in French first began to be largely composed. It was very far, however, from attaining the excellence or observing the form which it afterwards assumed. The institution of the Academy led to various linguistic works. One of the earliest of these was the *Remarques* of the Savoyard Vaugelas (1585–1650), afterwards re-edited by Thomas Corneille. Pellisson wrote a history of the Academy itself when it had as yet but a brief one. The famous *Examen du Cid* was an instance of the literary criticism of the time. Later, Boileau set the example of treating such subjects in verse, and in the latter part of the century *Reflections, Discourses, Observations,* and the like, on particular styles, literary forms, and authors, became exceedingly numerous. In earlier years France possessed a numerous band of classical authors of the first rank, such as Scaliger and Casaubon, who did not lack followers. But all or almost all this sort of work was done in Latin, so that it contributed little to French literature properly so-called. On the other hand, mathematical studies were pursued by persons of far other and far greater genius, and, taking from this time forward a considerable position in education and literature in France, had much influence on both. The mathematical discoveries of Pascal and Descartes are well known, and from their time forward until the Revolution men of letters, such as Voltaire and Diderot, who would in England have been likely to hold aloof from such studies, devoted themselves thereto. Of science proper, apart from mathematics, France did not produce many distinguished cultivators in this century. The philosophy of Descartes was not on the whole favorable to such investigations, which were in the next century to be pursued with ardor. Its tendencies found more congenial vent and are more thoroughly exemplified in the famous quarrel between the ancients and the moderns, which was long carried on in the latter part of the century between Boileau and Madame Dacier, on the one hand, and Perrault on the other, and which was so curiously renewed in England. The discussion was conducted, as is well known, without very much knowledge or judgment among the disputants on the one side or on the other. But at this very time there were in France students and scholars of the most profound erudition. We have already mentioned Fleury and his ecclesiastical history. But Fleury is only the last and the most popular of a race of omnivorous and untiring scholars, whose labors have ever since, until the modern fashion of first-hand investigations came in, furnished the bulk of historical and scholarly references and quotations. To this century belong Tillemont (1637–1698), whose enormous *Histoire des Empereurs* and *Mémoires pour servir à l' Histoire Ecclesiastique* served Gibbon and a hundred others as quarry; Ducange (1614–1688), whose well-known glossary was only one of numerous productions; Mabillon (1622–1707), one of the most voluminous of the voluminous Benedictines; and Montfaucon (1655–1741), chief of all authorities of the dry-as-dust kind on classical archæology and art.

Controversy between ancients and moderns.

Opening of the 18th Century.—The beginning of the 18th century is among the dead seasons of French literature. All the greatest men whose names had illustrated the reign of Louis XIV. in profane literature passed away long before him, and the last if the least of them, Boileau and Thomas Corneille, only survived into the very earliest years of the new age. The political and military disasters of the last years of the reign were accompanied by a state of things in society unfavorable to literary development. A show, purely external and hypocritical, of devotion, put on to please the aged monarch, covered an interior of frivolity and licentiousness which was for the time dissevered from such intellectual activity as has often accompanied similar states of morality in France. The devotion to pure literature and philosophy proper which Descartes and Corneille had inspired had died out, and the devotion to physical science, to sociology, and to a kind of free-thinking optimism which was to inspire Voltaire and the Encyclopedists had not yet become fashionable. Fénelon and Malebranche still survived, but they were emphatically men of the last age, as was Massillon, though he lived till nearly the middle of the century. The characteristic literary figures of the opening years of the period are D'Aguesseau, Fontenelle, St. Simon, personages in many ways interesting and remarkable, but purely transitional in their characteristics, and neither themselves indicating new and original paths to others, nor following out to their extremity and climax the paths which others had struck. Fontenelle (1657–1757) is, indeed, perhaps the most typical figure of the time. He was a dramatist, a moralist, a philosopher, physical and metaphysical, a critic, an historian, a poet, and a satirist. The manner of his works is always easy and graceful, and their matter rarely contemptible. We may adopt the same division of subjects in this period as heretofore, with one important addition—a separate heading, namely, for the essayists and literary critics who before the end of the century became of remarkable prominence. The spread of culture, however, and the increase of the mass of literature produced, render it more and more necessary to limit the notice given to those names whose bearers are in one way or another important. Modern literature once fairly constituted, the rank and file of its practitioners must be left unmentioned.

18th Century Poetry.—The dispiriting signs shown during the 17th century by French poetry proper received entire fulfilment in the following age. The two poets who were most prominent at the opening of the period were the Abbé de Chaulieuc (1639–1720) and the Marquis de la Fare (1644–1712), poetical or rather versifying twins who are always quoted together, and the fact of whose quotation as the chief poets of any period, however short, is sufficient proof of the low estate into which poetry must at that period have fallen. They were both men who lived to a great age, yet their characteristics are rather those of their later than of their earlier contemporaries. They derive on the one hand from the somewhat trifling school of Voiture, on the other from the Bacchic sect of St. Amand; and they succeed in uniting the inferior qualities of both with the cramped and impoverished though elegant style of which Fénelon had complained. It is only fair to say that the abbé is not nearly so bad a poet as the marquis. Their compositions are as a rule lyrical, as lyrical poetry was understood after the days of Malherbe,—that is to say, quatrains of the kind ridiculed by Molière, and Pindaric odes, which have been justly described as made up of alexandrines after the manner of Boileau cut up into shorter or longer lengths. They were followed, however, by the one poet who succeeded in producing something resembling poetry in this artificial style, J. B. Rousseau (1674–1741). Rousseau, who in some respects was nothing so little as a religious poet, was nevertheless strongly influenced, as Marot had been by the Psalms of David. His *Odes* and his *Cantates,* though still to English taste curiously devoid of the poetical *je ne sais quoi,* which an Englishman rarely finds in any French lyrist between Regnier and Hugo, are perhaps less destitute of that spirit than the work of any other poet during that long period excepting André Chénier. Rousseau was also an extremely successful epigrammatist, having in this respect, too, resemblances to Marot. Le Franc de Pompignan (1709–1784), to whom Voltaire's well-known sarcasms are not altogether just, and Louis Racine (1692–1763), who wrote pious and altogether forgotten poems, be-

J. B. Rousseau.

longed to the same poetical school; though both the style and matter of Racine are strongly tinctured by his Port Royalist sympathies and education. Those authors form the first of the three poetical schools of the century, though perhaps it would be safer to mark out only two, leaving Voltaire to himself as a master of both schools and a member of neither. The first method of versifying, indeed, subdivided itself into classes, not dissimilar in style to those which we have noticed in the preceding age as characterized respectively by elegance of a somewhat frivolous kind, and jollity not always free from ignoble admixture. The former was represented in the 18th century by the long-lived St. Aulaire (1643–1742), by Gentil Bernard, by the Abbé (afterwards Cardinal) de Bernis (1715–1794), by Dorat (1714–1789), and by Parny (1753–1814), the last the most vigorous, but all somewhat deserving the term applied to Dorat of *ver luisant du Parnasse*. The jovial traditions of St. Amand begat a similar school of anacreontic songsters, which, represented in turn by Panard (1674–1765), Collé (1709–1783), Gouffé (1775–1845), and Desaugiers (1772–1827), led directly to the best of all such writers, Béranger. To this class Rouget de Lisle (1760–1836) perhaps also belongs; though his most famous composition, the *Marseillaise*, is of a different stamp. Nor is the account of the light verse of the 18th century complete without reference to a long succession of fable writers, who, in an unbroken chain, connect La Fontaine in the 17th century with M. Viennet in the 19th. None of the links, however, of this chain, with the exception of Florian, deserve much attention.

Voltaire (poetry).

The universal faculty of Voltaire (1694–1778) showed itself in his poetical productions no less than in his other works, and it is perhaps not least remarkable in verse. It is impossible now-a-days to regard the *Henriade* as anything but a highly successful prize poem, but the burlesque epic of *La Pucelle*, discreditable as it may be from the moral point of view, is remarkable enough as literature. The epistles and satires are among the best of their kind, the verse tales are in the same way admirable, and the epigrams, impromptus, and short miscellaneous poems generally are the *ne plus ultra* of verse which is not poetry. It is impossible, moreover, not to be grateful to Voltaire for refusing to countenance by his example the second school of verse to which we have alluded. The Anglomania of the century extended into poetry, and the *Seasons* of Thomson set the example of a whole library of tedious descriptive verse, which in its turn revenged France upon England by producing or helping to produce English poems of the Darwin school. The first of these descriptive performances was the *Saisons* of St. Lambert (1717–1803), identical in title with its model, but of infinitely inferior value. St. Lambert was followed by Delille (1738–1813) in *Les Jardins*, Le Mierre (1723–1793) in *Les Fastes*, and Roucher (1745–1794) in *Les Mois*. Indeed, everything that could be described was seized upon by these describers. Delille also translated the *Georgics*, and for a time was the greatest living poet of France, the title being only disputed by Le Brun (1729–1807), a lyrist and ode writer of the school of J. B. Rousseau, but not destitute of energy. The only other poets until Chénier who deserve notice are Gilbert (1751–1780),—the French Chatterton, or perhaps rather the French Oldham, who died in a workhouse at twenty-nine after producing some vigorous satires and, at the point of death, an elegy of great beauty,—and Gresset (1709–1777), the author of *Ver-Vert* and of other poems of the lighter order, which are not far, if at all, below the level of Voltaire.

Chénier.

André Chénier (1762–1794) stands far apart from the art of his century, though the strong chain of custom, and his early death by the guillotine, prevented him from breaking through the fatal restraints of its language and its versification. Chénier, half a Greek by blood, was wholly one in spirit and sentiment. The manner of his verses, the very air which surrounds them and which they diffuse, are different from those of the 18th century; and his poetry is probably the utmost that the language and versification of Racine could produce. To do more, the Revolution which followed a generation after his death was required.

18th Century Drama.—The results of the cultivation of dramatic poetry at this time were even less individually remarkable than those of the attention paid to poetry proper. Here again the astonishing power and literary aptitude of Voltaire gave value to his attempts in a style which, notwithstanding that it counts Racine among its practitioners, was none the less predestined to failure.

Voltaire (plays).

Voltaire's own efforts in this kind are indisputably as successful as they could be. Foreigners usually prefer *Mahomet* and *Zaïre* to *Bajazet* and *Mithridate*, though there is no doubt that no work of Voltaire's comes up to *Polyeucte* and *Rodogune*, as certainly no single passage in any of his plays can approach the best passages of *Cinna* and *Les Horaces*. But the remaining tragic writers of the century, with the single exception of Crébillon *père*, are scarcely third-rate. Crébillon (1674–1763) himself had genius, and there are to be found in his work evidences of a spirit which had seemed to die away with *St. Genest*, and was hardly to revive until *Hernani*. Of the imitators of Racine and Voltaire, La Motte (1672–1731) in *Inez de Castro* was not wholly unsuccessful. La Grange-Chancel copied chiefly the worst side of the author of *Britannicus*, and Saurin (1706–1781) and De Belloy (1727–1775) performed the same service for Voltaire. There was an infinity of tragic writers and tragic plays in this century, but hardly any others of them even deserve mention. The muse of comedy was decidedly more happy in her devotees. Molière was a far safer if a more difficult model than Racine, and the inexorable fashion which had bound down tragedy to a feeble imitation of Euripides did not similarly prescribe an undeviating adherence to Terence. Tragedy had never been, has scarcely been since, anything but an exotic in France; comedy was of the soil and native. Very early in the century Le Sage (1668–1747), in the admirable comedy of *Turcaret*, produced a work not unworthy to stand by the side of all but his master's best. Destouches (1680–1754) was also a fertile comedy writer in the early years of the century, and in *Le Glorieux* and *Le Philosophe Marié* achieved considerable success. As the age went on, comedy, always apt to lay hold of passing events, devoted itself to the great struggle between the Philosophes and their opponents. Curiously enough, the party which engrossed almost all the wit of France had the worst of it in this dramatic portion of the contest, if in no other. The *Méchant* of Gresset and the *Métromanie* of Piron (1689–1773) were far superior to anything produced on the other side, and the *Philosophes* of Palissot (1734–1814), though scurrilous and broadly farcical, had a great success. On the other hand, it was to a Philosophe that the invention of a new dramatic style was due, and still more the promulgation of certain ideas on dramatic criticism and construction, which, after being filtered through the German mind, were to return to France and to exercise the most powerful influence on its dramatic productions.

Diderot (plays).

This was Diderot (1713–1784), the most fertile genius of the century, but also the least productive in finished and perfect work. His chief dramas, the *Fils Naturel* and the *Père de Famille*, are certainly not great successes; the shorter plays, *Est-il bon? est-il méchant?* and *La Pièce et la Prologue*, are better. But it was his follower Sédaine (1717–1779) who in *Le Philosophe sans le savoir* and other pieces produced the best examples of the bourgeois as opposed to the heroic drama. Diderot is sometimes credited or discredited with the invention of the *Comédie Larmoyante*, a title which indeed his own plays do not altogether refuse, but this special variety seems to be in its invention rather the property of La Chaussée (1692–1754). Comedy sustained itself, and even gained ground towards the end of the century; at the extrême limit of our present period there appears the remarkable figure of Beaumarchais (1732–1799).

Beaumarchais.

The *Mariage de Figaro* and the *Barbier de Séville* are well known as having had attributed to them no mean place among the literary causes and forerunners of the Revolution. Their dramatic and literary value would itself have sufficed to obtain attention for them at any time, though there can be no doubt that their popularity was mainly due to their political appositeness. The most remarkable point about them, as about the school of comedy of which Congreve was the chief master in England at the beginning of the century, was the abuse and superfluity of wit in the dialogue, indiscriminately allotted to all characters alike.

18th Century Fiction.—With prose fiction the case was altogether different. We have seen how the short tale of a few pages had already in the 16th century attained high if not the highest excellence; how at three different periods the fancy for long-winded prose narration developed itself in the prose rehandlings of the chivalric poems, in the *Amadis* romances, and in the portentous recitals of Gomberville and La Calprénède; how burlesques of these romances were produced from Rabelais to Scarron; and how at last Madame de Lafayette showed the way to something like the novel of the day. If we add the fairy story, and a small class of miniature romances, of which *Aucassin et Nicolette* in the 13th, and the delightful *Jehan de Paris* (of the 15th or 16th, in which a king of England is patriotically sacrificed) are good representatives, we shall have exhausted the list. The 18th century was quick to develop the system of the author of the *Princesse de Clèves*, but it did not abandon the cultivation of the romance, that is to say, fiction dealing with incident and with the simpler passions, in devoting itself to the novel, that is to say, fiction dealing with the analysis of sentiment and character. **Le Sage.** Le Sage, its first great novelist, in his *Diable Boiteux* and *Gil Blas*, went to Spain not merely for his subject but also for his inspiration and manner, following the lead of the picaroon romance of De Rojas and Scarron. Like Fielding, however, whom he much resembles, Le Sage mingled with the romance of incident the most careful attention to character and the most lively portrayal of it, while his style and language are such as to make his work one of the classics of French literature. The novel of character was really founded in France by the Abbé Prévost (1697–1763), the author of *Cleveland* and of the incomparable *Manon Lescaut*. The popularity of this style was much helped by the immense vogue in France of the works of Richardson. Side by side with it, however, and for a time enjoying still greater popularity, there flourished a very different school of fiction, of which Voltaire, whose name occupies the first or all but the first place in every branch of literature of his time, was the most brilliant cultivator. This was a direct development of the 16th century *conte*, and consisted usually of the treatment in a humorous, satirical, and not always over-decent fashion of contemporary foibles, beliefs, philosophies, and occupations. These tales are of every rank of excellence and merit both literary and moral, and range from the astonishing wit, grace, and humor of *Candide* and *Zadig* to the book which is Diderot's one hardly pardonable sin, and the similar but more lively efforts of Crébillon *fils* (1707–1777). These latter deeps led in their turn to the still lower depths of La Clos and Louvet. A third class of 18th century fiction consists of attempts to return to the humorous *fatrasie* of the 16th century, attempts which were as much influenced by Sterne as the sentimental novel was by Richardson. The *Homme aux Quarante Écus* of Voltaire has something of this character, but the most characteristic works of the style are the *Jacques le Fataliste* of Diderot, which shows it nearly at its best, and the *Compère Mathieu*, sometimes attributed to Pigault-Lebrun (1753–1835), but apparently in reality due to Du Laurens (1719–1797), which shows it at perhaps its worst. Another remarkable story-teller was Cazotte (1724–1793), whose *Diable Amoureux* displays much fantastic power, and connects itself with a singular fancy of the time for occult studies and *diablerie*, manifested later by the patronage shown to Cagliostro, Mesmer, St. Germain, and others. In this connection, too, may perhaps also be mentioned most appropriately Restif de la Bretonne, a remarkably original and voluminous writer, who was little noticed by his contemporaries and successors for the best part of a century, and whom bibliomania chiefly has of late induced French critics to resuscitate. Restif, who was nick-named the "Rousseau of the gutter," *Rousseau du ruisseau*, presents to an English imagination many of the characteristics of a non-moral Defoe. While these various schools busied themselves more or less with real life seriously depicted or purposely travestied, the great vogue and success of *Télémaque* produced a certain number of didactic works, in which moral or historical information was sought to be conveyed under a more or less thin guise of fiction. Such was the *Voyage du Jeune Anacharsis* of Barthélemy (1716–1795); such the *Numa Pompilius* and *Gonzale de Cordoue* of Florian (1755–1794), who also deserves notice as a writer of pastorals, fables, and short prose tales; such the *Bélisaire* and *Les Incas* of Marmontel (1728–1799). Between this class and that of the novel of sentiment may perhaps be placed *Paul et Virginie* and *La Chaumière Indienne;* though Bernardin de St. Pierre (1737–1814) should perhaps properly be noticed after Rousseau and as a moralist. Diderot's fiction-writing has already been referred to more than once, but his *Religieuse* deserves citation here as a powerful specimen of the novel both of analysis and polemic; while his undoubted masterpiece, the *Neveu de Rameau*, though very difficult to class, comes under this head as well as under any other. There are, however, two of the novelists of this age, and of the most remarkable, who have yet to be noticed, and these are the author of *Marianne* and the author of *Julie*. **Marivaux.** We do not mention Marivaux (1688–1763) in this connection as the equal of Rousseau (1713–1778), but merely as being in his way almost equally original and equally remote from any suspicion of school influence. He began with burlesque writing, and was also the author of several comedies, of which *Les Fausses Confidences* is the principal. But it is in prose fiction that he really excels. He may claim to have, at least in the opinion of his contemporaries, invented a style, though perhaps the term *marivaudage*, which was applied to it, has a not altogether complimentary connotation. He may claim also to have invented the novel without a purpose, which aims simply at amusement, and at the same time does not seek to attain that end by buffoonery or by satire. Gray's definition of happiness, "to lie on a sofa and read endless novels by Marivaux" (it is true that he added Crébillon), is well known, and the production of mere pastime by means more or less harmless has since become so well-recognized a function of the novelist that Marivaux, as one of the earliest to discharge it, deserves notice. **J. J. Rousseau.** The name, however, of Jean Jacques Rousseau is of far different importance. His two great works, the *Nouvelle Héloïse* and *Émile*, are as far as possible from being perfect as novels. But no novels in the world have ever had such influence as these. To a great extent this influence was due mainly to their attractions as novels, imperfect though they may be in this character, but it was beyond dispute also owing to the doctrines which they contained, and which were exhibited in novel form. They had not only a greater popularity than any other works of the same class during the century, not only a more important political and philosophical influence, but also a far greater practical influence than is generally supposed. As the fact has been lately treated as doubtful, it may be well to repeat that the *Émile* did actually to a great extent put a stop to the habit previously prevailing among French mothers of refusing to nurse their own infants, and that the recommendation which the same book contained that all children should be taught a trade undoubtedly contributed to the preservation and power of self-support of great numbers of the emigrants during the French Revolution. Great as has been the influence of prose fiction in various ways, this is perhaps the most direct and certain instance of its influence upon the daily life and conduct of large classes of men. Certainly it is the earliest of such instances, and this makes it remarkable in the history of literature.

Such are the principal developments of fiction during the century; but it is remarkable that, varied as they were, and excellent as was some of the work to which they gave rise, none of these schools were directly very fertile in results or successors. The period with which we shall next have to deal, that from the outbreak of the Revolution to the death of Louis XVIII., is curiously barren of fiction of any merit. It has been frankly noticed by French writers that since the Middle Ages many if not most of their great literary developments have needed the stimulus of foreign example and importation. Thus, in part of the 16th century the influence of Italy was predominant and productive, in the 17th that of Spain, in the 18th that of England. Less powerful during the thirty years of war, English influence began again to assert itself in the 19th century. Byron and Shakespeare, well or ill understood, were responsible for much of the development on the poetical side of the romantic movement. But their influence was as nothing compared with that of Scott on the prose side, and especially on the side of prose fiction. As yet, however, this influence was remote. The result of its working was that the prose romance began once more to be written in the later days of the Restoration, with the astonishing success which in the course of the last half-century has placed the French novel in quantity and general excellence, if not in the quality of a few chosen examples, at the head of the fictitious literature of modern Europe.

18th Century History.—It is not, however, in any of the departments of *belles lettres* that the real eminence of the 18th century as a time of literary production in France consists. In all serious branches of study its accomplishments

Montesquieu.

were, in a literary point of view, remarkable, uniting as it did an extraordinary power of popular and literary expression with an ardent spirit of inquiry, a great speculative ability, and even a far more considerable amount of laborious erudition than is generally supposed. The popular and rather desultory character of many of these researches and speculations makes it somewhat difficult to arrange them in an orderly fashion under the heads of separate departments of science. Historical, theological, metaphysical, physical, economical, political, and moral speculations confuse themselves constantly in the same author, and very often in the same work, and any division that can be adopted must be almost of necessity in many respects a cross division. The advantages, however, of maintaining some sort of order are so unmistakable that we shall continue to observe the arrangement hitherto adopted. The historical studies and results of the 18th century speculation in France are of especial and peculiar importance. There is no doubt that what is called the science of history dates from this time, and though the beginning of it is usually assigned to the Italian Vico, its complete indication may perhaps with equal or greater justice be claimed by the Frenchman Turgot. Before Turgot, however, there were great names in French historical writing, and perhaps the greatest of all is that of Montesquieu (1689–1755). The three principal works of this great writer are all historical and at the same time political in character. In the *Lettres Persanes* he handled, with wit inferior to the wit of no other writer even in that witty age, the corruptions and dangers of contemporary morals and politics. The literary charm of this book—the plan of which was suggested by a work of Dufresny (1648–1724), a comic writer not destitute of merit—is very great, and its plan was so popular as to lead to a thousand imitations, of which all, except those of Voltaire and Goldsmith, only bring out the immense superiority of the original. Few things could be more different from this lively and popular book than Montesquieu's next work, the *Grandeur et Décadence des Romains*, in which the same acuteness and knowledge of human nature are united with considerable erudition, and with a weighty though perhaps somewhat grandiloquent and rhetorical style. His third and greatest work, the *Esprit des Lois*, is again different both in style and character. Its defect is too hasty and sweeping generalization on facts insufficiently collected and observed. But this defect is as nothing as compared with the merits of its fertility in ideas, its splendid breadth of view, and the felicity with which the author, in a manner unknown before, recognizes the laws underlying complicated assemblages of fact which had up to that time been considered as connected only by the hazards of fate or by arbitrary causes. The style of this great work is equal to its substance; less light than that of the *Letters*, less rhetorical than that of the *Grandeur des Romains*, it is still a marvellous union of dignity and wit. Around Montesquieu, partly before and partly after him, is a group of philosophical or at least systematic historians, of whom the chief are Dubos (1670–1742), Boulainvilliers (1658–1722), and Mably (1709–1785). Dubos, whose chief work is not historical but æsthetic (*Réflexions sur la Poésie et la Peinture*), wrote a so-called *Histoire Critique de l'Établissement de la Monarchie Française*, which is as far as possible from being in the modern sense critical, inasmuch as, in the teeth of history, and in order to exalt the *Tiers État*, it pretends an amicable coalition of Franks and Gauls, and not an irruption by the former. Boulainvilliers, on the other hand, maintained the rights of the nobility in virtue and as a consequence of the Frankish conquest. Mably (*Observations sur l'Histoire de la France*) had a much greater influence than either of these writers, and a decidedly mischievous one, especially at the period of the Revolution. He, more than any one else, is responsible for the ignorant and childish extolling of Greek and Roman institutions, and the still more ignorant depreciation of the Middle Ages, which was for a time characteristic of French politicians. Montesquieu was, as we have said, followed by Turgot (1727–1781), whose writings are few in number, and not remarkable for style, but full of original thought. Turgot in his turn was followed by Condorcet (1743–1794), whose tendency is somewhat more sociological than directly historical. Towards the end of the period, too, a considerable number of philosophical histories were written, the usual object of which was, under cover of a kind of allegory, to satirize and attack the existing institutions and government of France. The most famous of these was the *Histoire des Indes*, nominally written by the Abbé Raynal (1711–1796), but really the joint work of many members of the Philosophe party, especially Diderot. Side by side with this really or nominally philosophical school of history there existed another and less ambitious school, which contented itself with the older and simpler view of the science. The Abbé de Vertot (1655–1735) belongs almost as much to the 17th as to the 18th century; but his principal works, especially the famous *Histoire des Chevaliers de Malte*, date from the later period, as do also the *Révolutions Romaines*. Vertot is above all things a literary historian, and the well-known "Mon siége est fait," whether true or not, certainly expresses his system. Of the same school, though far more comprehensive, was the laborious Rollin (1661–1741), whose works in the original or translated were long the chief historical manuals of Europe. In the same class, too, far superior as is his literary power, must be ranked the historical works of Voltaire, *Charles XII.*, *Pierre le Grand*, etc. A very perfect example of the historian who is literary first of all is supplied by Rulhière (1735–1791), whose *Révolution en Russie en 1762* is one of the little masterpieces of history, while his larger and posthumous work on the last days of the Polish kingdom exhibits perhaps some of the defects of this class of historians. Lastly must be mentioned the memoirs and correspondence of the period, the materials of history if not history itself. The century opened with the most famous of all of these, the memoirs of the Duc de St. Simon (1678–1755), an extraordinary series of pictures of the court of Louis XIV. and the Regency, written in an unequal and incorrect style, but with something of the irregular excellence of the great 16th century writers, and most striking in the sombre bitterness of its tone. The subsequent and less remarkable memoirs of the century are so numerous that it is almost impossible to select a few for reference, and altogether impossible to mention all. Of those bearing on public history the memoirs of De Staal, of D'Argenson, of Duclos, of Weber, of Madame de Genlis, of Bésenval, of Madame Campan, may perhaps be selected for mention; of those bearing on literary and private history, the memoirs of Madame d'Épinay, and the innumerable writings having reference to Voltaire and to the Philosophe party generally. Here, too, may be mentioned a remarkable class of literature, consisting of purely private and almost confidential letters, which were written at this time with very remarkable literary excellence. As specimens may be selected those of Mademoiselle Aissé (1693–1733), which are models of easy and unaffected tenderness, and those of Mademoiselle de Lespinasse, the companion of Madame du Deffand and afterwards of D'Alembert. These latter, in their extraordinary fervor and passion, not merely contrast strongly with the generally languid and frivolous gallantry of the age, but also constitute one of its most remarkable literary monuments. It has been said of them that they "burn the paper," and the expression is not exaggerated. While the imaginative works of the period were quite unable, with perhaps the exception of *Manon Lescaut* and the *Nouvelle Héloïse*, to express depth or heat of passion, these letters, written straight from the heart, equal anything that poet or novelist has ever elaborated. Of lighter letters the charming correspondence of Diderot with Mademoiselle Voland deserves special mention. But the correspondence, like the memoirs of this century, defies justice to be done to it in any cursory or limited mention. In this connection, however, it may be well to mention some of the most remarkable works of the time, the *Confessions*, *Rêveries*, and *Promenades d'un Solitaire* of Rousseau. In these works, especially in the *Confessions*, there is not merely exhibited passion as fervid though perhaps less unaffected than that of Mademoiselle de Lespinasse,—there appear in them two literary characteristics which, if not entirely novel (no literary characteristic is ever entirely novel), were for the first time brought out deliberately by powers of the first order, were for the first time made the mainspring of literary interest, and thereby set an example which for more than a century has been persistently followed, and which has produced some of the finest results of modern literature. The first of these was the elaborate and unsparing analysis and display of the motives, the weaknesses, and the failings of individual character. This process, which Rousseau unflinchingly performed on himself, has been followed usually in respect to fictitious characters by his successors.

Up to his time character-handling had been mainly abandoned to the dramatist, the satirist, the historian, the moralist, and the preacher, whose purposes led them to use bright or dark colors, bold outlines, and strongly contrasted lights and shades. Rousseau set the example of drawing a character in all its complexity, of showing the mixture of meanness and nobleness, and the intricate processes which led to the commission of acts the simplest in appearance. The other novelty was the feeling for natural beauty and the elaborate description of it, the credit of which latter must, it has been agreed by all impartial critics, be assigned rather to Rousseau than to any other writer. His influence in this direction was, however, soon taken up and continued by Bernardin de St. Pierre, some of whose works have been already alluded to. In sentiment as well as in literary history Bernardin de St. Pierre is the connecting link between Rousseau and Chateaubriand, and thus occupies a position of considerable interest. In particular the author of *Paul et Virginie* set himself to develop the example of description which Rousseau had set, and his word-paintings, though less powerful than those of his model, are more abundant, more elaborate, and animated by a more amiable spirit.

Condillac.

18th Century Philosophy.—The Anglomania which distinguished the time was nowhere more strongly shown than in the cast and direction of its philosophical speculations. As Montesquieu and Voltaire had imported into France a vivid theoretical admiration for the British constitution and for British theories in politics, so Voltaire, Diderot, and a crowd of others popularized and continued in France the philosophical ideas of Hobbes and Locke and even Berkeley, the theological ideas of Bolingbroke, Shaftesbury, and the English deists, and the physical discoveries of Newton. Descartes, Frenchman and genius as he was, and though his principles in physics and philosophy were long clung to in the schools, was completely abandoned by the more adventurous and progressive spirits. At no time indeed, owing to the confusion of thought and purpose to which we have already alluded, was the word philosophy used with greater looseness than at this time. Using it as we have hitherto used it in the sense of metaphysics, the majority of the Philosophes have very little claim to their title. They were all more or less partisans of materialism, but few of them were contented with arguing materialism out on purely philosophical grounds, or with purely philosophical applications. They usually busied themselves with deducing it from physical considerations, and with applying it to ethical and theological conclusions. There were some who manifested, however, an aptitude for purely philosophical argument, and one who confined himself strictly thereto. Among the former the most remarkable are La Mettrie (1709–1751) and Diderot. La Mettrie in his works *L'Homme Machine, L'Homme Plante*, etc., applied a lively and vigorous imagination, a considerable familiarity with physics and medicine, and a brilliant but unequal style to the task of advocating materialistic ideas on the constitution of man. Diderot, in a series of early works, *Lettre sur les Aveugles*, *Promenade d'un Sceptique*, *Pensées Philosophiques*, etc., exhibited a good acquaintance with philosophical history and opinion, and gave sign in this direction, as in so many others, of a far-reaching intellect. As in almost all his works, however, the value of the thought is extremely unequal, while the different pieces, always written in the hottest haste, and never duly matured or corrected, present but few specimens of finished and polished writing. Bonnet (1724–1793), a Swiss of Geneva, wrote a large number of works, many of which are purely scientific. Others, however, are more psychological, and these, though advocating the materialistic philosophy generally in vogue, were remarkable for uniting materialism with an honest adherence to Christianity. The half mystical writer, St. Martin, also deserves notice. But the French metaphysician of the century is undoubtedly Condillac (1714–1780), almost the only writer of the time in France who succeeded in keeping strictly to philosophy without attempting to pursue his system to its results in ethics, politics, and theology; still more without desiring to anticipate such results, and to discuss the application of a philosophy before the philosophy was itself established. In the *Traité des Sensations*, the *Essai sur l'Origine des Connaissances Humaines*, and other works Condillac elaborated and continued the imperfect sensationalism of Locke. As his philosophical view, though perhaps more restricted, was far more direct, consecutive, and uncompromising than that of the Englishman, so his style greatly exceeded Locke's in clearness and elegance. It cannot pretend to vie with the beauty and artistic suitability of the styles of Descartes and Malebranche, nor with that of Condillac's elder contemporary Berkeley. But for all that, it is a good medium of philosophical expression, and its literary character did not a little to assist the diffusion of the principles of materialism.

Voltaire (theology).

18th Century Theology.—To devote a section to the history of the theological literature of the 18th century in France may seem something of a contradiction; for, indeed, all or most of such literature was anti-theological. The magnificent list of names which the church had been able to claim on her side in the 17th century was exhausted before the end of the second quarter of the 18th with Massillon, and none came to fill their place. Very rarely has orthodoxy been so badly defended as at this time. The literary championship of the church was entirely in the hands of the Jesuits, and of a few disreputable literary free-lances like Fréron (1719–1776) and Desfontaines. The Jesuits were learned enough, and their principal journal, that of Trévoux, was conducted with much vigor and a great deal of erudition. But they were in the first place discredited by the moral taint which has always hung over Jesuitism, and in the second place by the persecutions of the Jansenists and the Protestants, which were attributed to their influence. No single name or work on the orthodox side has preserved the least reputation; while, on the other hand, the names of Père Nonotte and several of his fellows have been enshrined unenviably in the imperishable ridicule of Voltaire, one only of whose adversaries, Guénée (1717–1803), was able to meet him at something like his own weapons. At the same time, while religion and the church were never so badly off for defenders, they had never been, and have never been, so desperately in need of defence. The financial condition of the church was in scandalous contrast with the need and bankruptcy of the state. The lives of too many of its ministers were in more scandalous contrast still with its doctrines and precepts; while its political ascendency, and the use made of it, were felt to be, not merely unjust and improper in themselves, but an almost insuperable barrier to social and political reform. Meanwhile a spirit of hostility had long been growing up, not merely to the church, but to Christianity and religion itself, which was not entirely due to ecclesiastical corruptions. The Renaissance by its paganism, the Reformation by its latitudinarian developments, and the growth of modern science by its materialistic tendencies, had all contributed to this anti-theological movement. Even in the reign of Louis XIV. there was a considerable school of free-thinkers at the French court, and when the restraint of that monarch's devotion was removed the number became largely increased, especially as the study of the writings of the English deists came to strengthen the tendency. It has never been at all accurately decided how far what may be called the scoffing school of Voltaire represents a direct revolt against Christianity, and how far it was merely a kind of guerilla warfare against the clergy. It is positively certain that Voltaire was not an atheist, and that he did not approve of atheism. But for his aggressive and reforming tendencies he might very likely have confined himself to the colorless and speculative deism of Bolingbroke and Shaftesbury. As it was, however, he went farther, and his *Dictionnaire Philosophique*, which is typical of a vast amount of contemporary and subsequent literature, consists of a heterogeneous assemblage of articles directed against various points of dogma and ritual and various characteristics of the sacred records. From the literary point of view, it is one of the most characteristic of all Voltaire's works, though it is perhaps not entirely his. The desultory arrangement, the light and lively style, the extensive but not always too accurate erudition, and the somewhat captious and quibbling objections, are intensely Voltairian. But there is little seriousness about it, and certainly no kind of rancorous or deep-seated hostility. With many, however, of Voltaire's pupils and younger contemporaries the case was altered. They were distinctively atheists and anti-supernaturalists. The atheism of Diderot, unquestionably the greatest of them all, has been keenly debated; but in the case of Damilaville, Naigeon, Holbach, and others there is no room for doubt. By these persons a great mass of atheistic and anti-Christian literature was composed and set afloat. The characteristic work

The system of Nature.

Chamfort. Rivarol.

of this school, its last word indeed, is the famous *Système de la Nature*, attributed to Holbach (1723–1789), but known to be, in part at least, the work of Diderot. In this remarkable work, which caps the climax of the metaphysical materialism or rather nihilism of the century, the atheistic position is clearly put. It made an immense sensation; and it so fluttered not merely the orthodox but the more moderate free-thinkers, that Frederick of Prussia and Voltaire, perhaps the most singular pair of defenders that orthodoxy ever had, actually set themselves to refute it. The extreme unpopularity and startling nature of its tenets, which we do not here judge, have been wont to reflect themselves in the criticisms passed on it merely as a book. Viewed in this light, without prejudice either way, it must be pronounced undeserving of much of this unfavorable criticism. Its style and argument are very unequal, as books written in collaboration are apt to be, and especially books in which Diderot, the paragon of inequality, had a hand. But there is on the whole a great consistency and even rigor in the argument; there is an almost entire absence of the heterogeneous assemblage of anecdotes, jokes good and bad, scraps of accurate or inaccurate physical science, and other incongruous matter with which the Philosophes were wont to stuff their works; and lastly, there is in the best passages a kind of sombre grandeur which recalls the manner as well as the matter of Lucretius. It is perhaps well to repeat, in the case of so notorious a book, that this criticism is of a purely literary and formal character; but there is little doubt that the literary merits of the work considerably assisted its didactic influence. As the Revolution approached, and the victory of the Philosophe party was declared, there appeared for a brief space a group of cynical and accomplished phrasemakers presenting some similarity to that of which a hundred years before St. Evremond was the most prominent figure. The chief of this group were Chamfort (1747–1794) on the republican side, and Rivarol (1753–1801) on that of the royalists. Like the older writer to whom we have compared them, neither can be said to have produced any one work of eminence, and in this they stand distinguished from moralists like La Rochefoucauld. The floating sayings, however, which are attributed to them, or which occur here and there in their miscellaneous work, yield in no respect to those of the most famous of their predecessors in wit and a certain kind of wisdom, though they are frequently more personal than aphoristic.

Helvétius.

Thomas.

Vauvenargues.

18th Century Moralists and Politicians.—Not the least part, however, of the energy of the period in thought and writing was devoted to questions of a directly moral and political kind. The grave social and economical evils under which France labored made this devotion almost inevitable; and though we have already noticed under the head of history a certain number of works written under this inspiration, a still larger proportion remains to be mentioned—moral, political, and economical works having had, from the time of Aristotle downwards, sufficient connection to be treated together. With regard to morality proper the favorite doctrine of the century was what is commonly called the selfish theory, the only one indeed which was suitable to the sensationalism of Condillac and the materialism of Holbach. The pattern book of this doctrine was the *De l'Esprit* of Helvétius (1715–1771), the most amusing book perhaps which ever pretended to the title of a solemn philosophical treatise. There is some analogy between the principles of this work and those of the *Système de la Nature*. With the inconsistency—some would say with the questionable honesty—which distinguished the more famous members of the Philosophe party when their disciples spoke with what they considered imprudent outspokenness, Voltaire and even Diderot attacked Helvétius as the former afterwards attacked Holbach. Both were guilty of disregarding the curious cant of noble sentiment which was so dear to the 18th century, and with the tenacious steadiness of traditional criticism it has been usual to speak slightingly of Helvétius ever since. The truth is that, whatever may be the general value of *De l'Esprit*, it is full of acuteness, though that acuteness is as desultory and disjointed as its style. As Helvétius may be taken as the representative author of the cynical school, so perhaps Thomas (1732–1795) may be taken as representative of the votaries of noble sentiment to whom we have also alluded. The works of Thomas chiefly took the form of academic *éloges* or formal panegyrics, and they have all the defects, both in manner and substance, which are associated with that style. They were, however, useful in their way, as counteracting the prevailing cynicism, and have some literary importance, as being perhaps the least dead of an enormous mass of similar literature which was composed at the time. Of yet a third school, corresponding in form to La Rochefoucauld and La Bruyère, and possessed of some of the antique vigor of preceding centuries, was Vauvenargues (1715–1747). This writer, who died very young, has produced maxims and reflections of considerable mental force and literary finish. From Voltaire downwards it has been usual to compare him with Pascal, from whom he is chiefly distinguished by a striking but somewhat empty stoicism. Between the moralists, of whom we have taken these three as examples, and the politicians may be placed Rousseau, who in his novels and miscellaneous works is of the first class, in his famous *Contrat Social* of the second. The characteristics of Rousseau are too well known to need lengthy description. His discontent with the established social order and arrangements of the world led him, on the one hand, to advocate alterations in individual morality, such as the discarding of the vices and corruptions of civilization, and the return to a simpler and less complicated manner of living; on the other to develop and urge theories respecting the constitution of the body politic, which, if not altogether novel in their nature, were made so by the force of their statement and the literary beauties of its form. Rousseau's work was continued on the moral and literary rather than the political side by Bernardin de Saint Pierre. Of direct and avowed political writings there were few during the century, and none of anything like the importance of the *Contrat Social*, theoretical acceptance of the established French constitution being a point of necessity with all Frenchmen. Nevertheless it may be said that almost the whole of the voluminous writings of the Philosophes, even of those who, like Voltaire, were sincerely aristocratic and monarchic in predilection, were of more or less veiled political significance. There was one branch of political writing, moreover, which could be indulged in without much fear. The form of government was sacred, but the conduct of government could be discussed without much danger, for, whatever might be the divine rights of the best of princes, his intentions might always be frustrated by wicked or incapable ministers and officials. Political economy, therefore, and administrative theories, received much attention. The earliest writer of eminence on these subjects was the great engineer Vauban (1633–1707), whose *Oisivetés* and *Dîme Royale* exhibit both great ability and extensive observation. A more utopian enconomist of the same time was the Abbé de St. Pierre (1658–1743), not to be confounded with the author of *Paul et Virginie*. Soon political economy in the hands of Quesnay (1694–1774) took a regular form, and towards the middle of the century a great number of works on questions connected with it, especially that of free trade in corn, on which the Abbé Galiani (1723–1787), Morellet, and above all Turgot, distinguished themselves. Of writers on legal subjects and of the legal profession, the century, though not less fertile than in other directions, produced few or none of any great importance from the literary point of view. The chief name which in this connection is known is that of Chancellor d'Aguesseau (1668–1751), at the beginning of the century, an estimable writer of the Port Royal school, who took the orthodox side in the great disputes of the time, but failed to display any great ability therein. He was, as became his profession, more remarkable as an orator than a writer, and his works contain valuable testimonies to the especially perturbed and unquiet condition of his century—a disquiet which is perhaps also its chief literary note. There were other French magistrates, such as Montesquieu, Hénault (1685–1770), Des Brosses (1706–1773), and others, who made considerable mark in literature; but it was usually (except in the case of Montesquieu) in subjects not even indirectly connected with their profession. The bench and bar of France were indeed at this time almost as full of abuses as the other departments of state; and though the parliaments, metropolitan and provincial, would occasionally withstand a corrupt ministry, it was much more in the interest of their own privileges than of the community. The *Esprit des Lois* stands alone.

18th Century Criticism and Periodical Literature.—We have said that literary criticism assumes in this century a sufficient importance to be treated under a separate heading. Contributions were made to it of many different kinds and from many different points of view. Periodical literature, the chief stimulus to its production, began more and more to come into favor. Even in the 17th century the *Journal des Savants*, the Jesuit *Journal de Trévoux*, and other publications had set the example of different kinds of it. Just before the Revolution the *Gazette de France* was in the hands of Suard, a man who was nothing if not a literary critic. Perhaps, however, the most remarkable contribution of the century to criticism of the periodical kind was the *Feuilles de Grimm*, a circular sent for many years by the comrade of Diderot and Rousseau to the German courts, and containing a *compte rendu* of the ways and works of Paris, literary and artistic as well as social. These *Leaves* not only include much excellent literary criticism by Diderot, but also gave occasion to the incomparable *salons* or accounts of the exhibition of pictures from the same hand, essays which founded the art of picture criticism, and which have hardly been surpassed since. The prize competitions of the Academy were also a considerable stimulus to literary criticism, though the prevailing taste in such compositions rather inclined to elegant themes than to careful studies or analyses. Larger works on the arts in general or on special divisions of them were not wanting, as, for instance, that of Dubos before alluded to, and those of the Père Bouhours, the Abbé Trublet, and the Abbé Terrasson, the *Essai sur la Peinture* of Diderot, and others. Critically annotated editions of the great French writers also came into fashion, and were no longer written by mere pedants. Of these Voltaire's edition of Corneille was the most remarkable, and his annotations, united separately under the title of *Commentaire sur Corneille*, form not the least important portion of his works. Even older writers, looked down upon though they were by the general taste of the day, received a share of this critical interest. In the earlier portion of the century Lenglet-Dufresnoy and La Monnoye devoted their attention to Rabelais, Regnier, Villon, Marot, and others. Barbazan (1696–1774) and Le Grand d'Aussy (1737–1800) gathered and brought into notice the long scattered and unknown rather than neglected fabliaux of the Middle Ages. Even the chansons de gestes attracted the notice of the Comte de Caylus (1692–1765) and the Comte de Tressan (1705–1785). The latter, in his *Bibliothèque des Romans*, worked up a large number of the old epics into a form suited to the taste of the century. In his hands they became lively tales of the kind suited to readers of Voltaire and Crébillon. But in this travestied form they had considerable influence both in France and abroad—Wieland, for instance, writing his *Oberon* merely from a knowledge, and very soon after the appearance, of Tressan's version of *Huon de Bordeaux*. By these publications attention was at least called to early French literature, and when it had been once called, a more serious and appreciative study became merely a matter of time. The style of much of the literary criticism of the close of this period was indeed deplorable enough. Laharpe (1739–1803), who though a little later in time as to most of his critical productions is perhaps its most representative figure, shows criticism in one of its worst forms. He has all the defects of Malherbe and Boileau, with few of their merits and none of their excuses. The critic specially abhorred by Sterne, who looked only at the stop-watch, was a kind of prophecy of Laharpe; but such a writer is a natural enough expression of an expiring principle. The year after the death of Laharpe Sainte-Beuve was born.

Grimm.

18th Century Savants.—In science and general erudition the 18th century in France was at first much occupied with the mathematical studies for which the French genius is so peculiarly adapted, which the great discoveries of Descartes had made possible and popular, and which those of his supplanter Newton only made more popular still. Voltaire took to himself the credit which he fairly deserves of first introducing the Newtonian system into France, and it was soon widely popular—even ladies devoting themselves to the exposition of mathematical subjects, as in the case of the Marquise du Chatelet. Many of the greatest mathematicians of the age, such as De Moivre and Laplace, were French by birth, while others like Euler belonged to French-speaking races, and wrote in French. The physical sciences were also ardently cultivated, the impulse to them being given partly by the generally materialistic tendency of the age, partly by the Newtonian system, and partly also by the extended knowledge of the world provided by the circumnavigatory voyage of Bougainville (1729–1811), and other travels. Maupertuis (1698–1759) and La Condamine (1701–1774) made long journeys for scientific purposes, and duly recorded their experiences. The former, a mathematician and physicist of some ability but more oddity, is chiefly known to literature by the ridicule of Voltaire in the *Diatribe du Docteur Akakia*. D'Alembert (1713–1783), a great mathematician and a writer of considerable though rather academic excellence, is principally known from his connection with and introduction to the *Encyclopédie*, of which more presently. Chemistry was also assiduously cultivated, the Baron d'Holbach, among others, being a devotee thereof, and helping to advance the science to the point where, at the conclusion of the century, it was illustrated by Berthollet and Lavoisier. During all this devotion to science in its modern acceptation, the older and more literary forms of erudition were not neglected, especially by the illustrious Benedictines of the abbey of St. Maur. Calmet (1672–1757), the author of the well-known *Dictionary of the Bible*, belonged to this order, and to them also (in particular to Dom Rivet) was due the beginning of the immense *Histoire Littéraire de la France*, a work interrupted by the Revolution and long suspended, but for the last quarter of a century diligently continued. Of less orthodox names distinguished for erudition, Fréret (1688–1749), secretary of the Academy, is perhaps the most remarkable. But in the consideration of the science and learning in the 18th century from a literary point of view, there is one name and one book which require particular and, in the case of the book, somewhat extended mention. The man is Buffon (1747–1780), the book the *Encyclopédie*. The immense *Natural History* of Buffon, though not entirely his own, is a remarkable monument of the union of scientific tastes with literary ability. As has happened in many similar instances, there is in parts more literature than science to be found in it; and from the point of view of the latter, Buffon was far too careless in observation and far too solicitous of perfection of style and grandiosity of view. The style of Buffon has sometimes been made the subject of the highest eulogy, and it is at its best admirable; but one still feels in it the fault of all serious French prose in this century before Rousseau,—the presence, that is to say, of an artificial spirit rather than of natural variety and power. The *Encyclopédie*, unquestionably on the whole the most important French literary production of the century, if we except the works of Rousseau and Voltaire, was conducted for a time by Diderot and D'Alembert, afterwards by Diderot alone. It numbered among its contributors almost every Frenchman of eminence in letters. It is often spoken of as if, under the guise of an encyclopædia, it had been merely a *plaidoyer* against religion, but this is entirely erroneous. Whatever anti-ecclesiastical bent some of the articles may have, the book as a whole is simply what it professes to be, a dictionary,—that is to say, not merely an historical and critical lexicon, like those of Bayle and Moreri (indeed, history and biography were nominally excluded), but a dictionary of arts, sciences, trades, and technical terms. Diderot himself had perhaps the greatest faculty of any man that ever lived for the literary treatment in a workman-like manner of the most heterogeneous and in some cases rebellious subjects; and his untiring labor, not merely in writing original articles, but in editing the contributions of others, determined the character of the whole work. There is no doubt that it had, quite independently of any theological or political influence, an immense share in diffusing and gratifying the taste for general information by which the century which has succeeded its publication has been more distinguished than perhaps any other in history.

Buffon.

The Encyclopédie.

1789–1830.—*General Sketch.*—The period which elapsed between the outbreak of the Revolution and the accession of Charles X. has often been considered a sterile one in point of literature. As far as mere productiveness goes, this judgment is hardly correct. No class of literature was altogether neglected during these stirring five-and-thirty years, the political events of which have so engrossed the attention of posterity that it has sometimes been necessary for historians to remind us that during the height of the Terror and the final disasters of the empire the theatres were open and the booksellers' shops patronized as much or more than ever. Journalism, parliamentary eloquence and scientific writing were especially cultivated, and the former in its modern sense may also be said to have been created. But of the higher products of literature the period may justly be considered to have been somewhat barren. During the earlier part of it there is, with the exception of André Chénier, not a single name of the first or even second order of excellence. Towards the midst those of Chateaubriand (1768–1848) and Madame de Stael (1766–1817) stand almost alone; and at the close those of Courier, Béranger, and Lamartine are not seconded by any others to tell of the magnificent literary burst which was to follow the publication of *Cromwell.* Of all departments of literature, poetry proper was worst represented during this period. André Chénier was silenced at its opening by the guillotine. Le Brun and Delille, favored by an extraordinary longevity, continued to be admired and followed. It was the palmy time of descriptive poetry. Fontanes, Castel, Boisjolin, Esmenard, Berchoux, Ricard, Martin, Gudin, Cournaud, are names which chiefly survive as those of the authors of scattered attempts to turn the Encyclopædia into verse. Chénedollé (1769–1833) owes his reputation rather to amiability and to his association with men eminent in different ways, such as Rivarol and Joubert, than to any real power. Even more ambitiously, Luce de Lancival, Campenon, Dumesnil, and Parseval de Grand-Maison endeavored to write epics, and succeeded rather worse than the Chapelains and Desmarets of the 17th century. The characteristic of all this poetry was the description of everything in metaphor and paraphrase, and the careful avoidance of anything like directness of expression; and the historians of the romantic movement have collected many instances of this absurdity. Lamartine will be more properly noticed in the next division. But about the same time as Lamartine, and towards the end of the present period, there appeared a poet who may be regarded as the last important echo of Malherbe. This was Casimir Delavigne (1793–1843), the author of *Les Messéniennes*, a writer of very great talent, and, according to the measure of Rousseau and Lebrun, no mean poet. It is usual to reckon Delavigne as transitionary between the two schools, but in strictness he must be counted with the classicists. Dramatic poetry exhibited somewhat similar characteristics. The system of tragedy writing had become purely mechanical, and every act, almost every scene and situation, had its regular and appropriate business and language, the former of which the poet was not supposed to alter at all, and the latter only very slightly. Poinsinet, Laharpe, M. J. Chénier, Raynouard, De Jouy, Briffaut, Baour-Lormian, all wrote in this style. Of these Chénier (1764–1811) had some of the vigor of his brother André, from whom he was distinguished by more popular political principles and better fortune. On the other hand Ducis (1733–1816), who passes with Englishmen as a feeble reducer of Shakespeare to classical rules, passed with his contemporaries as an introducer into French poetry of strange and revolutionary novelties. Comedy, on the other hand, fared better, as, indeed, it had always fared. Fabre d'Eglantine (1755–1794) (the companion in death of Danton), Collin d'Harleville (1755–1806), Andrieux (1759–1833), Picard, Alexandre Duval, and Népomucène Lemercier (1771–1840) were the comic authors of the period, and their works have not suffered the complete eclipse of the contemporary tragedies which in part they also wrote. If not exactly worthy successors of Molière, they are at any rate not unworthy children of Beaumarchais. In romance writing there is again, until we come to Madame de Stael, a great want of originality and even of excellence in workmanship. The works of Madame de Genlis (1746–1830) exhibit the tendencies of the 18th century to platitude and noble sentiment at their worst. Madame Cottin, Madame Souza, and Madame de Krudener exhibited some of the qualities of Madame de Lafayette and more of those of Madame de Genlis. Fiévée (1767–1839), in *Le Dot de Suzette* and other works, showed some power over the domestic story; but perhaps the most remarkable work in point of originality of the time was Xavier de Maistre's (1763–1852) *Voyage autour de ma Chambre*, an attempt in quite a new style, which has been happily followed up by other writers. Turning to history we find comparatively little written at this period. Indeed, until quite its close men were too much occupied in making history to have time to write it. There is, however, a considerable body of memoir writers, especially in the earlier years of the period, and some great names appear even in history proper. Many of Sismondi's (1773–1842) best works were produced during the empire. De Barante (1782–1866), though his best known works date much later, belongs partially to this time. On the other hand, the production of philosophical writing, especially in what we may call applied philosophy, was considerable. The sensationalist views of Condillac were first continued as by Destutt de Tracy (1754–1832) and Laromiguière, and subsequently opposed, in consequence partly of a religious and spiritualist revival, partly of the influence of foreign schools of thought, especially the German and the Scotch. The chief philosophical writers from this latter point of view were Royer Collard (1763–1846), Maine de Biran (1776–1824), and Jouffroy (1796–1842). Their influence on literature, however, was altogether inferior to that of the reactionist school, of whom De Bonald (1753–1840) and Joseph de Maistre (1754–1821) were the great leaders. These latter were strongly political in their tendencies, and political philosophy received, as was natural, a large share of the attention of the time. In continuation of the work of the Philosophes, the most remarkable writer was Volney (1757–1820), whose *Ruines* are generally known. On the other hand, others belonging to that school, such as Necker and Morellet, wrote from the moderate point of view against revolutionary excesses. Of the reactionists, De Bonald is extremely royalist, and carries out in his *Législations Primitives* somewhat the same patriarchal and absolutist theories as our own Filmer, but with infinitely greater genius.

De Maistre.

As De Bonald is royalist and aristocratic, so De Maistre is the advocate of a theocracy pure and simple, with the pope for its earthly head, and a vigorous despotism for its system of government. Of theology proper there is almost necessarily little or nothing, the clergy being in the earlier period proscribed, in the latter part kept in a strict and somewhat discreditable subjection by the empire. In moralizing literature there is one work of the very highest excellence, which, though not published till long afterwards, belongs in point of composition to this period.

Joubert.

This is the *Pensées* of Joubert (1754–1824), the most illustrious successor of Pascal and Vauvenargues, and to be ranked perhaps above both in the literary finish of his maxims, and certainly above Vauvenargues in the breadth and depth of thought which they exhibit. Of science and erudition the time was fruitful. At an early period of it appeared the remarkable work of Cabanis (1757–1808), the *Rapports du Physique et du Morale de l'Homme,* a work in which physiology is treated from the extreme materialist point of view, but with all the liveliness and literary excellence of the Philosophe movement at its best. Another physiological work of great merit at this period was the *Traité de la Vie et de la Mort* of Bichat, and the example set by these works was widely followed; while in other branches of science Laplace, Lagrange, Hauy, Berthollet, etc., produced contributions of the highest value. From the literary point of view, however, the chief interest of this time is centred in two individual names, those of Chateaubriand and Madame de Stael, and three literary developments of a more or less novel character, which were all of the highest importance in shaping the course which French literature has taken since 1824. One of these developments was the reactionary movement of De Maistre and De Bonald, which in its turn largely influenced Chateaubriand, then Lamennais and Montalembert, and has been recently represented in French literature in different guises, chiefly by M. Louis Veuillot and Mgr. Dupanloup. The second and third, closely connected, were the immense advances made by parliamentary eloquence and by political writing, the latter of which, by the hand of Paul Louis Courier (1773–1825), contributed for the first time an undoubted masterpiece to French literature. The influence of the two combined has since raised journalism to even a greater pitch of power in France than in any other country. It is in the development of these new openings for literature, and in the cast and complexion which they gave to its matter, that the real literary importance of the Revolutionary period consists; just as it is in the new elements which they supplied for the treatment of such subjects that the literary value of the authors of *René* and *De l'Allemagne* mainly lies. We have already alluded to some of the beginnings of periodical and journalistic letters in France. For some time, in the hands of Bayle, Basnage, Des Maizeaux, Jurieu, Leclerc, periodical literature consisted mainly of a series, more or less disconnected, of pamphlets, with occasional extracts from forthcoming works, critical *adversaria*, and the like. Of a more regular kind were the often-mentioned *Journal de Trévoux* and *Mercure de France*, and later the *Année Littéraire* of Fréron and the like. The *Correspondance* of Grimm also, as we have pointed out, bore considerable resemblance to a modern monthly review, though it was addressed to a very few persons. Of political news there was, under a despotism, naturally very little. 1789, however, saw a vast change in this respect. An enormous efflorescence of periodical literature at once took place, and a few of the numerous journals founded in that year or soon afterwards survived for a considerable time. A whole class of authors arose who pretended to be nothing more than journalists, while many writers distinguished for more solid contributions to literature took part in the movement, and not a few active politicians contributed. Thus to the original staff of the *Moniteur*, or, as it was at first called, *La Gazette Nationale*, Laharpe, Lacretelle, Andrieux, Garat, and Ginguené were attached. Among the writers of the *Journal de Paris* André Chénier had been ranked. Fontanes contributed to many royalist and moderate journals. Guizot and Morellet, representatives respectively of the 19th and the 18th century, shared in the *Nouvelles Politiques*, while Bertin Fiévée and Geoffroy contributed to the *Journal de l'Empire*, afterwards turned into the still existing *Journal des Débats*. Of active politicians Marat (*L'Ami du Peuple*), Mirabeau (*Courrier de Provence*), Barère (*Journal des Débats et des Décrets*), Brissot (*Patriote Français*), Hébert (*Père Duchesne*), Robespierre (*Défenseur de la Constitution*), and Tallien (*La Sentinelle*) were the most remarkable who had an intimate connection with journalism. On the other hand, the type of the journalist pure and simple is Camille Desmoulins (1759–1794), one of the most brilliant, in a literary point of view, of the short-lived celebrities of the time. Of the same class were Pelletier, Durozoy, Loustalot, Royou. As the immediate daily interest in politics drooped, there were formed periodicals of a partly political and partly literary character. Such had been the *Décade Philosophique*, which counted Cabanis, Chénier, and De Tracy among its contributors, and this was followed by the *Revue Française* at a later period, which was in its turn succeeded by the *Revue des deux Mondes*. On the other hand, parliamentary eloquence was even more important than journalism during the early period of the Revolution. Mirabeau naturally stands at the head of orators of this class, and next to him may be ranked the well-known names of Malouet and Meunier among constitutionalists; of Robespierre, Marat, and Danton, the triumvirs of the Mountain; of Maury, Cazales, and the Vicomte de Mirabeau, among the royalists; and above all of the Girondist speakers Barnave, Vergniaud, and Lanjuinais. The last-named survived to take part in the revival of parliamentary discussion after the Restoration. But the permanent contributions to French literature of this period of voluminous eloquence are, as frequently happens in such cases, by no means large.

Courier.

The union of the journalist and the parliamentary spirit produced, however, in Paul Louis Courier a master of style. Courier spent the greater part of his life, tragically cut short, in translating the classics and studying the older writers of France, in which study he learnt thoroughly to despise the pseudo-classicism of the 18th century. It was not till he was past forty that he took to political writing, and the style of his pamphlets, and their wonderful irony and vigor, at once placed them on the level of the very best things of the kind. Along with Courier should be mentioned Benjamin Constant (1767–1830), who, though partly a romance writer and partly a philosophical author, was mainly a politician and an orator, besides being fertile in articles and pamphlets. Lamennais like Lamartine will best be dealt with later, and the same may be said of Béranger; but Chateaubriand and Madame de Stael must be noticed here. The former represents, in the influence which changed the literature of the 18th century into the literature of the 19th, the vague spirit of unrest and "Weltschmerz," the affection for the picturesque qualities of nature, the religious spirit occasionally turning into mysticism, and the respect sure to become more and more definite and appreciative for antiquity. He gives in short the romantic and conservative element.

Madame de Stael.

Madame de Stael, on the other hand, as became a daughter of Necker, retained a great deal of the Philosophe character and the traditions of the 18th century, especially its liberalism, its *sensibilité*, and its thirst for general information; to which, however, she added a cosmopolitan spirit, and a readiness to introduce into France the literary and social, as well as the political and philosophical, peculiarities of other countries to which the 18th century, in France at least, had been a stranger, and which Chateaubriand himself, notwithstanding his excursions into English literature, had been very far from feeling. She therefore contributed to the positive and liberal side of the future movement. Both of these remarkable persons have in their works a certain taint of what it is difficult to call by any other name than insincerity, though it is certain that there was in their case nothing consciously insincere. The 18th century, however, had left a tradition of "posing" in French literature from which these writers, two of its most distinguished children, were by no means free. The absolute literary importance of the two was very different. Madame de Stael's early writings were of the critical kind, half æsthetic half ethical, of which the 18th century had been fond, and which their titles, *Lettres sur J. J. Rousseau*, *De l'Influence des Passions*, *De la Littérature considérée dans ses rapports avec les Institutions Sociales*, sufficiently show. Her romances, *Delphine* and *Corinne*, have singularly lost their attraction in seventy years, but their influence at the time was immense. The work, however, which had really the most fertile influence was the *De l'Allemagne*, which practically opened up to the rising generation in France the till then unknown treasures of literature and philosophy, which during the most glorious half century of her literary history Germany had, sometimes on hints taken from France herself, been accumulating. The style of these various works is not of the most admirable, and in their matter there is still, as we have said, much hollow talk. But the enthusiasm which pervaded them had a powerful effect, and the indications of new sources at which this enthusiasm might satisfy itself had an effect more powerful still.

Chateaubriand.

The literary importance of Chateaubriand is far greater, while his literary influence can hardly be exaggerated. Chateaubriand's literary father was Rousseau, and his voyage to America helped to develop the seeds which Rousseau had sown. In *René* and other works of the same kind, the naturalism of Rousseau received a still further development. But it was not in mere naturalism that Chateaubriand was to find his most fertile and most successful theme. It was, on the contrary, in the rehabilitation of Christianity. The 18th century had used against religion the method of ridicule; Chateaubriand, by genius rather than by reasoning, set up against this method that of poetry and romance. "Christianity," says he, almost in so many words, "is the most poetical of all religions, the most attractive, the most fertile in literary, artistic, and social results." This theme he develops with the most splendid language, and with every conceivable advantage of style, in the *Genié du Christianisme* and the *Martyrs*. The splendor of imagination, the summonings of history and literature to supply effective and touching illustrations, analogies, and incidents, the rich coloring so different from the peculiarly monotonous and gray tones of the masters of the 18th century, and the fervid admiration for nature which were Chateaubriand's main attractions and characteristics, could not fail to have an enormous literary influence. The romantic school acknowledged, and with justice, its direct indebtedness thereto; but at the same time Chateaubriand's power of argument is perhaps weaker than that of any writer of equal eminence; and great as has been his literary following, his followers have very rarely adopted his principles.

Literature since 1830.—In dealing with the history of French literature during the last half century, a slight alteration of treatment is requisite. The subdivisions of literature have lately become so numerous, and the contributions to each have reached such an immense volume, that it is impossible to give more than cursory notice, or indeed allusion, to most of them. It so happens, however, that the purely literary characteristics of this period, though of the most striking and remarkable, are confined to a few branches of literature. The characteristic of the 19th century in France has hitherto been at least as strongly marked as that of any previous period. In the Middle Ages men of letters followed each other in the cultivation of certain literary forms for long centuries. The chanson de geste, the Arthurian legend, the roman d'aventure, the fabliau, the allegorical poem, the rough dramatic jeu, mystery, and farce, served successively as moulds into which the thought and writing impulse of generations of authors were successively cast, often with little attention to the suitableness of form and subject. The end of the 15th century, and still more the 16th, owing to the vast extension of thought and knowledge then introduced, finally broke up the old forms, and introduced the practice of treating each subject in a manner more or less appropriate to it, and whether appropriate or not, freely selected by the author. At the same time a vast but somewhat indiscriminate addition was made to the actual vocabulary of the language. The 17th and 18th centuries witnessed a process of restriction once more to certain forms and strict imitation of predecessors, combined with attention to purely arbitrary rules, the cramping and impoverishing effect of this (in Fénelon's words) being counterbalanced partly by the efforts of individual genius, and still more by the constant and steady enlargement of the range of thought, the choice of subjects, and the familiarity with other literature, both of the ancient and modern world. The literary work of the 19th century and of the great romantic movement which began in its second quarter was to repeat on a far larger scale the work of the 16th, to break up and discard such literary forms as had become useless or hopelessly stiff, to give strength, suppleness, and variety to such as were retained, to invent new ones where necessary, and to enrich the language by importations, inventions, and revivals. The result of this revolution is naturally most remarkable in the *belles lettres* and the kindred department of history. Poetry, not dramatic, has been revived; prose romance and literary criticism have been brought to a perfection previously unknown; and history has produced works more various, if not more remarkable, than at any previous stage of the language. Of all these branches we shall therefore endeavor to give some detailed account. But the services done to the language were not limited to the strictly literary branches of literature. Modern French, if it lacks, as it probably does lack, the statuesque precision and elegance of prose style to which between 1650 and 1800 all else was sacrificed, has become a much more suitable instrument for the accurate and copious treatment of positive and concrete subjects. These subjects have accordingly been treated in an abundance corresponding to that manifested in other countries, though the literary importance of the treatment has perhaps proportionately declined. We cannot even attempt to indicate the innumerable directions of scientific study which this copious industry has taken, and must confine ourselves to those which come more immediately under the headings previously adopted. In philosophy France, like other nations, has principally devoted itself to the historical side of the matter, and the names of Damiron, Jules Simon, Vacherot, Quinet, De Rémusat, and Renan must be mentioned. Victor Cousin (1792–1867), after enjoying a brief celebrity as the chief of an eclectic school, is now principally remembered as a philosophical historian and critic. Towards the latter part of his long life he quitted even this connection with philosophy, and devoted himself chiefly to the study of French history. The importance of Auguste Comte (1793–1857) is rather political and scientific than literary. We must also mention M. Taine (b. 1828), a brilliant writer, who busies himself alternately with history, philosophy, and criticism. Theology again, with the exception of Lamennais, to be mentioned hereafter, supplies no name on which we need linger except that of M. Renan (b. 1823), whose somewhat florid literary style has contributed largely to the influence of his theological ideas. Montalembert (1810–1870), an historian with a strong theological tinge, deserves notice, and among orators Lacordaire (1802–1861) and the Père Félix (b. 1810) on the Catholic side, and Athanase Coquerel (1820-1875) on the Protestant. The *Pensées* of Joubert, partly moral and partly literary, belong, in point of publication and interest, to this period, and so do the melancholy moralizings of De Sénancour (1770–1846), which have had a great influence, though on a somewhat limited circle. Political philosophy and its kindred sciences have naturally received a large share of attention. Towards the middle of the century there was a great development of socialist and fanciful theorizing on politics, with which the names of St. Simon, Fourier, Cabet, and others are connected. As political economists Bastiat, De Lavergne, Blanqui, and Chevalier may be noticed. In De Tocqueville (1805–1859) France produced a political observer of a remarkably acute, moderate, and reflective character. The name of Lerminier (1805-1857) is of wide repute for legal and constitutional writings, and that of Jomini (1779–1869) is still more celebrated as a military historian; while that of Lenormant (1801–1859) holds a not dissimilar position in archæology. With the publications devoted to physical science proper we do not attempt to meddle. Philology, however, demands a brief notice. In classical studies France has not recently occupied the position which might be expected of the country of Scaliger and Casaubon. She has, however, produced some considerable Orientalists, such as Champollion the younger, Burnouf, Silvestre de Sacy, and Stanislas Julien. In attention to the antiquities of their own country the French have been at last stimulated by the example of Germany. The foundation of Romance philology was due, indeed, to the foreigners Wolf and Diez. But early in the century, the curiosity as to the older literature of France created by Barbazan, Tressan, and others continued to extend. Méon published many unprinted fabliaux, gave the whole of the French *Renart* cycle, with the exception of *Renart le Contrefait*, and edited the *Roman de la Rose*. Fauriel and Raynouard dealt elaborately with Provençal poetry as well as partially with that of the trouvères; and the latter produced his comprehensive *Lexique Romane*. These examples were followed by many other writers, who edited manuscript works and commented on them, always with zeal and sometimes with discretion. Foremost among these must be mentioned M. Paulin Paris, who for fifty years has served the cause of old French literature with untiring energy, great literary taste, and a pleasant and facile pen. His selections from manuscripts, his *Romancero Française*, his editions of *Garin le Loherain* and *Berte aux Grans Piés*, and his *Romans de la Table Ronde* may especially be mentioned. Soon, too, the Benedictine *Histoire Littéraire*, so long interrupted, was resumed under M. Paris's general management, and has proceeded nearly to the end of the 14th century. Among its contents M. Paris's dissertations on the later chansons de gestes and the early song writers, M. Victor Le Clerc's on the fabliaux, and M. Littré's on the romans d'aventures may be specially noticed. For some time indeed the work of French editors was chargeable with a certain lack of critical and philological accuracy. This reproach, however, has recently been wiped off by the efforts of a band of young scholars, chiefly pupils of the *École des Chartes*, with MM. Gaston Paris and Paul Meyer at their head. The *Société des Anciens Textes Français* has also been formed for the purpose of publishing scholarly editions of inedited works. Yet France has as yet produced no lexicon of her older tongue to complete the admirable dictionary in which M. Littré (b. 1801), at the cost of a life's labor, has embodied the whole vocabulary of the classical French language. Meanwhile the period between the Middle Ages proper and the 17th century has not lacked its share of this revival of attention. To the literature between Villon and Regnier especial attention was paid by the early romantics, and Sainte-Beuve's *Tableau Historique et Critique de la Poésie et du Théâtre au Seizième Siècle* was one of the manifestoes of the school. Since the appearance of that work in 1828 editions with critical comments of the literature of this period have constantly multiplied, aided by the great fancy for tastefully produced works which exists among the richer classes in France; and there are probably now few countries in which works of old authors, whether in cheap reprints or in *éditions de luxe*, can be more readily procured.

Béranger.

The Romantic Movement.—It is time, however, to return to the literary revolution itself, and its more purely literary results. At the accession of Charles X. France possessed three writers, and perhaps only three, of already remarkable eminence, if we except Chateaubriand, who was already of a past generation. These three were Béranger (1780–1857), Lamartine (1790–1869), and Lamennais (1782–1854). The first belongs definitely in manner, despite his striking originality of *nuance*, to the past. He has remnants of the old periphrases, the cumbrous mythological allusions, the poetical properties of French verse. He has also the older and somewhat narrow limitations of a French poet; foreigners are for him mere barbarians. At the same time his extraordinary lyrical faculty, his excellent wit, which makes him a descendant of Rabelais and La Fontaine, and his occasional touches of pathos made him deserve and obtain something more than successes of occasion. Béranger, moreover, was very far from being the mere improvisatore which those who cling to the inspirationist theory of poetry would fain see in him. His studies in style and composition were persistent, and it was long before he attained the firm and brilliant manner which distinguishes him. Béranger's talent, however, was still too much a matter of individual genius to have great literary influence, and he formed no school.

Lamartine.

It was different with Lamartine, who was, nevertheless, like Béranger, a typical Frenchman. The *Méditations* and the *Harmonies* exhibit a remarkable transition between the old school and the new. In going direct to nature, in borrowing from her striking outlines, vivid and contrasted tints, harmony, and variety of sound, the new poet showed himself an innovator of the best class. In using romantic and religious associations, and expressing them in affecting language, he was the Chateaubriand of verse. But with all this he retained some of the vices of the classical school. His versification, harmonious as it is, is monotonous, and he does not venture into the bold lyrical forms which true poetry loves, and with which the alexandrine of Boileau could not unite itself. He has still the horror of the *mot propre;* he is always spiritualizing and idealizing, and his style and thought have a double portion of the feminine and almost flaccid softness which had come to pass for grace in French. Nevertheless the *Lac* is a poem such as had not been written in France for 200 years.

Lamennais.

The last of the trio, Lamennais, represents an altogether bolder and rougher genius. Strongly influenced by the Catholic reaction, Lamennais also shows the strongest possible influence of the revolutionary spirit. His earliest work, the *Essai sur l'Indifférence en Matière de Religion*, was a defence of the church on curiously unecclesiastical lines. It was written in an ardent style, full of illustrations, and extremely ambitious in character. The plan was partly critical and partly constructive. The first part disposed of the 18th century; the second, adopting the theory of papal absolutism which De Maistre had already advocated, proceeded to base it on a supposed universal consent, which the Church of Rome was very far from accepting as a contribution to its defence. The after history of Lamennais was perhaps not an unnatural recoil from this; but with this after history we are not concerned; it is sufficient to point out that in his prose, especially as afterwards developed in the apocalyptic *Paroles d'un Croyant*, are to be discerned many of the tendencies of the romantic school, particularly its hardy and picturesque choice of language, and the disdain of established and accepted methods which it professed. The signs of the revolution itself were, as was natural, first given in periodical literature. The feudalist affectations of Chateaubriand and the legitimists excited a sort of æsthetic affection for Gothicism, and Walter Scott became one of the most favorite authors in France. Soon was started the periodical *La Muse Française*, in which the names of Hugo, De Vigny, Deschamps, and Madame de Girardin appear. Almost all the writers in this periodical were eager royalists, and for some time the battle was still fought on political grounds. There could, however, be no special connection between classical drama and liberalism; and the liberal journal, the *Globe*, with no less a person than Sainte-Beuve among its contributors, declared definite war against classicism in the drama. Soon the question became purely literary, and the romantic school proper was born in the famous *cénacle* or clique in which Hugo was chief poet, Sainte-Beuve chief critic, and Gautier, Gerard de Nerval, Emile and Antony Deschamps, Petrus Borel, and others were officers. Alfred de Vigny and Alfred de Musset stand somewhat apart, and so does Charles Nodier (1783–1844), a versatile and voluminous writer, the very variety and number of whose works have somewhat prevented the individual excellence of any of them from having justice done to it. The objects of the school, which was at first violently opposed, so much so that certain Academicians actually petitioned the king to forbid the admission of any romantic piece at the Théâtre Français, were, briefly stated, the burning of everything which had been adored, and the adoring of everything which had been burnt. They would have no unities, no arbitrary selection of subjects, no restraints on variety of versification, no academically limited vocabulary, no considerations of artificial beauty, and, above all, no periphrastic expression. The *mot propre*, the calling of a spade a spade, was the great commandment of romanticism; but it must be allowed that what was taken away in periphrase was made up in adjectives. De Musset, who was very much of a free-lance in the contest, maintained indeed that the *differentia* of the romantic was the copious use of this part of speech. All sorts of epithets were invented to distinguish the two parties, of which *Flamboyant* and *Grisâtre* are perhaps the most accurate and expressive pair,—the former serving to denote the gorgeous tints and bold attempts of the new school, the latter the gray color and monotonous outlines of the old. The representation of *Hernani* in 1830 was the culmination of the struggle, and during great part of the reign of Louis Philippe almost all the younger men of letters in France were romantics. The representation of the *Lucrèce* of Ponsard (1814–1867) in 1846 is often quoted as the herald or sign of a classical reaction. But this was only apparent, and signified, if it signified anything, merely that the more juvenile excesses of the romantics were out of date. For forty years all the greatest men of letters of France have been on the innovating side, and all without exception, whether intentionally or not, have had their work colored by the results of the movement.

Drama and Poetry since 1830.—Although the immediate subject on which the battles of classics and romantics arose was dramatic poetry, the dramatic results of the movement have not been those of greatest value or most permanent character. The principal effect in the long run has been the introduction of a species of play called *drame*, as opposed to regular comedy and tragedy, admitting of much freer treatment than either of these two as previously understood in French, and lending itself in some measure to the lengthy and disjointed action, the multiplicity of personages, and the absence of stock characters which characterized the English stage in its palmy days. All Victor Hugo's dramatic works are of this class, and each, as it was produced or published (*Cromwell*, *Hernani*, *Marion de l'Orme*, *Le Roi s'amuse*, *Lucrèce Borgia*, *Marie Tudor*, *Ruy Blas*, and *Les Burgraves*), was a literary event, and excited the most violent discussion,—the author's usual plan being to prefix a prose preface of a very militant character to his work. A still more melodramatic variety of *drame* was that chiefly represented by Alexandre Dumas (1803–1874), whose *Henri III.* and *Antony*, to which may be added later *La Tour de Nesle* and *Mademoiselle de Belleisle*, were almost as much rallying points for the early romantics as the dramas of Hugo, despite their inferior literary value. At the same time Alexandre Soumet (1788–1845), in *Norma*, *Une Fête de Neron*, etc., and Casimir Delavigne in *Marino Faliero*, *Louis XI.*, etc., maintained a somewhat closer adherence to the older models. The classical or semi-classical reaction of the last years of Louis Philippe was represented in tragedy by Ponsard (*Lucrèce*, *Agnes de Méranie*, *Charlotte Corday*, *Ulysse*, and several comedies), and on the comic side, to a certain extent, by Emile Augier (b. 1820) in *L'Aventurière*, *Le Gendre de M. Poirier*, *Le Fils de Giboyer*, etc. During almost the whole period Eugène Scribe (1791–1861) poured forth innumerable comedies of the vaudeville order, which, without possessing much literary value, attained immense popularity. For the last twenty years the realist development of romanticism has had the upper hand in dramatic composition, its principal representatives being on the one side Victorien Sardou (b. 1831), who in *Nos Intimes*, *La Famille*, *Benoîton*, *Rabagas*, *Dora*, etc., has chiefly devoted himself to the satirical treatment of manners, and Alexandre Dumas *fils* (b. 1824), who in such pieces as *Les Idées de Madame Aubray* and *L'Étrangère* has rather busied himself with morals. Certain isolated authors also deserve notice, such as Autran (1813–1877), a poet and Academician having some resemblance to Lamartine, whose *Fille d'Æschyle* created for him a dramatic reputation which he did not attempt to follow up, and Legouvé (b. 1807), whose *Adrienne Lecouvreur* was assisted to popularity by the admirable talent of Rachel. A special variety of drama of the first literary importance has also been cultivated in this century under the title of *scènes* or *proverbes*, slight dramatic sketches, in which the dialogue and style are of even more importance than the action. The best of all of these are those of Alfred de Musset (1810–1857), whose *Il faut qu'une porte soit ouverte ou fermée*, *On ne badine pas avec l'amour*, etc., are models of grace and wit. Among his followers may be mentioned especially M. Octave Feuillet (b. 1812).

Victor Hugo.

In poetry proper, as in drama, M. Victor Hugo showed the way, and has never allowed any one since to take the lead from him. In him all the romantic characteristics are expressed and embodied,—disregard of arbitrary critical rules, free choice of subject, variety and vigor of metre, splendor and sonorousness of diction. If the careful attention to form which is also characteristic of the movement is less apparent in him than in some of his followers, it is not because it is absent, but because the enthusiastic conviction with which he attacks every subject somewhat diverts attention from it. As with the merits so with the defects. A deficient sense of the ludicrous which has characterized many of the romantics is strongly apparent in their leader, as is also an equally representative grandiosity, and a fondness for the introduction of foreign and unfamiliar words, especially proper names, which occasionally produces an effect of burlesque. Victor Hugo's earliest poetical works, his chiefly royalist and political *Odes*, are cast in the older and accepted forms, but already display astonishing poetical qualities. But it was in the *Ballades* (for instance, the splendid *Pas d'Armes du Roi Jean*, written in verses of three syllables) and the *Orientales* (of which may be taken for a sample the sixth section of *Navarin*, a perfect torrent of outlandish terms poured forth in the most admirable verse, or *Les Djinns*, where some of the stanzas have lines of two syllables each) that the grand provocation was thrown to the believers in alexandrines, careful cæsuras, and strictly separated couplets. *Les Feuilles d'Automne*, *Les Chants du Crépuscule*, *Les Voix Intérieures*, *Les Rayons et les Ombres*, the productions of the next twenty years, were quieter in style and tone, but no less full of poetical spirit. The Revolution of 1848, the establishment of the empire, and the poet's exile brought about a fresh determination of his genius to lyrical subjects. *Les Châtiments* and *La Légende des Siècles*, the one political, the other historical, reach perhaps the high water mark of French verse; and they were followed by the philosophical *Contemplations*, the lighter *Chansons des Rues et des Bois*, the *Année Terrible*, the second *Légende des Siècles*, and one or two more volumes which lead us to the present day. We have been thus particular because the literary productiveness of Victor Hugo himself has been the measure and sample of the whole literary productiveness of France on the poetical side. At five-and-twenty he was acknowledged as a master, at seventy-five he is a master still. His poetical influence has been represented in three different schools, from which very few of the poetical writers of the century can be excluded. These few we may notice first.

De Musset.

Alfred de Musset, a writer of great genius, felt part of the romantic inspiration very strongly, but was on the whole unfortunately influenced by Byron, and partly out of wilfulness, partly from a natural want of persevering industry and vigor, allowed himself to be careless and even slovenly in composition. Notwithstanding this many of his lyrics are among the finest poems in the language, and his verse, careless as it is, has extraordinary natural grace. Auguste Barbier, whose *Iambes* shows an extraordinary command of nervous and masculine versification, also comes in here; and the Breton poet Brizeux, together with Hégésippe Moreau, an unequal poet possessing some talent, and Pierre Dupont (1821–1870), one of much greater gifts, also deserve mention. Of the school of Lamartine rather than of Hugo are Alfred de Vigny (1799–1865) and Victor de Laprade (b. 1812), the former a writer of little bulk and somewhat over-fastidious, but possessing one of the most correct and elegant styles to be found in French, the latter a meditative and philosophical poet, like De Vigny an admirable writer, but somewhat deficient in pith and substance, as well as in warmth and color. The poetical schools which more directly derive from the romantic movement as represented by Hugo are three in number, corresponding in point of time with the first outburst of the movement, with the period of reaction already alluded to, and with the closing years of the second empire.

Gautier.

Of the first by far the most distinguished member was Théophile Gautier (1811–1872), the most perfect poet in point of form that France has produced. The side of the romantic movement which Gautier developed was its purely pagan and Renaissance aspect. When quite a boy he devoted himself to the study of 16th century masters, and though he acknowledged the supremacy of Hugo, his own talent was of an individual order, and developed itself more or less independently. *Albertus* alone of his poems has much of the extravagant and grotesque character which distinguished early romantic literature. The *Comédie de la Mort*, the *Poésies Diverses*, and still more the *Emaux et Camées*, display a distinctly classical tendency—classical, that is to say, not in the party and perverted sense, but in its true acceptation. The tendency to the fantastic and the horrible may be taken as best shown by Petrus Borel (1809–1859), a writer of singular power almost entirely wasted. Gerard Labrunie or de Nerval (1808–1855) adopted a manner also fantastic but more idealistic than Borel's, and distinguished himself by his Oriental travels and studies, and by his attention to popular ballads and traditions, while his style has an exquisite but unaffected strangeness hardly inferior to Gautier's. This peculiar and somewhat quintessenced style is also remarkable in the *Gaspard de la Nuit* of Louis Bertrand, a work of rhythmical prose almost unique in its character. The two Deschamps were chiefly remarkable as translators. The next generation produced three remarkable poets, to whom may perhaps be added a fourth. Théodore de Banville (b. 1820), adopting the principles of Gautier, and combining with them a considerable satiric faculty, composed a large amount of verse, faultless in form, delicate and exquisite in shades and colors, but so entirely neutral in moral and political tone that it has found comparatively few admirers. Leconte de Lisle (b. 1819), carrying out the principle of ransacking foreign literatures for subjects, has gone to Celtic, classical, or even Oriental sources for his inspiration, and despite a science in verse not much inferior to De Banville's, and a far wider range and choice of subject, has diffused an air of erudition, not to say pedantry, over his work which has disgusted some readers. Charles Baudelaire (1821–1867), by his choice of unpopular subjects and the terrible truth of his analysis, has revolted not a few of those who, in the words of an English critic, cannot take pleasure in the representation if they do not take pleasure in the thing represented. Thus by a strange coincidence each of the three representatives of the second romantic generation has for various reasons been hitherto disappointed of his due fame. The fourth poet of this time, Joséphin Soulary, is probably little known in England. His sonnets, however, are of rare beauty and excellence. In 1866 a collection of poems, entitled after an old French fashion *Le Parnasse Contemporain*, appeared. It included contributions by many of the poets just mentioned, but the mass of the contributors were hitherto unknown to fame. A similar collection appeared in 1869, and was interrupted by the German war, but continued after it, and a third in 1876. The contributors to these collections, who have mostly published separate works, were very numerous, and have become collectively known, half seriously and half in derision, as *Les Parnassiens*. From time to time aspirants to poetry, such as MM. Bouchor and Lafagette, have attempted to revolt against this society, but they have ended by being absorbed into it. The cardinal principle of the *Parnassiens* is in continuation of Gautier and Baudelaire, a devotion to poetry as an art, but under this general principle there is a considerable diversity of aim and object, and a still greater diversity of subject. François Coppée has devoted himself chiefly to domestic and social subjects. Sully Prudhomme has a certain classical tinge. Catulle Mendes has followed Leconte de Lisle in going far afield for his subjects; Louisa Siefert indulges in the poetry of despair; while Albert Glatigny, a poet who lived as a strolling actor, and died young, perhaps excelled any of the others in individuality of poetical treatment. As the *Parnassiens*, however, muster some three or four score poets, it is impossible to deal with them at length here. It is sufficient to say that the average merit of their work is decidedly high, though it is difficult to assign the first rank to any poet among them. Assuming that their work is to be classed as minor poetry, there has assuredly not even in the Elizabethan age in England been such a school of minor poets. It is fair to add that they appear to be little read in France, and hardly at all elsewhere. To complete the history of French poetry in the 19th century we must add that considerable efforts have been made to give Provençal rank once more as a literary tongue. The Gascon poet Jacques Jasmin has produced a good deal of verse in the western dialect of the language. Within the last twenty years a more cultivated and literary school of poets has arisen in Provence itself, the chief of whom are Frédéric Mistral (*Mirèio*, *Calendau*) and Théodore Aubanel.

Prose Fiction since 1830.—Even more remarkable, because more absolutely novel, was the outburst of prose fiction which followed 1830. We have said that in this department the productions of France since the discrediting of the Scudéry romances had not on the whole been remarkable, and had been produced at considerable intervals. Madame de Lafayette, Le Sage, Marivaux, Voltaire, the Abbé Prévost, Diderot, J. J. Rousseau, Benardin de St. Pierre, and Fiévée had all of them produced work excellent in its way, and comprising in a more or less rudimentary condition most varieties of the novel. But none of them had, in the French phrase, made a school, and at no time had prose fiction been composed in any considerable quantities. The immense influence which, as we have seen, Walter Scott exercised was perhaps the direct cause of the attention paid to prose fiction; the facility, too, with which all the fancies, tastes, and beliefs of the time could be embodied in such work may have had considerable importance. But it is difficult on any theory of cause and effect to account for the appearance in less than ten years of such a group of novelists as Hugo, Gautier, Dumas, Mérimée, Balzac, George Sand, Jules Sandeau, and Charles de Bernard, names to which might be added others scarcely inferior. There is hardly anything else resembling it in literature, except the great cluster of English dramatists in the beginning of the 17th century, and of English poets at the beginning of the 19th; and it is remarkable that the excellence of the first group has been maintained by a fresh generation,—Murger, About, Feuillet, Flaubert, Erckmann-Chatrian, Droz, Daudet, Cherbuliez, and Gaboriau, forming a company of *diadochi* not far inferior to their predecessors. The romance writing of France during the period has taken two different directions,—the first that of the novel of incident, the second that of analysis and character. The first, now mainly deserted, was that which, as was natural when Scott was the model, was formerly most trodden; the second required the astonishing genius of George Sand and of Balzac to attract students to it. The novels of Victor Hugo are novels of incident, with a strong infusion of purpose, and considerable but rather ideal character drawing. They are in fact lengthy prose *drames* rather than romances proper, and they have found no imitators, probably because no other genius was equal to the task. They display, however, the powers of the master at their fullest.

Dumas.

On the other hand, Alexandre Dumas originally composed his novels in close imitation of Scott, and they are much less dramatic than narrative in character, so that they lend themselves to almost indefinite continuation, and there is often no particular reason why they should terminate even at the end of the score or so of volumes to which they sometimes actually extend. Of this purely narrative kind, which hardly even attempts anything but the boldest character drawing, the best of them, such as *Vingt Ans Après*, *Les Trois Mousquetaires*, *La Reine Margot*, are probably the best specimens extant. Dumas possesses almost alone among novelists the secret of writing interminable dialogue without being tedious. Of something the same kind, but of a far lower stamp, are the novels of Eugène Sue (1804–1857). Dumas and Sue were accompanied and followed by a vast crowd of companions, independent or imitative. Alfred de Vigny had already attempted the historical novel in *Cinq-Mars*. Henri de La Touche, an excellent critic who formed George Sand, but a mediocre novelist, may be mentioned, and perhaps also Roger de Beauvoir and Frédéric Soulé. Paul Féval and Amédée Achard are of the same school, and some of the attempts of Jules Janin (1804–1874), more celebrated as a critic, may also be connected with it. By degrees, however, the taste for the novel of incident, at least of an historical kind, died out till it was revived in another form, and with an admixture of domestic interest, by MM. Erckmann-Chatrian. The last and one of the most splendid instances of the old style was *Le Capitaine Fracasse*, which Théophile Gautier wrote in his old age as a kind of *tour de force*. The last-named writer in his earlier days had modified the incident novel in many short tales, a kind of writing for which French has always been famous, and in which Gautier's sketches are masterpieces. His only other long novel, *Mademoiselle de Maupin*, belongs rather to the class of analysis. With Gautier as a writer, whose literary characteristics even excel his purely tale-telling powers, may be classed Prosper Mérimée (1803–1871), one of the most exqisite 19th century masters of the language. Already, however, in 1830 the tide was setting strongly in favor of novels of contemporary life and manners. These were of course susceptible of extremely various treatment. For many years Paul de Kock, a writer who did not trouble himself about classics or romantics or any such matter, continued the tradition of Marivaux, Crébillon *fils*, and Pigault Lebrun, in a series of not very moral or polished but lively and amusing sketches of life, principally of the bourgeois type. Later Charles de Bernard (1805–1850), with infinitely greater wit, elegance, propriety, and literary skill, did the same thing for the higher classes of French society. But the two great masters of the novel of character and manners as opposed to that of history and incident are Honoré de Balzac (1799–1850) and Aurore Dudevant, commonly called George Sand (1793–1876). Their influence affected the entire body of novelists who succeeded them, with very few exceptions. At the head of these exceptions may be placed Jules Sandeau (b. 1811), who, after writing a certain number of novels in a less individual style, at last made for himself a special subject in a certain kind of domestic novel, where the passions set in motion are less boisterous than those usually preferred by the French novelist, and reliance is mainly placed on minute character drawing and shades of color sober in hue but very carefully adjusted (*Catherine Mademoiselle de Penarvan*, *Mademoiselle de la Seiglière*). In the same class of the more quiet and purely domestic novelists may be placed X. B. Saintine (*Picciola*), Madame C. Reybaud (*Clementine*, *Le Cadet de Colobrières*), J. T. de St. Germain (*Pour un Épingle*, *La Feuille de Coudrier*), Madame Craven (*Rècit d'une Sœur*, *Fleurange*). Henri Beyle, who wrote under the *nom de plume* of Stendhal, also stands by himself. His chief work in the line of fiction is *La Chartreuse de Parme*, an exceedingly powerful novel of the analytical kind, and he also composed a considerable number of critical and miscellaneous works. Last among the independents must be mentioned Henry Murger (1822–1861), the painter of what is called Bohemian life, that is to say, the struggles, difficulties, and amusements of students, youthful artists, and men of letters. In this peculiar style, which may perhaps be regarded as an irregular descendant of the picaroon romance, Murger has no rival; and he is also, though on no extensive scale, a poet of great pathos. But with these exceptions, the influences of the two writers we have mentioned, sometimes combined, more often separate, may be traced throughout the whole of later novel literature.

G. Sand.

George Sand began with books strongly tinged with the spirit of revolt against moral and social arrangements, and she sometimes diverged into very curious paths of pseudo-philosophy, such as was popular in the second quarter of the century. At times, too, as in *Lucrezia Floriani* and some other works, she did not hesitate to draw largely on her own personal adventures and experiences. But latterly she devoted herself rather to sketches of country life and manners, and to novels involving bold if not very careful sketches of character and more or less dramatic situations. She was one of the most fertile of novelists, continuing to the end of her long life to pour forth fiction at the rate of many volumes a year. This fertility, and the inexhaustible supply of comparatively novel imaginations with which she kept it up, is one of the most remarkable characteristics of her work, and in this respect she is perhaps second only to Sir Walter Scott; but there is at the same time a certain want of finish about her fertility, and she is not generally found to be an author whose readers return to her individual works, as in the case with less productive but more laborious writers. Of her different styles may be mentioned as fairly characteristic, *Lélia*, *Lucrezia Floriani*, *Consuelo*, *La Mare au Diable*, *La Petite Fadette*, *François le Champy*, *Mademoiselle de la Quintinie*.

Balzac the younger.

Considering the shorter length of his life the productiveness of Balzac was almost more astonishing, especially if we consider that much of his early work is never reprinted, and has passed entirely out of remembrance. He is, moreover, the most remarkable example in literature of untiring work and determination to achieve success despite the greatest discouragements. His early work was, as we have said, worse than unsuccessful, it was positively bad; and even the partiality which is usually shown to the early work of a man of genius has found it impossible to reverse the verdict of his first readers. After more than a score of unsuccessful attempts, *Les Chouans* at last made its mark, and for twenty years from that time the astonishing productions composing the so-called *Comédie Humaine* were poured forth successively. The sub-titles which Balzac imposed upon the different batches, *Scènes de la Vie Parisienne*, *De la Vie de Province*, *De la Vie Intime*, etc., show like the general title a deliberate intention on the author's part to cover the whole ground of human, at least of French, life. Such an attempt could not succeed wholly; yet the amount of success attained is astonishing. Balzac has, however, with some justice been accused of creating the world which he described, and his personages, wonderful as is the accuracy and force with which many of the characteristics of humanity are exemplified in them, are somehow not altogether human, owing to the specially French fault which we noticed in Racine and Molière of insisting too much on the ruling passion. Since these two great novelists, many others have arisen, partly to tread in their steps, partly to strike out independent paths. Octave Feuillet, beginning his career by apprenticeship to Alexander Dumas and the historical novel, soon found his way in a very different style of composition, the *roman intime* of fashionable life, in which, notwithstanding some grave defects, he has attained much popularity. The so-called realist side of Balzac has been developed by Gustave Flaubert (b. 1821), who, to all his master's acuteness, and more than his knowledge of human nature, adds culture, scholarship, and a literary power over the language inferior to that of no writer of the century. *Madame Bovary* and *L'Éducation Sentimentale* are studies of contemporary life; in *Salammbô* and *La Tentation de St. Antoine* erudition and antiquarian knowledge furnish the subjects for the display of the highest literary skill. Of about the same date (b. 1828) Edmond About, before he abandoned novel-writing, devoted himself chiefly to sketches of abundant but always refined wit (*L'Homme à l'Oreille cassée, Le Nez d'un Notaire*), and sometimes to foreign scenes (*Tolla, le Roi des Montagnes*). Champfleury (b. 1821), an associate of Murger, deserves notice for stories of the extravaganza kind. During the whole of the second empire one of the most popular writers was Ernest Feydeau (1821–1874), a writer of great ability, but morbid and affected in the choice and treatment of his subjects (*Fanny, Sylvie, Catharine d'Overmeire*). In the last ten years many writers of the realist school have endeavored to outdo their predecessors in unflinching fidelity, nominally carrying out the principles of Balzac and Flaubert, but in reality rather reverting to the extravagance of the very earliest romantic school, such as that of Jules Janin in *L'Âne Mort*, and Petrus Borel in *Champavert*. Émile Zola, for instance, in parts of his long series *Les Rougon-Macquart*, descends to mere thieves' Latin and rhyparography. Émile Gaboriau, taking up that side of Balzac's talent which devoted itself to inextricable mysteries, criminal trials, and the like, produced *M. Le Coq, Le Crime d'Orcival, La Degringolade*, etc.; and Adolphe Belot for a time endeavored to out-Feydeau Feydeau in *La Femme de Feu* and other works. Of a different stamp, and less of a mere exaggerator, is Victor Cherbuliez, who has produced in *Le Roman d'une honnête Femme* a good novel of the analytic class, and in *Le comte Kostia, Ladislas Bolski*, etc., less successful romances of incident. Gustave Droz deserves praise for extraordinarily witty and finely drawn domestic sketches, and Alphonse Daudet has written novels of manners the popularity of which is too recent to allow us to judge its chances of continuance.

Periodical Literature since 1830.—Criticism.—One of the causes which led to this extensive composition of novels was the great spread of periodical literature in France, and the custom of including in almost all periodicals, daily, weekly, or monthly, a *feuilleton* or instalment of fiction. The same spread of periodical literature, together with the increasing interest in the literature of the past, led also to a very great development of criticism. Almost all French authors of any eminence during the last half century have devoted themselves more or less to criticism of literature, of the theatre, or of art, and sometimes, as in the case of Janin and Gautier, the comparatively lucrative nature of journalism and the smaller demands which it made for labor and intellectual concentration have diverted to feuilleton-writing abilities which might perhaps have been better employed. At the same time it must be remembered that from this devotion of men of the best talents to critical work has arisen an immense elevation of the standard of such work. Before the romantic movement in France Diderot in that country, Lessing and some of his successors in Germany, Hazlitt, Coleridge, and Lamb in England, had been admirable critics and reviewers. But the theory of criticism, though these men's principles and practice had set it aside, still remained more or less what it had been for centuries. The critic was merely the administrator of certain hard and fast rules. There were certain recognized kinds of literary composition; every new book was bound to class itself under one or other of these. There were certain recognized rules for each class; and the goodness or badness of a book consisted simply in its obedience or disobedience to these rules. Even the kinds of admissible subjects and the modes of admissible treatment were strictly noted and numbered. This was especially the case in France and with regard to French *belles lettres*, so that, as we have seen, certain classes of composition had been reduced to unimportant variations of a registered pattern. The romantic protest against this absurdity was specially loud and completely victorious. It is said that a publisher advised the youthful Lamartine to try "to be like somebody else" if he wished to succeed. The romantic standard of success was, on the contrary, to be as individual as possible. Victor Hugo himself composed a good deal of criticism, and in the preface to his *Orientales* he states the critical principles of the new school clearly. The critic, he says, has nothing to do with the subject chosen, the colors employed, the materials used. Is the work, judged by itself and with regard only to the ideal which the worker had in his mind, good or bad? It will be seen that as a legitimate corollary of this theorem the critic becomes even more of an interpreter than of a judge. He can no more satisfy himself or his readers by comparing the work before him with some abstract and accepted standard, and marking off its shortcomings. He has to reconstruct, more or less conjecturally, the special ideal at which each of his authors aimed, and to do this he has to study their idiosyncrasies with the utmost care, and set them before his readers in as full and attractive a fashion as he can manage. The first writer who thoroughly grasped this necessity and successfully dealt with it was Sainte-Beuve (1804–1869), who has indeed identified his name with the method of criticism just described. Sainte-Beuve's first remarkable work (his poems and novels we may leave out of consideration) was the sketch of 16th century literature already alluded to which he contributed to the *Globe*. But it was not till later that his style of criticism became fully developed and accentuated. During the first decade of Louis Philippe's reign his critical papers, united under the title of *Critiques et Portraits Littéraires*, show a gradual advance. During the next ten years he was mainly occupied with his studies of the writers of the Port Royal school. But it was during the last twenty years of his life, when the famous *Causeries du Lundi* appeared weekly in the columns of the *Constitutionnel* and the *Moniteur*, that his most remarkable productions came out. Sainte-Beuve's style of criticism (which is the key to so much of French literature of the last half century that it is necessary to dwell on it at some length), excellent and valuable as it is, lent itself to two corruptions. There is, in the first place, in making the careful investigations into the character and circumstances of each writer which it demands, a danger of paying too much attention to the man and too little to his work, and of substituting for a critical study a mere collection of personal anecdotes and traits, especially if the author dealt with belongs to a foreign country or a past age. The other danger is that of connecting the genius and character of particular authors too much with their conditions and circumstances so as to regard them as merely so many products of the age. These faults, and especially the latter, have been very noticeable in many of Sainte-Beuve's successors, particularly in M. Henri Taine, the most brilliant of living French critics, and, owing to his *Histoire de la Littérature Anglaise*, the best known in England. A large number of other critics during the period deserve notice because they have, though acting more or less on the newer system of criticism, manifested considerable originality in its application. As far as merely critical faculty goes, and still more in the power of giving literary expression to criticism, Théophile Gautier yields to no one. His *Les Grotesques*, an early work dealing with Villon, De Viau, and other *enfants terribles* of French literature, has served as a model to many subsequent writers, such as Charles Monselet and Charles Asselineau, the affectionate historian of the less famous promoters of the romantic movement. On the other hand, Gautier's picture criticisms, and his short reviews of books, obituary notices, and other things of the kind contributed to daily papers, are in point of style among the finest of all such fugitive

Sainte-Beuve.

compositions. Janin, chiefly a theatrical critic, excelled in light and easy journalism, but his work has neither weight of substance nor careful elaboration of manner sufficient to give it permanent value. This sort of light critical comment has become almost a specialty of the French press, and among its numerous practitioners the names of Armand de Pontmartin (an imitator and assailant of Sainte-Beuve), Arsène Houssaye, Fiorentino, may be mentioned. Edmond Scherer and Paul de St. Victor—the former of whom was born in 1812, the latter in 1827—represent different sides of Sainte-Beuve's style in literary criticism; and in theatrical censure Francisque Sarcey, an acute but somewhat severe judge, has succeeded to the good-natured sovereignty of Janin. The criticism of the *Revue des Deux Mondes* has played a sufficiently important part in French literature to deserve separate notice in passing. Founded in 1829, the *Revue*, after some vicissitudes, soon attained, under the direction of the Swiss Buloz, the character of being one of the first of European critical periodicals. Its style of criticism has on the whole inclined rather to the classical side,—that is, to classicism as modified by, and possible after, the romantic movement. Besides some of the authors already named, its principal critical contributors have been Gustave Planche, an acute but somewhat truculent critic, Henri Étienne, St. René Taillandier. Lastly we must notice the important section of professorial or university critics, whose critical work has taken the form either of regular treatises or of courses of republished lectures, books somewhat academic and rhetorical in character, but often representing an amount of influence which has served largely to stir up attention to literature. The most prominent name among these is that of Villemain (1790–1870), who was one of the earliest critics of the literature of his own country that obtained a hearing out of it. M. Nisard (b. 1806) has perhaps been more fortunate in his dealings with Latin than with French, and in his *History* of the latter literature represents too much the classical tradition; Alexandre Vinet (1797–1847), a Swiss critic of considerable eminence, Saint-Marc-Girardin (1801–1873), whose *Course de Littérature Dramatique* is his chief work, and Eugène Géruzez (1799–1865), who is the author not only of an extremely useful and well-written handbook to French literature before the Revolution, but also of other works dealing with separate portions of the subject, must also be mentioned.

History since 1830.—The remarkable development of historical studies which we have noticed as taking place under the Restoration was accelerated and intensified in the reigns of Charles X. and Louis Philippe. Both the scope and the method of the historian underwent a sensible alteration. For something like 150 years historians had been divided into two classes, those who produced elegant literary works pleasant to read, and those who produced works of laborious erudition, but not even intended for general perusal. The Vertots and Voltaires were on one side, the Mabillons and Tillemonts on another. Now, although the duty of a French historian to produce works of literary merit was not forgotten, it was recognized as part of that duty to consult original documents and impart original observation. At the same time, to the merely political events which had formerly been recognized as forming the historian's province were added the social and literary phenomena which had long been more or less neglected. Old chronicles and histories were re-read and re-edited; innumerable monographs on special subjects and periods were produced, and these latter were of immense service to romance writers at the time of the popularity of the historical novel. Not a few of the works, for instance, which were signed by Alexandre Dumas consist mainly of extracts or condensations from old chronicles, or modern monographs ingeniously united by dialogue and varnished with a little description. History, however, had not to wait for this second-hand popularity, and its cultivators had fully sufficient literary talent to maintain its dignity. Sismondi, whom we have already noticed, continued during this period his great *Histoire des Français*, and produced his even better known *Histoire des Republiques Italiennes au Moyen Age*. The brothers Thierry devoted themselves to early French history, Amédée Thierry (1787–1873) producing a *Histoire des Gaulois* and other works concerning the Roman period, and Augustin Thierry (1795–1856) the well-known history of the Norman Conquest, the equally attractive *Récits des Temps Mérovingiens*, and other excellent works. Philippe de Ségur (1780–1875) gave a history of the Russian campaign of Napoleon, and some other works chiefly dealing with Russian history. The voluminous *Histoire de France* of Henri Martin (b. 1810) is perhaps the best and most impartial work dealing in detail with the whole subject. De Barante, after beginning with literary criticism, turned to history, and in his *Histoire des Ducs de Bourgogne* produced a work of capital importance. As was to be expected, many of the most brilliant results of this devotion to historical subjects consisted of works dealing with the French Revolution. No series of historical events has ever perhaps received treatment at the same time from so many different points of view, and by writers of such varied literary excellence, among whom it must, however, be said that the purely royalist side is hardly at all represented. One of the earliest of these histories is that of Mignet (b. 1796), a sober and judicious historian of the older school. About the same time was begun the brilliant work of M. Thiers (1797–1877) on the Revolution, which established the literary reputation of the future president of the French republic, and was at a later period completed by the *Histoire du Consulat et de l'Empire.* The downfall of the July monarchy and the early years of the empire witnessed the publication of several works of the first importance on this subject. De Barante contributed histories of the Convention and the Directory, but the three books of greatest note were those of Lamartine, Michelet (1798–1873), and Louis Blanc (b. 1813). Lamartine's *Histoire des Girondins* is written from the constitutional republican point of view, and is sometimes considered to have had much influence in producing the events of 1848. It is, perhaps, rather the work of an orator and poet than of an historian. The work of Michelet is of a more original character. Besides his history of the Revolution, Michelet wrote an extended history of France, and a very large number of smaller works on historical, political, and social subjects. His imaginative powers are of the highest order, and his style stands alone in French for its strangely broken and picturesque character, its turbid abundance of striking images, and its somewhat sombre magnificence, qualities which, as may easily be supposed, found full occupation in a history of the Revolution. The work of Louis Blanc is that of a sincere but ardent republican, and is useful from this point of view, but possesses no extraordinary literary merit. The principal contributions to the history of the Revolution during the last twenty years are those of Quinet, Lanfrey, and Taine. Edgar Quinet (1803–1875), like Louis Blanc a devotee of the Republic and an exile for its sake, brought to this one of his latest works a mind and pen long trained to literary and historical studies; but *La Révolution* is not considered his best work. P. Lanfrey devoted himself with extraordinary patience and acuteness to the destruction of the Napoleonic legend, and the setting of the character of Napoleon I. in a new, authentic, and very far from favorable light. Quite recently M. Taine, after distinguishing himself, as we have mentioned, in literary criticism (*Histoire de la Littérature Anglaise*), and attaining less success in philosophy (*De l'Intelligence*), has begun an elaborate discussion of the Revolution, its causes, character, and consequences, which has excited some commotion among the more ardent devotees of the principles of '89. To return from this group, we must notice Michaud (1767–1839), the historian of the crusades, and Guizot (1787–1876), who, like his rival Thiers, devoted himself much to historical study. His earliest works were literary and linguistic, but he soon turned to political history, and for the last half-century of his long life his contributions to historical literature were almost incessant and of the most various character. The most important are the histories *Des Origines du Gouvernement Représentatif*, *De la Révolution d'Angleterre*, *De la Civilisation en France*, and latterly a *Histoire de France*, which he was writing at the time of his death. Among minor historians of the century may be mentioned Duvergier de Hauranne (*Gouvernement Parlementaire en France*), Mignet (*Histoire de Marie Stuart*), Ampère (*Histoire Romaine à Rome*), Beugnot (*Destruction du Paganisme d'Occident*), Haussonville (*La Réunion de la Lorraine à la France*), Vaulabelle (*Les Deux Restaurations*).

Summary and Conclusion.—We have in these last pages given such an outline of the 19th century literature of France as seemed convenient for the completion of what has gone before. It has been already remarked that the nearer approach is made to our own time the less is it possible to give exhaustive accounts of the individual cultivators of the different branches of literature. It may be added, perhaps, that such exhaustiveness becomes, as we advance, less and less necessary, as well as less and less possible. The individual *Parnassien* may and does produce work that is in itself of greater literary value than that of the individual trouvère. As a matter of literary history his contribution is less remarkable because of the examples he has before him and the circumstances which he has around him. Yet we have endeavored to draw such a sketch of French literature from the *Chanson de Roland* to the *Légende des Siècles* that no important development, and hardly any important partaker in such development, should be left out. A few lines may, perhaps, be now profitably given to summing up the aspects of the whole, remembering always that, as in no case is generalization easier than in the case of the literary aspects and tendencies of periods and nations, so in no case is it apt to be more delusive unless corrected and supported by ample information of fact and detail.

At the close of the 11th century and at the beginning of the 12th we find the vulgar tongue in France not merely in fully organized use for literary purposes, but already employed in most of the forms of poetical writing. An immense outburst of epic and narrative verse has taken place, and lyrical poetry, not limited as in the case of the epics to the north of France, but extending from Roussillon to the Pas de Calais, completes this. The 12th century adds to these earliest forms the important development of the mystery, extends the subjects and varies the manner of epic verse, and begins the compositions of literary prose with the chronicles of St. Denis and of Villehardouin, and the prose romances of the Arthurian cycle. All this literature is so far connected purely with the knightly and priestly orders, though it is largely composed and still more largely dealt in by classes of men, trouvères and jongleurs, who are not necessarily either knights or priests, and in the case of the jongleurs are certainly neither. With a possible ancestry of Romance and Teutonic *cantilenæ*, Breton *lais*, and vernacular legends, the new literature has a certain pattern and model in Latin and for the most part ecclesiastical compositions. It has the sacred books and the legends of the saints for examples of narrative, the rhythm of the hymns for a guide to metre, and the ceremonies of the church for a stimulant to dramatic performance. By degrees also in this 12th century forms of literature which busy themselves with the unprivileged classes begin to be born. The fabliau takes every phase of life for its subject; the folk-song acquires elegance and does not lose raciness and truth. In the next century, the 13th, mediæval literature in France arrives at its prime—a prime which lasts until the first quarter of the 14th. The early epics lose something of their savage charms, the polished literature of Provence quickly perishes. But in the provinces which speak the more prevailing tongue nothing is wanting to literary development. The language itself has shaken off all its youthful incapacities, and, though not yet well adapted for the requirements of modern life and study, is in every way equal to the demands made upon it by its own time. The dramatic germ contained in the fabliau and quickened by the mystery produces the profane drama. Ambitious works of merit in the most various kinds are published; *Aucassin et Nicolette* stands side by side with the *Vie de Saint Louis*, the *Jeu de la Feuillie* with *Le Miracle de Théophile*, the *Roman de la Rose* with the *Roman du Renart.* The earliest notes of ballade and rondeau are heard; endeavors are made with zeal, and not always without understanding, to naturalize the wisdom of the ancients in France, and in the graceful tongue that France possesses. Romance in prose and verse, drama, history, songs, satire, oratory, and even erudition, are all represented and represented worthily. Meanwhile all nations of Western Europe have come to France for their literary models and subjects, and the greatest writers in English, German, Italian, content themselves with adaptations of Chrétien de Troyes, of Benoit de Ste. More, and of a hundred other known and unknown trouvères and fabulists. But this age does not last long. The language has been put to all the uses of which it is as yet capable; those uses in their sameness begin to pall upon reader and hearer; and the enormous evils of the civil and religious state reflect themselves inevitably in literature. The old forms die out or are prolonged only in half-lifeless travesties. The brilliant coloring of Froissart, and the graceful science of ballade and rondeau writers like Lescurel and Deschamps, alone maintain the literary reputation of the time. Towards the end of the 14th century the translators and political writers import many terms of art, and strain the language to uses for which it is as yet unhandy, though at the beginning of the next age Charles d'Orléans by his natural grace and the virtue of the forms he used, emerges from the mass of writers. Throughout the 15th century the process of enriching or at least increasing the vocabulary goes on, but as yet no organizing hand appears to direct the process. Villon stands alone in merit as in peculiarity. But in this time dramatic literature and the literature of the floating popular broadsheet acquire an immense extension—all or almost all the vigor of spirit being concentrated in the rough farce and rougher lampoon, while all the literary skill is engrossed by insipid *rhétoriqueurs* and pedants. Then comes the grand upheaval of the Renaissance and the Reformation. An immense influx of science, of thought to make the science living, of new terms to express the thought, takes place, and a band of literary workers appear of power enough to master and get into shape the turbid mass. Rabelais, Amyot, Calvin, and Herberay fashion French prose; Marot, Ronsard, and Regnier refashion French verse. The Pléiade introduces the drama as it is to be and the language that is to help the drama to express itself. Montaigne for the first time throws invention and originality into some other form than verse or than prose fiction. But by the end of the century the tide has receded. The work of arrangement has been but half done, and there are no master spirits left to complete it. At this period Malherbe and Balzac make their appearance. Unable to deal with the whole problem, they determine to deal with part of it, and to reject a portion of the riches of which they feel themselves unfit to be stewards. Balzac and his successors make of French prose an instrument faultless and admirable in precision, unequalled for the work for which it is fit, but unfit for certain portions of the work which it was once able to perform. Malherbe, seconded by Boileau, makes of French verse an instrument suited only for the purposes of the drama of Euripides, or rather of Seneca, with or without its chorus, and for a certain weakened echo of those choruses, under the name of lyrics. No French verse of the first merit other than dramatic is written for two whole centuries. The drama soon comes to its acme, and during the succeeding time usually maintains itself at a fairly high level until the death of Voltaire. But prose lends itself to almost everything that is required of it, and becomes constantly a more and more perfect instrument. To the highest efforts of pathos and sublimity its vocabulary and its arrangement likewise are still unsuited, though the great preachers of the 17th century do their utmost with it. But for clear exposition, smooth and agreeable narrative, sententious and pointed brevity, witty repartee, it soon proves itself to have no superior and scarcely an equal in Europe. In these directions practitioners of the highest skill apply it during the 17th century, while during the 18th its powers are shown to the utmost of their variety by Voltaire, and receive a new development at the hands of Rousseau. Yet, on the whole, it loses during this century. It becomes more and more unfit for any but trivial uses, and at last it is employed for those uses only. Then occurs the Revolution, repeating the mighty stir in men's minds which the Renaissance had given, but at first experiencing more difficulty in breaking up the ground and once more rendering it fertile. The faulty and incomplete genius of Chateaubriand and De Stael gives the first evidence of a new growth, and after many years the romantic movement completes the work. The force of that movement is now, after fifty years, all but spent, though its results remain; and France in a literary point of view occupies a position not very dissimilar to that which she occupied at the extreme end of the 16th century, save that the greatest of her regenerators is yet alive. The poetical power of French has been once more triumphantly proved, and its productiveness in all branches of literature has been renewed, while in that of prose fiction there has been almost created a new class of composition. In the process of reform, however, not a little of the finish of French prose style has been lost, and the language itself has been affected in something the same way as it was affected by the less judicious innovations of the Ronsardists. The pedantry of the Pléiade led to the preposterous compounds of Du Bartas; the passion of the Romantics for foreign tongues and for the *mot propre* has loaded French with foreign terms on the one hand and with *argot* on the other. There is, therefore, room for new Malherbes and Balzacs, if the days for Balzacs and Malherbes had not to all appearance passed. Should they be once more forthcoming, they have the failure as well as the success of their predecessors to guide them.

Finally, we may sum up even this summary. For volume and merit taken together the product of these eight centuries of literature excels that of any European nation, though for individual works of the supremest excellence they may perhaps be asked in vain. No French writer is lifted by the suffrages of other nations—the only criterion when sufficient time has elapsed—to the level of Homer, of Shakespeare, or of Dante, who reign alone. Of those of the authors of France who are indeed of the thirty but attain not to the first three Rabelais and Molière alone unite the general suffrage, and this fact roughly but surely points to the real excellence of the literature which these men are chosen to represent. It is great in all ways, but it is greatest on the lighter side. The house of mirth is more suited to it than the house of mourning. To the latter, indeed, the language of the unknown marvel who told Roland's death, of him who gave utterance to Camilla's wrath and despair, and of the living poet who sings how the mountain wind makes mad the lover who cannot forget, has amply made good its title of entrance. But for one Frenchman who can write admirably in this strain there are a hundred who can tell the most admirable story, formulate the most pregnant reflection, point the acutest jest. There is thus no really great epic in French, few great tragedies, and those imperfect and in a faulty kind, little prose like Milton's or like Jeremy Taylor's, little verse (though more than is generally thought) like Shelley's or like Spenser's. But there are the most delightful short tales, both in prose and in verse, that the world has ever seen, the most polished jewelry of reflection that has ever been wrought, songs of incomparable grace, comedies that must make men laugh as long as they are laughing animals, and above all such a body of narrative fiction, old and new, prose and verse, as no other nation can show for art and for originality, for grace of workmanship in him who fashions, and for certainty of delight to him who reads.

Bibliography.—The bibliography of such a subject as French literature cannot be dealt with here exhaustively. We shall, however, indicate the principal works on the subject, and its subdivisions, which will serve to fill up the outline of the foregoing pages. On the general subject there is no work in English of any extent, except the recent compilation of Mr. H. Van Laun (Edinburgh). Notices more or less detailed of the earlier periods will be found in Hallam's works, and of the 17th and 18th centuries (which must, however, be read with great caution) in Buckle's *History of Civilization in Europe*. The chief English critical periodicals will supply monographs, though until recently in no great abundance, of the chief names and some of the chief forms. Mr. Besant's *French Poets* and *French Humorists* may be noticed.

In French the chief works on the whole subject are that of Géruzez, already noticed, and another by Demogeot. These works are both excellent, and being composed on different plans, they may with advantage be read together. They are chiefly deficient with regard to the earliest and latest literature.

For the literature of the Middle Ages the fountain-head is the ponderous *Histoire Littéraire* already referred to, which, notwithstanding that it extends to 27 quarto volumes, and has occupied, with interruptions, 150 years in publication, has only reached the 14th century. Many of the monographs which it contains are the best authorities on their subjects, such as that of M. P. Paris on the early chansonniers, of M. V. Leclerc on the fabliaux, and of M. Littré on the romans d'aventures. For the history of literature before the 11th century, the period mainly Latin, J. J. Ampère's *Histoire Littéraire de la France avant Charlemagne, sous Charlemagne, et jusqu'au onzième siècle* is the chief authority. Léon Gautier's *Épopées Françaises* (4 vols., but now reprinting on a still larger scale) contains almost everything known concerning the chansons de gestes. M. P. Paris's *Romans de la Table Ronde* is the main authority for this subject, though it does not include the contributions of Chrétien de Troyes. On the cycle of Reynard the standard work is Rothe, *Les Romans du Renart*. All parts of the lighter literature of old France are excellently treated by M. Lenient, *Le Satire au Moyen Âge*. The early theatre has been frequently treated by the brothers Parfaict (*Histoire du Théâtre Français*), by Fabre (*Les Clercs de la Bazoche*), by Leroy (*Étude sur les Mystères*), by Aubertin (*Histoire de la Langue et de la Littérature Française au Moyen Âge*). This latter book, recently completed, will be found a useful summary of the whole mediæval period. The historical, dramatic, and oratorical sections are especially full.

On the 16th century an excellent handbook has recently been written by MM. Darmesteter and Hatzfeld. Sainte-Beuve's *Tableau* has been more than once referred to. Ebert (*Entwicklungsgeschichte der Französischen Tragödie vornehmlich im* 16^{ten} *Jahrhundert*) is the chief authority for dramatic matters. The various editions of the great authors of this and other periods do not need special reference. For Provençal the most convenient and trustworthy handbook is Karl Bartsch, *Grundriss zur Geschichte der Provenzalischen Literatur*. In English, Dr. Hueffer's *Troubadours* is the only work of value.

The 17th century, as the supposed classical age, has been repeatedly treated in French. We may mention Sainte-Beuve's *Studies on Port Royal*, Demogeot's *Tableau du* 17^{eme} *Siècle avant Corneille*, and Géruzez (*Essais d'Histoire Littéraire*). Godefroy's *Histoire de la Litt. Française depuis le* 16^{eme} *Siècle jusqu'a nos jours* is an important work, as yet carried no further than the Revolution.

On the 18th century we may mention, in English, Mr. Carlyle's essays on Voltaire and Diderot, and Mr. John Morley's elaborate and exhaustive works on Voltaire, Diderot, and Rousseau, with his smaller essays on Turgot, Vauvenargues, etc. In French, the works of Vinet, Godefroy, and Villemain, and for the philosophical side Damiron, may be consulted. The best work on the period, in a small compass, is, however, a *Tableau* which M. Godefroy has published in addition to his larger work. Post-Revolution literature is as yet too recent to have been treated in works of sufficient comprehension to be noticed here. We may, however, mention Géruzez, *Littérature de la Révolution*, and Nettement, *Littérature Française sous la Restauration et la Monarchie de Juillet*.

On the subject of popular poetry, which, though a contrary impression appears to prevail in England, is of extreme importance in French literature, the main authorities are,—for the Breton district, M. Luzel (*Chants Populaires de la Basse-Bretagne*), (the more famous works of M. de la Villemarqué, *Barsaz-Breiz* and others, are of doubtful trustworthiness); for those of Lorraine, M. de Puymaigre; for those of Champagne, M. Tarbé. M. Haupt's *Französische Volkslieder*, Gaston Paris's *Chansons du* 15^{eme} *Siècle*, Wackernagel's *Alt-Französische Lieder und Leiche*, and Bartsch's *Romanzen und Pastourellen* may also be consulted, though rather for specimens than for comment. (G. S. A.)

FRANCESCA. See PIETRO DELLA FRANCESCA.

FRANCESCHINI, BALDASSARE (1611–1689), a painter of the Tuscan school, named, from Volterra the place of his birth, Il Volterrano, or (to distinguish him from Ricciarelli) Il Volterrano Giuniore, was the son of a sculptor in alabaster. At a very early age he learned from Cosimo some of the elements of art, and he started as an assistant to his father. This employment being evidently below the level of his talents, the Marquises Inghirami placed him, at the age of sixteen, under the Florentine painter Matteo Rosselli. In the ensuing year he had advanced sufficiently to execute in Volterra some frescoes, skilful in foreshortening, followed by other frescoes for the Medici family in the Valle della Petraia. In 1652 the Marchese Filippo Niccolini, being minded to employ Franceschini upon the frescoes for the cupola and back-wall of his chapel in S. Croce, Florence, despatched him to various parts of Italy to perfect his style. The painter, in a tour which lasted some months, took more especially to the qualities distinctive of the schools of Parma and Bologna, and in a measure to those of Pietro da Cortona, whose acquaintance he made in Rome. He then undertook the paintings commissioned by Niccolini, which constitute his most noted performance, the design being good, and the method masterly. Franceschini ranks higher in fresco than in oil painting. His works in the latter mode were not unfrequently left unfinished, although numerous specimens remain, the cabinet pictures being marked by much sprightliness of invention. Among his best oil paintings of large scale is the St. John the Evangelist in the church of S. Chiara at Volterra. One of his latest works was the fresco of the cupola of the Annunziata, which occupied him for two years towards 1683, a production of much labor and energy. Franceschini died of apolexy at Volterra on 6th January, 1689. He is reckoned among those painters of the decline of art to whom the general name of "machinist" is applied. He is not to be confounded with another Franceschini of the same class, and of rather later date, also of no small eminence in his time—the Cavaliere Marcantonio Franceschini, who was a Bolognese (1648–1729).

FRANCHE COMTÉ, from 1674 till the great Revolution one of the provinces of France, was bounded on the E. by the principality of Montbéliard or Mömpelgard and Switzerland, S. by Bresse, Bugey, and Gex, N. by Lorraine, and W. by the duchy of Burgundy and Champagne. It lay to the west of the Jura, and included the valley of the upper Saône and the greater part of the valley of the Doubs. In earlier history it is usually called the countship of Burgundy or Upper Burgundy; in later French history, on the other hand, it is frequently mentioned as the countship (la Comté) *par excellence.* The countship probably took its rise in the 10th century as a fief of the kingdom of Burgundy, which was dependent on the empire. It was held in the beginning of the 11th by Otto William, the warlike son of the king of the Lombards; his son and successor Reinhold or Reinaud I. ventured to refuse his homage to his suzerain Henry III., and his example was followed about a century afterwards by Reinhold III., who took up a position of independence against the emperor Lothar. In neither case was the attempt to throw off the yoke permitted to succeed, but on the latter occasion at least the prestige of the countship was improved, and according to one theory the honorable title of Free Countship (*Freigrafschaft*) was then acquired. After Lothar's death Reinhold again refused homage to the emperor Conrad, and though the emperor consequently bestowed his countship on Conrad of Zähringen, Reinhold was still in actual possession at his death in 1148. His daughter and heiress Beatrix was married to Frederick Barbarossa in 1156; and on her decease in 1185 Frederick bestowed the countship on his third son Otto, and raised Besançon to the rank of a free imperial city. Otto's daughter Beatrix married Duke Otto of Meran, and was succeeded first by their son Otto and afterwards by their daughter Alix. Otto, the son of Alix, offended the emperor Rudolph I., and his city Besançon was consequently besieged by the imperial troops in 1289; but it made a successful defence, and peace was soon afterwards concluded. A treaty was made with Philip the Fair of France, by which Otto's daughter Johanna was to marry Philip of Poitiers the king's second son, and the suzerainty of France was to be recognized by Franche Comté. The marriage took place in due course in 1307, and the importance attached by the king to his claims on Franche Comté is shown by the leniency with which the charges against the princess Johanna or Jeanne were enforced when her sisters-in-law were degraded and imprisoned and their paramours tortured and executed. On Philip's death in 1322 the countship passed to Otto IV., duke of Burgundy, and it was successively held by Philip de Rouvre, Margaret of France, Louis de Male, and Charles the Bold. On Charles's death, Louis XI. of France claimed the protectorate "for the good of the country and the lady of Burgundy, and in favor of the marriage of the dauphin with that lady." By feudal law the countship still held of the empire, being a German and a female fief; but the states accepted the French protection (February, 1477), and the claims of Maximilian were appeased by the promise of the hand of Charles of France for his daughter Margaret. In April, however, a rebellion broke out; the emperor recalled the people to their allegiance, and the Swiss hastened to support the popular cause. The French were constrained to withdraw; but in 1479 the Sire de Chaumont invaded the country, captured Dôle in spite of a vigorous defence, in which the students of the university displayed a desperate but resultless valor, and forced the people to submit. Besançon, the free imperial city, recognized the French king on the same conditions which it had demanded from the dukes of Burgundy, and promised to pay over half the product of its taxes. The parliament of Dôle was transferred to Salins, and the university to Besançon. When Charles VIII. refused to marry Maximilian's daughter, the people of Franche Comté rose in revolt, and the king relinquished his claims by the treaty of Senlis, May 23, 1493. Along with the rest of the domains of the house of Burgundy the countship was bestowed on Philip, Maximilian's son, and passed to the crown of Spain. As a Spanish territory its position was a peculiar and isolated one; and it was consequently treated with great leniency by the Spanish Government. It paid a "gratuitous gift" of not more than 200,000 livres every three years, and furnished very few soldiers to the royal army. Under the nominal authority of the governor-general of the Low Countries, it was practically governed by the parliament of Dôle and a governor chosen from the ranks of its own nobility. In 1668 Louis XIV. cast his eyes on the province, and Condé effected its conquest in fifteen days. On the 14th of February the king swore at Dôle to preserve the liberties of the town and province as count palatine of Burgundy, and the parliament issued an edict against those who refused to submit to his authority. By the peace of Aix-la-Chapelle, which almost immediately followed, Franche Comté was restored to Spain; but in 1674 Louis made a new invasion. Besançon was taken after a lengthened siege, at which Vauban and the king were both personally present; Dôle shared the same fate; and by the 4th of July the whole country was again in the hands of the French. To celebrate the conquest the triumphal arch of the Saint Martin gate at Paris was erected. The countship now became a French province; its gratuitous donation became a regular impost, which was soon after increased in amount; and the chief authority was placed in the hands of a governor-general. Instead of three great bailiwicks, as formerly, there were four:—Amont, Aval, Besançon, and Dôle—their chief towns being Vesoul, Salins, Besançon, and Dôle. See Clerc, *Histoire de la Franche Comté*.

FRANCHISE, in law, means some right or privilege, of a local or exclusive character, *e.g.*, the right of free fishery. The term is more particularly applied to the right of voting at an election for a member of parliament. See PARLIAMENT.

FRANCIA, a celebrated Bolognese painter was born towards 1450, and died 6th January, 1517. His real name was Francesco Raibolini, his father being Marco di Giacomo Raibolini, a carpenter; he was apprenticed to a goldsmith named Francia, and from him probably he got the nickname whereby he is generally known; he, moreover, studied design under Marco Zoppo. The youth was thus originally a goldsmith, and also an engraver of dies and niellos, and in these arts he became extremely eminent. He was particularly famed for his dies for medals; he rose to be mint-master at Bologna, and retained that office till the end of his life. A famous medal of Pope Julius II. as liberator of Bologna is ascribed to his hand, but not with certainty. At a mature age—having first, it appears, become acquainted with Mantegna—he turned his attention to painting. His earliest known picture is dated 1494 (not 1490, as ordinarily stated). It shows so much mastery that one is compelled to believe that Raibolini must before then have practised painting for some few years. This work is now in the Bologna gallery,—the Virgin enthroned, with Augustine and five other saints. It is an oil picture, and was originally painted for the church of S. Maria della Misericordia, at the desire of the Bentivoglio family, the rulers of Bologna. The same patrons employed him upon frescoes in their own palace; one of Judith and Holophernes is especially noted, its style recalling that of Mantegna. Francia probably studied likewise the works of Perugino; and he became a friend and ardent admirer of Raphael, to whom he addressed an enthusiastic sonnet. Raphael cordially responded to the Bolognese master's admiration, and said, in a letter dated in 1508, that few painters or none had produced Madonnas more beautiful, more devout, or better portrayed than those of Francia. If we may trust Vasari—but it is difficult to suppose that he was entirely correct—the exceeding value which Francia set on Raphael's art brought him to his grave. Raphael had consigned to Francia his famous picture of St. Cecilia, destined for the church of S. Giovanni in Monte, Bologna; and Francia, on inspecting it, took so much to heart his own inferiority, at the advanced age of about sixty-six, to the youthful Umbrian, that he sickened and shortly expired. Distanced though he may have been by Raphael, Francia is rightly regarded as the greatest painter of the earlier Bolognese school, and hardly to be surpassed as representing the art termed "anticomoderno," or of the "quattrocento." It has been well observed that his style is a medium between that of Perugino and that of Giovanni Bellini; he has somewhat more of spontaneous naturalism than the former, and of abstract dignity in feature and form than the latter. The magnificent portrait in the Louvre of a young man in black, of brooding thoughtfulness and saddened profundity of mood, would alone suffice to place Francia among the very great masters, if it could with confidence be attributed to his hand, but in all probability its real author was Franciabigio; it had erewhile passed under the name of Raphael, of Giorgione, or of Sebastian del Piombo. The London National Gallery contains two remarkably fine specimens of Francia, once combined together as principal picture and lunette,—the Virgin and Child and St. Anne enthroned, surrounded by saints, and (in the lunette) the Pietà, or lamentation of angels over the dead Saviour. They come from the Buonvisi chapel in the church of S. Frediano, Lucca. Other leading works are—in Munich, the Virgin sinking on her knees in adoration of the Divine Infant, who is lying in a garden within a rose trellis; in the Borghese Gallery, Rome, a Peter Martyr; in Bologna, the frescoes in the church of St. Cecilia, illustrating the life of the saint, all of them from the design of Raibolini, but not all executed by himself; a public passage now traverses these frescoes, and they are in a pitiful state of decay. His landscape backgrounds are of uncommon excellence. Francia had more than 200 scholars. Marcantonio Raimondi the famous engraver is now the most renowned of them; next to him, the painter Lorenzo Costa; also Amico Aspertini, and Francia's own son Giacomo, and his cousin Julio.

FRANCIA, JOSÉ GASPAR RODRIGUEZ, commonly called Dr. Francia, dictator of Paraguay, one of the most remarkable men connected with the history of South America. The date of his birth is not definitely ascertained, but probably falls about 1757. According to one account, he was of French descent; but the truth seems to be that his father, Garcia Rodriguez França, was a native of S. Paulo in Brazil, and came to Paraguay to take charge of a plantation of black tobacco for the Government. He studied theology at the college of Cordova de Tucuman, and is said to have been for some time a professor in that faculty; but he afterwards turned his attention to the law, and practised in Asuncion. Having attained a high reputation at once for ability and integrity, he was naturally selected for various important offices, and exercised great personal influence. The Robertsons, whose accounts have done so much to blacken his memory, relate how, when he was requested by one of his friends to undertake an unjust cause in his behalf, he not only refused, but went and offered his services to the man who was likely to be wronged, and by his boldness and energy secured his case. On the declaration of Paraguayan independence in 1811, he was appointed secretary to the national junta, and exercised an influence on affairs greatly out of proportion to his nominal position. When the congress or junta of 1813 changed the constitution and established a duumvirate, Dr. Francia and the Gaucho general Fulgencio were elected to the office. A story is told in connection with their installation, which recalls the self-coronation of William I. of England and Napoleon the Great. In theatrical imitation of Roman custom, two curule chairs had been placed in the assembly, one of them bearing the name of Cæsar and the other that of Pompey. Francia seated himself in the Cæsar chair, and left his colleague to play the part of Pompey as best he might. In 1814 he secured his own election as dictator for three years, and at the end of that period he obtained the dictatorship for life. He was no mere nominal sovereign; but for the next twenty-five years he might have boasted, with even more truth than Louis XIV., "L'état c'est moi." In the accounts which have been published of his administration we find a strange mixture of capacity and caprice, of far-sighted wisdom and reckless infatuation, strenuous endeavors after a high ideal and flagrant violations of the simplest principles of justice. He put a stop to the foreign commerce of the country, but carefully fostered its internal industries; was disposed to be hospitable to strangers from other lands, and kept them prisoners for years; lived a life of republican simplicity, and punished with Dionysian severity the slightest want of respect. As time went on he appears to have grown more arbitrary and despotic, more determined to maintain his mastery over the country, and more apprehensive lest he should lose it. And yet at the time of his death it is said that he was generally regretted, and his bitterest opponents cannot deny that if he did much evil he also did much good. Deeply imbued with the principles of the French Revolution, he was a stern antagonist of the church. He abolished the Inquisition, suppressed the college of theology, did away with the tithes, and inflicted endless indignities on the priests. "What are they good for?" was his saying; "they make us believe more in the devil than in God." He discouraged marriage both by precept and example, and left behind him several illegitimate children. For the extravagances of his later years the plea of insanity has been put forward; and it was evident that his worst characteristics were at their worst when the east wind blew. The circumstances of his death were in strange keeping with his life. He was about to sabre his doctor when he was seized with a fit, and he expired the same day, September 20, 1840. He was buried in the cathedral of Asuncion, but the spot is no longer known, and a story is told by Mr. Mansfield and by Lieutenant-Colonel Thomson, to the effect that his body was dug up by some private enemies and flung into the river. On the other hand it is well known that the greatest respect was shown to his memory by those who succeeded him in the government of Paraguay. Unfortunately for the history of his administration, Francia kept no records; and he caused all his orders to be returned to him with the word "executed" on the margin, and then to be destroyed.

The first and fullest account of Dr. Francia was given to the world by two Swiss surgeons, Rengger and Longchamps, whom he had detained from 1819 to 1825—*Essai historique sur la révolution de Paraguay et la gouvernement dictatorial du docteur Francia*, Paris, 1827. Their work was almost immediately translated into English under the title of *The Reign of Dr. Joseph G. R. De Francia in Paraguay*, 1827. About eleven years after there appeared at London *Letters on Paraguay*, by J. P. and W. P. Robertson, two young Scotchmen whose hopes of commercial success had been rudely destroyed by the dictator's interference. The account which they gave of his character and government was naturally of the most unfavorable description, and they rehearsed and emphasized their accusations in *Francia's Reign of Terror*, 1839, and *Letters on South America*, 3 vols., 1843. From the very pages of his detractors Thomas Carlyle succeeded in extracting materials for a brilliant defence of the dictator "as a man or sovereign of iron energy and industry, of great and severe labor." It appeared in the *Foreign Quarterly Review* for 1843, and is reprinted in vol. iv. of the author's *Critical and Miscellaneous Essays*. Comparatively little new light has since been thrown on the subject Captain Richard F. Burton gives a graphic sketch of Francia's life and a favorable notice of his character in his *Letters from the Battle-fields of Paraguay*, 1870, while C. A. Washburn takes up a hostile position in his *History of Paraguay*, 1871.

FRANCIABIGIO (1482–1525), a Florentine painter. The name of this artist is generally given as Marcantonio Franciabigio; it appears, however, that his only real ascertained name was Francesco di Cristofano; and that he was currently termed Francia Bigio, the two appellatives being distinct. He was born in Florence, and studied under Albertinelli for some months. In 1505 he formed the acquaintance of Andrea del Sarto; and after a while the two painters set up a shop in common in the Piazza del Grano. Franciabigio paid much attention to anatomy and perspective, and to the proportions of his figures, though these are often too squat and puffy in form. He had a large stock of artistic knowledge, and was at first noted for diligence. As years went on and he received frequent commissions for all sorts of public painting for festive occasions, his diligence merged in something which may rather be called workmanly offhandedness. He was particularly proficient in fresco, and Vasari even says that he surpassed all his contemporaries in this method—a judgment which modern connoisseurship does not accept. In the court of the Servi (or cloister of the Nunziata) in Florence he painted in 1513 the Marriage of the Virgin, as a portion of a series wherein Andrea del Sarto was chiefly concerned. The friars having uncovered this work before it was quite finished, Franciabigio was so incensed that, seizing a mason's hammer, he struck at the head of the Virgin and some other heads; and the fresco, which would otherwise be his masterpiece in that method, remains thus mutilated to the present day. At Lo Scalso, in another series of frescoes on which Andrea was likewise employed, he executed in 1518–19 the Departure of John the Baptist for the Desert, and the Meeting of the Baptist with Jesus; and, at the Medici Palace at Poggio a Caiano, in 1521, the Triumph of Cicero. Various works which have been ascribed to Raphael are now known or reasonably deemed to be by Franciabigio. Such are the Madonna del Pozzo, in the Uffizi Gallery; the half figure of a Young Man, in the Louvre (a noble work, already mentioned in the article Francia); and the famous picture in the Fuller-Maitland collection, a Young Man with a Letter. These two works show a close analogy in style to another in the Pitti Gallery, avowedly by Franciabigio, a Youth at a Window, and to some others which bear this painter's recognized monogram. The series of portraits, taken collectively, places beyond dispute the eminent and idiosyncratic genius of the master. Two other works of his, of some celebrity, are the Calumny of Apelles, in the Pitti, and the Bath of Bathsheba (painted in 1523), in the Dresden Gallery.

FRANCIS I. (1494–1547), king of France, son of Charles of Orleans, count of Angoulême, and Louisa of Savoy, was born at Cognac 12th September, 1494. As heir-presumptive of the throne of France, he received special favors from Louis XII., who created him duke of Valois and in 1512 gave him the command of the army of Navarre. In this position, though achieving no important results, he conducted himself with such prudence and courage that in 1513 he was appointed to the command of the army in Picardy, where he successfully carried out the plan of defensive operations that was entrusted to him. He married Claude, daughter of Louis XII., in 1514, and succeeded him on the throne 1st January, 1515. After his accession, the first and great object that occupied his ambition was the recovery of Milan, the inheritance of which he claimed through his great-grandmother Valentina Visconti. Accordingly, while, in order to render himself secure against external attacks, he negotiated an alliance with Charles of Austria, afterwards the emperor Charles V., and the renewal of a treaty concluded by Louis XII. with Henry VIII. of England, he also began to collect his forces for an Italian expedition. The politic negotiations which won him Genoa, the acquisition of which was all-important as commanding the connection between Milan and the sea, placed the purpose of his preparations beyond all doubt, and caused Leo X. to unite in an alliance against him with the Spaniards and the Swiss. The Swiss at once occupied all the mountain passes; but Francis, guided by a Piedmontese peasant, succeeded after great labor and difficulty in leading his army over the Alps by a pass deemed impracticable, and, descending into the friendly territories of the marquis of Saluzzo, surprised and routed at Villa Franca Colonna the general of the papal cavalry, and thus outflanking the Swiss caused them to fall back upon Milan. Completely disconcerted by the sudden movement, they at first actually entered into negotiations for a truce; but receiving shortly afterwards a reinforcement of troops and their arrears of pay, they endeavored to surprise the French at Marignano. This battle, begun on the 13th September, 1515, prolonged into the night, and renewed on the following morning, was fought on both sides with furious and stubborn courage; but on the arrival of Alviano the Venetian commander to the succor of Francis, the Swiss retreated unpursued to Milan. Shortly afterwards Milan surrendered, and in November a treaty was concluded between Francis and the Swiss, which subsequently took the form of a perpetual alliance. Such rapid and brilliant success at once gave Francis a position of commanding influence, and enabled him still further to strengthen himself by additional advantageous treaties. In 1516, he compromised the long dispute with the popes by superseding the Pragmatic Sanction of Bourges by a "Concordat," an act which, while it recognized the superiority of the pope over the councils, and gave him the command of the *annates* and other rich sources of revenue, entrusted the French monarch with the power of nominating to vacant benefices. In 1517 he entered into an alliance with the emperor Maximilian and Charles I. of Spain against the Turks; and in 1518 he made an arrangement with Henry VIII. of England, by which France bought back Tournay.

On the death of Maximilian in 1519, Francis became a candidate for the imperial crown; but chiefly through the recommendation of Frederick the Wise of Saxony the choice fell on Charles I. of Spain, from that time known as Charles V. The success of Charles was prophetic of the relative positions which the two rivals were thenceforth to occupy, for the resolute and persevering ambition of the emperor, and his hitherto wholly unsuspected abilities both in war and in diplomacy, were to prove themselves more than a match for the headstrong valor and showy accomplishments of the French monarch. War between them could scarcely have been avoided, even if the materials for kindling it had not been already prepared; but inherited disputes in regard to Navarre, Milan, Burgundy, and Arles would in any case have sooner or later rendered an appeal to the decision of the sword almost inevitable. With a view to such possibilities, the great aim of both was to secure the alliance of Henry of England and the pope, and here fortune again ultimately smiled on Charles. Francis, elated by his previous achievements on the battlefield, and chagrined at the overthrow of his hopes of obtaining the imperial crown, was naturally eager to strike the first blow; and the request of Henry II. of Navarre to aid him in regaining his kingdom came opportunely to second his wishes. Accordingly in April, 1521, he sent an army to the aid of Henry. Charles at once retaliated by an invasion of France, and in May concluded a treaty with Pope Leo X. for the expulsion of the French from Italy. Navarre after being almost won was again lost by Henry; and in Italy the French, chiefly through the blunders of Lautrec, the brother of the king's mistress, lost Milan, Genoa, and all their conquests with the exception of the stronghold of Cremona; but the attempt of the imperialists to enter France was pushed back, and Francis, following in pursuit, only by unaccountable negligence missed the opportunity of inflicting a crushing defeat on Charles between Cambray and Valenciennes. After this, difficulties continued to thicken round the French king; on the 9th January, 1522, the papal throne was mounted by Adrian VI., who had formally been tutor to Charles V., and in May Henry VIII. declared war against France; in August, 1523, a coalition was formed against her which included the pope, the emperor, the king of England, the archduke of Austria, the duke of Milan, and the principal Italian republics; and about the same time Charles Constable Bourbon, having been unjustly used by Louise of Savoy, withdrew from France, and offered his sword to Charles V. The Spanish troops crossed the French frontiers at Bayonne; the English entered Picardy, and advanced to within 11 leagues of Paris; and after the repulse of the French army despatched against Milan, the imperialists passed over into Provence and laid siege to Marseilles. Through cautious but stubbornly defensive tactics, however, both the Spanish and English incursions were foiled, and Francis was thus able to advance to the relief of Marseilles with a large army. The imperialists did not wait his approach; but, determined on retaliation, he crossed the Alps and laid siege to Pavia, where a strong Italian force had taken refuge. Here he was attacked, 24th February, 1525, by a relieving army under Bourbon and Pescara. The attack was unsuccessful; but, flushed with the victory which he believed already in his grasp, he rashly left his impregnable position, and so blundered in his manœuvres as to render his overwhelming defeat inevitable. His army was speedily either cut down or dispersed in flight, and he himself, after a desperate attempt to rally, was made prisoner and conveyed by Charles to Madrid. He only regained his liberty, 21st February, 1526, by signing a treaty whereby he ceded to Charles both Burgundy and Milan. Its stipulations were guaranteed by the retention of his two sons in the emperor's hands; but he nevertheless resolved to disregard it, and in this he was supported by Pope Clement VII. and also by Henry of England, whom jealousy and alarm at the emperor's success had induced to change sides. Though formal war was not declared, a French army was despatched to Italy, but the supineness with which the campaign was prosecuted enabled the imperialists to have it all their own way; and an army of mercenaries under Bourbon, who perished in the assault, marching unopposed to Rome, captured and sacked the city, and took the pope prisoner. On this Francis and Henry at once declared war against the emperor; but the army sent into Italy under Lautrec almost melted away before the walls of Naples: and Genoa, by suddenly declaring for the emperor, completed the ruin of the French cause in Italy. The pope soon thereafter saw it to be his interest to be reconciled with Charles; and in August, 1529, Charles and Francis agreed to the treaty of Cambray, by which Francis retained Burgundy and obtained by a ransom the release of the French princes, but renounced his claims in Italy and ceded Artois and Flanders to his rival. He also agreed to fulfil the promise entered into at Madrid to marry Eleanor of Portugal, sister of Charles, his first wife having died in 1524. During the years of peace that followed this treaty, Francis, though he had encouraged the Smalkald League in Germany, persecuted with great vigor the adherents of Protestantism in his own kingdom; but when war was again declared, he issued an edict of toleration. The pretext for the renewal of the war was the murder of the French ambassador by Duke Sforza of Milan in 1533, but hostilities were delayed till 1535, when, emboldened by the weakened condition of the emperor after his war against the Turks, Francis overran Savoy and took possession of Turin. His advantages were, however, followed up with so little energy that Charles, after driving the French out of Italy, began an invasion of Provence; and his progress was only checked by the barbarous destruction of the country before him by Anne of Montmorency. Meantime Francis attacked Flanders, and entered into an alliance with Sultan Soliman II., whose invasion of Hungary induced Charles in 1538 to consent to the ten years' truce of Nice. In 1540 Charles, while the guest of the French monarch, held out to him the hope of a complete satisfaction of his wishes through the investiture of the duke of Orleans with the duchy of Milan; but the promise, if definitely made, was never fulfilled, and Francis, finding a favorable opportunity after the disastrous issue of the emperor's expedition against Algiers, renewed on a flimsy pretext the war in 1542. An offensive alliance was formed with the Turks, the duke of Cleves, and Denmark and Sweden; separate armies attacked at various points the Spanish, Flemish, and Italian frontiers; and the united French and Turkish forces captured and burned Nice. The monotony of the indecisive conflict was relieved in April, 1544, by a brilliant French victory at Ceresole, but the success came too late to permit of its being followed up by an advance into Italy; for in the July following, the emperor from Champagne and the king of England from Picardy were marching to join their forces before the walls of Paris. The siege of Boulogne by the English gave Francis, however, sufficient time to make a show of defence such as convinced Charles of the doubtful nature of the enterprise; and without consulting the king of England he sent to Francis from Crespy terms of peace, which were signed 17th September. By this treaty France retained Burgundy and resigned its claims on Flanders, Artois, and Naples, while the duchy of Milan was promised to the duke of Orleans on his marrying one of the imperial princesses—an arrangement, however, which his death in 1545 rendered nugatory. For some time afterwards the English king continued the war in Picardy, but a treaty of peace was signed in June, 1546. As soon as peace was concluded with the emperor, the prosecution of the Protestants in France was renewed, and in 1545 an edict was passed for the expulsion of the Waldenses from Provence. The health of Francis had for several years been completely undermined, and he succumbed to an acute attack of disease, 31st May, 1547.

In the reign of Francis were combined most of the faults and excellences which have been specially prominent in the subsequent history of his country. He was in a sense the creator of a new political and intellectual era. As regards government, he was virtually the founder of the "ancient régime," whose final result and overthrow was the great Revolution; he gave its death blow to feudalism; he deprived the *parlements* of all independent power; under the auspices of the minister Du Prat he confirmed and extended the system of corruption in civil and ecclesiastical appointments; and he turned the efforts of statesmanship away from the paths of constitutional progress, and into those of military renown. His reign in its social and intellectual results was more beneficial, for if he sanctioned by his example licentiousness of manners, he at the same time gave a great impulse to refinement in taste and to intellectual progress by fostering in his country the offshoots of the Italian Renaissance. He founded in 1530 the college of France for the study of the three languages; he was himself a writer of verses, and a special friend and benefactor of artists and men of letters; and by the purchase of the great masterpieces of Italian painting and sculpture, and in the magnificent structures of Chamford, Azai-le-Redeau, Amboise, and Fontainebleau he left behind him a permanent influence on French art. Compared with his great rival Charles V., he was open, impulsive, and generous, but he was less actuated by consistent principles; he was hopelessly inferior in diplomacy, and in sagacity and comprehensiveness of purpose; he had perhaps equal abilities as a general, but his occasional victories were more than counterbalanced by the results of his own indolence and by the blunders of his subordinates; and while able to defend France against all external attacks, he was compelled to content himself with a place second to that of the emperor in the sphere of European politics.

FRANCIS II. (1543–1560), king of France, eldest son of Henry II. and of Catherine de' Medici, was born at Fontainebleau, 19th January, 1543. He married the famous Mary Stuart, daughter of James V. of Scotland, 25th April, 1558, and ascended the French throne 10th July, 1559. During his short reign he was the mere tool of his uncles, the duke of Guise and the cardinal of Lorraine, into whose hands he virtually delivered the reins of government. The exclusiveness with which they were favored, and their high-handed proceedings, awakened the resentment of the princes of the blood, Anthony king of Navarre and Louis prince of Condé, who gave their countenance to a conspiracy with the Protestants against the house of Guise. It was, however, discovered shortly before the time fixed for its execution in March, 1560, and an ambush having been prepared, most of the conspirators were either killed or taken prisoners. It leadership and organization had been entrusted to Godfrey du Barry, lord of La Renaudie; and the prince of Condé, who was not present, disavowed all connection with the plot. The duke of Guise was now named lieutenant-general of the kingdom, but his Catholic leanings were somewhat held in check by the chancellor Michel de l'Hôpital, through whose mediation the edict of Romorantin, providing that all cases of heresy should be decided by the bishops, was passed in May, 1560, in opposition to a proposal to introduce the Inquisition. At a meeting of the states-general held at Orleans in the December following, the prince of Condé, after being arrested, was condemned to death, and extreme measures were being enacted against the Huguenots; but the deliberations of the Assembly were broken off, and the prince saved from execution, by the king's somewhat sudden death, on the 5th of the month, from an abscess in the ear.

FRANCIS I. (1708–1765), head of the Holy Roman Empire, the eldest son of Leopold, duke of Lorraine, was born on the 8th of December, 1708. His full name was Francis Stephen. At the age of fifteen he was sent to Vienna, where he received the Silesian duchy of Teschen. In 1735, in return for Lorraine, which Charles VI., at the end of the war of the Polish succession, gave to Stanislaus Leszczynski, Francis Stephen obtained the reversion to the duchy of Tuscany, to which he succeeded in 1737. The year before the latter date he married Maria Theresa, the daughter of the emperor Charles VI., and after the emperor's death in 1740 he was declared by his wife joint regent of her dominions. He was elected emperor after the death of Charles VII., and crowned at Frankfort on the 4th of October, 1745. He carried on extensive trading operations, and was an enthusiastic collector of works of art; but he had no energy of character, and was quite willing that the empress-queen, Maria Theresa, should do all the real work of government. When Austria and France, laying aside the animosities of two centuries, were coming to an understanding before the Seven Years' War, he was shrewd enough to see the difficulties which would inevitably arise from such an alliance. Maria Theresa, however, although she sincerely loved him, had no respect for the political judgment of her good-natured husband, and he quietly acquiesced in her will. He suddenly died at Innsbruck on the 18th of August, 1765, falling into the arms of his second son Leopold, who succeeded him as duke of Tuscany, and ultimately (after the death of Joseph II.) became emperor.

FRANCIS II. (1768–1835), the last Holy Roman Emperor, and, as Francis I., first emperor of Austria, was born in Florence on the 12th February, 1768. He was the son of the emperor Leopold II., after whose death, in 1792, he succeeded to the hereditary dominions of the house of Austria, being crowned emperor in the same year. Before this time he had gained some experience of war during the conflict of the emperor Joseph II. with the Turks. He was immediately involved in the first of his famous wars with France, in which, till 1795, he had the support of the king of Prussia. In 1794 he himself was with the Austrian army which defeated the French at Tournay; but when fortune turned on the side of France he went back to Vienna. He was compelled, mainly in consequence of the victories of Napoleon, who pressed northward from Italy into Carinthia, to conclude, on the 17th October, 1797, the treaty of Campo Formio, whereby the empire lost the greater part of the left bank of the Rhine, and Austria had to give up the Netherlands and Lombardy. Austria received in return Venetia, Friuli, Istria, and Dalmatia. In 1799 war broke out afresh, the emperor having on this occasion England and Russia as allies. During the first campaign the French were everywhere defeated; but in the following year Napoleon gained the brilliant victory of Marengo, while Moreau was equally successful at Hohenlinden. The shock of these two battles made it impossible for Austria to continue the war, and on the 9th February, 1801, she concluded the treaty of Lunéville, which confirmed that of Campo Formio, besides exacting fresh sacrifices. France now obtained the whole of the left bank of the Rhine. Once more in association with Russia and England, the emperor began another war with France in 1805. The capitulation of Ulm and the battle of Austerlitz, great as were these disasters, did not make the case of Austria hopeless, for she still had large forces, Russia was willing to continue the war, and the power of France had been seriously crippled at Trafalgar. But Francis was dispirited, and craved peace. On December 25, 1805, was concluded the treaty of Presburg, which deprived Austria of Venetia and Tyrol. In 1806, after the formation of the Confederation of the Rhine, he formally resigned the imperial crown, thus bringing to an end the Holy Roman Empire and the kingdom of Germany. Forgetting the true meaning of the word emperor, he had in 1804 proclaimed himself, as Francis I., hereditary emperor of Austria; and this title has been retained by his successors. He took no part in the war of Prussia with France in 1806, but after some time began to make preparations for a determined struggle, by which he should regain all the advantages lost in previous wars. The new conflict broke out in 1809, and the whole of Germany awaited the result with intense anxiety. Austria was unfortunate at first: but the highest hopes were excited by her thorough victory of Aspern. It was followed by the battle of Wagram, which enabled Napoleon to dictate peace from the palace of Schönbrunn, where he had once before taken up his quarters. By the treaty of Schönbrunn (October 14, 1809) he transferred the allegiance of about four millions of Austrian subjects to other rulers; but as in the following year he married Maria Louisa, the eldest daughter of Francis, it seemed probable that the two sovereigns would in future be on friendly terms. Francis was the ally of Napoleon in his war with Russia in 1812; and when, after the retreat from Moscow, France found herself confronted by Russia and Prussia, Austria at first remained neutral, and in the summer of 1813 acted as mediator. In August of the same year she joined the allies; and, like the sovereigns of Prussia and Russia, Francis accompanied his troops in the war which followed. The settlement of Europe which resulted from the final defeat of Napoleon made Francis a more powerful sovereign than he had been at the beginning of his reign; and from this time forward he lived at peace, except that he had to put down a rising in Lombardy in 1821. He was a well-meaning ruler, but had been so alarmed by the successes of the French Revolution that he detested modern ideas of government. The aspirations of his various states for some measure of independence he regarded as criminal, and in Prince Metternich he found a willing agent for his policy of stern repression. Thus a large amount of discontent was excited, which prepared serious troubles for the emperors who came after him. Francis was married four times, having by his second wife, Maria Theresa, princess of Sicily, thirteen children. He died on the 2d March, 1835, and was succeeded by his son Ferdinand.

FRANCIS, St. (1182–1226), a well-known saint of the

Roman Catholic Church, the founder of the great order of Franciscans, was born at Assisi in the year 1182. His father was a trader in goods which he appears chiefly to have purchased in the south of France, to which he made frequent journeys; and his son was born during one of these journeys, and in consequence received from the grateful father on his return the name of Francesco. His mother had wished to call him, it is said, Giovanni or John, The youth grew up very much like any other boy of his class. He received but little learning from the priest of the parish, and does not seem to have manifested any special love for school instruction. He was by nature a merry-hearted and careless fellow, and developed early an inclination for fine clothes and street amusements with other boys of his class. His parents, indulgent to his gayeties, saw with pride the higher tastes and bright intelligence of their son, and would sometimes say to one another, "He is like the son of a prince." The father formed expectations of a successful courtly career; but the mother, seeing more into the boy's heart, would say to her neighbors, "If he lives like the son of a prince now, he shall hereafter be a child of God."

Soon a great change came to him. At the age of twenty-five Francis was seized with a severe illness. Reflections came to him on his sick-bed, and he rose from it an altered man. Henceforward, says one of his biographers, "he held that in contempt which he had hitherto held in admiration and love." The ardor of his natural character flamed forth first in the idea of military devotion, and then in a consuming spirit of self-sacrifice for the good of others. All his love of amusement and worldly display disappeared. He began to speak of poverty as his bride; and the poor and the sick and the leper became the objects of his peculiar care. He would seek out the lepers, hitherto abhorred by him as by the popular feeling, and kiss them and minister to their wants. He made a pilgrimage to Rome, and in his enthusiasm for poverty flung all he had on the altar of St. Peter's, joined himself to a troop of beggars, and gave himself up to a wandering life of almsgiving and charity. His mother guessed something of the feelings that were struggling in her son's heart; but his father, not unnaturally, was greatly concerned at his conduct. At last matters came to an open rupture between them; and the saint's severance of the parental tie for the sake of his divine mission is a significant incident in his career with all his biographers. It happened in this wise. There was an old church or small chapel of the name of St. Damian in the neighborhood of Assisi which had fallen into ruins. The spot was a favorite one with the youthful enthusiast for meditation and prayer; and one day as he sat in meditation among the ruins he seemed to hear a voice saying to him clearly, "Francis, seest thou not that my house is in ruins? go and restore it for me." To hear was to obey. The divine voice, as with some other enthusiasts, seemed to silence every other voice in his heart, even the voice of conscience. He returned home, saddled his horse, took a bale of his father's goods, and repairing to Foligno he sold both horse and goods, and rushed to the priest of St. Damian with the money to pay for the restoration of the church. The good priest was startled; his father heard with indignation of his son's conduct, and at length with blows and curses securely imprisoned him from any further freaks. But his father's harshness overshot the mark. Released by the tenderness of his mother, and summoned to restore the goods he had taken away and renounce all his patrimonial rights, the popular feeling, which had previously sided with his father against him, now turned in the youth's favor. The bishop, before whom the case finally came, discovered the youth's vocation to a religious life, and induced him to restore the value of the goods to his father. The money had been all the while lying neglected amidst the ruins of the church. This accomplished, Francis renounced all dependence upon his father, and gave himself up to the profession of a religious mendicant. "I have but one, a Father in heaven, now," he said. The people were melted to tears by his devotion, and the good bishop took him for a time under his own charge.

Gradually Francis found his full vocation, not only in a life of entire devotion and poverty for himself, but in founding an order of mendicants devoted to the service of the church. It was in the old scene of his earlier inspiration that the new idea came to him. Once more the divine voice was heard sounding in his ears: "Provide neither gold nor silver nor brass in your purses, nor scrip for your journey, neither two coats, nor yet staves." This was about the year 1208 or 1209, when, therefore, the saint was about twenty-six years of age. He was henceforth a preacher as well as an exemplar of poverty. He essayed to reproduce the picture of the divine life on earth, having not where to lay his head, going about doing good, and preaching the gospel of the kingdom. "Sell all that thou hast, and give to the poor; then thou shalt have treasure in heaven." Gradually there gathered round his cell, which he had fixed outside the town near a little church, the St. Maria degli Angeli, better known as the Portiuncula, a band of disciples as enthusiastic as himself. "Fear not," he said to them, "because you are small and seem foolish. Have confidence in the Lord who has vanquished the world. Some will receive you. Many proud will resist you. Bear all with sweetness and patience. Soon the wise and the noble will be with us. The Lord hath given me to see this. I have in my ears the sounds of the languages of all the people who will come to us,—French, Spaniards, Germans, English. The Lord will make us a great people, even to the end of the earth."

In this insignificant manner was laid the foundation of the great Franciscan order. At first there were only seven, himself the eighth, but all were animated by the same spirit, and all followed the same rule of life. As he sent them forth he said, "Go and preach two and two. Preach peace and patience; tend the wounded; relieve the distressed; reclaim the erring; bless them which persecute you, and pray for them that despitefully use you." The gospel of divine poverty was proclaimed everywhere. The spirit of self-renunciation spread by and by like wildfire, and multitudes were added to the order day by day. It may seem to our modern imagination a fantastic dream, but the gospel of St. Francis met a congenial root in the social and spiritual life of the 13th century, and rapidly grew into great results. The sanction and blessing of the papacy, however, were necessary to give the order ecclesiastical position and influence. Francis himself undertook a new journey to Rome, and suddenly appeared before the great Innocent III. as he was walking one day on the terrace of the Lateran. The startled pope dismissed the mean stranger with mingled pity and contempt; but the same night a vision came to him of the marvellous growth of a palm tree from meanness to magnificence; and, as he pondered the meaning of the vision, a divine whisper reached him that thus powerful on behalf of the church was to prove the poor man whose appearance had startled him. The natural conclusion followed. The poor man was recalled, his projects were submitted to the judgment of the Vatican, and the result was that the papal saction was formally extended to the order,—a few years before the same sanction was given to the great rival order headed by the learned and noble Dominic. The founders of the two great mendicant orders are said to have met afterwards at Rome, and again at a great meeting of the Franciscans in 1219. St. Dominic is credited with the most friendly greetings offered to his brother saint. "Thou art my companion; thy work and mine is the same." It is said also that he looked with amazement at the second meeting on the remarkable fascination which the simple-minded Francis exerted over his followers. But it is difficult to know whether these reputed *rapprochements* of the great leaders were not an afterthought of their biographers, interested in promoting the idea of the friendliness of the two powers which were destined for a time to divide the influence of the church between them.

Francis founded an order of poor sisters as well as poor brothers, known by the name of Poor Claras or Clarisses. The origin of the sisterhood is encircled in a halo of romance, such as everywhere surrounds the footsteps of St. Francis. Clara was a young lady of the neighborhood, who, either attracted by the saint's preaching, or enamored of his life of poverty, or both, resolved to devote herself to self-sacrifice as he and his companions had done. He is said to have "poured into her ears the sweetness of Christ." The result was that she forsook her home, fled to the Portiuncula, and, being first a member of the order, was then placed in a female convent. From this questionable beginning sprang the sisterhood nearly as famous in its history as the great brotherhood, and which survives till this day. There was a third order also sprung up in the course of the saint's lifetime. So marvellous were the consequencess of his preaching that whole populations, it is said, wished to devote themselves to consecrated poverty. But many, of course, had no real vocation to such a service, and Francis, visionary as he was, saw that the excesses of his system might prove its ruin. So he arranged to receive persons of this class into an order of what was called Tertiaries or Brethren of Penitence, who retained their social position and their customary employments in the world, while coming under general vows to abstain from worldly dissipations, such as the theatre, and otherwise to be scrupulous in all their conduct. Women were not admitted to this order without the consent of their husbands. Its members did not wear silk or other costly materials, but they had no special costume, and otherwise were at liberty. His conduct in this matter is sufficient to prove that, amidst all the apparently childlike enthusiasm of the saint, he possessed, as indeed cannot be doubted, no inconsiderable vein of shrewd discernment and of practical ability. This order was established in 1221.

Meanwhile Francis was unceasing in his personal labors. It is not easy to trace the chronology of his age or his adventures; but the same spirit of self-sacrifice, of burning ardor and spiritual industry, is everywhere conspicuous. He made long missionary journeys to Illyrica, to Spain, and even to the East, to preach to the Mahometans. He gained access to the sultan, it is said, and proclaimed to him the gospel of poverty. He was for some time in the Holy Land, and everywhere he gained multitudes of disciples. The atmosphere of miracle everywhere accompanied him, and his fame was spread throughout Christendom. Whatever we may think of many events of his life, and impossible as it is now to disentangle the legendary thread of the supernatural from its more credible texture, there are many traits of the saint's character which are in no sense doubtful, but show with a clear and life-like impress what sort of a man he was. He was passionately fond of all living things, and found his chief happiness in ministering to the needs of his fellow-creatures or the enjoyment of the lower creatures around him. His love for animals of all kinds was one of his most remarkable and winning features. Of the birds in the woods, the sheep in the fields, the ass on which he rode, the bees, the hares, the rabbits, he always spoke as his brothers and sisters. When the birds sang he said, "Our sisters, the birds, are pleasing God." A little rabbit ran to him for protection; it was received into his bosom, as one of his biographers, the famous general of the order Bonaventura, says, "as if it had some hidden sense of the perfection of the father's heart." The very wolves, which all men were afraid to encounter, were tamed by him, and came like lambs and crouched at his feet. So at least it is related in one memorable case in the legends of the "Fioretti di San Francesco" (the "Little Flowers of St. Francis,"—a collection of marvellous stories about the saint very popular in Italy to this day). There may be much in these stories that exceeds the limits of credibility; the amount of accurate fact lying beneath them can no longer be traced; but none can hesitate to believe the beautiful depth of love which they reveal in the character of St. Francis, and the fascination of personal influence which they show to have been possessed by him.

Connected with his love of nature and all living things was his poetry—for St. Francis was not only saint but poet. The stream of Italian song, so soon to swell into the full volume of Dante (1265–1321), began to flow in the rugged but touching verse of the great preacher of Assisi. In him the troubadour inspiration, dying out in its original seat, was transmuted into a spiritual minstrelsy—hardly poetry, so imperfect is its form, but a lyrical cry, as Ozanam says (in his volume *Les poëtes franciscains*, 1852), the first broken utterance of a new voice which was soon to fill the world. The most characteristic of his songs is a *Cantico delle Creature* (Song of the Creation), which has been translated in Mrs. Oliphant's interesting life of the saint.

Marvellous as is the life of St. Francis, the marvel that followed his death is more astonishing than any that marked his earthly career. It is said that when his naked body was visible after death, there were found upon it legibly impressed the marks of our Lord's passion; and the sacred story is that one day as he prayed in the solitude of Mount Averno, near the sources of the Tiber and the Arno, there appeared to him the vision as of a seraph with the arms extended and the feet as if fixed to a cross; and as he thought in his heart what the vision might mean, there were revealed on his hands and feet the signs of nails as in the Crucified One. This is well known as the famous miracle of the *Stigmata* or wounds of our Lord. There seems to be no doubt that some such marks were found on the dead body of the saint, whatever explanation the phenomena may admit of. That there was anything really supernatural in the phenomena will be so readily discredited by the modern reader that it is unnecessary we should attempt any elaborate solution of the marvel. An interesting analysis of all the facts, and such historical explanation as they seem to admit of, will be found in Hase's life of the saint, and an article, founded upon the analysis there given, in *Good Words* for 1867, p. 38 ("History of a Miracle"). St. Francis, worn out by his many labors and consuming zeal, died on 4th October, 1226.

"Of all saints," says Milman (*Hist. of Latin Christ.*, vol. iv. 268), "St. Francis was the most blameless and gentle. He was emphatically the saint of the people,—of a poetic people like the Italians." And to this day the name, the life, and the long-suffering of the popular saint live in the hearts of the poorer and devout Italians.

Of what may be called more or less original biographies of the saint there are in the well known *Acta Sanctorum* no fewer than three:—(1) The *Life* by Thomas of Celano (whose name is also associated with the composition of the famous *Dies Iræ*), written only three years after the saint's death; (2) the *Life of the Tres Socii*, three companions of the saint, written in 1247; and, lastly, (3) the *Life* by Bonaventura, Platonic schoolman and general of the order in 1263. The works of the saint have been collected and edited by Joh. de la Haye, *S. Francisci Opera*, 1739 *sq*. There is an elaborate biography by Malan, *Hist. de S. François d'Assisi*, 1841; and notices are also to be found in Helyot's *Hist. des Ordres Religieux*, t. vii., and Butler's *Lives of the Saints*. There are two recent lives, both of special interest, by the German divine, Hase, and by Mrs. Oliphant in Macmillan's Sunday Library series. See FRANCISCANS. (J. T.)

FRANCIS BORGIA, St. (1510–1572), duke of Gandia, and afterwards general of the Jesuit order, was the son of John, duke of Gandia, a scion of the well-known family of Borgia or Borja, to which Popes Calixtus III. and Alexander VI. had belonged, and of Joanna of Aragon, daughter of Alphonso, a natural son of Ferdinand the Catholic. He was born at Gandia (Valencia), on the 10th of October, 1510, and from his infancy was remarkable for his piety. Educated from his twelfth year at Saragossa under the charge of his uncle the archbishop, he had begun to show a strong inclination towards the monastic life, when his father, wishing to divert his thoughts elsewhere, sent him in 1528 to the court of Charles V. Here he soon distinguished himself greatly by his diligence and fidelity; and on his marriage with Eleanor de Castro, a Portuguese lady of high rank, he was created by the emperor Marquis of Lombay, and at the same time received the appointment of master of the horse to the empress. He accompanied Charles on his African expedition in 1535, and also into Provence in 1536; and on the death of the empress in 1539 he was deputed to convoy the body to the burial place in Granada. Circumstances connected with the funeral obsequies there deepened in his mind long-cherished impressions as to the vanity of all worldly things, and fixed his determination to leave the court betimes, and also, should he survive his consort, to embrace the monastic life. On his return to Toledo, however, new honors were thrust upon him, much against his will; he was made viceroy of Catalonia and commander of the order of St. James. At Barcelona, the seat of his government, he lived a life of great austerity, but discharged his official duties with energy and efficiency until 1543, when, having succeeded his father in the dukedom, he at length obtained permission to resign his viceroyalty, and to retire to a more congenial mode of life at Gandia. Having already held some correspondence with Loyola, he now encouraged the recently founded order of Jesuits to the utmost of his power. One of his first cares at Gandia was to build a college for them; and on the death of Eleanor in 1546, he resolved to become himself a member of their society. The difficulties arising from political and family circumstances were removed by a papal dispensation, which allowed him, in the interests of his young children, to retain his dignities and worldly possessions for four years after he should have taken the vows. In 1550 he visited Rome, where he was received with every mark of distinction, and where he furnished the means for building the Collegium Romanum. Returning to Spain in the following year, he, with the emperor's consent, formally resigned his rank and estate in favor of his eldest son, laid aside his ducal robes, assumed the Jesuit habit, was ordained as a priest, and entered upon a life of penance and prayer. At his own earnest request, in which he was seconded by Loyola, a proposal that he should be created a cardinal by Julius III. was departed from; and at the command of his superior he employed himself in the work of itinerant preaching. In 1554 he was appointed commissary-general of the order in Spain, Portugal, and the Indies, in which capacity he showed great activity, and was successful in founding many new and thriving colleges. In 1556, shortly after the retirement from public life of his old master Charles, Borgia had an interview with him. Charles, unfavorable to all innovation, and looking with distrust upon Jesuit pretensions, endeavored, it is said, to induce the commissary to transfer his allegiance to the older order of Jeronymites. This attempt, though unsuccessful, did not disturb the old relations of confidence and friendship between the two men, as was shown some time afterwards when Borgia was employed by Charles to conduct some delicate negotiations with reference to a project which was to secure for Don Carlos of Spain the succession to the Portuguese crown in the event of the death of his cousin Don Sebastian. On the death of Lainez in 1565, Francis Borgia was chosen to succeed him as third general of the Jesuits. In this capacity he showed great zeal and administrative skill; and so great was the progress of the society under his government that he has sometimes been called "its second founder." It is to be noticed, however, that the peculiarities which are understood to be most characteristic of the order have been derived from Loyola and Lainez rather than from Borgia, whose ideal was a pure and simple monasticism rather than a life of manifold and influential contact with the world. His death took place at Rome towards midnight on the 30th of September, 1572. He was beatified by Urban VIII. in 1624, and canonized by Clement X. in 1671, his festival being afterwards (1683) fixed by Innocent XI. for the 10th of October.

Several works by St. Francis Borgia have been published, the principal of these being a series of *Exercises* similar to the *Exercitia Spiritualia* of Loyola, and a treatise *Rhetorica Concionandi*. The *Opera Omnia* were published at Brussels in 1675. His life was written by his confessor Ribadeneira. See also Butler's *Lives of the Saints*, and the *Breviarium Romanum* (second nocturn for 10th October).

FRANCIS, St., of Paola (1416–1507), founder of the order of Minims (Ordo Minimorum Fratrum Eremitarum Fratris Francisci de Paula), was born of humble parentage at Paola in Calabria in the year 1416. His education appears to have made very little progress until he reached his thirteenth year, when, in accordance with a vow, he was taken by his father to the Franciscan convent of San Marco in Calabria. Here he learned to read, and distinguished himself by his austerities; but at the close of a probationary year he, for some reason that is not mentioned, left San Marco, and, after a pilgrimage to Assisi and Rome, retired to the neighborhood of his native town, where in a cave by the sea-shore he gave himself wholly to a hermit life, after the example of the great St. Francis, having no bed but the bare rock, and no other food than the herbs which he gathered in the neighboring wood, or which were sometimes brought to him by his friends. In the course of time he was joined by some others like-minded with himself, and the building of a chapel in 1436 is generally considered as marking the first beginning of the Minimite order. At that time, however, and for many years afterwards, they were mere "Eremites of St. Francis," and did not claim to be distinguished from other Franciscans unless by a stricter fidelity to the common principles of the order. In eighteen years the little community had increased so much in numbers and in popularity that, with the help of a friendly neighborhood, it was able to build a large church and monastery in 1454. In 1469, owing to reports which he had received, Pope Paul II. sent one of his chamberlains into Calabria to ascertain the actual condition of matters at Paola; the account brought back by him was highly favorable, and the result was that in 1474 the order of the Eremites was incorporated by a bull of Sixtus IV., and Francis appointed its first "corrector" or superior-general. In addition to the usual vows, there was a special rule, which pledged the members to the observance of a perpetual Lent. Several new convents were founded in Calabria and Sicily during the following years; and the fame of Francis for sanctity and miraculous powers increased daily. When Louis XI. of France was seized with his last illness, he despatched a special message to beg of the holy man that he would come and restore him to health. Not until he had been commanded by Pope Sixtus IV. could Francis overcome his reluctance to undertake so long a journey on so doubtful an errand; and on his arrival at Plessis-lès-Tours, in April, 1482, to the king's entreaties for his intervention to prolong his life he simply replied that the lives of kings had their appointed limits, that God's decree was unchangeable, and that for his Majesty nothing remained to be done but to resign himself to the divine will and prepare for death. At the request of Louis, Francis remained at Plessis; where he was treated with great respect by that sovereign, and also by his successor Charles VIII. In particular, the latter built two convents for the order, one near Plessis and another at Amboise; and on his triumphant arrival in Rome in 1495, he caused a third to be erected there. In 1501–2 a new and stricter constitution was granted to the order by Alexander VI., who at the same time conceded all the privileges and immunities enjoyed by the other mendicant orders, and bestowed, at the urgent request of Francis, the distinctive name of Minimi, which has ever since been retained. At the same time a lay order of Tertiaries was sanctioned, under a special rule. In 1506 the fourth vow (to observe a perpetual Lent) was made more definite and stringent in its character by Julius II. The death of Francis took place in his ninety-first year, at Plessis, on the 2d of April, 1507. He was canonized by Leo X. in 1519,—his day in the calendar being April 2 (Duplex).

A graphic incidental notice of Francis occurs in the *Memoirs* of Philip de Comines (b. vi. c. 7), who says, "I never saw any man living so holy, nor out of whose mouth the Holy Ghost did more manifestly speak." A brief sketch of his life occurs in the *Breviarium Romanum;* and his miracles and prophecies are related at considerable length by the Bollandists. Reference may also be made to Butler's *Lives of the Saints*. The order of Minims, called also Les Bons Hommes in France, Los Padres de la Vitoria in Spain, and Paulaner or Pauliner in Germany, never attained to any great prominence by the side of the great societies of Dominic and Francis of Assisi. Their cloisters never exceeded 450, and at present are very much fewer. The principal establishment is in Rome.

FRANCIS, St., of Sales (1567–1622), bishop of Geneva, and a well-known devotional writer of the Roman Catholic Church, was born at the Château de Sales, near Annecy in Savoy, in 1567. His father, known as M. de Boisy, was a Savoyard, seigneur, soldier, and diplomatist; his mother was also of a noble family and an heiress, the title De Boisy being derived from one of her hereditary possessions. Francis was their eldest son, born six years after marriage, and the child of many prayers. He received his education first at Annecy, then at the Jesuit College de Clermont in Paris, and for some time it seemed uncertain whether he should devote himself to law or the church. He studied jurisprudence, after leaving Paris, at Padua, became an advocate of the senate of Savoy, and seemed likely to gratify his father's cherished ambition for his future career. But all the while Francis's own inclinations were strongly towards the church. He had received the tonsure as early as 1578, while still a boy at Annecy, very much against his father's wishes, and the spirit shown in this early manifestation of pious self-devotion never forsook him. Notwithstanding all his father's remonstrances, he resolved to enter an ecclesiastical life; and, the office of provost or dean of Geneva becoming vacant, the dignity of this office, which was offered to him, was used as a temptation to secure the father's consent. At length M. de Boisy gave way. Francis received holy orders (1593), and entered upon his duties as dean and preacher. He possessed great gifts as a preacher, and his fame soon spread through Savoy. His sermons were marked by great simplicity and persuasiveness. "The only real point of preaching," he said, "is the overthrow of sin and the increase of righteousness;" and the principle of this saying guided him in all his sermons. He preached constantly, and in the simplest and most touching and popular words he could find. His father failed to appreciate his style of preaching, as he had failed to understand his self-denial. "I never refused to preach," Francis tells us, "on the principle of 'give to them that ask you.' My dear father used to hear the bells ringing, and asked who preached. 'Who but your son,' was often the answer. One day he took me aside and said, 'Provost, you preach too often; even on week days the bells go, and it is always the same story, the provost, the provost! It used not to be so in my day. Sermons were much rarer. But then, to be sure, God knows those were something like sermons—full of learning, well got up, more Latin and Greek in one than you stick into a dozen.'" Francis, however, knew his own mind, and was not moved. "My test of the worth of a preacher," he said, "is when his congregation go away saying not 'what a beautiful sermon,' but 'I will do something.'" A man may set forth his own learning and eloquence in a fine sermon, but the true sign of success is when his words induce people to leave off bad habits. And as he preached often, he preached briefly. "The more you say, the less people remember; the fewer your words, the greater their profit," was his motto. "When a sermon is too long, the end makes one forget the middle and the middle the beginning."

Francis was plainly a man of some originality both of mind and character, and destined to become a power in the church to which he had so passionately devoted himself. Accordingly he soon became marked out for arduous work. Savoy was at this time greatly invaded by Calvinistic "heresies." The neighborhood of Geneva—a focus for the dissemination of Protestantism—and the political and military complications arising out of the hostile relations of the duke of Savoy and the king of France, all tended to the progress of Calvinism. Chablais had been invaded, and Protestant ministers long established at Thonon and other towns. For nearly sixty years in fact this region had been Protestant, and the people by express stipulation enjoyed the exercise of the Reformed religion. A missionary of apostolic fervor and courage was required to recover the lapsed district to the Catholic faith, and all eyes were turned to the young provost of Geneva as the only man fitted to grapple with the exigences of the position. His father as usual was the obstacle. He entreated his son not to expose himself to the dangers of such a mission, but Francis felt the call within him, and calmly replied, "I cannot refuse to obey, 'Wist ye not that I must be about my Father's business?'" The result was that he gave himself for four years (1594–1598) to laborious and self-denying work in the district, often, it is said by his flattering biographers, preaching and administering the offices of his church at the peril of his life. His persuasive eloquence and the apostolic simplicity of his life were at first unsuccessful. The inhabitants of Chablais remained hardened in Protestantism. But more violent measures, some of them reflecting little honor on Francis, at length succeeded in reclaiming the district to the Catholic faith. His success in this work led the pope to believe that he might gain over Calvin's celebrated successor, Theodore Beza; and lengthened conferences were held between the Protestant teacher and the Roman Catholic missionary, but without result. In 1598 Francis was appointed coadjutor bishop of Geneva, and became the official companion, as he had long been the warm friend, of Claude de Garnier, the aged bishop who had fostered his talents and largely shaped his career. Some years after this, in 1602, he spent some time in France and especially in Paris, where his preaching attracted great crowds, and his influence was felt from the court of Henry IV. to the poor sisters at Port Royal. Before St. Cyran became the spiritual leader of Angelique Arnaud and other of the devoted band which gathered around him, Francis had given a definite direction to her thoughts and aspirations. It is not the name of Angelique Arnaud, however, but that of another celebrated pietist, who was destined to be associated with Francis de Sales. Shortly after his succession to the bishopric by the death of his aged friend, he met at Dijon Madame de Chantal, a character of rare enthusiasm and devotion, whose spirit had been greatly chastened by the loss of her husband and child. She put herself under his direction, cut off her beautiful hair, and clothed herself as a religieuse. Her good works were incessant, and she became known as the "Sainte de Monthélon." At length Francis prepared a mission for her. Submitting her saintly obedience to various tests, he intimated his decision that she was destined to establish an order for the relief of the sick and the poor, the only rules for which were to be "charity and the love of Jesus Christ." The order was not fully established till 1610, but gradually acquired great influence. The relation of the saint to Madame de Chantal and other devout ladies has been much canvassed. There was a good deal of spiritual coquetry in it, and some of his letters to them contain doubtful sentiments; but there is no reason to doubt the purity of his character, and that his main object was to promote what he considered to be the interests of religion. He liked to be "surrounded by women," but chiefly that he might influence them for the good of the church. In 1608 Francis published his best known and most valuable work, the *Introduction à la Vie Dévote*, the circulation of which was immense. He became famous through all the Catholic world. Henry IV. sought to tempt him by a French bishopric; but he remained true to the country of his birth, and the comparatively quiet and unambitious life he was able to continue there. Loving, as all men of his temperament and religious attractiveness more or less do, to impress the force of his mind and character upon others, he yet seems to have been honestly free from vulgar ambition. He was a true priest, and found ample gratification in the diffusion of the spiritual charm and potency which radiated from his character and writings. His apparent simplicity was one of the most powerful elements of the wide influence which he exerted. Both as a preacher and as a writer a certain overweening "sweetness" may be said to be his marked characteristic,—a sweetness at times not without duplicity and a taint of cold-blooded fanaticism. Possessing singular graces of character, he was yet above all things an ecclesiastic, and had few scruples in serving the interests of his order and church. Superior to the coarser aspirations and the more commonplace ambitions of his time, he was yet often a subtle politician in the guise of a saint; and if his animating aim was to rule hearts rather than possess for himself a great position, the means by which he sought to do so were in many cases more adroit than magnanimous. He died in the end of 1622, and was canonized in 1665.

In addition to the *Introduction à la Vie Dévote* already mentioned, which has been translated into all languages, St. Francis de Sales published other works, especially a *Traité de l'Amour de Dieu*. His complete works were published in 17 vols. in 1835. There are elaborate lives of St. Francis in French by the Abbé Marsollier and Loyau d'Amboise. There is also an interesting but rather highly colored life of the saint (Sears's *Christian Biographies*, 1877) by the writer of the lives of Bossuet and Fénelon, who has likewise translated his *Spiritual Letters*. (J. T.)

FRANCIS, Sir Philip (1740–1818), a conspicuous Whig politician and, even apart from his supposed connection with the *Letters of Junius*, a powerful pamphleteer, was born in Dublin on the 22d of October, 1740. He was the only son of Dr. Philip Francis, a man of some literary celebrity in his time, who is still known by his translations of Horace, Æschines, and Demosthenes. He received the first rudiments of an excellent education at a free school in Dublin, and afterwards spent a year or two (1751–2) under his father's roof at Skeyton rectory, Norfolk, with Edward Gibbon as a fellow-pupil. In March, 1753, he entered St. Paul's school, London, where he remained for three years and a half, and became head boy. Here Henry Sampson Woodfall and Philip Rosenhagen were for some time his companions. In 1756, immediately on his leaving school, he was appointed to a junior clerkship in the secretary of state's office by Mr. Henry Fox (afterwards Lord Holland), with whose family Dr. Francis was at that time on intimate terms; and this post he retained under the succeeding administration. In 1758 he was employed as secretary to General Bligh in the expedition against Cherbourg; and in the same capacity he accompanied the earl of Kinnoul on his special embassy to the court of Portugal in 1760. In 1761 he became personally known to Pitt, who, recognizing his ability and discretion, once and again made use of his services as private amanuensis. In 1762 he was appointed to a principal clerkship in the war office, and in the same year he married Miss Macrabie, the daughter of a retired London merchant. The union was not approved by his father and led to some estrangement; but it does not appear to have been on the whole unhappy. The ten years which followed are very obscure, and a long-continued and close scrutiny by numerous and skilful investigators has led to few definite results, beyond the certain conclusion that the events of this period in the life of Francis must have been such as to have wielded a singularly commanding influence over all his subsequent conduct and career. Comparatively humble in position, and somewhat straitened in means, he had few opportunities of mingling familiarly in the society of the great; but his official duties brought him into direct relations with many who were well versed in the politics of the time, while he all along enjoyed a peculiar intimacy with Calcraft, the rich army agent, who has been described as having been Chatham's "wire-puller and political agent as well as informant." Public events of great interest took place during these years. It was in 1763, for example, that the great constitutional questions arising out of the arrest of Wilkes began to be so sharply canvassed. It was natural that Francis, who from a very early age had been in the habit of writing occasionally to the newspapers, should be eager to take an active part in the discussion, though his position as a Government official made it necessary that his intervention should be carefully disguised. He is known to have written to the *Public Ledger* and *Public Advertiser*, as an advocate of the popular cause on many occasions about and after the year 1763;[1] he frequently attended debates in both Houses of Parliament, especially when American questions were being discussed; and between 1769 and 1771 he is also known to have been favorable to the scheme in which Calcraft and others were engaged for the overturn of the Grafton Government and afterwards of that of Lord North, and for persuading or forcing Lord Chatham into power. In January, 1769, the first of the *Letters of Junius* appeared, and the series was continued till January 21, 1772. They had been preceded by others under various signatures, which, however, are all attributed to one and the same hand. The authorship of these letters has been assigned to Francis on a variety of grounds; but it must be said that the evidence is still only of the circumstantial kind, and far from conclusive (see JUNIUS). It ought to be mentioned here that, so far as can be ascertained, no one of his intimate friends suspected him at the time to be Junius, and also that he himself in after life energetically denied the charge. There was, however, it must be added, every motive for concealment on his part, both at the time and afterwards, if he was indeed the writer of the *Letters*.

In January, 1772, the office of deputy secretary in the war office became vacant, and the post was offered by Lord Barrington to Francis, who declined it. By a curious coincidence the last letter of Junius appeared on the very day in which Anthony Chamier was gazetted deputy secretary (January 21st). Two months afterwards Francis finally left the war office. "It is my own act," he wrote to an intimate friend. "Be not alarmed for me. Everything is secure and as it should be!" In July of the same year he left England for a tour through France, Germany, and Italy, which lasted until the following December. On his return he was, according to an autobiographical fragment which has been preserved, contemplating emigration to New England, when, in June, 1773, Lord North, on the recommendation of Lord Barrington, appointed him a member of the newly constituted supreme council of Bengal, at a salary of £10,000 per annum. Along with his colleagues Monson and Clavering he reached Calcutta in October, 1774, and a long struggle with Warren Hastings immediately began. That struggle passed through three phases, during the first of which, until the death of Monson in 1776, Francis had the majority of votes in the council; afterwards, until the arrival of Wheler in December, 1777, he was continually overborne; while, during the remaining three years, forces were more evenly balanced, Hastings having on the whole the preponderance. A dispute, more than usually embittered, led in August, 1780, to a minute being delivered to the council board by Hastings, in which he stated that "he judged of the public conduct of Mr. Francis by his experience of his private, which he had found to be void of truth and honor." A duel was the consequence, in which Francis received a dangerous wound. Though his recovery was rapid and complete, he did not choose to prolong his stay abroad. He arrived in England in October, 1781, and was received with little favor. Little is known of the nature of his occupations during the next two years, except that he was untiring in his efforts to procure first the recall and afterwards the impeachment of his hitherto triumphant adversary. It may be mentioned, as a curious coincidence at least, if nothing more, that the "bookseller's edition" of *Junius*, described on the title page as more complete than any yet published, appeared in 1783. In the same year Fox produced his India Bill, which led to the overthrow of the coalition Government. In the general election of April, 1784, Francis was returned by the borough of Yarmouth, Isle of Wight, and his first appearance in the house was made in the following July, when the financial affairs of the East India Company were under discussion. On this occasion he took an opportunity to disclaim every feeling of personal animosity towards Hastings. This did not prevent him, however, on the return of the latter, in 1785, from doing all in his power to bring forward and support the charges which ultimately led to the impeachment resolutions of 1787. Although excluded by a majority of the House from the list of the managers of that impeachment, Francis was none the less its most energetic promoter, supplying his friends Burke and Sheridan with all the materials for their eloquent orations and burning invectives. At the general election of 1790 he was returned a member for Bletchingley. In common with all English politicians he found his attention very strongly called to the events which were then occurring in France; his sympathies were strongly with the revolutionary party, and he opposed in parliament all the measures of the Government against reformers and Jacobins at home. In 1793 he supported Mr. (afterwards Lord) Grey's motion for a return to the old constitutional system of representation, and so earned the title to be regarded as one of the earliest promoters of the cause of parliamentary reform. He rendered further services to the same cause by repeated vindications of the Society of the Friends of the People in the days of its unpopularity. The acquittal of Hastings in April, 1795, again disappointed Francis of the governor-generalship, and in 1798 he had to submit to the additional mortification of a defeat in the general election. He was once more successful, however, in 1802, when he sat for Appleby, and it seemed as if the great ambitions of his life were about to be realized when the Whig party came into power into 1806. His disappointment was great when the governor-generalship was, owing to party exigences, conferred on Sir Gilbert Elliot (Lord Minto); he declined, it is said, soon afterwards the government of the Cape, but accepted a knight companionship of the order of the Bath. Though re-elected for Appleby in 1806, he failed to secure a seat in the following year; and the remainder of his life was spent in comparative privacy. In 1814 he married his second wife, Miss Emma Watkins, who long survived him, and who has left voluminous manuscripts relating to his biography. He died on the 23d of December, 1818.

Among the later productions of his pen were, besides the *Plan of a Reform in the Election of the House of Commons*, a pamphlet entitled *Reflections on the Abundance of Paper in Circulation and the Scarcity of Specie* (1810), and a *Letter to Earl Grey on the Policy of Great Britain and the Allies towards Norway* (1814). His *Memoirs, with Correspondence and Journals*, commenced by the late Joseph Parkes, and completed and edited by Mr. Herman Merivale, were published in two volumes in 1867. They help the reader to form a tolerably vivid conception of the man, and show that in his domestic relations he was exemplary, and that he lived on terms of mutual affection with a wide circle of friends. They indicate at the same time, however, that he was far from incapable of vindictiveness, dissimulation, and treachery. His biographers are firmly convinced of his identity with Junius, and bring a great body of circumstantial proof in support of their belief.

FRANCISCANS. The Franciscan orders include the three orders of the Minorites, and all the less important associations who trace their rule to Francis of Assisi. The three orders of the Minorites, or Franciscans proper, include (1) the Minorite friars, properly so-called, under a succession of generals of the whole order from the foundation; (2) the order of the Poor Ladies or Poor Clares—the Franciscan nuns; (3) the order of Penitent Men and Women, which includes (*a*) all those who dwell in

---

[1] A letter in the *Public Ledger* (March, 1763) signed "One of the People," in which the popular cause is supported in a contest that had arisen between the public and the proprietors of Drury Lane and Covent Garden theatres, is among the earliest known productions of his pen. There is strong evidence that he was the author of the "Candor" pamphlet (September, 1764), in which the verdicts obtained by the Government against the printers of the *North Briton* for libel in "No. 45" are condemned. With regard to the "Anti-Sejanus" letters (January and February, 1766), written in condemnation of the American policy of the Rockingham ministry, Parkes affirms that "the most sceptical cannot doubt that they emanated from his pen;" but Merivale brings evidence to show that, if so, he must at least have had colleagues in writing them. The communication in the *Public Advertiser* (June, 1768), signed "A Friend to Public Credit," is undoubtedly attributable to him. There is some likelihood also that sundry letters to the *North Briton* and other periodicals (1768-70), copies of which have been found among his papers corrected and punctuated by himself, may have been his contributions.

Franciscan cloisters and keep the third rule, (*b*) those who live in cloisters of their own, keeping the third rule, and (*c*) the Tertiaries properly so-called. All these three orders of Friars, Nuns, and Tertiaries are more or less under the jurisdiction of the general-minister of the Francisan order.

I. The Minorite friars, or the first order, are divided into two "families," Cismontana, or convents in Italy, Germany, Hungary, Poland, Syria, and Palestine, and Ultramontana, or convents in France, Spain, the Low Countries, Saxony, the Islands of the Mediterranean, Africa, Asia, and the Indies—the one ruled directly by the minister-general, and the other by a commissary-general. Each family is divided into provinces ruled over by a provincial. The Cismontane has sixty-six provinces, and the Ultramontane has eighty-one. A province is the union of a certain number of convents under a chief directly responsible to the minister-general. Besides provinces the order originally contained *vicarates* and *custodia*. The vicarates were a number of convents united together, but too few to be counted a province. The custodia were at first subdivisions of provinces, but since Leo X. the custodia are like the old vicarates, and are governed by a vicar or custos directly responsible to the minister-general. The convents of the order *in partibus infidelium* are governed by prefects. The minister-general is chosen in full chapter for a term of six years, and if he dies or removes to a higher office during his term, the "discreet perpetual fathers" choose a deputy for the remainder of the term. The minister-general is chosen from the two families alternately, and the chapter at the same time elects a commissary-general for the other family.

The rule originally prescribed by St. Francis was very strict, and, rigidly enforced, would have made all the members of the order pious beggars. This was the founder's idea, but when the order became popular it was found that few of its members could act up to its requirements; and even in the life-time of the founder attempts were made to relax them. The relaxations sanctioned by the decrees of popes and by general usage were repeatedly fought against by small but zealous minorities, and these struggles gave rise to various divisions in the order. Since the time of Leo X. and his union bull these divisions have been reduced to three,—the Observants, the Conventuals, and the Capuchins,—all of whom belong to the first order of the Franciscans; and they are the survivals of a much more numerous division. The Observants are supposed to keep the rule of Francis with some strictness, and they take the first rank among the Franciscans; their minister-general has pre-eminence. The Conventuals follow the rule of Francis with certain relaxations permitted by successive popes. Their general has to be confirmed by the great minister-general, but otherwise they are independent. Since 1528 the Capuchins have had an independent general under the minister-general.

1. *The Observants.*—The relaxation of the rule of Francis and attempts at reformation to the original simplicity and strictness date from the time of Elias, successor as minister-general to Francis himself. Some of these reforms were unsuccessful, and only resulted in small schisms condemned by the general and by the pope; others were successful, and resulted in the formation of separate congregations more or less independent, until they were all abolished or rather brought together under one rule by Leo X. The *Cæsarins* were the followers of Cæsarinus of Spires, who revolted against the relaxations and innovations of Elias. After varying fortunes the reformers were punished as rebels. They gradually returned to the ranks of the order, and ceased to exist separately in 1256. The *Celestines* were the followers of Peter of Macerata, who called himself Liberatus, and Peter of Fossombrone, called Angelus, from his frequent fellowship with angels. They taught and professed a life of the strictest poverty and solitude, and were permitted to live separately from the rest of the order by Pope Celestine V. in 1294. The permission was recalled by later popes, and after many struggles the Celestine hermits were reckoned schismatics and heretics (see CELESTINES). From them came the Fratricelli (see FRATRICELLI). The *Congregation of Narbonne*, the Spirituales, were mainly followers of Peter John de Oliva. They were really a branch of the Celestines settled at Narbonne; but their special grievances were that their laxer brethren did not wear the clothes prescribed by Francis,—their robes were too long and too rich, and their hoods too large,—and that they accepted presents of wine and corn during the vintage and harvest. After some struggles they forced on a controversy in 1282, and were finally condemned by John XXII. at Vienna in 1312. They refused to submit, and were pronounced schismatic in 1318. The *Clarenins* were a revival, in 1302, of the Celestine hermits under Angelus of Cordova. They fought for recognition and existence down to 1581. The *Congregation of Philip of Majorca* arose in 1308. They were refused recognition, but struggled on only to disappear among the fanatical schismatics of the period. The reform of John of Vallées and Gentilis of Spoleto was occasioned by a further relaxation of the rule in 1336, sanctioned by Pope Benedict XII. Their fight for existence lasted almost forty years.

These six attempts to return to the original rule of St. Francis, and to follow in the letter and spirit his principles of a religious life, were all unsuccessful. The historians of the order ascribe the failures to the rashness of the reformers or their followers, but the real cause was the utter incompatibility of the rule of Francis with social life in any form. Any thorough-going return to the primitive rule was impossible, but many partial reforms were attempted. The aim of each reformer was to reconstruct the society, or at least to found a small society, which would be so independent of the rules and officials of the Franciscan order as to be free from interference with their endeavors to obey the rule of Francis in their own way. Some of these reforms achieved a very considerable degree of independence, and lasted for a long time. They were all, nominally at least, brought under the common government of the order by the famous union bull of Pope Leo X. Of these reforms the most important are the following:—

The Soccolantes (named from wearing a wooden sandal), were founded by Paul of Foligny in 1368, noted from his fourteenth year for his enthusiastic piety. This is the most important, because it started with the principles of the earlier unsuccessful reforms, and succeeded because it professed unconditional submission to the pope. Paul and his companions showed all the idiosyncrasies of Francis: their cells were full of frogs, and their beds of serpents; they rejoiced in ill health, and nausea at the sight of food was esteemed a sign of the complete mortification of the body. They obtained permission, and retained it against many attempts at deprivation, to live in independence of the ordinary officials of the order. Their reform became successful and spread, and when Leo X. issued his bull of union they were sufficiently numerous to impose their name (*Observantes*) on one of the great divisions of the reorganized order. At the first they held disputations with the Fratricelli and Beghards regarding the principles of Francis, for these heretics with great justice declared that they were more true to the Christian ideal of Francis than the professed followers of the saint. The only argument the Observants could adduce against their opponents was that Francis had made unconditional submission to the pope part of his ideal.

The congregation of Villacrezes was founded by Peter of Villacrezes, in the convent of Our Lady of Salceda in Castile, about 1390,. His principles were very like those of Paul of Foligny, but were even more strictly enforced. The brethren were obliged to wear the scantiest and coarsest raiment, and to content themselves with the barest necessaries of life. The independence of the congregation was finally secured at the council of Constance. (*Cf.* Mendoza, *Hist. del Monte Celia de nuestra Señora de la Salceda.*)

The Congregation of Collette, from the nun Collette, is noticed below.

The congregation founded by Amadeus of Assisi obtained independence in 1469 and 1471; it was never very strong, labored under suspicion of heresy, refused to submit to the bull of Leo X., and was finally suppressed by Pius V.

The congregation of Philip Berbegal took its rise from attempts of Martin V. to reform the order in 1430. Nominally suppressed in 1433, it reappeared under another name (the Neutrals), obtained recognition, but was finally suppressed in 1463.

The Caperolani, or followers of Peter Caperole, were for a short time independent, and then were reunited with the Observants. Two famous preachers, Anthony of Castel St. Jean and Matthew of Tivoli, held out and gathered around them a new congregation, which for long refused to submit itself to the order.

More important, however, than any of these reforms, save the first, were the series of national reformatory movements within the order, which produced in Spain the Bare-footed Friars under the leadership of John of Guadaloupe, in Italy the Riformati led by Stephen Molina, and in France the Récollets. These congregations arose to embody the reforms suggested by John of Puebla, and survived Leo's bull of union. Lapse of time brought relaxations, and these led again to a reaction which produced the reform of Peter of Alcantara, who named his fellows The Brethren of the Strictest Observance. Peter obtained a species of independence for his convents. They were under the rule of the general of the order, but not of the provincials. From this congregation arose a further reform under John of Paschase and Jerome of Lanza, which, after some years of independent life, reunited with the congregation of Peter of Alcantara.

Most of these reforms were brought together by the bull of Leo X., and are merged under the general name of Observants.

2. The *Conventuals* included, at the time of Leo X., all the Franciscans who kept the rule in a relaxed form, and had not been influenced by the various attempts at reformation. They claimed to be *the* Franciscan order, and in fact at the time were so. Now they are only one of the great divisions of the order. An attempt was made after the council of Trent to reform the Conventuals, and a congregation of Reformed Conventuals was founded, but it did not exist very long.

3. The *Capuchins* exist as an independent congregation, and do not take rank with the Observants and Conventuals. They owe their origin to Matthew of Bassi, a Franciscan of the family of Observance, who had conscientious scruples about the shape of his hood or capuce. It was revealed to him in visions that St. Francis had worn a long pointed hood, and he began to wear one of the revealed pattern. Others began to copy it. They were persecuted by their fellows, strove for freedom, and at length got it. In 1536 Paul III. formally recognized them under the title of Capuchins of the order of the Minorites, but ordained that their vicar-general or chief was to be confirmed by the general of the Conventuals, and that they were to march under the cross of the Conventual Minorites in religious processions. In 1619 Paul V. removed these restrictions. They now have their own cross and choose their own chief quite independently, and he is called general, not vicar-general. See CAPUCHINS.

II. The Franciscan nuns owed their origin to Clara, a noble maiden of Assisi. Born in 1193, she left her home in 1212, fled to the Portiuncula to Francis, and refused to return. The same year she gathered a company of ladies, including her three younger sisters, and founded the order of Franciscan nuns. The order spread rapidly through Italy, France, Spain, Germany, and Bohemia. In 1220 Cardinal Hugolin gave them a rule of life taken from the rule for the strictest sect of the Benedictine nuns, with some special observances. Four years later Francis gave them a written rule, which was approved of by Gregory IX. and by Innocent IV.

The rule of Hugolin compelled the nuns among other things to fast every day, to abstain at all seasons on Wednesdays and Fridays from wine and soup, and to content themselves on those days with some fruits or raw herbs, to fast also on bread and water thrice a week during Lent and twice during Advent. They were also to keep perpetual silence, to be broken only by the permission of the superior. They were to wear two tunics, a mantle and scapulary, besides a hair shirt. The rule of Francis was not so strict; he did not oblige them to fast on bread and water during certain seasons, and there were other relaxations. These two rules gave rise to disputes and divisions, and Pope Urban IV. gave the sisters a third rule which was less strict than either. The result was that several convents adhered to the first and strictest rule; that of the reform of Collette, a French sister, adhered to the second rule, that of Francis; while the large proportion of the nuns followed the new rule of Urban.

The Capuchin movement within the Franciscan order also affected the Minorite nuns, and the Capuchin nuns soon became a large and prosperous community. The only other important reform was that set in motion by Peter of Alcantara. The sisters who followed him are called the Poor Clares of the Strictest Observance. They take the vow of perpetual silence.

III. The Tertiaries consist of lay brethren and sisters in the Franciscan monasteries, confraternities who keep the third rule of St. Francis, and men and women living in society who have taken the third rule. The Tertiaries of the begging monks have become so famous that many are disposed to trace their origin to Francis and Dominic, but the class of penitents existed in connection with other and older orders. The third rule was intended to suit the requirements of all those who wished to live a higher religious life, and who could not from their circumstances embrace the monastic life. It is said that the origin of the Franciscan Tertiaries dates from Francis preaching at Canari, a small town near Assisi, where the whole population wished *en masse* to enter the Franciscan order and desert their life and duties in society. Francis refused to permit this, but to assist them framed a third rule to serve as a religious guide. Its provisions resemble the rules commonly found in pious books with which the present ritualistic movement has made us familiar, and the associations of Tertiaries may be compared with the guilds now found in connection with many High Church congregations. These Tertiaries believed that they were imitating not Christ but his early disciples; they had to spend some time in novitiate, and then vowed obedience to the third rule, which enjoined that they were to wear poor clothing of an unobtrusive color, without worldly ornament of any kind. It forbade them to bear arms save for the defence of the church or their country. It prohibited attendance at fêtes, balls, dancing parties, and the theatre. It forbade meat on Monday, Wednesday, Friday, and Saturday. It enjoined fasting at Lent and Advent, and at other times only two meals a day. The hours of devotion and the devotional exercises were prescribed. Tertiaries were bound to attend mass and preaching at least once a month, to go to confession and holy communion at least thrice a year, and to attend the funerals of their fellows. This third order was very successful, but it is worth noticing that the common people, after the first burst of enthusiasm, seemed unable to distinguish the Tertiaries from the Fratricelli and Beghards, who professed a somewhat similar mode of life, and had been condemned by various popes.

At some period of their existence, when it is difficult to say, many of the Tertiaries began to practise the monastic life, and to take the vow of chastity in addition to the third rule. Convents of the third rule were in existence in the 15th century, and in 1433 brethren living under this rule were permitted to choose a general. The earlier bulls permitting such confraternities were at first generally addressed to penitents living in particular countries, and the divisions of the brethren take generally a local name. There were, for example, the religious penitents of the third order of St. Francis of the regular observance in Italy, in Sicily, Dalmatia, and Istria, and in the Low Countries; these three were united in the congregation of Lombardy. There were besides the congregations of Germany, Spain, Portugal, and France. Congregations were also formed to observe the rule with complete and literal strictness. The Tertiaries included women as well as men, and these also began to take a special vow of chastity and live in cloisters. One branch of these includes the lay sisters in the ordinary convents of the Poor Clares, who devote themselves to menial work. Their foundress was Elizabeth of Hungary. Another branch was founded by Angeline of Corbaro, and has convents of its own. There are also the Gray Sisters, the Recollectines, and several other congregations, who live in cloisters under regular government, but practise the third and not the second rule. From the beginning of the movement the Tertiaries were charged to take special care of the poor, the sick, and the aged; and several confraternities, both of men and of women, have been formed, who live under the third rule, and devote themselves to hospital work.

Besides these three orders of Friars, Nuns, and Tertiaries, the Franciscans may also be said to include one or two orders of minor importance which trace their origin to Francis,—such, for example, as the Chevaliers of the Order of the Immaculate Conception of the Blessed Virgin, and the Archiconfraternity of the Stigmata of St. Francis, but they are of minor importance.

The Franciscan soon became one of the most important of the mediæval monastic orders. It had a peculiar character, and attracted minds of the sympathetic mystical cast. This led to its curious connection with many of the mediæval heretical sects. The Franciscan theology was also peculiar. It had the same Pelagian characteristics that distinguish the modern Jesuit theology, which has done little more than develop the Franciscan ideas on the immaculate conception, the doctrines of freedom and grace, etc. During the Middle Ages, the Franciscans, however, furnished many strong opponents to the papal theology and ecclesiastical claims. The order has produced a long array of distinguished theologians and churchmen,—Bonaventura, Alexander of Hales, John Duns Scotus, and William of Occam were all Franciscans. Wadding, the great historian of the Franciscans, has filled a folio volume with names of distinguished members of the order.

FRANCISQUE. Jean François Millet (*c.* 1644–1680), commonly called Francisque, was born at Antwerp about 1644, and is generally classed amongst the painters of Flanders on account of the accident of his birth. But his father was a Frenchman, a turner in ivory of Dijon, who took service with the prince of Condé, and probably returned after a time to his native country. He remained long enough in Antwerp to apprentice his son to an obscure member of a painter family called Laurent, pupil of Gabriel Franck. With Laurent Franck Francisque left Antwerp for Paris, and there settled after marrying his master's daughter. He was received a member of the Academy of Painting at Paris in 1673, and after gaining consideration as an imitator of the Poussins he died in 1680, bequeathing his art and some of his talents to one of his sons. Francisque probably knew, as well as imitated, Nicolas Poussin, Gaspar Dughet, and Sebastian Bourdon; and it is doubtless because of his acquaintance with these travelled artists that, being himself without familiarity with the classic lands of Italy and Greece, he was able to imagine and reproduce Italian and Arcadian scenery with considerable grace and effectiveness. It is indeed surprising to observe, even at this day, how skilfully he executed these imaginary subjects, enlivened them with appropriate figures, and shed over them the glow of a warm yet fresh and sparkling tone. Unhappily time has been unkind to Francisque. Twelve of his most important landscapes, which remained in the palace of the Tuileries, were destroyed by fire quite recently; and though many of his pieces may still be found catalogued in Continental and English collections, others in great number remain unknown and unacknowledged. In England there are specimens of Francisque in the galleries of the duke of Devonshire, and Earls Dudley and Suffolk. Abroad, most of his known works are in public museums. It often happens that his name is appended to pictures by Jean François, his son.

Jean François Millet, the younger, was born in Paris, and was made a member of the Academy of Painting at Paris in 1709. He died in 1773. He is not quite so independent in his art as his father; but he had clever friends, and when he wanted figures to his landscapes, he consulted Watteau, and other followers of the "court shepherdess" school. But on the whole Jean François the younger's work is often lost in that of his father, and it is difficult to point to any picture by him except that in the museum of Grenoble, which is prettily adorned with Watteau's figures.

FRANCK. The name of Franck has been given indiscriminately but improperly to painters of the school of Antwerp who belong to the families of Francken and Vranex (see Francken and Vranex). One artist truly entitled to be called Franck is Gabriel, who entered the guild of Antwerp in 1605, became its president in 1636, and died in 1639. Gabriel Franck formed a great number of pupils, amongst whom we notice Abraham Genoels the elder, and Laurent Franck, the master of Francisque. But none of his works are now to be traced.

FRANCK or FRANK, Sebastian (*c.* 1500–1543), not unfrequently called by the Latinized form of his name *Francus*, an important German writer of the Reformation period, was born about 1500 at Donauworth, and regularly styled himself Franck of Wörd. Of his early years nothing is known except by inference. It appears that he studied at Heidelberg, and about 1524 was ordained a Roman Catholic priest. In 1528 he married Ottilia Behaim at Nuremberg; and the same year he produced his German translation of Althamer's *Diallage, or Reconciliation of the Contradictions of the Scriptures*, and wrote a treatise against the *Horrible Vice of Drunkenness.* Two years later appeared, with an introduction by Luther, his translation of a *Chronicle and Description of Turkey, written by a Transylvanian who had been Twenty-two Years in Turkish Captivity.* In 1531 he was in Strasburg, and published his *Chronika, Zeitbuch, und Geschichtbibel*, one of the first German works in which an attempt was made to give a survey of universal history. From Strasburg he removed to Esslingen; and there during 1532 and 1533 he attempted to support himself by soap-boiling, but found it on the whole an unprofitable occupation. In hope of a better market for his wares he went to Ulm, where in 1534 he received the freedom of the city. For some time he remained peacefully printing his books, but on the publication of his *Parodoxa* his privileges were withdrawn, and he was ordered to depart. A promise to submit his writings to censure procured a temporary reprieve of the sentence. but in 1539 he was finally banished, and from that time he appears never to have settled long in one place. He was engaged as a printer and publisher at Basel when he died, in 1543 or 1545. Besides the works already mentioned, he wrote also a collection of proverbs (*Spruch-Wörter*) in 1532, which appeared in fuller form in 1591, a *Germaniæ Chronicon*, 1538, and the *Guldin Arch* or *Arca Aurea*, 1538, a collection of Scripture doctrines with proof passages, not only from the Bible itself, but also from pagan writers. Franck's position as a thinker was a peculiar one. Though associated at first with the Reformers, he soon showed that he was out of sympathy with their dogmatic tendencies, and at length was branded by Luther as a "devil's mouth." He was naturally inclined to subjectivity and mysticism, and may to a certain extent be regarded as a forerunner of modern German idealism. His religion was practically pantheistic, and tended to foster a spirit of tolerance that found good in everything. Amid the bitter controversies of contending sects it was rare to find a professed theologian maintaining that the true church consisted of "all pious and good-hearted men in all the world, even among the heathen." As an historian, while still credulous enough to believe in the Trojan myths of the Middle Ages, he displayed a remarkably modern spirit in the attention he gave to social conditions. The first part of his *Chronicon*, etc., contains the history of antiquity, the second includes the period from Christ to Charles V., and the third gives account of the popes, councils, heretics, ceremonies, etc. His German style is plain, vigorous, and idiomatic, and ranks him high among the founders of German prose.

Theol.*, 1855; Bischof, *Sebastian Franck und die Deutsche Geschichtschreibung*, Tübingen, 1857; Hase, *Sebastian Franck von Wörd der Schwarmgeist*, Leipsic, 1869; Latendorf in his edition of *Sebastian Franck's erste namenlose SprUchwörtersammlung von Jahre 1532*, Posneck, 1876; and a valuable review of this last work in the *Jena Lit. Zeitung*, 1877, No. 22. A critical catalogue of the whole literature of the subject appeared in Birlinger's *Alemannia*, 1876.

FRANCKE, August Hermann (1663–1727), an influential German philanthropist and theologian, was born on the 22d of March, 1663, at Lübeck, where his father, a doctor of laws, at that time held a professional appointment. He was educated, chiefly in private, at Gotha (to which his family had removed in 1666), and afterwards at the universities of Erfurt, Kiel, and Leipsic. During his student career, he busied himself specially with the Hebrew and Greek languages; and in order to acquire the former more thoroughly, he for some time put himself under the instructions of Rabbi Ezra Edzardi at Hamburg, at whose instance he is said to have read through the entire Hebrew Bible seven times within a year. He graduated at Leipsic in 1685, but, having found employment as a "privat-docent," did not quit the university until the end of 1687. During the last year of his residence he had, by the help of his friend P. Anton, and with the approval and encouragement of Spener, who was at that time coming into notice, originated the afterwards famous collegium philobiblicum, at which a number of graduates were accustomed to meet for the regular and systematic study of the Bible. He next passed a number of months at Lüneburg as assistant or curate to the learned and pious superintendent Sand-hagen, and there his religious life was remarkably quickened and deepened. His own account of his experience at that crisis in his life, and of the influence of the particular text (John xx. 31) to which he believed he owed his conversion, is very interesting and characteristic. On leaving Lüneburg, he spent some time in Hamburg, where he was engaged as a teacher in a private school, and there also he considered himself to have acquired some experience which proved invaluable in after life. After a long visit to Spener, who was at that time in Dresden, and who encouraged him in the plans he had formed, he returned to Leipsic in the spring of 1689, and began to give Bible lectures of an exegetical and practical kind, at the same time resuming the collegia philobiblica of earlier days. He rapidly became very popular as a lecturer; but the peculiarities of his teaching almost immediately aroused a violent opposition on the part of the university authorities; and before the end of the year he was, on the ground of his alleged pietism, interdicted from lecturing. Thus it was that Francke's name first came to be publicly associated with that of Spener, and with one of the most fruitful church movements of the 17th century. Although, however, the majority of those claiming to be orthodox chose to regard the pietists as a new and dangerous sect, it must be remembered that neither Spener nor Francke taught in any spirit of sectarianism or with any consciousness of antagonism to any of the doctrines of the Lutheran Church. Loyal churchmen, they were distinguished from other Lutherans simply by their readiness to subordinate mere confessional orthodoxy to the interests of spiritual religion and practical morality, and also by the unusual earnestness with which they insisted on the necessity of conversion, and of the appearance of certain symptoms of a moral and spiritual change, before any one could rightly lay claim to the Christian name. The pietism of Francke, at all events, was quite as compatible with churchliness as was the methodism of Wesley or the evangelicalism of Simeon; and it is well known that neither of these two men desired to set up a sect against the church. Prohibited from lecturing in Leipsic, Francke in 1689 found work at Erfurt as "deacon" of one of the city churches. Here his evangelistic fervor attracted multitudes to his preaching, but at the same time excited the jealousy of his less zealous colleagues as well as the antipathy of the Catholic section of the population; and the result of their combined opposition was that after a ministry of fifteen months, he was, in September, 1691, banished from the town by the civil authorities. The same year witnessed the expulsion of Spener from Dresden. In December Francke received and accepted an invitation to fill the chair of Greek and Oriental languages in the new university of Halle, which was at that time being organized by the Elector Frederick III. of Brandenburg; and at the same time, the chair having no salary attached to it, he was appointed minister of the parish of Glaucha in the immediate neighborhood of the town. Here, for the next thirty-six years, he continued to discharge the twofold office of pastor and professor with rare energy and success. Besides preaching on Sundays, with an eloquence and earnestness and depth that attracted and held together a large congregation, he found time for many week day meetings for edification, and was unwearied in the work of catechising the young and of giving spiritual direction to those who sought his private advice. At the very outset of his labors, he had been profoundly impressed with a sense of his responsibility towards the numerous outcast children who were growing up around him in ignorance and crime. After a number of tentative plans, such as that of gathering them together once a week at the parsonage, and that of paying their school fees, he resolved in 1695 to institute what would be called in this country a ragged school, relying for funds upon the charity of the benevolent public. A single room was at first sufficient for the needs of the institution; but within a year it was found necessary to purchase a house, to which another was added in 1697. In 1698 there were 100 orphans under his charge to be clothed and fed, besides 500 children who were taught as day scholars. The later statistics of the many and various educational institutions of Halle which owe their origin to him will be found in vol. vii. p. 586. The principles there indicated were consistently applied in his university teaching. Even as professor of Greek he had given great prominence in his lectures to the study of the Scriptures; but he found a much more congenial sphere when, in 1698, he was appointed to the chair of theology. Yet his first courses of lectures in that department were on Old and New Testament introduction; and to this, as also to hermeneutics, he always attached special importance, believing that for theology a sound exegesis was the one indispensable requisite. "Theologus nascitur in scripturis," he used to say; but during his occupancy of the theological chair he lectured at various times upon other branches of the science also, according to the custom still usual in Germany. Amongst his colleagues were Anton, Breithaupt, and Joachim Lange—men like-minded with himself. Through their influence upon the students, Halle became a centre from which pietism, as it was called, became very widely diffused over Germany; but while in some quarters the new light was welcomed and cherished, in others every effort was made to suppress it. Thus, while Frederick William I. of Prussia is said to have gone so far as to issue an edict forbidding that any one should receive a cure of souls in his dominions who had not studied in Halle for two years, and received from the faculty there satisfactory certificates as to his status gratiæ, legislative enactments were elsewhere frequently directed against the Halle school. It ought to be borne in mind with reference to these that Francke cannot fairly be held responsible for the separatistic and perfectionist and chiliastic tendencies which are now most commonly associated with the pietistic name. He died at Halle on the 8th of June, 1727.

His principal contributions to theological literature were—*Manuductio ad Lectionem Scripturæ Sacræ* (1693); *Prælectiones Hermeneuticæ* (1717); *Commentatio de Scopo Librorum Veteris et Novi Testamenti* (1724); and *Lectiones Paræneticæ*, (1726–36). The *Manuductio* was translated into English in 1813, under the title *A Guide to the Reading and Study of the Holy Scriptures.* An account of his orphanage, entitled *Segensvolle Fuss-stapfen,* etc. (1709), which subsequently passed through several editions, has also been partially translated, under the title *The Footsteps of Divine Providence; or, The Bountiful Hand of Heaven defraying the Expenses of Faith.* See Guerike's *A. H. Francke* (1827), which has been translated into English (*The Life of A. H. Francke,* 1837); and Kramer's *Beiträge zur Geschichte A. H. Francke's* (1861), and *Neue Beiträge* (1875).

FRANCKEN. Eleven painters of this family cultivated their art in Antwerp during the 16th and 17th centuries. Several of these were related to each other, whilst many bore the same Christian name in succession. Hence unavoidable confusion in the subsequent classification of paintings not widely differing in style or execution. When Franz Francken the first found a rival in Franz Francken the second, he described himself as the "elder," in contradistinction to his son, who signed himself the "younger." But when Franz the second was threatened with competition from Franz the third, he took the name of "the elder," whilst Franz the third adopted that of Franz "the younger." It is possible, though not by any means easy, to sift the works of these artists. The eldest of the Franckens, Nicholas of Herenthals, died at Antwerp in 1596, with nothing but the reputation of having been a painter. None of his works remain. He bequeathed his art to three children. Jerom Francken, the eldest son, after leaving his father's house, studied under Franz Floris, whom he afterwards served as an assistant, and wandered, about 1560, to Paris. In 1566 he was one of the masters employed to decorate the palace of Fontainebleau, and in 1574 he obtained the appointment of court painter from Henry III., who had just returned from Poland and visited Titian at Venice. In 1603, when Van Mander wrote his biography of Flemish artists, Jerom Francken was still in Paris living in the then aristocratic Faubourg St. Germain. Among his earliest works we should distinguish a Nativity in the Dresden Museum, executed in co-operation with Franz Floris. Another of his important pieces is the Abdication of Charles V. in the Amsterdam Museum. Equally interesting is a Portrait of a Falconer, dated 1558, in the Brunswick Gallery. In style these pictures all recall Franz Floris. Franz, the second son of Nicholas of Herenthals, is to be kept in memory as Franz Francken the first. He was born about 1544, matriculated at Antwerp in 1567, and died there in 1616. He, too, studied under Floris, and never settled abroad, or lost the hard and gaudy style which he inherited from his master. Several of his pictures are in the Museum of Antwerp, one, dated 1597 in the Dresden Museum represents Christ on the road to Golgotha, and is signed by him as D. c̃ (Den ouden) F. Franck. Ambrose, the third son of Nicholas of Herenthals, has bequeathed to us more specimens of his skill than Jerom or Franz the first. He first started as a partner with Jerom at Fontainebleau, then he returned to Antwerp, where he passed for his guild in 1573, and he lived at Antwerp till 1618. His best works are the Miracle of the Loaves and Fishes and the Martyrdom of St. Crispin, both large and ambitious compositions in the Antwerp Museum. In both these pieces a fair amount of power is displayed, but marred by want of atmosphere and shadow, or by hardness of line and gaudiness of tone. There is not a trace in the three painters named of the influence of the revival which took place under the lead of Rubens. Franz Francken the first trained three sons to his profession, the eldest of whom, though he practised as a master of guild at Antwerp from 1600 to 1610, left no visible trace of his labors behind. Jerom the second took service with his uncle Ambrose. He was born in 1578, passed for his guild in 1607, and in 1620 produced that curious picture of Horatius Cocles defending the Sublician bridge which still hangs in the Antwerp Museum. The third son of Franz Francken the first is Franz Francken the second, who signed himself in pictures till 1616 "the younger," from 1630 till his death "the elder" F. Francken. These pictures are usually of a small size, and are found in considerable numbers in Continental collections. Franz Francken the second was born in 1581. In 1605 he entered the guild, of which he subsequently became the president, and in 1642 he died. His earliest composition is the Crucifixion in the Belvedere at Vienna dated 1606. His latest compositions as "the younger" F. Francken are the Adoration of the Virgin (1616) in the Gallery of Amsterdam and the Woman taken in Adultery (1628) in Dresden. From 1616 to 1630 many of his pieces are signed F. Francken; then come the Seven Works of Charity (1630) at Munich, signed "the elder F. F.," the Prodigal Son (1633) at the Louvre, and other almost countless examples. It is in F. Francken the second's style that we first have evidence of the struggle which necessarily arose when the old customs, hardened by Van Orley and Floris, or Brueghel and De Vos were swept away by Rubens. But F. Francken the second, as before observed, always clung to small surfaces; and though he gained some of the freedom of the moderns, he lost but little of the dryness or gaudiness of the earlier Italo-Flemish revivalists. F. Francken the third, the last of his name who deserves to be recorded, passed in the Antwerp guild in 1639, and died at Antwerp in 1667. His practice was chiefly confined to adding figures to the architectural or landscape pieces of other artists. As Franz Pourbus sometimes put in the portrait figures for Franz Francken the second, so Franz Francken the third often introduced the necessary personages into the works of Pieter Neefs the younger (museums of St. Petersburg, Dresden, and the Hague). In a Moses striking the Rock, dated 1654, of the Augsburg Gallery, this last of the Franckens signs D. õ (Den ouden) F. Franck. In the pictures of this artist we most clearly discern the effects of Rubens's example.

FRANÇOIS DE NEUFCHATEÂU, Nicolas Louis, Count (1750–1828), a French statesman and poet, was born at Saffais, in the district of Meurthe, 17th April, 1750. He studied at the college of Neufchâteau in the Vosges, and at the age of fourteen published a volume of poetry which obtained the approbation of Rousseau, and secured for its author so much *éclat* that Neufchâteau conferred on him its name, and he was elected member of some of the principal academies of France. In 1783 he was named procureur-general to the council of St. Domingo. He had previously been engaged on a translation of Ariosto, which he finished before his return to France five years afterwards, but it perished during the shipwreck which occurred during his voyage home. After the Revolution he was elected deputy to the National Assembly, of which he first became secretary and then president. In 1793 he was imprisoned on account of the political sentiments of his drama *Pamela*, but a few days afterwards the Revolution of the 9th of August restored to him his freedom. In 1798 he became minister of the interior, in which office he distinguished himself by the thoroughness of his administration in all departments. It is to him that France owes its system of inland navigation. From 1804 to 1806 he was president of the senate, and in that capacity the duty devolved upon him of soliciting Napoleon to assume the title of emperor. In 1808 he received the dignity of count. Retiring from public life in 1814, he occupied himself chiefly in the study of agriculture, until his death, 10th January, 1828. François de Neufchâteau had very multifarious accomplishments, and interested himself in a great variety of subjects, but his fame rests chiefly on what he did as a statesman for the encouragement and development of the industries of France. His maturer poetical productions did not fulfil the promise of those of his early years, for though some of his verses have a superficial elegance, his poetry generally lacks force and originality. He had considerable qualifications as a grammarian and critic, as is witnessed by his editions of the *Provinciales* and *Pensées* of Pascal, Paris, 1822 and 1826, and *Gil Blas*, Paris, 1820. His principal poetical works are *Poésies Diverses*, 1765; *Ode sur les Parlements*, 1771; *Nouveaux Contes Moraux*, 1781; *Les Vosges*, 1796; *Fables et Contes*, 1814; and *Les Tropes, ou les Figures de Mots*, 1817. He is also the author of a large number of works on agriculture.

See H. Bonnelier, *Mémoires sur François de Neufchâteau*, Paris, 1829; and J. Lamouroux, *Notice historique et littéraire sur la vie et les écrits de François de Neufchâteau*, Paris, 1843.

FRANCONIA, in German Franken, a name of very different application in different historical periods. It properly signifies the land of the Franks, and is consequently identical in original meaning with the word Francia or France. In the beginning of the 4th century the Frankish territory stretched from the Loire eastward to the basin of the Rhine and the Main; but it was shortly afterwards broken up into two divisions—Austrasia, Francia Orientalis, or the kingdom of the East Franks, and Neustria, Francia Occidentalis, or the kingdom of the West Franks. As time went on both kingdoms extended their boundaries; and when the treaty of Verdun in 845 settled the claims of the grandsons of Charles the Great, there was a kingdom of Western France with Latin tendencies, and a kingdom of Eastern France with Teutonic tendencies, each possessing a central district or duchy of its own name. These districts were separated from each other by the district of Lotharingia or Lorraine. The western was soon after lost sight of; but the eastern continued for a long period to be considered the very core and kernel of the German kingdom, and a theory became prevalent that it was the original seat of the Franks in Germany. Under the Saxon and Franconian emperors it was subdivided into Ost-Franken, Francia Orientalis, or Eastern Franconia *par excellence*, and Rhein-Franken, Francia Rhenensis, or Rhenish Franconia. The former, which was also distinguished as Saal-Franken, stretched from the Fichtelgebirge and the Rhone to the Danube, and from the Upper Palatinate to the Spessart and the lands of the Neckar; while the latter was the country between the Spessart and the Rhine, and included the present district of Frankfort-on-the-Main. Though the name frequently occurs in our histories, there was probably no proper "duchy" of Franconia, in the same sense at least as there was a duchy of Saxony or a duchy of Bavaria. Conrad I. and Conrad II., for example, do not style themselves dukes "of" Franconia but dukes "in" Franconia. Both Eastern Franconia and Rhenish Franconia were broken up into a number of distinct territories—countships, lordships, etc. When Maximilian divided Germany into circles in 1501, he gave the name of Franconia to the circle which included the bishoprics of Würzburg, Bamberg, and Eichstädt, the district of Mergentheim belonging to the grand master of the Teutonic Order, the territory of the abbey of Schönthal, the principalities of Baireuth and Ausbach, the countships of Henneberg and Schwarzenberg, the territories of the curia of Franconian counts, the imperial towns of Nuremberg, Rothenburg, Schweinfurt, Weissenburg, and Windsheim. Altogether the circle comprised 69 territories and had an area of about 10,430 square miles, and in 1792 its population amounted to 1,547,000. The name of Franconia ceased to be officially used after the dissolution of the German empire in 1806; but in 1837 King Louis I. of Bavaria gave the names of Upper, Middle, and Lower Franconia to what had previously been known as the circles of the Upper Main, the Rezat, and the Lower Main. Upper Franconia forms the north-east portion of Bavaria, and is partly conterminous with the frontiers of Bohemia, Saxony, and Prussia. Its mountains are the Fichtelgebirge, the Frankenwald, the Böhmerwald, and the Steigerwald; and the Main, the Naab, the Saale, and the Eger take their rise within its territory. The seat of the administration is at Baireuth, and the court of appeal at Bamberg. Lower Franconia lies to the west, and forms the north-west province of the kingdom,—conterminous with Prussia, Weimar, Meiningen, Würtemberg, Baden, and Hesse. Its rivers are the Main, the Saale, the Itz, and the Baunach. The principal town is Würzburg. Middle Franconia lies to the south of the other two, conterminous with the Upper Palatinate, Swabia, and Würtemberg. It is watered by the Regnitz and the Altmühl. The principal town is Nuremberg, the seat of the administration is at Ausbach, and the court of appeal at Eichstädt.

FRANEKER, a town of Holland, province of Friesland, is situated 10 miles W. of Leeuwarden, on the canal between that town and Haarlingen. The university founded here in 1585 was abolished by Napoleon I., and its endowments were diverted in 1815 to the support of an athenæum, and later of a gymnasium, with which a physiological cabinet and a botanical garden are connected. Franeker also possesses a very fine observatory. The university buildings are occupied by an asylum for insane. The chief industries of the town are silk-weaving, woollen spinning, and shipbuilding. Population in 1876, 6643.

FRANKENBERG, an important manufacturing town of Saxony, circle of Zwickau, is situated on the Zschopau, 7 miles N.E. of Chemnitz. The principal buildings are the great church, restored in 1874–5, and the new town-house. Frankenberg has extensive woollen, cotton, and silk manufactures, and also dye-works and cigar factories. Its educational establishments include a city school, a real school, and a technical school for engineering, in connection with which there is a chemical laboratory. Population in 1875, 10,462.

FRANKENHAUSEN, a town of Germany, principality of Schwartzburg-Rudolstadt, is situated on the Little Wipper, 36 miles N.N.E. of Gotha. It consists of an old and a new town, the latter mostly rebuilt since a very destructive fire in 1833, and has an old castle, two churches, a seminary for teachers, a hospital, and a new town-house. Its industries include the manufacture of sugar, cigars, and buttons, and there is a salt mine in the vicinity. At Frankenhausen a battle was fought 15th May, 1525, in which the peasants under Thomas Münzer were defeated by the Saxon, Brunswick, and Hessian troops. Population in 1875, 4725.

FRANKENSTEIN, a town in the Prussian province of Silesia, government of Breslau, is situated 35 miles S. by W. of the town of that name. It has a monastery of the charity friars, a garrison, and an old castle. The principal manufactures are linen, woollen, and cotton goods, straw hats, chemical substances, and salt. Population in 1875, 7492.

FRANKENTHAL, a town in the Rhenish district of Bavaria, is situated on the Isenach, 9 miles N.W. of Mannheim, and is connected with the Rhine by a canal 4 miles in length. It has a poorhouse, an infirmary, a deaf and dumb institution, an asylum for insane, and the ruins of an old monastery. Its principal industries are the manufacture of machinery, bell-founding, and brewing.

Frankenthal existed as a village in the 8th century, but it owes its prosperity to a colony of Flemish Protestant refugees who settled there in 1562. After this it rose very rapidly, so that in 1577 it became a town. The Spaniards made an unsuccessful attempt to capture it in 1621, and it was taken by them in 1623. In 1689 it was burned to the ground by the French, and it delivered itself up to the same power in 1796. Population in 1875, 7907.

FRANKFORT, a city of the United States, capital of Franklin county and of the State of Kentucky, is picturesquely situated on both sides of the Kentucky river, on a space of elevated ground bounded by a bluff 150 feet high. It is distant 29 miles W.N.W. from Lexington, and 65 miles E. from Louisville, by rail. The river is crossed at Frankfort by two bridges, and that portion of the town lying on the south side of the river is known as South Frankfort. The principal buildings are the State house, a marble building with a handsome portico supported by Ionic columns, the institution for imbecile children, the State penitentiary, the county court-house, and the public hall. The beautiful cemetery contains the remains of Daniel Boone, the pioneer of Kentucky, who died September 20, 1820. Frankfort has distilleries and flour and cotton mills, and a considerable trade in lumber. The river is navigable for steamers 40 miles above the city. Frankfort was laid out in 1787, and became the capital of the State in 1792. In 1862 it was occupied for a short time by the Confederates. The population in 1860 was 3702, and in 1870, 5396, of whom 2335 were colored.

FRANKFORT-ON-THE-MAIN, in German FRANKFURT or FRANKFURTH-AM-MAIN, one of the principal cities of the German empire, in the circle of Wiesbaden, in the Prussian province of Hesse-Nassau, and till 1866 one of the four free cities of Germany. It lies about 330 feet above the level of the sea, in 50° 6′ 43″ N. lat. and 8° 41′ 9″ E. long., 22 miles E. of Mainz and 16 miles N. of Darmstadt. The position which it occupies is one of no small natural beauty in the broad and fertile valley of the Main, its northern horizon being formed by the soft outlines of the Taunus range. The surrounding country is richly clad with orchard and forest, and in the season of spring especially presents a prospect of indescribable luxuriance. In earlier times the city with its fortifications had the form of an irregular pentagon, of which the longest side was defined by the right bank of the river; but now that the fortifications have been demolished, new suburbs have spread out widely in all directions, and the village of Sachsenhausen on the opposite side of the stream has extended in a similar fashion, so that the whole area of architectural occupation measures about 2½ miles from E. to W., and about 2 miles from N. to S. Even within the old encincture great transformations have been effected, and much of the quaint domestic architecture and the intricate network of narrow streets and lanes has given way to modern improvements. Only one side, for example, of the famous Judengasse or Jews' Street is now standing, the other having been demolished since 1870; but the visitor can still see the house were Ludwig Börne was born in 1786, and the dingy and unpretentious premises of No. 148 which saw the rise of the Rothschild family. When the whole of what remains of this street has been pulled down and rebuilt, as it must be ere long, there

will still be many less celebrated parts of the old city of no small interest as eloquent relics of bygone conditions of life. In the modern quarters Frankfort will compare favorably, both in the general appearance of the streets and in the architectural character of individual buildings, with all except a very few of the greater cities of the Continent; and almost every year this is becoming more certainly true. Among the more spacious streets are the Schöne Aussicht or Beautiful Prospect along the Main, the Kaiser-Strasse or Emperor Street, and the Zeil. The business of the city is largely concentrated in the Zeil, the Rossmarkt or Horse Market, the Kaiser-Strasse, Friedens-Strasse, and their immediate vicinity.

The principal ecclesiastical building in Frankfort is the cathedral of St. Bartholomew's, which is situated not far from the river between the Domplatz on the N. and the Weekmarkt on the S. The date of its first foundation is not precisely known. A church called Salvator's was erected on the site by Louis the German at least as early as 874 A.D., and he enriched it with considerable donations, and instituted a chapter of twelve priests and an abbot. Charles the Fat not only confirmed his father's gifts in 882, but he added a *nona* or ninth of the produce of Frankfort, Trebur, Ingelheim, Kreiznach, and other royal domains. In the 12th century the church obtained possession of the skull of St. Bartholomew, and by the early part of the 13th it appears to have been known as St. Bartholomew's church. The building was by that time in a very dilapidated condition; and consequently Pope Gregory IX. urged the faithful of the diocese of Mainz to contribute to its restoration. When in 1315 the church was appropriated to the religious ceremonies connected with the coronation of the emperors, it was found necessary to enlarge its dimensions. The eastern portion, consisting of the choir and two towers, was pulled down and rebuilt on a larger scale about 1338, and in the same century the wings of the transepts and the imperial election chapel were added. The so-called *Pfarrthurm* or Parson's Tower was built between 1414 and 1512. In 1855 the interior was renovated; but on the night of the 14th August, 1867, the whole building was laid in ruins by a conflagration. In 1869 F. J. Denziger, chief architect of the Ratisbon (or Regensburg) cathedral was entrusted with the work of restoration, and his task has been steadily prosecuted. The only portions of the enterprise uncompleted in 1878 were the cloister and the grand organ. In the interior are still to be seen the high altar at which after 1562 the imperial coronations were celebrated, the tombstone of the emperor Günther of Schwarzburg, who died in Frankfort in 1349, and the tombstone of Rudolph, the last knight of Sachsenhausen, who died in 1371. The other Catholic churches are Leonhardskirche and Liebfrauenkirche, and the Deutschhauskirche in Sachsenhausen. St. Leonhard's ranks second to the cathedral in point of antiquity, and is said to occupy the site of the palace of Charles the Great. It possesses a stained glass window above the high altar, with a Lord's Supper by Hans Holbein. Our Lady's Church was founded in 1322 by Schöffen Weigel of Wambach, was made collegiate in 1326, and underwent a restoration in the second half of the 18th century. St. Paul's (Paulskirche), the principal church of the Evangelical Lutherans, was built between 1786 and 1833 on the site of the old church of the Minorites, and is mainly interesting as the seat of the national parliament of 1848–49. The church of St. Nicholas (Nicolaikirche) dates from the 13th century, and has a fine cast-iron spire erected in 1843. From 1570 to 1721, and again from 1813 to 1841, it was used as a warehouse. St. Catherine's was built about 1678–1680 on the site of an older building famous in Frankfort history as the place where the first Protestant sermon was preached in 1522. The principal synagogue—there are three altogether—is a Mauro-Byzantine structure erected between 1855 and 1860 in room of an older synagogue of the 15th century. Of the secular buildings in Frankfort perhaps the most characteristic is the Rathhaus or Römer, which by a strange coincidence bears a name suggestive of, though not derived from, its principal historical associations. It was here, in the Wahlzimmer or election room, that the electors or their plenipotentiaries decided the choice of the emperors, and here, in the Kaisersaal or emperor's hall, the coronation festival was held, at which the new recipient of the crown dined with the electors after having shown himself from the balcony to the people assembled in the Römerberg, as the open place in front of the building is called. The building dates from the 15th century, and occupies the site of the Golden Swan and two private houses which from time immemorial had borne the name of the Römer. The Kaisersaal retained its antique appearance till 1843; but it is now ornamented with a series of modern paintings by Veit, Jung, Ballenberger, and a score of other German artists representing the "German" emperors from Charlemagne to Francis II., in all fifty-two. The palace of the prince of Thurn and Taxis is a large building in the old French style of considerable historical interest: from 1806 to 1810 it was the residence of the "prince-primate," or head of the confederation of the Rhine; after the battle of Leipsic it was occupied by Francis I. of Austria; and from 1816 to 1866 the parliament of the German confederation held its sessions within its walls. The Eschenheim Tower is a picturesque relic of the ancient fortifications dating from the middle of the 14th century.

Hardly any fact about Frankfort is more familiar to the reader of Goethe than that it has an old bridge over the Main, and that on the bridge there has been for centuries an iron crucifix surmounted by a somewhat insignificant figure of a cock, commemorating, according to tradition, the unfortunate fowl which first crossed the bridge, and thus fell a prey to the devil who, in hope of a nobler victim, had sold his assistance to the original architect. The first distinct mention of a bridge over the river occurs in 1222, and the present structure dates from the 14th century. As late, at least, as 1475 the central span was not arched over. There are now fourteen arches in all, the total length of the bridge being 869 feet. The cock and crucifix are mentioned as early as 1405, and antiquaries assert that it probably marks the spot where criminals in the olden time were flung into the river. About half a mile below the old bridge a new bridge, called the "Unter-Main Brücke," was constructed by P. Schmick, between 1872 and 1874; and about midway between the two lies the footbridge or "Steg," erected by the same engineer in 1868–69, and the first example of its kind in Germany. The "Ober-Main" or Upper-Main Bridge was opened to traffic in the spring of 1878. Several other bridges for railway purposes are projected.

Few cities of the same size as Frankfort are so richly furnished with literary, scientific, and artistic institutions, or possess so many handsome buildings appropriated to their service. The town theatre was built between 1780 and 1827 in a Dutch-French style, and was restored in 1855; and as it has proved too small for the wants of the people, a new opera house has been erected near the Bockenheim gate, after the plans of Professor Lucä of Berlin. There is a public picture gallery in the Saalhof, containing works by Hans Holbein, Grünewald, Vandyck, Teniers, Van der Neer, Hans von Culmbach, Lucas Cranach, Martin Schön, etc. The nucleus of the collection is of very ancient date; considerable additions were made in 1803 at the secularization of the monasteries; in 1839 Ernst Fr. K. Prehn's cabinet of more than 850 small oil-paintings was presented by his heirs, and 220 that had belonged to Johann G. Chr. Daems were added in 1856, in terms of his bequest. The Städel Art Institute (Städel'sche Kunst-Institut) takes its name from Johann Friedrich Städel, who not only left his collection of paintings, engravings, and other property to the town, but appropriated a million marks to the erection of an institute and college. Its picture gallery and cabinet of engravings are both extremely rich in works of German art: the latter in 1874 had 54,300 plates. In the town library, which is kept in a building erected between 1820 and 1825, there are upwards of 100,000 volumes; and among its rarer treasures are a Gutenberg Bible, printed at Mainz between 1450 and 1455, another on parchment dated 1462, the *Institutiones Justiniani*, Mainz, 1468, the *Theuer-Dank*, with woodcuts by Hans Scheufelein, Abyssinian manuscripts presented by the African traveller Rüppel, and autographs of Luther, Melanchthon, Wallenstein, Napoleon I., Goethe, Schiller, etc. The Bethmann Museum owes its celebrity principally to Dannecker's Ariadne, but it also possesses the original plaster model of Thorwaldsen's Entrance of Alexander the Great into Babylon. Among the scientific institutions perhaps the chief place belongs to those named after J. Chr. Senckenberg, the physician. Senckenberg himself founded both the Bürger or citizens' hospital and the medical institute, with an anatomical theatre, botanical garden, and library; and a society of natural science (*Senckenbergsche*

Naturforschende Gesellschaft) was instituted in his honor in 1817, and now possesses an extensive and valuable museum. Large gardens were opened for the patients of the citizens' hospital in 1851, and in 1875 new buildings were added. A physical association was founded in 1824, an association for geography and statistics in 1836, a medical association in 1845, the association for history and archæology in 1857, and the free German institute for science, art, and general culture in 1859. An association for the cultivation of classical and especially of church music (the Cäcilien-Verein) was instituted by Schelble in 1818, and a similar association (the Rühl'sche Verein) by Rühl in 1851; and there are several other musical unions, such as the Philharmonische Verein, the Liederkranz, etc. In 1858 a zoological garden was opened by a joint-stock company near the Bockenheim Road; and in 1873 it was transferred to a new site on the Pfingstweide or Pentecost Meadow, and assigned to a new company. When in 1868 the duke of Nassau offered the plants of his winter garden for sale, a company, the Palm Garden Company, was formed at Frankfort, which purchased the collection, and established what is now the most beautiful of all the pleasure-grounds in the city.

Besides the Bürger Hospital already mentioned, Frankfort has several large institutions for the sick and infirm. The Holy Ghost Hospital, originally founded in 1278 for invalid pilgrims, is now appropriated to the servants and apprentices of Frankfort citizens. Its convalescent hospital, opened in 1868 at the Mainkur, was the first establishment of the kind in Germany. It maintains in each of the fourteen quarters of the town a physician, a surgeon, and an apothecary for the gratuitous assistance of the poor. The new asylum for the insane, with room for 200 patients, was erected between 1859 and 1863, partly by public subscription, and partly by a donation of 100,000 florins from Herr von Wiesenhütten. For its deaf and dumb institution the town is indebted to Ludwig Kosel, who in 1827 started with three pupils; and it was at his suggestion that the blind asylum was established by the society for the furtherance of the useful arts. The Waisenhaus or orphan asylum, erected in 1829, is no longer employed for its original purpose, as it has, since 1860, been thought better to board the orphan children with families in the neighboring villages of Lich, Wächtersbach, etc. It is sufficient to mention the Jewish infirmary, built at the expense of the Rothschilds; the new Jewish hospital, erected in 1874; Dr. Christ's children's hospital, originated in 1835; and the maternity hospital, opened in 1855. Among the numerous associations for benevolent purposes are the *Frauen-Verein*, or ladies' union, founded in 1813 for the assistance of sick families and women in childbed; the Jewish ladies' union for the education of orphan girls; the association originated in 1851 for taking charge of infants during the working hours; the Pestalozzi union (1846) for the education of neglected children, and its auxiliary, the Schuboth institute for Protestant boys (1865); the prison association, dating from 1868; and the Martha asylum, dating from 1866.

Frankfort has always been much more of a commercial than an industrial town, and at present it manufactures little else but Frankfort black, waxcloth, jewelry, gold and silver thread, tapestry, and such like articles. Bockenheim, however, a small town with which it is connected by tramway lines, is a flourishing manufacturing centre; and the Frankfort capitalists are connected with the industrial enterprises of Wiesbaden, Hanau, Offenbach, etc. There are two great fairs held in the town—the Ostermesse or spring fair, and the Herbstmesse or autumn fair. The former, which was the original nucleus of all the commercial prosperity of the city, begins on the second Wednesday before Easter; and the latter on the second Wednesday before the 8th of September. They last three weeks, and the last day save one, called the *Nickelchestag*, is distinguished by the influx of people from the neighboring country. The trade in leather is of great and growing importance. A horse fair has been held twice a year since 1862 under the patronage of the agricultural society; and the wool market was reinstituted in 1872 by the German Trade Society. Frankfort has long been famous as one of the principal banking centres of Europe; and throughout the city there are upwards of 220 banking offices. The so-called "Frankfort Bank" was founded in 1854, with a capital of 10,000,000 gulden. The exchange occupies a building opposite the Paulskirche, erected since 1840 according to the plans of Stüler of Berlin; and it is remarkable for the large business that is done in Government stock. In the 17th century the town was the seat of a great book-trade; but it has long been distanced in this department by Leipsic. The *Frankfurter Journal* was founded in 1615, the *Postzeitung* in 1616, the *Neue Frankfurter Zeitung* in 1859, and the *Frankfurter Presse* in 1866. The zoological garden company publish a monthly magazine devoted to the popularization of natural history; and the Senckenberg society have issued *Transactions* since 1854–55.

There are four railway stations in Frankfort: by the Weser station the traveller leaves for Nauheim and Cassel, for Homburg, for Kronberg, and the north generally; from the Taunus station he proceeds along the right bank of the river to Mainz; from the Neckar station he leaves for Darmstadt and the south, and for Mainz by the line along the left bank of the river; and from the Hanau station he proceeds eastwards. In Sachsenhausen there is the Offenbach-Hanau station. The Neckar railway crosses the river by a bridge erected in 1846–48, which is also used by the Offenbach and the "Linksmainisch" lines. Several other bridges across the river are projected in connection with the scheme for centralizing the railway systems. Communication within the town is facilitated by tramways; and there is also a line all the way to Bockenheim.

Frankfort has been the birthplace of not a few of the most celebrated men of Germany. J. G. Schlosser the historian, Feuerbach the philosopher, Kirchner the scholar and naturalist, Clement Brentano, Bettina von Arnim, and Ludwig Börne, are all in the list; but what the city considers its highest literary distinction is the fact that Johann Wolfgang Goethe was born in 1749 at No. 23 Hirschgraben. In 1863 the house was purchased for 56,000 florins by the Free German "Hochstift" (or Grand Association) for the sciences, arts, and general culture, and thus made for ever the common property of the German people. The society consists of members in all parts of the world, associated by admiration of the poet. Under the direction of Otto Volga the house has been as much as possible put into the state in which it was in Goethe's youth; and at the same time the rooms are turned into so many little museums of Goethe literature and art. On the high grounds to the south of the river there is a spot, now known as the Gothe Ruhe, or Goethe's Rest, where the poet is said to have admired the prospect of his native town, and there a tasteful wooden tower in the Swiss châlet style was built in 1877 by the Verschönerungs-Verein, or association for the beautifying of the city. The Goethe statue was erected in 1844 in what is now the Goethe Platz to the north of the Rossmarkt; it was designed by Schwanthaler, and cast in the royal foundry at Munich.

Of memorial monuments the largest and most elaborate in Frankfort is that erected in 1858 in honor of the early German printers. It was modelled by Ed. von der Lausitz and executed by Herr von Kreis. The statues of Gutenberg, Fust, and Schöffer form a group on the top; an ornamented frieze presents medallions of a number of famous printers; below these are figures representing the towns of Mainz, Strasburg, Venice, and Frankfort; and on the corners of the pedestal are allegorical statues of theology, poetry, science, and industry. The Schiller statue, erected in 1863, is the work of a Frankfort artist, Dielmann. A monument in the Bockenheim Anlege, dated 1837, preserves the memory of Guiollet, the burgomaster, to whom the town is mainly indebted for the beautiful promenades which occupy the site of the old fortification; and similar monuments have been reared to Senckenberg (1863), Bethmann, and Wiesenhütten. A statue of Charlemagne adorns the old Main bridge.

The new cemetery (opened in 1828) contains the graves of Arthur Schopenhauer and Feuerbach, of Passavant the biographer of Raphael, Ballenberger the artist, Hessemer the architect, Sömmerring the naturalist, Dr. Böhmer, and Städel. The Bethmann vault attracts attention by three bas-reliefs from the chisel of Thorwaldsen; and the Reichenbach mausoleum is a vast pile designed by Hessemer at the command of William II. of Hesse, and adorned with sculptures by Zwerger and Von der Lausitz. In the Jewish section, which is walled off from the rest of the burying-ground, the most remarkable tombs are those of the Rothschild family.

The present municipal constitution of the town dates from

1867, and conforms to the Prussian system. The electors choose 54 representatives for a term of 6 years; and every two years a third of the number retire, but are eligible for re-election. The 54 representatives elect twelve town councillors, six of whom receive a salary and serve for 12 years, while the rest receive no salary and serve for 6 years. The chief burgomaster is nominated by the king for 12 years, and the second burgomaster must receive the king's recognition. Since 1873 the town has been supplied with water from the Vogelsberg and the Spessart by the Frankfurter Quellwasserleitung Gesellschaft at the rate of about a million cubic feet per day, the natural pressure being sufficient to carry the water to the highest stories. The population of Frankfort has continued almost steadily to increase since the beginning of the century, the yearly percentage varying from 0·1 in 1843 to 8·9 in 1872. In 1817 the civil population was 41,458; in 1840, 55,269; in 1849, 58,599; in 1855, 63,495; and in 1864, 77,372. The events of 1866 led to a decline, and in 1867 the number was only 75,918. By 1871 it had again risen to 89,265; in 1872 it was 97,230; in 1873, 102,680; and in 1875, 103,136. Including the suburban villages (Bornheim 10,085, Bockenheim 13,043, Oberrad 4609, and Rödelheim 3903), the total is 134,776.

History.—Though the Romans certainly had settlements in the valley of the Main, as at Mattiacum (Wiesbaden) and Novus Vicus (Heddernheim), there is no proof that the site of Frankfort was permanently occupied before the arrival of the Franks, from whom it derives its name. Father Fuchs of Mainz, indeed, asserted in the end of the 18th century, that he had epigraphic evidence for the statement that Frankfort was founded by the Romans in the 2d century of the Christian era, and that by the 3d century it had become a great fortified city; but unfortunately none of the inscriptions to which he referred have ever been shown to exist. Popular tradition connects the origin of the town with the history of Charlemagne, asserting that the name Frankfort is due to the fact that once, when he was retreating from the Saxons, he and his Frankish army were safely conducted across the river by a doe, and that Sachsenhausen was so called because he settled there a colony of the Saxons whom he had subdued. The first truly historical notice of the town occurs in 793, when Eginhard, Charlemagne's biographer, tells us that he spent the winter in the villa Frankonovurd. Next year there is mention more than once of a royal palace there, and the early importance of the place is indicated by the fact that it was chosen as the seat of an ecclesiastical council, which was attended not only by German but by French and Italian bishops, as well as by two papal legates. The name Frankfort is also found in several official documents of Charlemagne's reign; and from the notices that occur in the early chronicles and charters it would appear that the place was the most populous at least of the numerous villages of the Main district. During the Carlovingian period it was the seat of no fewer than 16 imperial councils or colloquies. The town was probably at first built on an island in the river. It was originally governed by a royal officer or *actor dominicus*, and down even to the close of the empire it remained a purely imperial or royal town. It gradually acquired various privileges, and by the close of the 14th century the only mark of dependence was the payment of a yearly tax. Louis the Pious dwelt even more frequently at Frankfort than his father had done, and about 823 he built himself a new palace, the basis of the later Saalhof. In 822 and 823 two great diets were held in the palace, and at the former there were present deputies from the eastern Slavs, the Avars, and the Normans. The place continued to be a favorite residence with Louis the German, and he died there in 876. By the rest of the Carlovingian kings it was less frequently visited, and this neglect was naturally greater during the period of the Saxon and Salic emperors from 908 to 1137. Diets, however, were held in the town in 951, 1015, 1069, and 1109, and councils in 1000 and 1006. From a privilege of Henry IV., in 1074, granting the city of Worms freedom from tax in their trade with several royal cities, it appears that Frankfort was even then a place of some commercial importance. In 1217 we find mention made of an imperial mint and a corn market in the town. About 1227 it was already in possession of a yearly fair. Between 1140 and the beginning of the interregnum it saw 21 diets, and that of 1142 gave rise to the Guelph and Ghibelline parties. No fewer than 10 new churches were erected in the 50 years from 1220 to 1270. It was about the same period, probably in 1240, that the Jews first settled in the town. In the contest which Louis the Bavarian maintained with the papal throne Frankfort sided with the emperor, and it was consequently placed under an interdict for 20 years from 1329 to 1349. On Louis's death it refused to accept the papal conditions of pardon, and only yielded to Charles IV., the papal elect, when Günther of Schwarzburg thought it more prudent to abdicate in his favor. Charles granted the city a full amnesty, and confirmed its liberties and privileges. By the famous bull of 1356, called by way of distinction the Golden Bull, or, after the emperor, *Bulla Carolina*, Frankfort is declared the seat of the imperial elections (Wahlstadt Reiches), and it still preserves an official contemporaneous copy of the original document as the most precious of the eight imperial bulls in its possession. In the 17th and 18th centuries, says Kriegk, the bull was regarded as the most notable sight of the city, and was only exhibited to persons of high rank. From the date of the bull to the close of the empire, Frankfort retained the position of "Wahlstadt," and only five of the two-and-twenty monarchs who ruled during that period were elected elsewhere. In 1388–89 Frankfort assisted the South-German towns in their wars with the princes and nobles, and in a consequent battle with the troops of the Palatinate, the town banner was lost and carried to Kronberg, where it was long preserved as a trophy. On peace being concluded in 1391, the town had to pay 12,562 florins, and this brought it into great financial difficulties. In the course of the next 50 years debt was contracted to the amount of 126,772 florins. The diet at Worms in 1495 chose Frankfort as the seat of the newly instituted Imperial Chamber, or "*Reichs-Kammergericht*," for the settlement of discussions between the different states of the empire; and it was not till 1527 that the chamber was removed to Spires. At the Reformation Frankfort heartily joined the Protestant party, and in consequence it was hardly treated both by the emperor Charles V. and by the archbishop of Mainz. It refused to subscribe the Augsburg Recess, but at the same time it was not till 1536 that it was prevailed to join the Smalkaldic League. On the failure of this confederation it opened its gates of its own accord to the imperial general Büren on 29th Dec., 1546, although he had passed by the city, which he considered too strong for the forces under his command. The emperor was merciful enough to leave it in possession of its privileges, but he inflicted a fine of 80,000 gold gulden, and the citizens had to endure till Oct., 1547, the presence of from 8000 to 10,000 soldiers. This resulted in a pestilence which not only lessened the population but threatened to give the death-blow to the great annual fairs; and at the close of the war it was found that it had cost the city no less than 228,931 gulden. In 1522 Frankfort was invested for three weeks by Maurice of Saxony, who was still in arms against the emperor, but it continued to hold out till peace was concluded between the principal combatants. Between 1612 and 1616 occurred the great Fettmilch insurrection, perhaps the most remarkable episode in the internal history of Frankfort. The magistracy had been acquiring more and more the character of an oligarchy; all power was practically in the hands of a few closely-related families; and the gravest peculation and malversation took place without hindrance. The ordinary citizens were roused to assert their rights, and they found leaders in Fettmilch, Gerngross, and Schopp, who carried the contest to dangerous excesses, but lacked ability to bring it to a successful issue. An imperial commission was ultimately appointed, and the three principal culprits and several of their associates were executed in 1616, with the barbarous devices of the times. It was not until 1801 that the last mouldering head of the Fettmilch company dropped unnoticed from that old tower which, from its position near the bridge, is known as the Brückenthurm. In the words of Dr. Kriegk, who has furnished a detailed history of the whole period, the insurrection completely destroyed the political power of the guilds, gave new strength to the supremacy of the patriciate, and brought no further advantage to the rest of the citizens than a few improvements in the organization and administration of the magistracy. The Jews, who had been attacked by the popular party, were solemnly reinstated by imperial command in all their previous privileges, and received full compensation for their losses. During the Thirty Years' War Frankfort did not escape. In 1631 Gustavus Adolphus garrisoned it with 600 men, who remained in possession till they were expelled four years later by the imperial general Lamboy. In 1792 the citizens had to pay 2,000,000 gulden to the French general Custine; and in 1796 Kléber bombarded the town, and exacted 8,000,000 francs. The independence of Frankfort was brought to an end in 1806, on the formation of the Confederation of the Rhine; and in 1810 it was made the capital of a grand-duchy of Frankfort, which had an area of 3215 square miles, with 302,100 inhabitants, and was divided into the four districts of Frankfort, Aschaffenburg, Fulda, and Hanau. On the reconstitution of Germany in 1815 it again became a free city, and in the following year it was declared the seat of the German Confederation. In April, 1833, occurred what is known as the Frankfort Riot (Frankfurter Attentat), in which a number of German students, assisted by the peasants of the vicinity, attempted to break up the diet. The city joined the German Zollverein in 1836. During the revolutionary period of 1848 the people of Frankfort took a chief part in political movements, and the streets of the town were more than once the scene of conflict. In the war of 1866 they were on the Austrian side. On the 16th of July the Prussian troops, under General Vogel von Falkenstein, entered the town, and on the 8th of October it was formally incorporated with the Prussian state. A fine of 6,000,000 florins was exacted. In 1871 the treaty which concluded the Franco-German war was signed in the Swan Hotel by Prince Bismarck and Jules Favre, and it is consequently known as the Frankfort Peace.

M. und seiner nächsten Umgebung; nach der Natur aufgenommen und auf geometrischer Basis in Vogelschau gezeichnet.* (H. A. W.)

FRANKFORT-ON-THE-ODER, in German *Frankfurt-an-der-Oder*, a town of Germany at the head of a government in the Prussian province of Brandenburg, about 50 miles in an easterly direction from Berlin. The town proper, which has far outgrown the limits of its ancient walls, lies on the left of the river, but it is connected by a wooden bridge 900 feet long with the suburb of Damm. Among the more important buildings are the Protestant church of St. Mary's (the Oberkirche), a handsome brick edifice of the 13th century, the Roman Catholic church, the Jewish synagogue, the Rathhaus, dating from 1607, and bearing on its southern gable the sign of the Hanseatic League, the city infirmary, three hospitals, an orphan asylum, a workhouse, a theatre, the Frederick gymnasium, and the provincial industrial school. The university of Frankfort, which was founded in 1506 by the elector of Brandenburg, Joachim I., was removed to Breslau in 1811, and the university buildings are now occupied by the Realschule. As the chief town of a province, Frankfort is the seat of a court of appeal, a general commission, and a number of administrative boards. Its industry is mainly devoted to the manufacture of iron-wares, pottery, paper, silk and woollen goods, bone-dust, chocolate, and liqueurs. Being situated on the high road from Berlin to Silesia, commanding an extensive system of water communication by means of the Oder and its canals to the Vistula and the Elbe, and in modern times having become an important railway junction, it maintains no small commercial activity, which is further fostered and concentrated by its three annual fairs held respectively at *Reminiscere* or the second Sunday in Lent, at St. Margaret's day, and at Martinmas. The population, which in 1849 was 29,969, had at the census of 1875 attained to 47,176. The municipal existence of Frankfort goes back to 1253, when it was colonized by Frankish merchants introduced by John and Conrad of Brandenburg, who had recently conquered the district from the Wends. The principal facts in its external history are—the siege which it successfully sustained against the emperor Charles IV. in the time of the pretender Waldemar; the papal excommunication in 1426, on account of its quarrel with the bishop of Lebus; the siege of the Hussites in 1432, of the Poles in 1450, and of the duke of Sagan in 1477; and its capture by Gustavus Adolphus in 1631, and by the Russians in 1759. The presence of the Russians on this occasion cost the town 300,000 thalers, and in the earlier part of the following century the continual quartering of foreign troops created great destitution, compelling the magistrates to procure a loan of 208,000 thalers. Ewald von Kleist died in the town in August, 1759, from the effects of a wound received in the battle at the neighboring village of Kunersdorf; a monument was erected over his grave in the "park" in 1779. Henrich von Kleist was born in the town in 1776, and Franz von Gaudy in 1800.

FRANKINCENSE,[1] or OLIBANUM[2] (Gr., *λιβανωτός*, later *θύος*; Lat., *tūs* or *thus*; Heb., *lebonah*;[3] Ar., *lubân*;[4] Turk., *ghyunluk*; Hind,, *ganda-birosa*[5]), a gum-resin obtained from certain species of trees of the genus *Boswellia*, and natural order *Burseracæ*. The members of the genus are possessed of the following characters:—Bark often papyraceous; leaves deciduous, compound, alternate, and imparipinnate, with leaflets serrate or entire; flowers in racemes or panicles, white, green, yellowish, or pink, having a small persistent, 5-dentate calyx, 5 petals, 10 stamens, a sessile 3 to 5-chambered ovary, a long style, and a 3-lobed stigma; fruit trigonal or pentagonal; and seed compressed. Dr. George Birdwood (*Trans. Lin. Soc.*, xxvii., 1871) distinguishes five species of Boswellia:—(A) *B. thurifera*, Colebr. (*B. glabra* and *B. serrata*, Roxb.), indigenous to the mountainous tracts of Central India and the Coromandel coast, and *B. papyrifera* (*Plösslea floribunda*, Endl.) of Abyssinia, which, though both thuriferous, are not known to yield any of the olibanum of commerce; and (B) *B. Frereana* (see ELEMI, vol. viii. p. 116), *B. Bhau-Dajiana*, and *B. Carterii*, the "Yêgaar," "Mohr Add," and "Mohr Madow" of the Somali country, in East Africa, the last species including a variety, the "Maghrayt d'Sheehaz" of Hadramaut, Arabia, all of which are sources of true frankincense, or olibanum. The trees on the coast of Adel are described by Captain G. B. Kempthorne as growing, without soil, out of polished marble rocks, to which they are attached by a thick oval mass of substance resembling a mixture of lime and mortar: the purer the marble the finer appears to be the growth of the tree. The young trees, he states, furnish the most valuable gum, the older yielding merely a clear glutinous fluid resembling copal varnish.[6] To obtain the frankincense a deep incision is made in the trunk of the tree, and below it a narrow strip of bark five inches in length is peeled off. When the milk-like juice ("spuma pinguis," Pliny) which exudes has hardened by exposure to the atmosphere, the incision is deepened. In about three months the resin has attained the required degree of consistency. The season for gathering lasts from May until the first rains in September. The large clear globules are scraped off into baskets, and the inferior quality that has run down the tree is collected separately. The coast of South Arabia is yearly visited by parties of Somalis, who pay the Arabs for the privilege of collecting frankincense.[7] In the interior of the country about the plain of Dhofár,[8] during the south-west monsoon, frankincense and other gums are gathered by the Beni Gurrah Bedouins, and might be obtained by them in much larger quantities; their lawlessness, however, and the lack of a safe place of exchange or sale are obstacles to the development of trade. (See C. Y. Ward, *The Gulf of 'Aden Pilot*, p. 117, 1863.) Much as formerly in the region of Sakhalites in Arabia (the tract between Ras Makalla and Ras Agab),[9] described by Arrian, so now on the sea-coast of the Somali country, the frankincense when collected is stored in heaps at various stations. Thence, packed in sheep and goat-skins, in quantities of 20 to 40 ℔, it is carried on camels to Berbera, for shipment either to Aden, Makalla, and other Arabian ports, or directly to Bombay.[10] At Bombay, like gum-acacia, it is assorted, and is then packed for re-exportation to Europe, China, and elsewhere.[11] Arrian relates that it was an import of Barbarike on the Sinthus (Indus). The idea held by several writers, including Niebuhr, that frankincense was a product of India, would seem to have originated in a confusion of that drug with benzoin and other odoriferous substances, and also in the sale of imported frankincense with the native products of India. The gum resin of *Boswellia thurifera* was described by Colebrooke (in *Asiatick Researches*, ix. 381, and after him by Dr. J. Fleming (*Ib.*, xi. 158), as true frankincense, or olibanum; from this, however, it differs in its softness, and tendency to melt into a mass[1] (Birdwood, *loc. cit.*, p. 146). It is sold in the village bazaars of Khandeish in India under the name of *Dup-Salai, i. e.*, incense of the "Salai tree;" and according to Mr. F. Porter Smith, M.B. (*Contrib. towards the Mat. Med. and Nat. Hist. of China*, p. 162, Shanghai, 1871), is used as incense in China. The last authority also mentions olibanum as a reputed natural product of China. Bernhard von Breydenbach,[2] Ausonius, Florus, and others, arguing, it would seem, from its Hebrew and Greek names, concluded that olibanum came from Mount Lebanon; and Chardin (*Voyage en Perse*, etc., 1711) makes the statement that the frankincense-tree grows in the mountains of Persia, particularly Caramania.

---

[1] Stephen Skinner, M.D. (*Etymologicon Linguæ Anglicanæ*, Lond., 1671), gives the derivation: "Frankincense, Thus, *q. d.* Incensum (*i. e.*) Thus Libere seu Liberaliter, ut in sacris officiis par est, adolendum."

[2] "Sic *olibanum* dixere pro thure ex Græco ὁ *λίβανος*" (Salmasius, *C. S. Plinianæ Exercitationes*, t. ii. p. 926, b. F., Traj., ad Rhen., 1689, fol.). So also Fuchs (*Op. Didact.*, pars. ii. p. 42, 1604, fol.), "Officinis non sine risu eruditorum, Græco articulo adjecto, *Olibanus* vocatur." The term *olibano* was used in ecclesiastical Latin as early as the pontificate of Benedict IX., in the 11th century. (See Ferd. Ughellus, *Italia Sacra*, tom. i. 108, D., Ven., 1717, fol.)

[3] So designated from its whiteness (J. G. Stuckius, *Sacror. et Sacrific. Gent. Descrip.*, p. 79, Ludg. Bat., 1695, fol.; Kitto, *Cycl. Bibl. Lit.*, ii. p. 806, 1870): *cf. Laben*, the Somali name for cream (R. F. Burton, *First Footsteps in E. Africa*, p. 178, 1856).

[4] Written *Louan* by Garcias da Horta (*Aromat. et Simpl. Medicament. Hist., C. Clusii Atrebatis Exoticorum Lib. Sept.*, p. 157, 1605, fol.), and stated to have been derived by the Arabs from the Greek name, the term less commonly used by them being *Conder*: *cf.* Sanskrit *Kunda*. According to Colebrooke (in *Asiatick Res.*, ix. p. 379, 1807), the Hindu writers on Materia Medica use for the resin of *Boswellia thurifera* the designation *Cunduru*.

[5] A term applied also to the resinous exudation of *Pinus longifolia* (see Dr. E. J. Waring, *Pharmacopœia of India*, p. 52, Lond., 1868).

[6] See "Appendix," vol. i. p. 419 of Sir W. C. Harris's *Highlands of Æthiopia*, 2d ed., Lond., 1844; and *Trans. Bombay Geog. Soc.*, xiii., 1857, p. 136.

That frankincense, or olibanum, was in ancient times, as now, of West-Asiatic origin there is abundant evidence in the writings of classical authors. It was Sabæan incense that was burnt on the altar of Venus at Paphos (Virg., *Æn.*, i. 416; *cf. Georg.*, ii. 117), and Arabia and the land of Thus were synonymous (*cf.* Plautus, *Trinummus*, iv. 2. 89, and *Pœnulus*, v. 4. 6). Herodotus (iii. 107) and Pliny (*loc. cit.*) speak of Arabia as the only country that yields frankincense; Strabo (xvi. 4) and Arrian more correctly mention it as an export also of the neighboring African coast. According to Diodorus Siculus (v. 41), the "Holy Island," at the furthest point of Arabia Felix, the habitation of the Panchæans, was the source of frankincense.

In the Scriptures "incense," or frankincense, is noticed as forming part of the merchandise of the Sabæans (Heb. *Shebaiim*), who inhabited Sheba or Arabia Felix (*cf.* Is. xl. 6, Jer. vi. 20, and 1 Kings x. 10). Theophrastus (*Opera*, ix. 4., ed. F. Wimmer, p. 143) relates that with other spices it was produced by the regions of Arabia about Saba, Adramyta, Citibæna, and Mamali, and after transportation to the Sabæan temple of the Sun was purchased by merchants who came thither.

The libanotophorous region of the ancients is defined by Carter (*J. Bombay Br. R. Asiatic Soc.*, ii. p. 387, 1847) as extending between the Sabhan Mountains, in 17° 30′ N. lat. and 55° 23′ E. long., and the town of Damkote, in the bay of Alkammar, in 52° 47′ E. long. The trees there are congregated in two distinct localities—on the Nejdee or high land, two days' journey from the sea-shore, and on the Sahil or plain on the coast.[3] Its ancient evil reputation as a land of fogs and dark atmosphere, where slaves, as a punishment, collected the frankincense (Vincent's *Voyage of Nearchus*, etc., p. 89, Oxf., 1809), and where the trees that afforded that substance were infested with winged serpents of various colors, which could be driven away only by the smoke of storax (Herod. iii. 107), was not improbably due to the fertile imaginations of Arabian spice-monopolists. By their trade in frankincense and other aromatics the Sabæans and Gerrhæi, we are informed by Strabo, became the richest of all the Arabian tribes; and it was doubtless from their emporium at Petra that these, with other articles of commerce, were by caravan conveyed into Egypt and Canaan by the Edomites, Idumæans, or, as they came to be called, Nabatæans, and into the Mediterranean coast-regions by the Phœnician Arabs. (See Dr. G. Birdwood's *Handbook to the British Indian Section, Paris Universal Exhibition of 1878*, Lond. and Par., 1878, p. 32.) In what is believed to have been the early part of the 15th century B.C. (see EGYPT, vol. vii. p. 639), the ships of the Egyptian queen Hatasu, or Hatshepu, made an expedition to Pun or Punt (held by Professor Dümichen to be the countries on the Arabian coast of the Red Sea where the Phœnicians were established before they settled on the shores of the Mediterranean), and thence brought to Thebes, together with ivory, gold, silver, dog-faced baboons,[4] leopard-skins, and other of the "magnificent products of Pun," not only incense-resin, but 31 incense-trees, planted in tubs, from the "mountains of the barbarians."[5]

From the frequent employment of frankincense in the sacrifices of the ancients, shown by numerous passages in their prose and poetic writings, it is evident that the trade in that substance must formerly have been very extensive. A tribute of no less than a thousand talents' weight of it was brought to Darius every year by the Arabs, and the same quantity was yearly burnt by the Chaldæans on their great altar to Bel at Babylon (Herodotus, iii. 97, i. 183). From the spoils of Gaza, in Syria, 500 talents' weight of frankincense was sent by Alexander the Great to Leonidas (see Plutarch's *Lives*). It was in olden times accounted one of the most valuable of the products of the East. Ten talents' weight of it was one of the precious gifts sent by Seleucus II., king of Syria, and his brother Antiochus Hierax, king of Cilicia, to the temple of Apollo at Miletus, 243 B.C.;[6] and gold, frankincense, and myrrh were presented by the magi from the East to the infant Saviour (Matt. ii. 11).[7] Later, in the time of St. Silvester (314–335 A.D.), we find 100 pounds of "aromatum in incensum," or frankincense, mentioned among the costly offerings made by the emperor Constantine in the basilica of St. Marcellinus and St. Peter at Rome.[8]

Frankincense, or olibanum, occurs in commerce in semi-opaque, round, ovate, or oblong tears or irregular lumps, which are covered externally with a white dust, the result of their friction against one another. It has an amorphous internal structure, a dull fracture; is of a yellow to a yellowish-brown hue, the purer varieties being almost colorless, or possessing a greenish tinge; and has a somewhat bitter aromatic taste, and a balsamic odor, which is developed by heating. Immersed in alcohol it becomes opaque, and with water it yields an emulsion. It contains about 72 per cent. of resin soluble in alcohol (Kurbatow); a large proportion of gum soluble in water, and apparently identical with gum-arabic; and a small quantity of a colorless inflammable essential oil, one of the constituents of which is the body oliben, $C_{10}H_{16}$. Frankincense burns with a bright white flame, leaving an ash consisting mainly of calcium carbonate, the remainder being calcium phosphate, and the sulphate, chloride, and carbonate of potassium (Braconnot).[9] Good frankincense, Pliny tells us, is recognized by its whiteness, size, brittleness, and ready inflammability. That which occurs in globular drops is, he says, termed "male frankincense;" the most esteemed, he further remarks, is in breast-shaped drops, formed each by the union of two tears.[10] The best frankincense, as we learn from Arrian,[11] was formerly exported from the neighborhood of Cape Elephant in Africa (the modern Ras Fiel); and A. von Kremer, in his description of the commerce of the Red Sea (*Ægypten*, etc., p. 185, ii. Theil, Leipzig, 1863) observes that the African frankincense, called by the Arabs "asli," is of twice the value of the Arabian "luban." Captain S. B. Miles (*loc. cit.*, p. 64) states that the best kind of frankincense, known to the Somali as "bedwi" or "sheheri," comes from the trees "Mohr Add" and "Mohr Madow" (*vide supra*), and from a taller species of *Boswellia*, the "Boido," and is sent to Bombay for exportation to Europe; and that an inferior "mayeti," the produce of the "Yegaar," is exported chiefly to Jeddah and Yemen ports.[12]

---

[1] "*Boswellia thurifera,*" . . . says Waring (*Pharm. of India*, p. 52), "has been thought to yield East Indian olibanum, but there is no reliable evidence of its so doing."

[2] "Libanus igitur est mons redolentie & summe aromaticitatis. nam ibi herbe odorifere crescunt. ibi etiam arbores thurifere coalescunt. quarum gummi electum olibanum a medicis nuncupatur."—*Perigrinatio*, p. 53, 1502, fol.

[3] *Cf.* Theophrastus (*op. cit.*, p. 144): *τὰ μέν ἐν τῷ ὄρει τὰ δ' ἐν ταῖς ἰδίαις γεωργίαις ὑπὸ τὴν ὑπώρειαν.*"

[4] *Cf.* King Solomon's imports in the ships of the Phœnician city of Tarsus or Tarshish (2 Chron. ix. 21).

[7] According to an old Persian legend, and other traditions, the gold signified the kingship, the frankincense the divinity, the myrrh the healing powers of the Child. See H. Yule, *The Book of Ser Marco Polo*, vol. i. pp. 73–78, 1871.

[8] Vignolius, *Liber Pontificalis*, t. i. p. 101, Romæ, 1724, 4to.

[9] See, on the chemistry of frankincense, Braconnot, *Ann. de Chimie*, lxviii., 1808, pp. 60–69; Johnston, *Phil. Trans.*, 1839, pp. 301–305; J. Stenhouse, *Ann. der Chem. und Pharm.*, xxxv., 1840, p. 306; and A. Kurbatow, *Zeitsch. für Chem.*, 1871, p. 201.

[10] "Præcipua autem gratia est mammoso, cum hærente lacryma priore consecuta alia miscuit se" (*Nat. Hist.*, xii. 32). One of the Chinese names for frankincense, *Ju'-hiang*, "milk-perfume," is explained by the *Pen Ts'au* (xxxiv. 45), a Chinese work, as being derived from the nipple-like form of its drops. (See E. Bretschneider, *On the Knowledge possessed by the Ancient Chinese of the Arabs*, etc., p. 19, Lond., 1871.)

[11] *The Voyage of Nearchus, loc. cit.*

[12] Vaughan (*Pharm. Journ.*, xii., 1853) speaks of the Arabian Lubân, commonly called *Morbat* or *Shaharree Luban*, as realizing higher prices in the market than any of the qualities exported from Africa. The incense of "Esher," *i. e.*, Shihr or Shehr, is mentioned by Marco Polo, as also by Barbosa. (See Yule, *op. cit.*, ii., p. 377.) J. Raymond Wellsted (*Travels to the City of the Caliphs*, p. 173, Lond., 1840) distinguishes two kinds of frankincense—"*Meaty*," selling at $4 per cwt., and an inferior article fetching 20 per cent. less.

The latter may possibly be what Niebuhr alludes to as "Indian frankincense."[1] Garcias da Horta, in asserting the Arabian origin of the drug, remarks that the term "Indian" is often applied by the Arabs to a dark-colored variety.[2]

According to Pliny (*Nat. Hist.* xiv. 1; *cf.* Ovid, *Fast.* i. 337 *sq.*), frankincense was not sacrificially employed in Trojan times. It was used by the ancient Egyptians in their religious rites, but, as Herodotus tells us (ii. 86), not in embalming. It constituted a fourth part of the Jewish incense of the sanctuary (Ex. xxx. 34), and is frequently mentioned in the Pentateuch. With other spices it was stored in a great chamber of the house of God at Jerusalem (1 Chron. ix. 29, Neh. xiii. 5–9). On the sacrificial use and import of frankincense and similar substances see Incense.

In the Red Sea regions frankincense is valued not only for its sweet odor when burnt, but as a masticatory; and blazing lumps of it are not infrequently used for illumination instead of oil lamps. Its fumes are an excellent insectifuge. As a medicine it was in former times in high repute. Pliny (*Nat. Hist.*, xxv. 82) mentions it as an antidote to hemlock. Avicenna (ed. Plempii, lib. ii. p. 161, Lovanii, 1658, fol.) recommends it for tumors, ulcers of the head and ears, affections of the breast, vomiting, dysentery, and fevers. Dr. Delioux of Toulon (*Bull. Gén. de Thérap.*, Feb. 28, 1861) considers its curative properties equal to those of other balsamic medicines, and that for cheapness it is preferable for hospital use to the balsams of Peru and Tolu, and, being more agreeable to the stomach, to tar. As a fumigating agent, he advocates its employment in bronchitis and chronic laryngitis. In the East frankincense has been found efficacious as an external application in carbuncles, blind boils, and gangrenous sores, and as an internal agent is given in gonorrhœa. In China it was an old internal remedy for leprosy and struma, and is accredited with stimulant, tonic, sedative, astringent, and vulnerary properties. Its stimulant action appears to be directed chiefly to the mucous surfaces of the body. (See Waring, *Pharm. of India*, p. 443, etc.; and F. Porter Smith, *op. cit.*, p. 162.)

Common Frankincense or Thus, *Abietis resina*, is the term applied to a resin which exudes from fissures in the bark of the Norway spruce fir, *Abies excelsa*, D.C.; when melted in hot water and strained it constitutes "Burgundy pitch," *Pix abietina.* The concreted turpentine obtained in the United States by making incisions in the trunk of a species of pine, *Pinus australis*, is also so designated. It is commercially known as "scrape," and is similar to the French "galipot" or "barras." Common frankincense is an ingredient in some ointments and plasters, and on account of its pleasant odor when burned has been used in incense as a substitute for olibanum. (See Flückiger and Hanbury, *Pharmacographia.*) The "black frankincense oil" of the Turks is stated by Hanbury (*Science Papers*, p. 142, 1876) to be liquid storax. (F. H. B.)

FRANKLIN. See Freehold.

FRANKLIN, Benjamin (1706–1790), one of the most eminent journalists, diplomatists, statesmen, and philosophers of his time, was born in the city of Boston, and in the colony of Massachusetts Bay, on the 17th of January, 1706. He was the youngest of ten children, and the youngest son of the youngest son for five consecutive generations. His father, who was born at Ecton, in Northamptonshire, England, where the family may be traced back for some four centuries, married young, and emigrated to America with three children in 1682. From his parents, who never knew any illness save that of which they died (the father at eighty and the mother at eighty-five), he inherited an excellent constitution, and a good share of those heroic mental and moral qualities by which a good constitution is preserved. In his eighth year Benjamin, who never could remember when he did not know how to read, was placed at school, his parents intending him for the church. That purpose, however, was soon abandoned, and in his tenth year he was taken from school to assist his father, who, though bred a dyer, had taken up, on his arrival in New England, the business of tallow-chandler and soap-boiler. The lad worked at this, to him, most distasteful business, until his twelfth year, when he was apprenticed to his elder brother James, then just returned from England with a new printing press and fount of type, with which he proposed to establish himself in the printing business. In 1720–21 James Franklin also started a newspaper, the second that was published in America, called *The New England Courant.* Benjamin's tastes inclined him rather to intellectual than to any other kind of pleasures, and his judgment in the selection of books was excellent. At an early age he had made himself familiar with the *Pilgrim's Progress*, with Locke *On the Understanding*, and with some odd volumes of the *Spectator*, then the literary novelty of the day, which he turned to good account in forming the style which made him what he still remains, the most uniformly readable writer of English who has yet appeared on his side of the Atlantic. His success in reproducing articles he had read some days previously in the *Spectator* led him to try his hand upon an original article for his brother's paper, which he sent to him anonymously. It was accepted, and attracted some attention. The experiment was repeated until Benjamin had satisfied himself that his success was not an accident, when he threw off his disguise. He thought that his brother treated him less kindly after this disclosure; but that did not prevent James from publishing his paper in Benjamin's name when, in consequence of some unfortunate paragraphs which appeared in its columns, he could only obtain his release from prison, to which the colonial assembly had condemned him, upon condition that he "would no longer print the *New England Courant.*" The relations of the two brothers, however, gradually grew so inharmonious that Benjamin determined to quit his brother's employment and leave New England. He sold some of his books, and with the proceeds, in October, 1723, he found his way to the city of Philadelphia, where, 400 miles from home, at the immature age of seventeen, without an acquaintance, and with only a few pence in his pocket, he was fortunate enough to get employment with a Jew printer named Keimer. Keimer was not a man of business, and knew very little of his trade, nor had he any very competent assistants. Franklin who was a rapid composer, ingenious and full of resources, soon came to be recognized by the public as the master spirit of the shop, and to receive flattering attentions from prominent citizens who had had opportunities of appreciating his cleverness. Among others, Sir William Keith, the governor of the province, who may have possessed all the qualifications for his station except every one of the few which are quite indispensable to a gentleman, took him under his patronage, and proposed to start him in business for himself, and to give him the means of going to England and purchasing the material necessary to equip a new printing office. Franklin, rather against the advice of his father, whom he revisited in Boston to consult about it, embraced the governor's proposal, took passage for London, which he paid with his own money (the governor being more ready with excuses than coin), and on reaching London in December, 1724, where he had been assured he would find a draft to cover his expenses, discovered too late that he had been the dupe of Keith, and that he must rely upon his own exertions for his daily bread. He readily found employment at Palmer's, then a famous printer in Bartholomew Close, where, and afterwards at Wall's printing house, he continued to be employed until the 23d of July, 1726, when he again set sail for Philadelphia in company with a Mr. Dunham, whose acquaintance he had made on his voyage out, and who tempted him back by the offer of a position as clerk in a commercial business which he proposed to establish in Philadelphia. While in London Franklin had been engaged in setting up the type of a second edition of Wollaston's *Religion of Nature.* The perusal of this work led him to write and print a small edition of a pamphlet, which he entitled *A Dissertation on Liberty and Necessity, Pleasure and Pain.* Had he deferred printing it a few years, it would probably never have been heard of, for he lived to be rather ashamed of it. It procured him, however, the acquaintance of Dr. Mandeville, author of the *Fable of the Bees*, whom he described as a most facetious and entertaining companion. Only a few months after Franklin's return to Philadelphia, the death of Mr. Dunham put an end to his career as a merchant. While awaiting something more favorable, he was induced by large wages to return to his old employer Keimer. This led to his making the acquaintance of a young man of the name of Meredith, whom he afterwards described as a "Welsh Pennsylvanian, thirty years of age, bred to country work, honest, sensible, who had a great deal of solid observation, was something of a reader, but given to drink." He was learning the printer's art, and offered to furnish the capital to establish a new printing office—his father being a man of some means—if Franklin would join him and direct the business. This proposal was accepted, the types were sent for, a house was rented at £20 a year, part of which was sublet to a glazier who was to board them, and before the expiration of a year from his return to Philadelphia, Franklin, for the first time in his life, was in business for himself. "We had scarce opened our letters and put our press in order," he says, "before George House, an acquaintance of mine, brought a countryman to us whom he had met in the street inquiring for a printer. All our cash was now expended in the variety of particulars we had been obliged to procure, and this countryman's five shillings, being our first-fruits, and coming so seasonably, gave us more pleasure than any crown I have since earned, and the gratitude I felt towards House has made me often more ready than perhaps I should otherwise have been to assist young beginners."

---

[1] "Es scheint dass selber die Araber ihr eignes Räuchwerk nicht hoch schätzen; denn die Vornehmen in Jemen brauchen gemeiniglich indianisches Räuchwerk, ja eine grosse Menge Mastix von der Insel Scio" (*Beschreibung von Arabien*, p. 143, Kopenh., 1772).

[2] "De Arabibus minus mirum, qui nigricantem colorem, quo Thus Indicum præditum esse vult Dioscorides [lib. i. c. 70], Indum plerumque vocent, ut ex Myrobalano nigro quem Indum appellant, patet" (*op. sup. cit.*, p. 157).

Almost simultaneously, in September, 1729, he bought for a nominal price the *Pennsylvania Gazette*, a newspaper which Keimer had started nine months before to defeat a similar project of Franklin's which accidentally came to his knowledge. It had only 90 subscribers. His superior arrangement of the paper, his new type, some spirited remarks on a controversy then waging between the Massachusetts assembly and Governor Burnet (a son of the celebrated Bishop Gilbert Burnet) brought his paper into immediate notice, and his success, both as a printer and as a journalist, was from that time forth assured and complete. The influence which he was enabled to exert by his pen through his paper, and by his industry and good sense, bore abundant fruit during the next seventeen years, during which he was at the head of journalism in America. In 1731 he established the first circulating library on the continent; in 1732 he published the first of the *Poor Richard's Almanacs*, a publication which was continued for twenty-five years, and attained a marvellous popularity. The annual sale was about 10,000 copies, at that time far in excess of any other publication in the colonies, and equivalent to a sale at the present time of not less than 300,000. In the next ten years he acquired a convenient familiarity with the French, Italian, Spanish, and Latin languages.

In 1736 Franklin was chosen a clerk of the general assembly, and was re-elected the following year. He was then elected a member of assembly, to which dignity he was re-elected for ten successive years, and was appointed one of the commissioners to treat with the Indians at Carlisle. In 1737 Colonel Spotswood, then postmaster-general, appointed him deputy postmaster at Philadelphia. About this time he organized the first police force and fire company in the colonies, and a few years later initiated the movements which resulted in the foundation of the university of Pennsylvania and of the American Philosophical Society, in the organization of a militia force, in the paving of the streets, and in the foundation of a hospital; in fact, he furnished the impulse to nearly every measure or project which contemplated the welfare and prosperity of the city in which he lived. It was during this period, and in the midst of these very miscellaneous avocations, that he made the discoveries in electricity which have secured him undisputed rank among the most eminent of natural philosophers. He was the first to demonstrate that lightning and electricity were one. The Royal Society, when an account of his experiments, which had been transmitted to a scientific friend in England, was laid before it, made sport of them, and refused to print them. Through the recommendation of his friend they were printed, however, in an extra number of the *Gentleman's Magazine*, of which the publisher ultimately sold five editions. A copy chancing to fall into the hands of Buffon, he saw their value, and advised their translation and publication in France, where they immediately attracted attention. The "Philadelphia experiments," as they were called, were performed in the presence of the royal family in Paris, and became the sensation of the period. The Royal Society of London found it necessary to reconsider its action, published a summary of the experiments in its *Transactions*, and, as Franklin afterwards averred, more than made him amends for the slight with which it had before treated him, by electing him an honorary member, exempting him from the customary payments, and sending him for the rest of his life a copy of the *Transactions*. Since the introduction of the art of printing, it would be difficult to name any discovery which has exerted a more important influence upon the industries and habits of mankind.

In 1754 a war with France was impending, and Franklin, who by this time had become the most important man in the colony of Pennsylvania, was sent to a congress of commissioners from the different colonies, ordered by the Lords of Trade to convene at Albany, to confer with the chiefs of the Six Nations for their common defence. Franklin there submitted a plan for organizing a system of colonial defence which was adopted and reported; it provided for a president-general of all the colonies to be appointed by the crown, and a grand council to be chosen by the representatives of the people of the several colonies. The colonies so united, he thought, would be sufficiently strong to defend themselves, and there would then be no need of troops from England. Had this course been pursued, the subsequent pretence for taxing America would not have been furnished, and the bloody contest it occasioned might have been avoided. The Lords of Trade, however, feared that any such union of the colonies would reveal to them their strength; and the project of union, though accompanied with a recommendation from the governor of the province of Pennsylvania, when it was brought into the assembly, as it was during Franklin's casual absence from the hall, was rejected. This Franklin thought a mistake. "But such mistakes," he said, "are not new; history is full of the errors of states and princes. Those who govern, having much business on their hands, do not generally like to take the trouble of considering and carrying into execution new projects. The best public measures are therefore seldom adopted from previous wisdom, but forced by the occasion." Instead of allowing the colonists to unite and defend themselves, the home Government sent over General Braddock with two regiments of regular English troops, whom the colonists were expected to maintain. The proprietaries, Thomas and Richard Penn, sons of William Penn, and the hereditary governors of the colonies, however, "with incredible meanness," instructed their deputies—the governors they sent out—to pass no act for levying the necessary taxes unless their vast estates were in the same act exempt. They even took bonds of their deputies to observe these instructions. The assembly finally, "finding the proprietaries obstinately persisted in manacling their deputies with instructions inconsistent not only with the privileges of the people but with the service of the crown,"—we are quoting the language of Franklin,—"resolved to petition the king against them," and appointed Franklin as their agent to go to England and present their petition. He arrived in London on the 27th July, 1757, not this time as a poor printer's boy, but as a messenger to the most powerful sovereign in the world from a corporate body of some of his most loyal subjects.

Franklin lost no time, after reaching London, in waiting upon Lord Grenville, then president of the council, and held with him a conversation which he deemed of so much importance that he made a record of it immediately upon returning to his lodgings. Nor did he exaggerate its importance, for in it were the germs of the revolt and independence of the North American colonies. "You Americans," said Grenville, "have wrong ideas of the nature of your constitution; you contend that the king's instructions to his governors are not laws, and think yourselves at liberty to regard or disregard them at your own discretion. But those instructions are not like the pocket instructions given to a minister going abroad for regulating his conduct in some trifling point of ceremony. They are first drawn up by judges learned in the law; they are then considered, debated, and perhaps amended in council, after which they are signed by the king. They are then, so far as they relate to you, the *law of the land*, for the king is the legislature of the colonies." Franklin frankly told his lordship that this was new doctrine,—that he understood from the colonial charters that the laws of the colonies were to be made by their assemblies, approved by the king, and when once approved the king alone could neither alter nor amend them.

Franklin admits that he was alarmed by this conversation, but he was not as much alarmed as he had reason to be, for it distinctly raised the issue between the king and a fraction of his people which was to require a seven years' war to decide. Franklin next sought an interview with the brothers Penn to lay before them the grievances of the assembly. Finding them entirely inaccessible to his reasonings, he supplied the material for an historical review of the controversy between the assembly and the proprietaries, which made an octavo volume of 500 pages. The success of Franklin's mission thus far was not encouraging, for he appealed to a class largely interested in the abuses of which he complained. Meantime, Governor Denny, who had been recently sent out to the province by the proprietaries, tired of struggling with the public opinion which was surging about him in Pennsyvania, and in disregard of his instructions, assented to the passing of laws which taxed equally the entire landed property of the province, and assumed that the assembly was the proper judge of the requirements of the people it represented. An equivalent in paper money was issued upon the faith of this tax. The proprietaries were very angry with the governor, recalled him, and threatened to prosecute him for a breach of his instructions. But they never carried their threat into execution.

The subject of "taxing all estates," after a careful discussion by counsel on both sides in London, was finally referred to a committee of the privy council for plantations, who reported adversely to the petitioners whom Franklin represented. Disappointed, but not discouraged, he suggested a compromise involving a personal engagement on his part that, among other things, the assembly should pass an act exempting from taxation the *unsurveyed* waste lands of the Penns' estate, and secure the assessment of the surveyed waste lands at the usual rate at which other property of that description was assessed. Upon this proposal, to the infinite disgust of the Penns, a favorable report was made, and approved by the king, George II., then within a few weeks of his death. "Thus," wrote Franklin, a few days later, to Lord Kames, "the cause is at length ended, and in a great degree to our satisfaction." Franklin's stipulation gave to the Penns nothing, in fact, which they had not always had, and therefore the assembly never passed the superfluous act for securing it. They did, however, relieve Pennsylvania from the financial embarrassments that must have followed the repeal of a money bill which had already been a year in operation, and it established the principle till then denied by the proprietaries, that their estates were subject to taxation. The success of his first foreign mission, therefore, was substantial and satisfactory.

During this sojourn of five years in England, Franklin made many valuable friends outside court and political circles, among whom the names of Hume, Robertson, and Adam Smith are conspicuous. In the spring of 1759, he received the degree of doctor of laws from the Scottish university of St. Andrews. He also made active use of his marvellous and unsurpassed talent for pamphleteering. He wrote for the *Annual Register*, of which young Edmund Burke was then editor, and with whom, at a later day, he was destined to have closer relations, a paper "On the Peopling of Countries," traces of which may readily be discerned in the first book of *The Wealth of Nations*. In this paper Franklin combated the popular delusion that the people and wealth of the colonies were necessarily so much population and wealth abstracted from the mother country, and he estimated that the population of the colonies, by doubling once in every twenty-five years, would, at the end of a century, give a larger English population beyond the Atlantic than in England, without at all interfering with the growth of England in either direction. Franklin's conjecture, that the population of the colonies would double every twenty-five years, commended itself to the judgment of Adam Smith, who adopted it; and it has thus far been vindicated by the census.

On the 25th of October, 1760, King George II. died, and his grandson ascended the throne. A clamor for peace followed. Franklin was for a vigorous prosecution of the war then pending with France, and wrote what purported to be a chapter from an old book, which he said was written by a Spanish Jesuit to an ancient king of Spain, entitled, *On the Means of disposing the Enemy to Peace*. It was ingenious and had a great effect, and, like everything Franklin wrote, is about as readable to-day as when first printed. Soon after the capture of Quebec, Franklin wrote a more elaborate paper, entitled, *The Interests of Great Britain considered with regard to her Colonies and the Acquisitions of Canada and Guadeloupe.* Its purpose was to show that, while Canada remained French, the English colonies of North America could never be safe nor peace in Europe permanent. Tradition reports that this pamphlet had great weight in determining the ministry to retain Canada, which, thanks in a large degree to his foresight and activity, is to-day one of the brightest jewels in the English crown. "I have long been of opinion," he wrote about this time to Lord Kames, "that the foundations of the future grandeur and stability of the British empire lie in America; and though, like other foundations, they are low and little now, they are nevertheless broad and strong enough to support the greatest political structure that human wisdom ever erected. I am, therefore, by no means for restoring Canada. If we keep it, all the country from the St. Lawrence to the Mississippi will in another century be filled with British. Britain will become vastly more populous by the immense increase of its commerce. The Atlantic sea will be covered with your trading ships; and your naval power, thence continually increasing, will extend your influence round the whole globe and awe the world." What Englishman can read these papers to-day without a feeling of regret that Franklin was not permitted to occupy a seat in parliament as one of the representatives of the British colonies, so that England and the world might have had the advantage in a larger measure of his rare wisdom, sagacity, and patriotism?

Franklin sailed again for America in August, 1762, after an absence of five years, during which he had found an opportunity of visiting large portions of the Continent, and of acquiring information about European affairs both in and out of England, which made him more than ever an enlightened and trustworthy authority in America upon all foreign questions affecting the interests of the colonists. The peace with the proprietary government was only temporary. The question of taxing their estates had come up in a new form, and finally resulted in a petition from the assembly drawn by Franklin himself for a change of government for Pennsylvania. The election which took place in the fall of 1764 turned upon the issue raised in this petition, and the proprietary party succeeded, by a majority of 28 votes out of 4000, in depriving Franklin of the seat to which he had been chosen for fourteen successive years in the provincial assembly. The victory, however, was a barren one, for no sooner did the assembly convene than it resolved again to send Franklin as its special agent to England to take charge of their petition for a change of government, and to look after the interests of the province abroad. On the 7th of November following his defeat, he was again on his way across the Atlantic. We may as well here say at once that the petition which he brought with him for a change of government came to nothing. Franklin presented it, and the Penns opposed it; but matters of so much graver consequence continually arose between 1765, when it was presented, and 1775, when the revolution began, that it was left to the final disposition of time. The Penns at last had the sagacity to sell betimes what they were not wise enough to keep. The State of Pennsylvania gave them £130,000 for their interest in its soil, and the British Government settled upon the head of the family a pension of £4000 a year.

Early in the year 1764 Grenville, the prime minister, had sent for the agents of the American colonies resident in London, and told them that the war with France which had just terminated had left upon England a debt of £73,000,000 sterling, and that he proposed to lay a portion of this burden upon the shoulders of the colonists by means of a stamp duty, unless the colonists could propose some other tax equally productive and less inconvenient. He directed the agents to write to their several assemblies for instructions upon this point. The assembly of Pennsylvania, which expressed the sentiment of all the colonies, was decidedly of the opinion that to tax the colonies, which were already taxed beyond their strength, and which were surrounded by aboriginal enemies and exposed to constant expenditures for defence, was cruel, but to tax them by a parliament in which they were not represented was an indignity. While such was their feeling, they allowed it to be understood that they would not reject any requisition of their king for aid, and if he would only signify his needs in the usual way, the assembly would do their utmost for him. These views were summed up in a "resolution" thus expressed: "that, as the assembly always had, so they always should think it their duty to grant aid to the crown according to their abilities, whenever required of them in the usual manner." To prevent the introduction of such a bill as the ministry proposed, and which Franklin characterized as "the mother of mischief," he left no stone unturned, by personal intercession, by private correspondence, and through the press. At last, in despair, he, with his associate agents, sought an interview with the minister. They found him inexorable. The Government wanted the money, and it did not wish to recognize the principle upon which the colonists resisted the Government method of obtaining it. The bill was introduced, and was promptly passed, only 50 voting against it in the Commons, and the Lords not dividing upon it. The sum expected from this tax being only £100,000, it was thought the colonists would soon be reconciled to it. This was evidently Franklin's hope, which he did his utmost to realize. Writing home to a friend shortly after the passage of the Act he said, "The tide was too strong for us. We might as well have hindered the sun's setting; but since it is down, my friend, and it may be long before it rises again, let us make as good a night of it as we can. We may still light candles. Frugality and industry will go a great way towards indemnifying us. Idleness and pride tax with a heavier hand than kings and parliament." But when the news of the passage of the Stamp Act reached the colonies, and its provisions came to be scanned,[1] the indiscretion of those who advised it was manifest. Meetings were held in all the colonies, where resolves were passed unanimously to consume no more British manufactures until the hateful Act was repealed. For simply recommending a trusty person to collect the tax, Franklin himself was denounced, and his family in Philadelphia was in danger of being mobbed. The Act not only failed of its purpose in producing a revenue, but before it went into operation a formidable agitation for its repeal had already commenced.

The succeeding session of parliament, which began in December, 1765, is specially memorable for Franklin's examination before a committee of the House on the effects of the Stamp Act; for the magnificent parliamentary début of Edmund Burke, whose speeches for the repeal, said Dr. Johnson, "filled the town with wonder;" and for the repeal of the offensive act by a majority of 108. The first six weeks of this session were devoted to taking testimony at the bar of the House on American affairs, and especially upon the probable advantages and disadvantages of the Stamp Act. Franklin was the only one of the witnesses who lifted a voice that could be heard by posterity. Burke said the scene reminded him of a master examined by a parcel of schoolboys. George Whitfield, the great field preacher, wrote—"Our trusty friend, Dr. Franklin, has gained immortal honor by his behavior at the bar of the House. The answer was always found equal to the questioner. He stood unappalled, gave pleasure to his friends, and did honor to his country." The examination was first published in 1767, without the name of printer or of publisher, and the following remarks upon it appeared in the *Gentleman's Magazine* for July of that year. "From this examination of Dr. Franklin the reader may form a clearer and more comprehensive idea of the state and disposition of America, of the expediency or inexpediency of the measure in question, and of the character and conduct of the minister who proposed it, than from all that has been written upon the subject in newspapers and pamphlets, under the titles of essays, letters, speeches, and considerations, from the first moment of its becoming the object of public attention till now. The questions in general were put with great subtlety and judgment, and they are answered with such deep and familiar knowledge of the subject, such precision and perspicuity, such temper and yet such spirit, as do the greatest honor to Dr. Franklin, and justify the general opinion of his character and abilities."

The light thrown upon colonial affairs by Franklin's examination, more probably than all other causes combined, determined parliament to repeal the bill almost as soon as it was to have gone into operation, and immediately after the conclusion of Franklin's examination. It was to Franklin a never-to-be-forgotten triumph. He celebrated it characteristically. "As the Stamp Act," he wrote to his wife, "is at length repealed, I am willing you should have a new gown, which you may suppose I did not send sooner as I knew you would not like to be finer than your neighbors unless in a gown of your own spinning. Had the trade between the two countries totally ceased, it was a comfort to me to recollect that I had once been clothed, from head to foot, in woollen and linen of my wife's manufacture, that I never was prouder of my dress in my life, and that she and her daughter might do it again if it was necessary. I told the parliament that it was my opinion, before the old clothes of the Americans were worn out, they might have new ones of their own making. I have sent you a fine piece of Pompadour satin, 14 yards, cost 11s. a yard; a silk négligée and petticoat of brocaded lute string, for my dear Sally [his daughter]; with two dozen gloves, four bottles of lavender water, and two little reels."

The news of the repeal filled the colonists with delight, and restored Franklin to their confidence and affection. From that time until the end of his days he was, on the whole, the most popular man in America. Unhappily the repeal of the Stamp Act was a concession to the commercial interests of the mother country, not to the political dogmas of the colonists. The king's party was more irritated than instructed by its defeat, and instead of surrendering any of its pretensions to tax the colonies, almost immediately brought in a bill, which was passed, asserting the absolute supremacy of parliament over the colonies, and in the succeeding parliament another bill, which also passed, imposing duties on the paper, paints, glass, and tea imported by the colonies. This tax was resented by the colonies with no less bitterness and determination than they had resented the Stamp Act. It conveyed sterility into their recent triumph, and aroused a feeling akin to disloyalty. It made the minor differences among the colonists disappear, and crystallized public opinion with marvellous rapidity around the principle of "no taxation without representation,"—a principle which it was impossible to make acceptable to the king, whose old-fashioned notions of the royal prerogative had only been confirmed and strengthened by the irritating pertinacity of the colonists. Thus the issue was gradually made up between the mother country and its American dependencies. Each party felt that its first duty was to be firm, and that any concession would be disastrous as well as dishonorable. Such a state of feeling could terminate but in one way. It is now clear to all, as it was then clear to a few, that the passing of the tea and paper bill, made the difference between the crown and the colonists irreconcilable, and that nothing but the death of the king could prevent a war. The nine succeeding years were spent by the contending parties in struggling for position,—the colonies becoming more indifferent to the mother country, and the mother country less disposed to put up with the pretensions of her offspring. Franklin, when he went to London in 1764, confidently expected to return in the following year; but he was not destined to leave England till ten years later, and then with the depressing suspicion that the resources of diplomacy were exhausted. Meantime he remitted no effort to find some middle ground of conciliation. Equipped with the additional authority derived from commissions to act as the agent of the provinces of Massachusetts, of New Jersey, and of Georgia, and with a social influence never possessed probably by any other American representative at the English court, he would doubtless have prevented the final alienation of the colonies, if such a result, under the circumstances, had been possible. But it was not. The colonists were Englishmen for the most part, and they could not be brought to make concessions which would have dishonored them; and Franklin was not the man to ask of them such concessions. He took the position that "the parliament had no right to make any law whatever binding the colonies; that the king, and not the king, Lords, and Commons collectively, was their sovereign; and that the king, with *their* respective parliaments, is their only legislator." In other words, he asked only what England has since granted to all her colonies, and what, but for the fatuous obstinacy of the king, who at this time was rather an object of commiseration than of criticism, she would undoubtedly have yielded. But under the pressure of the crown, negotiation and debate seemed rather to aggravate the differences than to remove them. The solemn petitions of the colonists to the throne were treated with neglect or derision, and their agents with contumely, and Franklin was openly insulted in the House of Lords, was deprived of his office of deputy-postmaster, and was scarcely safe from personal outrage. Satisfied that his usefulness in England was at an end, he placed his agencies in the hands of Arthur Lee, an American lawyer practising at the London bar, and on the 21st of March, 1775, again set sail for Philadelphia. On reaching home his last hope of maintaining the integrity of the empire was dissipated by the news which awaited him of collisions which had occurred, some two weeks previous, between the people and the royal troops at Concord and at Lexington. He found the colonies in flagrant rebellion, and himself suddenly transformed from a peacemaker into a warmaker.

---

[1] One clause of the Act provides that the Americans shall have no commerce, make no exchange of property with each other, neither purchase, nor grant, nor recover debts; they shall neither marry nor make their wills unless they pay such and such sums in specie for the stamps which are to give validity to the proceedings. Franklin testified under oath before a committee of parliament that such a tax would drain the Government of all their specie in a single year.

The two years which followed were among the busiest of his life. The very morning of his arrival he was elected, by the Assembly of Pennsylvania, a delegate to that continental congress then sitting in Philadelphia which consolidated the armies of the colonies, placed George Washington in command of them, issued the first continental currency, and assumed the responsibility of resisting the imperial government. In this congress he served on not less than ten committees. One of its first measures was to organize a continental postal system and to make Franklin postmaster-general. Thus he was avenged for his dismissal 18 months before from the office of deputy by being appointed to a place of higher rank and augmented authority. He planned an appeal for aid from the king of the French, and wrote the instructions of Silas Deane, a member of the congress, who was to convey it; he was sent as one of three commissioners to Canada, in one of the most inclement months of the year, on what proved an ineffectual mission to persuade the Canadians to join the new colonial union; he was elected a delegate from Philadelphia to the conference which met on the 18th of June, 1776, and which, in the name of the people of the colonies, formally renounced all allegiance to King George, and called for an election of delegates to a convention to form a constitutional government for the United Colonies. He was also one of the committee of five which drew up what is known as the "Declaration of Independence." When about to sign it, Hancock, one of his colleagues, is reported to have said, "We must be unanimous; there must be no pulling different ways; we must all hang together." "Yes," replied Franklin, "we must hang together, or we will be pretty sure to hang separately." He was also chosen president of the convention called to frame a constitution for the State of Pennsylvania, which commenced its session on the 16th of July, 1776. He was selected by congress to discuss terms of peace with Admiral Lord Howe, who had arrived in New York harbor on the 12th of July, 1776, to take command of the British naval forces in American waters, and on the 26th of September, upon the receipt of encouraging news from France, he was chosen unanimously to be one of three to repair to the court of Louis XVI. and solicit his support. His colleagues were John Adams, destined to be Washington's successor in the presidency, and Arthur Lee, Franklin's successor in the agency in London.

Franklin, now in the seventieth year of his age, proceeded to collect all the money he could command, amounting to between £3000 and £4000, lent it to congress, and with two grandsons set sail in the sloop of war "Reprisal" on the 27th day of October, arriving at Nantes on the 7th of December, and at Paris towards the end of the same month. With his usual tact and forecast he found quartérs in a house in Passy (then a suburb but now a part of the city of Paris) belonging to an active friend of the cause he represented—Le Ray de Chaumont—who held influential relations with the court, and through whom he was enabled to be in the fullest communication with the French Government without compromising it.

At the time of Franklin's arrival in Paris, he was already one of the most talked about men in the world. He was a member of every important learned society in Europe; he was a member, and one of the managers of the Royal Society, and one of eight foreign members of the Royal Academy of Sciences in Paris. Three editions of his scientific works had already appeared in Paris, and a new edition, much enlarged, had recently appeared in London. To all these advantages he added a political purpose—the dismemberment of the British empire—which was entirely congenial to every citizen of France. "Franklin's reputation," wrote Mr. Adams, who, unhappily, was never able to regard his colleague's fame with entire equanimity, "was more universal than that of Leibnitz or Newton, Frederick or Voltaire, and his character more beloved and esteemed than all of them. . . . If a collection could be made of all the gazettes of Europe for the latter half of the 18th century a greater number of panegyrical paragraphs upon *le grand Franklin* would appear, it is believed, than upon any other man that ever lived."

"Franklin's appearance in the French salons, even before he began to negotiate," says the German historian Schlosser, "was an event of great importance to the whole of Europe. . . . His dress, the simplicity of his external appearance, the friendly meekness of the old man, and the apparent humility of the Quaker, procured for Freedom a mass of votaries among the court circles who used to be alarmed at its coarseness and unsophisticated truths." We may here add that such was the number of portraits, busts, and medallions of him in circulation before he left Paris that he would have been recognized from them by nearly every adult citizen in any part of the civilized world. Writing to his daughter in the third year of his residence in Paris, of a medallion to which she had alluded, he says—"A variety of others have been made since, of different sizes; some to be set in the lids of snuff-boxes and some so small as to be worn in rings, and the numbers sold are incredible. These, with the pictures, busts, and prints (of which copies are spread everywhere) have made your father's face as well known as the moon, so that he durst not do anything that would oblige him to run away, as his phiz would discover him wherever he should venture to show it."

The story of Franklin's mission to France, as recorded in his own correspondence, is singularly interesting and romantic. In these respects it is difficult to find its parallel in the literature of diplomacy. Its results may be summed up in a few words. He became at once, as already stated, an object of greater popular interest than any other man in France,—an interest which, during his eight years' sojourn there, seemed always on the increase. Streets in numerous cities, and several societies, were named after him; the French Academy paid him its highest honors, and he conferred more distinction upon any salon he frequented than it could reciprocate. He animated French society with a boundless enthusiasm for the cause of the rebel colonists, persuaded the Government that the interests of France required her to aid them, obtained a treaty of alliance at a crisis in their fortunes in the winter of 1777, when such an alliance was decisive, and the great moral advantage of a royal frigate to convey the news of it to America. A few months later he signed the treaties which bound the two countries to mutual friendship and defence, and on the morning of the 20th March, 1778, the three envoys were formally received by the king at Versailles, and through them the country they represented was first introduced into the family of independent nations.

In February of the following year General Lafayette, who had distinguished himself as a volunteer in the rebel army, returning to France on leave, brought a commission from the American congress to Dr. Franklin as sole plenipotentiary of the United States to the court of France. From this time until the close of the war it was Franklin's paramount duty to encourage the French Government to supply the colonists with money. How successfully he discharged this duty may be inferred from the following statement of the advances made by France upon his solicitation:—In 1777, 2,000,000 francs; in 1778, 3,000,000 francs; in 1779, 1,000,000 francs; in 1780, 4,000,000 francs; in 1781, 10,000,000 francs; in 1782, 6,000,000 francs,—26,000,000 francs in all. To obtain these aids at a time when France was not only at war, but practically bankrupt, and in defiance of the strenuous resistance of Necker, the minister of finance, was an achievement, the credit of which, there is the best reason for believing, was mainly due to the matchless diplomacy of Franklin. Writing to the French minister in Philadelphia, December 4, 1780, the Count de Vergennes said—

> "As to Dr. Franklin, his conduct leaves congress nothing to desire. It is as zealous and patriotic as it is wise and circumspect, and you may affirm with assurance, on all occasions where you think proper, that the method he pursues is much more efficacious than it would be if he were to assume a tone of importunity in multiplying his demands, and above all in sup-

> porting them by menaces (an allusion to the indiscreet conduct of Franklin's colleagues), to which we should give neither credence nor value, and which would only tend to render him personally disagreeable."

Again, February 15, 1781, Vergennes wrote:—

> "If you are questioned respecting an opinion of Dr. Franklin, you may without hesitation say that we esteem him as much on account of the patriotism as the wisdom of his conduct; and it has been owing in a great part to this cause, and the confidence we put in the veracity of Dr. Franklin, that we have determined to relieve the pecuniary embarrassments in which he has been placed by congress. It may be judged from this fact, which is of a personal nature, if that minister's conduct has been injurious to the interests of his country, or if any other would have had the same advantages."

Franklin had been for some years a martyr to the gout, which, with other infirmities incident to his advanced age of seventy-five, determined him to ask congress, in 1781, to relieve him, in a letter so full of dignity and feeling, that no one can read it even now, after the lapse of nearly a century, without emotion.

> "I must now," he wrote, after disposing of official topics, "beg leave to say something relating to myself—a subject with which I have not often troubled congress. I have passed my seventy-fifth year, and I find that the long and severe fit of the gout which I had the last winter had shaken me exceedingly, and I am yet far from having recovered the bodily strength I before enjoyed. I do not know that my mental faculties are impaired—perhaps I shall be the last to discover that—but I am sensible of great diminution of my activity, a quality I think particularly necessary in your minister at this court. I am afraid, therefore, that your affairs may some time or other suffer by my deficiency. I find also that the business is too heavy for me and too confining. The constant attendance at home, which is necessary for receiving and accepting your bills of exchange (a matter foreign to my ministerial functions), to answer letters, and perform other parts of my employment, prevents my taking the air and exercise which my annual journeys formerly used to afford me, and which contributed much to the preservation of my health. There are many other little personal attentions which the infirmities of age render necessary to an old man's comfort, even in some degree to the continuance of his existence, and with which business often interferes.
>
> "I have been engaged in public affairs, and enjoyed public confidence in some shape or other during the long term of fifty years, and honor sufficient to satisfy any reasonable ambition; and I have no other left but that of repose, which I hope the congress will grant me by sending some person to supply my place. At the same time I beg they may be assured that it is not any the least doubt of their success in the glorious cause, nor any disgust received in their service, that induces me to decline it, but purely and simply the reasons I have mentioned. And as I cannot at present undergo the fatigues of a sea voyage (the last having been almost too much for me), and would not again expose myself to the hazard of capture and imprisonment in this time of war, I propose to remain here at least till the peace—perhaps it may be for the remainder of my life—and if any knowledge or experience I have acquired here may be thought of use to my successor, I shall freely communicate it and assist him with any influence I may be supposed to have, or counsel that may be desired of me."

Congress not only declined to receive his resignation, but with its refusal sent him a commission, jointly with John Adams and John Jay, who had been the agent of the congress in Spain, to negotiate a peace. Cornwallis had surrendered at Yorktown on the 17th of October of that year, the anniversary of Burgoyne's disastrous surrender at Saratoga just four years before, and a farther prosecution of the war beyond what might be necessary to secure the most favorable terms of peace was no longer advocated by any party in England. Active negotiations with Franklin and his associates were opened, and on the 30th of November a preliminary treaty was signed by the English and American commissioners; a definitive treaty was signed on the 30th of September, 1783, and ratified by congress January 14, 1784, and by the English Government on the 9th of April following. At the conclusion of the preliminary treaty Franklin renewed his application to congress to be relieved, to which he received no answer. A few weeks after signing the definitive treaty, he renewed it again, but it was not until the 7th of March, 1785, that congress adopted the resolution which permitted "The Honorable Benjamin Franklin to return to America as soon as convenient," and three days later it appointed Thomas Jefferson to succeed him.

During his stay in Paris Franklin gave by no means all his time to political problems. He wrote a paper for the Royal Society on the subject of balloons, a topic which, under the auspices of the Montgolfiers, attracted a great deal of attention at that time in France. Sir Joseph Banks commended it for its completeness. To some one who asked the use of the new invention Franklin replied by asking, "What is the use of a new-born baby?" In 1784 he was appointed by the French Academy one of a commission ordered by the king to investigate the phenomena of "mesmerism;" and to a large extent he directed the investigation which resulted in the disgrace and flight of Mesmer and his final disappearance from the public eye. Franklin's *Information to those who would Remove to America*, his *New Treatise on Privateering*, his *Essay on Raising the Wages in Europe by the American Revolution*, his *Letter to Vaughan on Luxury*, his *Story of the Whistle*, together with his private as well as official correspondence, kept the world constantly talking about him and wondering at the inexhaustible variety and unconventional novelty of his resources. "You replace Dr. Franklin, I hear," said the Count de Vergennes to Jefferson when they first met. "I succeed, no one can replace him," was Jefferson's reply.

It was on the 12th of July, 1785, that, accompanied by some members of his family and most intimate friends, he set out for Havre on his return to America. In view of his infirmities, the queen had placed one of her litters at his disposal; the next day he was constrained by a most pressing invitation to accept the hospitality of Cardinal de la Rochefoucauld at Gaillon. At Rouen, he was waited upon by a deputation of the Academy of that city. At Portsmouth, where the party joined the vessel that was to take them home, the bishop of St. Asaph's, "the good bishop," as Franklin used to style him, an old friend and correspondent, came down with his family to see him, and remained with him for the two or three days before they sailed.

On the 13th of September Franklin, who had become by far the most widely known and the most eminent of Americans, disembarked again at the very wharf in Philadelphia on which, sixty-two years before, he had landed a houseless, homeless, friendless, and substantially penniless runaway apprentice of seventeen. The day succeeding his arrival, the assembly of Pennsylvania voted him a congratulatory address; the public bodies very generally waited upon him, and General Washington, by letter, asked to join in the public gratulations upon his safe return to America, and upon the many eminent services he had rendered. Sensible as his countrymen were of the magnitude of their obligations to him, and of his increasing infirmities, it never seems to have occurred to them that they could dispense with his services. In the month succeeding his arrival he was chosen a member of the municipal council of Philadelphia, of which he was also unanimously elected chairman. He was soon after elected by the executive council and assembly president of Pennsylvania, by seventy-six out of the seventy-seven votes cast. "I have not firmness enough," he wrote to an old friend, "to resist the unanimous desire of my country folks, and I find myself harnessed again to their service another year. They engrossed the prime of my life. They have eaten my flesh, and seem resolved now to pick my bones."

At the expiration of his term in 1786, he was unanimously re-elected, and again unanimously in 1787. He was also chosen a member of the national convention, of which Washington was a member and president, which met on the second Monday of May, 1787, to frame a constitution for the new confederacy. To the joint influence of Franklin and Washington probably should be ascribed the final adoption of the constitution which this convention framed, and which continues to be the fundamental law of the United States. The most original, if not the most ingenious, and perhaps, in view of the grave difficulties it disposed of, the most important feature of the constitution they constructed—that which gave the States equal representation in the upper house or senate and in the lower house representation according to population—was the device of Franklin. For his three years' service as president of Pennsylvania Franklin refused to accept any compensation beyond a reimbursement of the postage he had paid on official letters, amounting to some £77, 5s. 6d., it being one of his notions, which he advocated in the convention, that the chief magistrates of a nation should serve without pecuniary compensation. Franklin survived his retirement from office two years, which he consecrated almost as exclusively to the public use as any other two of his life, although most of the time the victim of excruciating pain. His pen was never more actively nor more effectively employed. He helped to organize and was president of the first society formed on the American continent or anywhere else, we believe, for the abolition of slavery, and as its president wrote and signed the first remonstrance against slavery addressed to the American congress.

Franklin died in his own house, in Philadelphia, on the 17th of April, 1790, and in the eighty-fifth year of his age. Since then, as in life, his fame has gone on increasing. No American has ever received such varied and extensive homage from his countrymen. There is no State in the United States, and there are few counties that have not a town called Franklin (Ohio has nineteen of them); scarce a town that does not boast of its Franklin Street, or its Franklin Square, or its Franklin hotel, or its Franklin bank, or its Franklin insurance company, and so on; his bust or portrait is everywhere; and some sort of a monument of Franklin is among the attractions of almost every large city.

When Franklin, the fugitive apprentice boy, in 1723, walked up Market Street on the morning of his first arrival in Philadelphia, munching the rolls in which he had invested a portion of the last dollar he had in the world, the curious spectacle he presented did not escape the attention of Miss Read, a comely girl of eighteen years who chanced to be standing in the door of her father's house when he passed. Not long after, accident gave him an introduction to her; they fell in love, and soon after his return from his trip to England he married her. By her he had two children, a son who died young, whom Franklin spoke of as the finest child he ever saw, and a daughter, Sally, who married Richard Bache, of Yorkshire, England. Mrs. Bache had eight children, from whom are descended all that are now known to inherit any of the blood of Benjamin Franklin. Before his marriage Franklin had a son whom he named William, who acted as his secretary during his first official residence in England, and who, as a compliment to the father, was made governor of the province of New Jersey. When the rebellion broke out, William adhered to the mother country, which exposed him to serious indignities and was a source of profound mortification to his father. Next to the loss of his only legitimate son, this was perhaps the greatest sorrow of Franklin's life.

> "You conceived, you say," wrote Franklin to him nine years after the rupture, "that your duty to your king and regard for your country required this. I ought not to blame you for differing in sentiments with me on public affairs. We are men all subject to errors. Our opinions are not in our own power. They are formed and governed much by circumstances that are often as inexplicable as they are irresistible. Your situation was such that few would have censured your remaining neuter, though there are natural duties which precede political ones, and cannot be extinguished by them."

Without presuming to extenuate anything that was unfilial in Governor Franklin's conduct, we cannot help remarking that Franklin, with a blindness common to parents, quite overlooked the fact that his son, when he determined to adhere to the sovereign whom he had sworn loyally to serve, was a lusty lad of forty-five years.

In his will the father left William his lands in Nova Scotia, and forgave him the debts due to him. "The part he acted against me in the late war," continued the will, "which is of public notoriety, will account for my leaving him no more of an estate he endeavored to deprive me of." Governor Franklin had a son who also was not born in wedlock, named William Temple Franklin. He was brought up by his grandfather and served him in the capacity of private secretary during most of his residence in France, and after his return to the United States. Franklin tried repeatedly but unsuccessfully to have the young man appointed to some subordinate mission. He had been brought up in France, his education was strangely deficient, and he does not seem to have left an altogether favorable impression upon his countrymen abroad or at home after his return. It would not be strange if they judged him more correctly than his grandfather did. To this grandson Franklin bequeathed most of his books and all his manuscripts and papers, from which he published the first edition of the writings of his grandfather, purporting to be complete, in 1816, and after a delay never satisfactorily explained and apparently inexcusable. A criticism of this publication, attributed to Jeffrey, appeared in the *Edinburgh Review*, No. 56, August, 1817.

Though spending more than half of his life in the public service, Franklin was never for a moment dependent upon the Government for his livelihood. With the aid of his newspaper, his frugality, and his foresight, he was enabled to command every comfort and luxury he desired through his long life, and to leave to his descendants a fortune neither too large nor too small for his fame, and valued at the time of his death at about £30,000 sterling. Though rendering to his country as a diplomatist and statesman, and to the world as a philosopher, incalculable services, he never sought nor received from either of these sources any pecuniary advantage. Wherever he lived he was the inevitable centre of a system of influences always important and constantly enlarging; and dying, he perpetuated it by an autobiography which to this day not only remains one of the most widely read and readable books in our language, but has had the distinction of enriching the literature of nearly every other. No man has ever lived whose life has been more universally studied by his countrymen or is more familiar to them.

Though his pen seemed never idle, the longest production attributed to his pen was his autobiography, of less than 300 8vo pages, and yet, whatever subject occupied his pen, he never left the impression of incompleteness. He was never tedious, and an inexhaustible humor, a classic simplicity, an exquisite grace, and uniform good sense and taste informed and gave permanent interest to everything he wrote. Franklin was not an orator, but when he spoke, as he did occasionally in the several deliberative bodies of which he was a member, his word, though brief, was, like his writings, always clear, judicious, felicitous, and potential. No man ever possessed in a greater degree the gift of putting an argument into an anecdote.

His country owes much to him for his service in various public capacities; the world owes much to the fruits of his pen; but his greatest contribution to the welfare of mankind, probably, was what he did by his example and life to dignify manual labor. While Diderot was teaching the dignity of labor in France and the folly of social standards that proscribed it, Franklin was illustrating it in America, and proving by his own most conclusive example that

"Honor and fame from no condition rise."

There are few born into this world so ill-conditioned that they cannot find comfort and encouragement from some portion of the life of Franklin; none of any station who may not meditate on it with advantage. That feature of it which is most valuable will probably be found most difficult to imitate. It is stated by himself in the following extract from his diary in 1784:—

> "*Tuesday*, 27th.—Lord Fitzmaurice called to see me, his father having requested that I should give him such instructive hints as might be useful to him. I occasionally mentioned the old story of Demosthenes's answer to one who demanded what was the first point of oratory? *Action*; the second? *Action*; the third? *Action*—which I said had been generally understood to mean the action of an orator with his hands in speaking, but that I thought another kind of 'action' of more importance to an orator who would persuade people to follow his advice, viz.—such a course of action in the conduct of life as would impress them with an opinion of his integrity as well as of his understanding; that this opinion once established, all the difficulties, delays, and oppositions usually occasioned by doubts and suspicions were prevented; and such a man, though a very imperfect speaker, would almost always carry his points against the most flourishing orator who had not the character of sincerity. To express my sense of the importance of a good private character in public affairs more strongly, I said the advantage of having it, and the disadvantage of not having it, were so great that I even believe if George III. had had a bad private character and John Wilkes a good one, the latter might have turned the former out of his kingdom."

Though Franklin was far from being insensible to what are termed worldly considerations, his public life was singularly free from any vulgar or degrading trace of self-seeking; he never is found making the public interests secondary to his own; though holding office a good portion of his life, he never treated office-holding as a profession, nor the public treasury as the accumulations of the many for the good of a few. His private affairs and the public business were never allowed to become entangled or to depend the one upon the other. Though, from the nature of his various employments, a target for every form of malevolence and detraction during the last half of his life, his word was never impeached, nor his good faith and fairness, even to his enemies, successfully questioned. Of some irregularities in his youth he early repented, and for the benefit of mankind made a public confession, and all the reparation that was possible.

The most complete edition of Franklin's works is that of Jared Sparks, in 10 vols. 8vo, Boston, 1836–40. An edition of the autobiography, revised by John Bigelow, from original MSS., appeared in 1868, and again in 1875, 3 vols. Parton's *Life and Times of Benjamin Franklin*, 2 vols., was published at New York in 1864. (J. BI.)

The foregoing article is reprinted, by permission of Messrs. Little, Brown, & Co., Boston, Mass., from *Franklin, a Sketch*, by John Bigelow, Boston, 1879.

FRANKLIN, Sir John (1786–1847), rear-admiral, was born at Spilsby, Lincolnshire, April 16, 1786. Sprung from a line of free-holders, or "franklins," his father inherited a small family estate, which was so deeply mortgaged by his immediate predecessor that it was found necessary to sell it; but by his success in commercial pursuits he was enabled to maintain and educate a family of twelve children. John, the youngest son, was destined for the church by his father, who, with this view, had purchased an advowson for him. He received the rudiments of education at St. Ives, and afterwards attended Louth Grammar School for two years; but having employed a holiday in walking 12 miles with a companion to look at the sea, which up to that time he knew only by description, his imagination was so impressed that he determined to be a sailor. In the hope of dispelling what he considered to be a boyish fancy, his father sent him on a trial voyage to Lisbon in a merchantman; but it being found on his return that his wishes were unchanged, an entry on the quarter-deck of the "Polyphemus," 74, Captain Lawford, was procured for him in 1800; and this ship having led the line in the battle of Copenhagen in 1801, young Franklin had the honor of serving in Nelson's hardest-fought action. Two months after the action of Copenhagen, he joined the "Investigator," discovery-ship, commanded by his relative Captain Flinders, and under the training of that able scientific officer, while employed in exploring and mapping the coasts of Australia, he acquired a correctness of astronomical observation and a skill in surveying which proved of eminent utility in his future career. Franklin was on board the "Porpoise" when that ship and the "Cato" were wrecked, August 18, 1803, on a coral reef, off the coast of Australia (see Flinders). After this misfortune, Franklin proceeded to Canton, where he obtained a passage to England in the "Earl Camden," East Indiaman, commanded by Sir Nathaniel Dance, commodore of the China fleet of 16 sail. On the 15th of February, 1804, Captain Dance repulsed a strong French squadron, led by the redoubtable Admiral Linois. In this action Franklin performed the important duty of signal midshipman. On reaching England, he joined the "Bellerophon," 74, and in that ship he was again entrusted with the signals, a duty which he executed with his accustomed coolness and intrepidity in the great battle of Trafalgar. In the "Bedford," his next ship, he attained the rank of lieutenant, and remaining in her for six years, latterly as first lieutenant, served in the blockade of Flushing, on the coast of Portugal, and in other parts of the world, but chiefly on the Brazil station, whither the "Bedford" went as part of the convoy which escorted the royal family of Portugal to Rio de Janeiro in 1808. In the ill-managed and disastrous attack on New Orleans, he commanded the "Bedford's" boats in an engagement with the enemy's gunboats, one of which he boarded and captured, receiving a slight wound in the hand-to-hand fight.

On peace being established, Franklin turned his attention once more to the scientific branch of his profession, and sedulously extended his knowledge of surveying. In 1818 the discovery of a north-west passage became again, after a long interval, a national object, and Lieutenant Franklin was appointed to the "Trent," as second to Captain Buchan of the "Dorothea," hired vessels equipped for penetrating to the north of Spitzbergen, and, if possible, crossing the Polar Sea by that route. During a heavy storm, both ships were forced to seek for safety by boring into the closely packed ice, in which extremely hazardous operation the "Dorothea" was so much damaged that her reaching England became doubtful; but the "Trent" having sustained less injury, Franklin requested to be allowed to prosecute the voyage alone, or under Captain Buchan, who had the power of embarking in the "Trent" if he chose. The latter, however, declined to leave his officers and men at a time when the ship was almost in a sinking condition, and directed Franklin to convoy him to England. Though success did not attend this voyage, it brought Franklin into personal intercourse with the leading scientific men of London, and they were not slow in ascertaining his peculiar fitness for the command of such an enterprise. To calmness in danger, promptness and fertility of resource, and excellent seamanship, he added other qualities less common, more especially an ardent desire to promote science for its own sake, and not merely for the distinction which eminence in it confers, together with a love of truth that led him to do full justice to the merits of his subordinate officers, without wishing to claim their discoveries as a captain's right. Added to this, he had a cheerful buoyancy of mind, which, sustained by religious principle of a depth known only to his most intimate friends, was not depressed in the most gloomy times. It was, therefore, with full confidence in his ability and exertions that he was, in 1819, placed in command of an expedition appointed to travel through Rupert's Land to the shores of the Arctic Sea, while Lieutenant Parry was despatched with two vessels to Lancaster Sound. At this period, the northern coast of America was known at two isolated points only, viz., the mouth of the Coppermine River, discovered by Hearne,—but placed erroneously by him four degrees of latitude too much to the north,—and the mouth of the Mackenzie. Lieutenant Franklin, accompanied by a surgeon, two midshipmen, and a few Orkneymen, embarked for Hudson's Bay, in June, 1819. His instructions left the route he was to pursue much to his own judgment, guided by the information he might be able to collect at York Factory from the Hudson's Bay Company's servants there assembled. Wintering the first year on the Saskatchewan, the expedition was fed by the Hudson's Bay Company; the second winter was spent on the "barren grounds," the party subsisting on game and fish procured by their own exertions, or purchased from their native neighbors; and in the following summer the expedition descended the Coppermine River, and surveyed a considerable extent of the sea coast to the eastward. The survivors of this expedition travelled, from their start at York Factory to their return to it again, by land and water, 5550 miles. While engaged on this service, Franklin was promoted to be a commander, and after his return to England in 1822 he obtained the post rank of captain, and was elected a fellow of the Royal Society. In the succeeding year he married Eleanor, the youngest daughter of Mr. Porden, an eminent architect.

In a second expedition, which left home in 1825 (his wife dying within the same year), Franklin descended the Mackenzie and traced the coast-line through 37 degrees of longitude, from the mouth of the Coppermine River, where his former survey commenced, to near the 150th meridian, and approaching within 160 miles of the most easterly point attained by Captain Beechey, who was co-operating with him from Behring's Strait. His exertions were fully appreciated at home and abroad. He was knighted in 1829, received the honorary degree of D.C.L. from the university of Oxford, was awarded the gold medal of the Geographical Society of Paris, and was elected in 1846 correspondent of the Paris Academy of Sciences. Though the surveys executed by himself and by a detachment under command of Dr. Richardson comprised one, and within a few miles of two, of the spaces for which a parliamentary reward was offered, the Board of Longitude declined making the award; but a bill was soon afterwards laid before parliament by the secretary of the Admiralty abrogating the reward altogether, on the ground of the discoveries contemplated having been thus effected. The results of these expeditions are described by Franklin and his companion Dr. (afterwards Sir John) Richardson in two magnificent works published in 1824–29. In 1828 he married his second wife, Jane, second daughter of Mr. John Griffin. His next official employment was on the Mediterranean station, in command of the "Rainbow," and his ship soon became proverbial in the squadron for the happiness and comfort of her officers and crew.[1] As an acknowledgment of the essential service he had rendered off Patras in the "war of liberation," he received the Cross of the Redeemer of Greece from King Otho, and after his return to England he was created Knight Commander of the Guelphic order of Hanover.

In 1836 Sir John accepted the lieutenant-governorship of Van Diemen's Land (now Tasmania). His government, which lasted till the end of 1843, was marked by several events of much interest. One of his most popular measures was the opening of the doors of the legislative council to the public. He also originated a college, endowing it largely from his private funds with money and lands, in the hope that it would eventually prove the means of affording to all parties secular and religious instruction of the highest kind. He requested Dr. Arnold to select some one competent to take the direction of this institution; and the choice fell on the Rev. John Philip Gell. In his time also the colony of Victoria was founded by settlers from Tasmania; and towards its close, transportation to New South Wales having been abolished, the convicts from every part of the British empire were sent to Tasmania. On an increase to the lieutenant-governor's salary being voted by the colonial legislature, Sir John declined to derive any advantage from it personally, while he secured the augmentation to his successors. In 1838 he founded a scientific society at Hobart Town (now called the "Royal Society of Tasmania"), the meetings of which were held in Government House, and its papers printed at his expense. He welcomed eagerly the various expeditions for exploration and surveying which visited Hobart Town under command of Captains Wickham, Stokes, Owen Stanley, and others. Conspicuous among these, and of especial interest to himself, were the French and English Antarctic expeditions of Dumont D'Urville and Sir James C. Ross,—the latter commanding the "Erebus" and "Terror," with which the name of Franklin was to be for ever so pathetically connected. A magnetic observatory, fixed at Hobart Town as a dependency of the central establishment under Colonel Sabine, was an object of deep interest up to the moment of his leaving the colony.

Thus pleasantly occupied, the years allotted to a colonial governorship drew to a close. Franklin had passed through phases of difficulty common to all governors of colonies remote from the imperial centre; and it was impossible for an impartial and high-minded ruler to avoid collision with personal interests. But that his unflinching efforts for the social as well as the political advancement of the colony were already appreciated was abundantly proved by the affection and respect universally testified by the addresses which proceeded from every section of the community, and by the demonstrations from all classes on his departure. A local newspaper, describing the scene in much detail, adds, "Thus departed from among us as true and upright a governor as ever the destinies of a British colony were entrusted to." That this was no evanescent feeling is attested by the fact that several years afterwards the colonists showed their remembrance of his virtues and services by sending to Lady Franklin a subscription of £1700 in aid of her efforts in the search for their former governor, and later still by a unanimous vote of the legislature for the erection of a statue in honor of him at Hobart Town.

Sir John found, on reaching England, that the confidence of the Admiralty in him was undiminished, as was shown by his being offered in 1845 the command of an expedition for the discovery of the North-West passage; this offer he accepted. The prestige of Arctic service and of his former experiences attracted a crowd of volunteers of all classes, from whom were selected a body of officers conspicuous for talent and energy. Thus supported, with crews carefully chosen (some of whom had been engaged in the whaling service), victualled for three years, and furnished with every appliance then known, Franklin's expedition, consisting of the "Erebus" and "Terror" (134 officers and men), with a transport ship to convey additional stores as far as Disco in Greenland, sailed from Greenhithe on the 19th of May, 1845. The ships were last seen on the 26th of July in Baffin's Bay by a whaler which was moored to an iceberg in lat. 74° 48′ N. and long. 66° 13′ W.; and at that time the expedition was proceeding prosperously. Letters written by Franklin a few days previous to that date were couched in language of cheerful anticipation of success, while those received from his officers expressed their glowing hope, their admiration of the seaman-like qualities of their commander, and the happiness they had in serving under him.

Franklin's instructions were framed (in conjunction with Sir John Barrow and upon his own suggestions) by the eminent explorers with whom his former work had closely connected him. The experience of Parry made it evident that a fresh attempt to force ships through the heavy ice seen by him to the south-west of Melville Island would be futile, as has since been fully proved. On the other hand, Franklin's surveys of the north coast of America had long before satisfied him that a navigable passage existed along it, from the Fish River to Behring's Strait. He was therefore directed to pursue a course towards the coast after he had approached the longitude of about 98° W., and was allowed the single alternative of previously examining Wellington Channel if the navigation were open. An explicit prohibition was given against a westerly course beyond the longitude of 98° W.

In 1847, though there was no real public anxiety as to the fate of the expedition, preparations began to be made for the possible necessity of succoring the explorers. As time passed, however, and no tidings of the expedition reached England, the search began in earnest; expedition after expedition was despatched in quest of them in 1848 and succeeding years, regardless of cost or hazard. In this great national undertaking Sir John's heroic wife took a part which will ennoble her name for all time. Between 1848 and 1854 about fifteen expeditions were sent out by England and America in the hope of rescuing, or at least finding traces of the missing explorers. The details of the work done by those expeditions will be given in the article on POLAR REGIONS; here we shall confine ourselves to the results, so far as the search for Franklin was concerned. Lady Franklin's exertions were unwearied; she exhausted her private funds in sending out auxiliary vessels to quarters not comprised in the public search, and by her pathetic appeals she roused the sympathy of the whole civilized world. Traces of the missing ships were discovered by Ommanney and Penney in August, 1850, and were brought home by the "Prince Albert," fitted out by Lady Franklin with the especial object of following to the southward the route which would be almost certainly taken by Franklin in carrying out his instructions. It was thus ascertained that the first winter had been spent behind Beechey Island, where they had remained at least as late as April, 1846. No further tidings were obtained until the spring of 1854, when Dr. Rae, then conducting an exploring party of the Hudson's Bay Company from Repulse Bay, was told by the Eskimo that (as was inferred) in 1850 white men, to the number of about forty, had been seen dragging a boat over the ice near the north shore of King William's Island, and that later in the same season, but before the breaking up of the ice, the bodies of the whole party were found by the natives at a point a short distance to the north-west of Back's Great Fish River, where they had perished from the united effects of cold and famine. The latter statement was afterwards disproved by the discovery of skeletons upon the presumed line of route; but indisputable proof was given that the Eskimo had communicated with members of the missing expedition, by the various articles obtained from them and brought home by Dr. Rae, who, on his return to England, claimed, and succeeded in obtaining, the reward of £10,000 offered by the Admiralty in 1849, "to any party or parties who, in the judgment of the Board of Admiralty, shall, by virtue of his or her efforts, first succeed in ascertaining" the fate of the missing expedition. On account of the information obtained by Dr. Rae, a party in two canoes under Messrs. Anderson and Stewart was in 1855 sent by Government down the Great Fish River, and they succeeded in obtaining from the Eskimo at the mouth of the river a considerable number of articles which had evidently belonged to the Franklin expedition; and many others were picked up on Montreal Island, articles evidently belonging to a boat which, it was reported, had been cut up by the Eskimo. This expedition was unable to make so thorough a search as was desirable, but it was clear from the results obtained by it, and from the examinations which had been made by the many other expeditions of all straits and inlets and coasts except the region to the north of Great Fish River, that King William's Island, the west coast of Boothia, and the neighboring sea were the fields likely to yield the most satisfactory results. It was clear that a party from the "Erebus" and "Terror" had endeavored to reach by the Fish River route the settlements of the Hudson Bay Company, and equally evident that the expedition, in making a southerly course, had been arrested within the channel into which the Great Fish River empties itself. At this time Government was wholly taken up with the events in the East, and when the war was over it was deemed useless to spend any more money and risk any more lives in what was regarded as a hopeless quest. But Lady Franklin's pious devotion to the memory of her noble husband prompted her to make one last effort to ascertain his fate; to this object she dedicated all her available means, aided, as she had been before, by the subscriptions of sympathizing friends, her judgment being confirmed by the opinion of all those best able to form one as to the hopefulness as well as the feasibility of such an attempt. Accordingly she purchased and fitted out the little yacht "Fox," which sailed from Aberdeen in July, 1857; the command was accepted by Captain (afterwards Sir) Leopold M'Clintock, whose high reputation had been won in three of the Government expeditions sent out in search of Franklin. Having been compelled to pass the first winter in Baffin's Bay, it was not till the autumn of 1858 that the expedition passed down Prince Regent's Inlet, and the "Fox" put into winter quarters at Port Kennedy, at the eastern end of Bellot Strait, between North Somerset and Boothia Felix. In the spring of 1859 three sledging parties went out, Captain (now Sir) Allen Young to examine Prince of Wales Island, Lieutenant (now Captain) Hobson the north and west coasts of King William's Island, and M'Clintock the east and south coasts of the latter, the west coast of Boothia, and the region about the mouth of Great Fish River. The search was successful so far as ascertaining the course and fate of the expedition is concerned. From the Eskimo in Boothia many relics were obtained, and reports as to the fate of the ships and men; all along the west and south coast of King William's Island remains of articles belonging to the ships were discovered, and skeletons that told a terrible tale of disaster. Above all, in a cairn at Point Victory a precious record was discovered by Lieut. Hobson that briefly told the history of the expedition up to April 25, 1848, three years after it set out full of hope. In 1845–6 the "Erebus" and "Terror" wintered at Beechey Island, on the S.W. coast of North Devon, in lat. 74° 43′ 28″ N., long. 91° 39′ 15″ W., after having ascended Wellington Channel to lat. 77° and returned by the west side of Cornwallis Island. This statement was signed by Graham Gore, lieutenant, and Charles F. Des Vœux, mate, and bore date May 28, 1847. These two officers and six men, it was further told, left the ships on May 24, 1847, no doubt for an exploring journey, at which time all was well,

---

[1] The sailors, with their usual fondness for epithets, named the ship the "Celestial Rainbow" and "Franklin's Paradise."

The success of the first year's work, thus briefly stated, was greater than has been since attained within any one season in arctic service. The alternative course permitted by Franklin's instructions had been attempted but was not pursued, and in the autumn of 1846 he followed that which was especially commended to him. But on his attempting to reach the coast of America, the obstruction of heavy ice, which presses down from Melville Island through M'Clintock Channel (not then known to exist) upon King William's Island had finally arrested his progress. It must be remembered that in the chart carried out by Franklin this island was laid down as a part of the mainland of Boothia, and he therefore could pursue his way *only* down its western coast. The record that revealed all which has been briefly stated was written upon one of the forms supplied by the Admiralty to surveying vessels, to be thrown overboard after the required data had been filled in. But upon the margin around the printed form was an addendum dated the 25th April, 1848, which extinguished all hopes of a successful termination of their grand enterprise. The facts are best conveyed by the terse and expressive words of the record, which is therefore given *verbatim*:—"April 25th, 1848. H. M. Ships 'Terror' and 'Erebus' were deserted on 22d April, five leagues N.N.W. of this, having been beset since 12th September, 1846. The officers and crews, consisting of 105 souls under the command of Captain F. R. M. Crozier, landed here in lat. 69° 37′ 42″ N., long. 98° 41′ W. Sir John Franklin died on the 11th June, 1847; and the total loss by deaths in the expedition has been to this date 9 officers and 15 men." The handwriting is that of Captain Fitzjames, to whose signature is appended that of Captain Crozier, who also adds the words of chief importance, namely, that they would "start on tomorrow 26th April, 1848, for Back's Fish River." A briefer record has never been told of so tragic a story. Thus it was reserved for the latest effort of Lady Franklin to develop not only the fate of her husband's expedition, but also the steps of its progress up to crowning success, mingled indeed with disaster almost unprecedented.

All of the party had without doubt been greatly reduced through want of sufficient food, and the injurious effects of three winters in these regions. They had greatly overrated their strength in attempting to drag with them two boats, besides heavily laden sledges, and doubtless had soon been compelled to abandon much of their burden, and leave one boat on the shore of King William's Island, where it was found, near the middle of the west coast, by M'Clintock; it contained two skeletons. From the Eskimo we learn that the men dropped down as they walked, and often had to be left unburied. Although many relics were found in possession of the Eskimo, there seems no reason to believe that the retreating crews met with foul play. From all that can be gathered, one of the vessels must have been crushed in the ice and the other stranded on the shore of King William's Island, where it lay for years, forming a mint of wealth for the neighboring Eskimo. M'Clintock examined all the shores of the island with the greatest care, but found no trace of a stranded vessel.

This is all we know of the fate of Franklin and his brave men. His memory is cherished as one of the most conspicuous of the naval heroes of Britain, and as one of the most successful and daring of her explorers. He is certainly entitled to the honor of being the first discoverer of the North-West passage; the point reached by the ships brought him to within a few miles of that attained from the westward by the explorations of earlier years; he had indeed all but traversed the entire distance between Baffin's Bay and Behring's Strait. On the monument erected to Franklin by his country, in Waterloo Place, London, the honor of discovering the passage is justly awarded to him and his companions,—a fact which was also affirmed by the president of the Royal Geographical Society, when presenting to Lady Franklin in 1860 their gold medal. More recently a fine monument, erected in 1875 in Westminster Abbey, commemorates the heroic deeds and fate of Sir John Franklin, the death (which occurred in that year) of Lady Franklin, and the inseparable connection of her name with the fame of her husband. Most of the Franklin relics brought home by M'Clintock were presented by Lady Franklin to the United Service Museum, while those given by Dr. Rae to the Admiralty are deposited in Greenwich Hospital. Captain Hall, so well known in connection with the "Polaris" expedition, spent five years with the Eskimo, and made two journeys in endeavoring to trace the remnant of Franklin's party, bringing back in 1869 a number of additional relics and some information confirmatory of that given by M'Clintock. In 1878 a search expedition was sent out from America in consequence of a tale told to Mr. Barry, the mate of a whaler, by some Nechelli Eskimo, met by him at Whale Point, Hudson's Bay. He obtained from these Eskimo some spoons bearing Franklin's crest. The Eskimo were understood to say that these were received from a party of white men, who passed a winter near their settlement, and all died. The white men, the Eskimo stated, left a number of books with writing in them, which were buried. The story has some points about it that make one inclined to doubt its accuracy. Still it is satisfactory that the search party has been sent out, and we can only hope that it will be rewarded by discovering some of the records of the unfortunate expedition.[1] (J. S. K.)

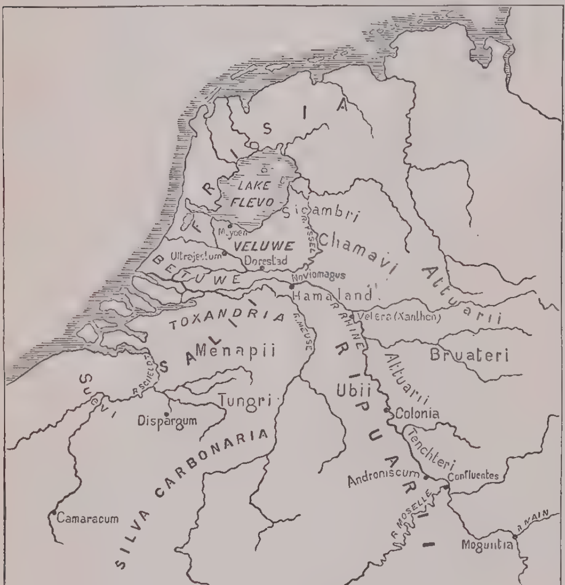
FRANKS, The. When, in the year 241 A.D., the soldiers of Aurelian, who just before had been on the north German frontier, marched out of Rome on their way to the Persian war, they sang (Vopiscus *in Aureliano*, c. 7) a rough barrack song—

> "Mille Sarmatas, mille *Francos*, semel et semel occidimus;
> Mille mille mille mille mille Persas quærimus;"

---

[1] The first portion of this notice is mainly from Sir John Richardson's article in last edition, and the whole has been revised by Miss Cracroft, Sir John Franklin's niece.

and the words, caught up by the admiring mob, became a street boys' ballad in those days of debased imperialism. Unless we give to Peutinger's *Itinerary* an earlier date than is probable, this street song marks the first appearance in history of the Frankish name. Cæsar, Tacitus, Ptolemy, are alike silent as to it, although they often speak of other tribes which occupied the very districts in which we afterwards find the Franks. It is therefore probable, though Jacob Grimm (*Geschichte der Deutschen Sprache*, p. 518) says that the view has "only a moderate value," that Frank is the newest of all German names, and represents, somewhat vaguely, a group of tribes who dwelt about the lower and middle Rhine. The Frank lived in districts previously occupied by tribes bearing other names; nor have we proof of any incursion of a strange tribe called Franks from north or east. The old Frankish legend that they came from the Danube to the Rhine probably arose from the fact that a colony of the Sicambrian cohort was planted by the Romans on the spot where Buda-Pesth now stands; nor need we seriously consider the usual annalist statement that they were "reliquiæ Troianorum." The meaning and origin of the term also lends itself to the view above stated,—the words "frank and free," usually grouped together, are in fact the same in origin and meaning (*fri*, *frech*, M.H.G.; *frekkar*, Scand.; *friks*, Goth. =*audax*, *avidus;* then by insertion of *n*, cp. *linquo* from root of *liqui*, we get *frank*). The two words thus grouped together form an epithet rather than a proper name; the "free Franks" are those tribes whose freedom suffered most attack; the name probably came into being in the 3d century A.D. as a part of the resistance of northern and north-western Germany to the ceaseless attempts of Rome. "Francus habet nomen a feritate sua," says Ermoldus Nigellus (i. 344); and the word carries the sense of boldness, defiance, freedom. As it did not lend itself well to Latin verse-endings, and as its origin was late, we find the silver and leaden poets delighting to call the Franks Sicambri, as in the famous speech of St. Remi to Hlodowig, "Depone mitis colla, Sicamber," etc.



The Salians and Ripuarians, *cir.* 400.

When their history begins, the Franks are in three groups, mostly on the left bank of the Rhine, from Mainz to the sea. It is, however, quite clear that in earlier days they dwelt also on the right or German bank; for if at first the Romans pressed on them, ere long they began to press on the Romans in return. The oldest Frankish land was then on the Rhine; some of it lay to the north of the Betuwe (the island between Meuse and Rhine), having the river Yssel as its eastern limit, and a line drawn through Durstede, Utrecht, and Muyden as its western boundary. The Franks of this district, afterwards called Salians (a name derived either from Sala, an inheritance, or from the river Saal, or Yssel), filled the parts called the Veluwe and the territory of the Sicambri; south-east of these was a second group, the Chamavi, Bructeri, Attuarii, also at first on the right bank of the Rhine; beyond these, a group of Chatti and Suevi, from a little above Cologne to the Main, filling up all the country between the Taunus hills and the Rhine. It is to this group of tribes, says Watterich (*Germanen des Rheins*, p. 166), that the title Frank was first given. This view of their geographical distribution is supported by the evidence of Peutinger's *Itinerary*, in which Francia stands on the right bank of the Rhine from just above Nimwegen to a little below Coblentz; and though this famous map is a road-chart rather than a record of ethnology and tribal distribution, still it may fairly be urged that its author would not have placed the Franks on the very outside of his map had their home been on the left bank of the Rhine.

In the middle of the 3d century these Franks began to press into the First and Second Germany, two tracts of land on the left bank of the Rhine from Alsace to the sea. In 240 the Chatti crossed at Mainz; in 258 Franks are in the army of Postumus as well as opposed to him; with them he drove their brethren across the Rhine and made Cologne his capital. By degrees they filled the whole district from the Moselle to the Betuwe, occupying the lands of the Ubii and Tungri, that is, from the Ardennes to the Rhine and Meuse. These Franks are known to history as the Ripuarians, receiving, as was not unnatural, a partly Latin name (Ripuarii, Riparii, bank-men; or possibly Rip-wehr-ii, bank-defenders). About the same time the Salian Franks also moved southward, crossing the Rhine, which in those days was slow and shallow in its lower course, the main waters having been diverted into the Meuse. They occupied the whole Betuwe, and spread down to the sea, inhabiting the marshy delta of the rivers ("paludicolæ Sigambri," or "Franci inviis strati paludibus," *circa* 280 A.D.); and presently (287) they took part in naval expeditions down the coast of Gaul. Then, passing the Meuse also, they seized on Toxandria, which was given over to them in 358 by the emperor Julian, who defeated them, and admired their bravery and independent spirit. Henceforth we find plenty of Franks taking service under the empire: Frankish chiefs, like Bald, Mellobald, Arbogast, rise to high places in court and army; their names appear even in the Consular Fasti; they make or unmake emperors. By the end of the 4th century the frontiers of the empire to the north had permanently receded: Andernach was the outmost Rhine station held by the Romans; Tournay was still theirs; they had a fleet on the Sambre; all beyond was Frankish land. Before long the Franks advanced again: in 429 we hear (in Gregory of Tours) that the Salians, coming "from Dispargum (Disiburg, the city of the goddesses), in Toringia," won a great battle at Cambrai under Chlodion their king, and penetrated even as far as the Loire. This Toringia is probably a confusion with Tongria, a little district on the Meuse; the Franks were never in Thuringia. With their two capitals, the Salians at Dispargum, the Ripuarians at Cologne, the Franks now became the bulwark of the Romans: they resisted the barbarians who crossed the Rhine at Mainz in 406; and in 451 again joined the legions to repel at Chalons the hideous invasion of Attila. Thus feeling their strength, it was not long before, under their young king Hlodowig, or Clovis, the Salian Franks became masters of northern Gaul, while their brethren the Ripuarians remained for the time near the Rhine. And "as the son of Childerich, following in the steps of his kinsfolk, pressed southwards, in mid career of victory he met the Christians' God. The Disi, the wild goddesses, abandoned him; he trusted in the god of Hlotehild, and conquered all his foes" (Watterich *Die Germanen des Rheins*, p. 238). These Christianized Salians, under the Merwing house, became in time lords of all Gaul, and gave it a new name, Francia Occidentalis, or Interior, or Latina, to distinguish it from the older Francia Orientalis, the Germany of the middle Rhine; the latter name drifted off towards the east, and has found a home in that central district of Franconia, which lies far away from the true Frankish land.

Henceforth the history of the Franks falls under that of France; while their institutions were mainly those of all Germans. (See FRANCE and GERMANY). Their physical features were also those of the race in general; the fierceness of their looks; the wrinkled scowl about their brows, "torvi Sicambri;" their wild blue eyes; their large limbs, which contrasted with the little stature of the Romans; their long fair hair, which was a choice commodity at Rome, being bought eagerly by the ladies of fashion in those late imperialist days,—all these things had little in them that was specially Frankish. Their weapons were more characteristic, being their own and connected closely with their name. They fought either with the "framea" (a word which is almost certainly a copyist's error for "franca"), which was a light javelin, tipped with iron sharpened on either side, a weapon fit for casting or smiting, and sometimes spoken of as a little axe; or with the francisca, which was a heavy battle-axe. It is to the Franks that the great Siegfried Saga properly belongs; and their early history is hopelessly mixed up with legend. It is not till the days of Hlodowig that any light is thrown on their institutions,—the *Lex Salica*, the law of the Salian Franks, and the *Lex Ripuaria*, of which the origin was a little later, belonging probably to the end of the 5th and the early part of the 6th centuries. The *Lex Salica* was afterwards enlarged and altered; in its earliest form it presents to us the Franks in their Toxandrian or Tongrian time, before Christianity had touched them. This law shows no trace of a feudal nobility or a "feudal system" of any kind; as Waitz (*Deutsche Verfassungsgeschichte: Das alte Recht der Salischen Franken*, p. 103) says, "Das Salische Gesetz kennt keinen Adel; auch nicht die leiseste Spur desselben findet sich." The tribes had chiefs or kings, elected by the whole body of free men from one family (as Hlodowig from among the Merwings); there were also sundry officers of justice and administration, rachimburgs or grafs, but these are no more noble than the rest of the free Franks, who formed a republic of fighting men, each man's voice being as potent in the mall as his arm was in the battle. The "læti," or the "pueri regis," the king's "damsels," and the antrustions belong to the later editions of the law. King, free Frank, and slave of war,—these are the only grades. The code endeavors, always by imposition of carefully graduated fines, to protect the sanctity of the Frank's family, to determine his duties towards the king, the graf, and the tribal council or mall, to provide for the security of his property, whether personal or landed. It is in this last part of the code that we find the famous clause (*Lex Salica*, lix., De Alodis, § 5; Waitz, p. 266) on which the so-called Salic law of France was afterwards based: "De terra vero nulla in muliere hereditas est, sed ad virilem sexum qui fratres fuerint tota terra perteneat." This special limitation as to the inheriting of Salic land (the Stamm-land as the Germans call it, the Odal of the Icelanders) is but a scanty basis on which to build a great law of royal succession, which lasted in France as long as the monarchy continued, and might still reappear, were the present republic to prove untrue to itself. Up to the time of the Revolution, the French noblesse prided themselves on being the "proud descendants of the conquerors;" but though it is possible, in earlier times, to trace or to fancy distinctions of feature and character, marking off the noble from the *roturier* or the peasant, still in the later days of the monarchy "the noble race of conquerors" was so much changed, so many old houses had become extinct, so many had been diluted with foreign blood, so many new patents of nobility had been issued, that it would require no small ingenuity and imagination to see in the courtiers of Louis XVI. the representatives of the Franks of Hlodowig or Charles the Great.

The chief authorities for the Franks are Jakob Grimm, *Geschichte der deutschen Sprache*, Leip., 1848; Waitz, *Das alte Recht der Salischen Franken: Beilage zur deutschen Verfassungsgeschichte*, Kiel, 1846; Gohm, *Fränkische Reichs- und Gerichts-Verfassung*, Weimar, 1871; Watterich, *Die Germanen des Rheins*, Leip., 1872. There is also an ingenious lecture by Giesebrecht. In modern days not much has been written on the Franks, except in connection with the history of institutions. (G. W. K.)

FRANZÉN, FRANS MICHAEL (1772–1847), Swedish poet, was born at Uleåborg in Finland, 9th February, 1772. At thirteen he entered the university of Åbo, where he graduated in 1789, and became "eloquentiæ docens" in 1792. Three years later he started on a tour through Denmark, Germany, France, and England, returning in 1796 to accept the office of university librarian at Åbo. In 1801 he became professor of history and ethics, and in 1808 was elected a member of the Swedish Academy. On the cession of Finland to Russia Franzén removed to Sweden, where he was successively appointed parish priest of Kumla in the diocese of Strengnäs (1810); minister of the Clara Church in Stockholm (1824), and bishop of Hernösand (1831). He died at Säbrå parsonage, 14th August, 1847. From the autumn of 1793, when his *Till en ung Flicka* and *Menniskans anlete* were inserted by Kellgren in the *Stockholmspost*, Franzén grew in popular favor by means of many minor poems of singular simplicity and truth, as *Till Selma*, *Den gamle knekten*, *Riddar St. Göran*, *De Små*, *Blommorna*, *Modren vid vaggan*, *Nyårsmorgonen*, and *Stjernhimmelen*. His songs *Goda gosse glaset töm*, *Sörj ei den gryende dagen förut*, *Champagnevinet*, and *Bevaringssång* were widely sung, and in 1797 he won the prize of the Swedish Academy by his *Sång öfver grefve Filip Creutz*. This noble lyric is the turning-point of Franzén's poetic life. Henceforth his muse, touched with the academic spirit, grew more reflective and didactic. His longer works, as *Emili eller en afton i Lappland*, and the epics *Sven Sture eller mötet vid Alvastra*, *Kolumbus eller Amerikas upptäckt*, and *Gustaf Adolf i Tyskland* (the last two incomplete), though rich in beauties of detail, are far inferior to his shorter pieces. Franzén was a true lyric poet, fixing with masterly art the fleeting traits of common life in a glorified and fascinating form. At a time when revolution shrieked against every traditional bond of society, the lyre of Franzén breathed innocence and peace. With gentle earnestness and naïveté he sang the sweetness of love and family life—his highest human type the prattling child, the flowery meadows his elysium. His innocence is his peculiar charm; "his very *espièglerie*," says Malmström, "is but the laugh of children's lips."

The poetical works of Franzén are collected under the title *Skaldestycken* (7 vols., 1824–61; new ed., *Samlade dikter*, with a biography by A. A. Grafström, 1867–69). A selection is published in 2 vols. (1871). His prose writings, *Om svenska drottningar* (1823), *Skrifter i obunden stil* (vol. i., 1835), *Predikningar* (5 vols., 1841–45), and *Minnesteckningar*, prepared for the Academy (3 vols., 1848–60), are marked by faithful portraiture and purity of style. See Malmström, *Inträdestal i Svenska Akademien* (1850); Hollander, *Minne af F. M. Franzén* (1868); Cygnæus, *Teckningar ur F. M. Franzéns lefnad* (1872); and Gustaf Ljunggren, *Svenska vitterhetens häfder efter Gustaf III.'s död*, vol. ii. (1876).

FRANZENSBAD, KAISER-FRANZENSBAD, EGERBRUNNEN, and formerly SCHLADAER SÄURLING a well-known Bohemian watering-place which owes its most popular name to the emperor Francis II. It is a little over three miles N. W. of Eger, at the height of about 1500 feet above the sea, in the neighborhood of the Fichtelgebirge, the Böhmerwald, and the Erzgebirge. There are altogether eight mineral springs, of which the first known was the Franzensquelle or Francis's fountain. The Poltersbrunnen gives off carbonic acid gas, which is utilized for medical purposes in a building erected in 1826. Besides the great *cursaal* or pump-room, the village contains several bathing establishments, one of which belongs to the town of Eger. In the park, which is also the property of the Eger municipality, there is a bronze statue of Francis I. by Schwanthaler. The mineral waters are saline and alkaline, and act as mild aperients and tonics. They have a great reputation, and have given rise to a considerable literature. See the works of Cartellieri (1869), Hamburger (1873), and Klein (1874).

FRASCATI, a town of Italy, in the province of Rome and about 10½ miles south of the city, with a station at the terminus of a branch railway from the main line between Rome and Naples. It is the seat of a bishop, and a favorite summer residence of the Roman nobility. Among the public buildings are the old cathedral of S. Rocco, dating from the beginning of the 14th century; the new cathedral of San Pietro, founded about 1700 by Innocent XII.; the church of Santa Maria, of the 9th century; and seven old conventual establishments. But the interest of the place is due rather to its palatial villas. The villa Aldobrandini takes its name from Cardinal Pietro Aldobrandini, was designed by Della Porta, contains frescoes by Arpino, and now belongs to the Borghese family. The villa Ruffinella or Tusculana dates from the 16th century, was for some time in the possession of Lucien Bonaparte, and afterwards passed into the hands of King Victor Emmanuel. In the chapel are the tombs of Lucien Bonaparte, his wife, his father, and his son Joseph. The villa Mondragone, the largest of all, was erected by Cardinal Altemps in the 16th century, now belongs to the Borghese family, and is partly occupied by a Jesuit school. The villa Conti, formerly known as the Ludovisi, is the property of the Torlonia family. The villa Falconieri, having been founded in 1550 by Cardinal Ruffini, ranks as the oldest in Frascati; and the villa Piccolomini is interesting as the place where Baronius composed part of his *Annals*. About 3 miles from Frascati is the Greek monastery of Grotta Ferrata, interesting mainly for the frescoes of Domenichino in the chapel of St. Nilus, the best of the Greek manuscripts formerly contained in its library having been removed to Rome. The extensive gardening operations of the people of Frascati have rendered the name "Frascatese" almost equivalent to garden-girl. In 1871 the population was 7045. For Roman remains and history see Tusculum.

FRASER, James Baillie (1783–1856), Scottish diplomatist, traveller, and author, was born at Reelick or Relig in the county of Inverness, in June, 1783. He was the eldest of the four sons of Edward S. Fraser of Reelick, all of whom found their way to the East, and gave proof of their ability. When Reza Kooleé Murza and Nejeff Kooleé Murza, the exiled Persian princes, visited England, he was appointed to be their *mehmindar*, and on their return he accompanied them as far as Constantinople. He was afterwards sent to Persia on a diplomatic mission by Lord Glenelg, and effected a most remarkable journey on horseback through Asia Minor to Teheran. His health, however, was impaired by the fatigue and exposure; and he consequently retired to his estate in Scotland. In 1823 he married a daughter of Lord Woodhouselee, and sister of Patrick Fraser Tytler. He died at Reelick in January, 1856. Fraser is said to have displayed great skill in water-colors, and several of his drawings have been engraved; and the astronomical observations which he took during some of his journeys did considerable service to the cartography of Asia. The works by which he attained his literary reputation were accounts of his travels and fictitious tales illustrative of Eastern life. In both he employed a vigorous and impassioned style, which was on the whole wonderfully effective in spite of minor faults in taste and flaws in structure. Some of his tales have not yet altogether lost their popularity.

In 1820 there appeared a *Journal of a Tour through part of the Snowy Range of the Himala Mountains*; in 1825, a *Narrative of a Journey into Khorasan in the years 1821 and 1822, including an Account of the Countries to the North-East of Persia*; and in 1826, *Travels and Adventures in the Persian Provinces on the Southern Banks of the Caspian Sea*. The first part of *The Kuzzilbash, a Tale of Khorasan*, was published in 1828, and the second part or continuation in 1830, under the title of the *Persian Adventurer*. These were followed in 1833 by *The Khan's Tale*, of which the scene is laid in Khorasan. In 1834 appeared a *History of Persia* (in the Edinburgh Cabinet Library), and in 1838 a *Narrative of the Residence of the Persian Princes in London, 1835–6*, and *A Winter Journey (Tâtar) from Constantinople to Teheran, with Travels through various parts of Persia*. Next came *Travels in Koordistan and Mesopotamia*, 1840; *The Highland Smugglers*, 1842; *Allee Neemroo*, 1842; *The Dark Falcon, a Tale of the Attruck*, 1844; *Mesopotamia and Assyria* (Edinburgh Cab. Lib.), 1847; *Military Memoirs of Lieut.-Col. Skinner*, 1851.

FRASER, Simon. See Lovat.

FRASERBURGH, a seaport town of Scotland, Aberdeenshire, on the south side of Kinnaird's Head, 42 miles north of Aberdeen. It is built nearly in the form of a square, and most of the streets cross each other at right angles. The cross is a fine structure of an hexagonal form, covering an area of 500 feet, and surmounted by a stone pillar 12 feet high, ornamented by the British arms and the arms of Fraser of Philorth. Fraserburgh is one of the chief stations of the herring fishing in Scotland, the number of herring boats engaged by the curers of the port averaging about 900. During the herring season the increase to the population of the town is upwards of 10,000. In 1877 the number of barrels of herrings cured in Fraserburgh was 180,000, and the value of the herring landed was about £280,000. The harbor, originally constructed as a refuge for British ships of war, is one of the best on the east coast of Scotland, and has lately been improved by the widening of the piers and the extension of the breakwaters. The total sum expended on the harbor from 1857 to 1877 was £87,485. It has an area of upwards of six acres, is easy of access, and affords anchorage for vessels of every size. Still further improvements are proceeding, which, when completed, will afford outside the harbor an area of 8 acres of sheltered water, with a depth of from one to two fathoms at low tide. The population of Fraserburgh in 1871 was 4268.

Fraserburgh takes its name from Sir Alex. Fraser of Philorth, who in 1613 obtained for it a charter as a burgh of regality, and whose representative, Lord Saltoun, is now superior of the town. The same Sir A. Fraser obtained in 1592 a charter for the institution and endowment of a college and university here; and at the west end of the town is a quadrangular tower of three stories which formed part of the building designed for this seminary. The intention was subsequently abandoned, probably from want of funds.

FRATRICELLI was a common name given to a number of obscure mediæval sects who flourished in the 13th and 14th centuries. They were also called Bioschi, Bighini, Bocasoti, Frérots, etc., and included such sects as the Brethren of the Full Spirit, the Brethren of the Free Spirit, the Beghards, the Brethren of the Common Life, etc. The history of these mediæval sects is very obscure; but it seems now made out that while they had some relation to and sympathy with the older Cathari and other Manichæan heretics, they had a distinct origin in the Franciscan order, and that their real aim was to carry out the principles of St. Francis even in defiance of the court of Rome. Their origin has been traced to Peter of Macerata and Peter of Fossombrone, who put themselves at the head of certain malcontent Franciscans, who, having been condemned by Pope Celestine in 1294, declared that the rule of Francis was of more authority than any pope, and that papal opposition only showed that the pope himself might become anti-Christian. They soon began to teach opposition to the pope, the clergy, and the church. They held millenarian views, and preached and practised communism after the fashion, they said, of the early Christians. Their opinion soon spread among the Franciscan Tertiaries, and the common people everywhere favored them. Boniface VIII. ordered the Inquisition to look after them, and on a report of Matthew of Chieti they were condemned in 1297 and handed over to the Inquisition. This only roused opposition. They held a general meeting in Rome, elected a pope of their own, organized themselves, spread over Europe, and by preaching missions made converts everywhere. Their ranks were continually recruited from the malcontent friars, especially from the Franciscans. Pope John XXII. condemned them under the names of Fratricelli, Fratres de pauperi vita, Bizochi, and Bighini, and issued briefs against them in 1322 and 1331. They gave great trouble to the church in Strasburg, Cologne, and the Rhineland. In Italy their headquarters were in the Mark of Ancona and in Turin, where persecutions were organized against them in 1335, 1368, 1373–88. Popes Martin V., Eugenius IV., and Nicholas V. also persecuted them. In spite of all they survived until the Reformation. Their smouldering fire probably burnt itself out in the Anabaptist movement of the 16th century.

The best collective accounts are to be found in Mosheim, *De Beguinis et Beguinabus*, and Hahn's *Gesch. der Ketzer im Mittelalter*, vol. ii. bk. iv.

FRAUD, in law, is a word of wide import, to which it is difficult to assign any exact definition. The courts have in fact deliberately refrained from defining it, because they did not wish to limit their power of dealing with fraudulent transactions. The word, however, carries its own meaning on the face of it, and there is practically no difference between fraud in the popular and fraud in the legal sense. Any course of conduct that would generally be described as dishonest, any cheating or deceiving another so that he would be injured thereby, would be fraud in law as in common parlance. In some writers, indeed, there is found an attempted distinction between *legal* and *moral* fraud. The acts of a vendor who puffs the goods he sells are, it is said, in so far as they conceal the truth or produce a false impression in the mind of the buyer, fraudulent from an ethical point of view. The law, however, regards them not, holding that the buyer must look to his bargain for himself. *Caveat emptor*; if he chooses to believe the assertions of the puffer when he might verify the facts for himself, so much the worse for him. An examination of the case, however, shows that there is little or no value in the alleged distinction. The meaning of the maxim is that when the parties are dealing at arm's length, neither is in fact *deceived* by the exaggerations or depreciations of the other. If actual and intentional misrepresentation is proved the law will avoid the contract, but it will not readily listen to the claim of a man who, having the opportunity of examining what he bought, protests that he purchased on the strength of the vendor's recommendations.

The essential element in fraud is misrepresentation,—producing a false impression on the mind of another—causing him to believe that which is not true. And misrepresentation, to amount to fraud, must also be intentional. There is a wide difference between a false statement believed to be true by the person who makes it and a false statement known to be false by the person who makes it The latter is clearly fraudulent, and although it would not be safe to set this down as a sufficient definition of fraud, something of this sort will be found to exist in all conduct which is recognized as legally or morally fraudulent. The innocent misrepresentation of facts is, both in law and in common morality, a much less serious thing than wilful misrepresentation. The latter would include not merely the cases where the statement is known to be false by the person making it, but also the cases in which the statement is made recklessly without any belief one way or the other. He who deliberately makes a statement which he does not know or believe to be true does so at his peril, and if it turns out to be false he will find himself in the same position as if he had known it to be false from the beginning.

It is in reference to contracts that the legal treatment of fraud is of the greatest importance. The broad rule is that any contract tainted by fraud is void at the option of the party injured. Innocent misrepresentation in the sense above defined has no such effect on a contract, has in general no effect at all unless in certain exceptional cases. Thus if the representation is a *condition*, the contract is avoided if it turn out not to be true. Or if it is a *warranty*, its falsehood will give a right of action for the breach thereof. And so in certain other cases. But wilful misrepresentation or fraud taints the whole contract. Suppose a contract for the sale of goods between A and B. A, the vendor, makes statements relating to the contract which are not true. If the truth of the statements was made a condition of the contract, or if A warranted their truth, he would be responsible to B whether he in point of fact believed the statements to be true or not. In other cases he would be responsible if he knew the statements to be false or made them recklessly without any belief as to their truth or falsehood.

Statements, misrepresentations, or frauds, to be within the rule, must be such as are material to or such as have given rise to the contract. There must be *dolus dans locum contractui*. A fraudulent concealment or misrepresentation, which had no effect on the mind of the innocent party because the circumstances for which it was prepared did not arise, has no effect on the contract. And the fraud must be the fraud of one of the contracting parties or his agents. False or fraudulent statements, through which A is induced to enter into contract with B, have no effect on the contract if B was in no way privy to them. So also it has been held that the fraud must relate to the same transaction, *e.g.*, a fraudulent misrepresentation made on a former occasion by one of the contracting parties has no effect on the contract, although in point of fact it was that which induced the other party to contract.

A contract vitiated by fraud is void at the option of the party injured. He may rescind the agreement if he chooses, or he may affirm it and require the other party to place him in the same position as if the false statement had in point of fact been true. This option he must exercise within a reasonable time after discovering the misrepresentation.

Apart from contract, fraud or misrepresentation may give a right of action to the party injured thereby. A typical case is where A is induced by the false representation of B to give credit to C. A has a right of action against B for any damage he may have sustained in consequence.

It may be expedient here to notice the *Statute of Frauds* (29 Charles II., c. 3)—perhaps the most important piece of legislation in the whole statute-book. Its object is stated to be the "prevention of frauds and perjuries," and its effect is to make writing essential to the validity of many transactions. The most important sections are those relating to contracts, viz., the 4th and the 17th, almost every word of which has been the subject of numerous decisions. By the 4th section *no action shall be brought* on the contracts therein mentioned unless the agreement, or some note or memorandum thereof, shall be in writing and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorized. The contracts referred to are the following:—(1) any special promise by an executor or administrator to answer damages out of his own estate; (2) any special promise to answer for the debt, default, or miscarriage of another person; (3) any agreement made upon consideration of marriage; (4) any contract or sale of lands, tenements, or hereditaments, or any interest in or concerning them; and (5) any agreement that is not to be performed within the space of one year from the making thereof. It will be noticed that this section does not make the contract null and void, but only unactionable. The 17th section refers to sales of goods for the price (or value) of £10 and upwards, which are "not allowed to be good" unless some memorandum of the bargain has been made in writing (see CONTRACT). Arrangements by which an insolvent debtor agrees to give to one of his creditors a preference over the others without their knowledge or consent, are known as *fraudulent preferences*, and are null and void.

Fraud can hardly be said to be under that name an offence known to the criminal law; the vagueness of the conception renders it impossible to treat fraud *per se* as a crime. But there are specific offences (both at common law and by statute) of which fraud is the gist, and in dealing with these the courts have had some little difficulty in drawing the line between criminal and non-criminal fraud. At common law it would appear that only those cheats or frauds are indictable which amount to "fraudulently obtaining the property of another by any deceitful and illegal practice or token (short of felony) *which affects or may affect the public*" (Russell *On Crimes*, vol. ii.). Chief Justice Cockburn in one case stated, as the result of the authorities, that "if a person in the course of his trade, *openly and publicly carried on*, were to put a false mark upon an article so as to pass it off as a genuine one, when in fact it was only a spurious one, and the article was sold and money obtained by means of that false mark or token, that would be a cheat at common law." On the other hand, cheats by means of a bare lie or false affirmation in a private transaction are not indictable at common law; *e.g.*, when a merchant falsely pretended that a certain parcel of gum was gum seneca, whereas it was an inferior and less valuable gum, the fraud was held not indictable. And in another case where the defendant was charged with obtaining money from another by a falsehood, Chief Justice Holt said, "Shall we indict one man for making a fool of another? Let him bring his action." Frauds affecting the crown would be indictable, and so would any cheat aimed at the general public, *e.g.*, when an impostor maims himself to have a pretence for asking charity. Russell considers that the publication of false news likely to produce any *public detriment* would be criminal.

The principal criminal enactment against frauds is 24 and 25 Vict., c. 96, §§ 75–90. By § 88, "whoever shall by any false pretence obtain from any other person any chattel, money, or valuable security, with intent to defraud, shall be guilty of a misdemeanor." Other sections deal with frauds by agents, bankers, or factors, by trustees, by directors of companies (keeping fraudulent accounts, publishing false statements, etc.). Other enactments are the statutes of Elizabeth against fraudulent conveyances (13 Eliz., c. 5, and 27 Eliz., c. 4); 9 Geo. II., c. 5 (persons pretending to exercise witchcraft, tell fortunes, etc.); 25 and 26 Vict., c. 88 (forgery, trade marks, etc.); the Debtors Act, 1869 (fraudulent debtors, etc.).

The distinction between private and public frauds does not hold in the law of Scotland. Thus if a person undertake to supply an article according to sample, or an article which has been inspected and ordered, and intentionally send a substance which is not the thing contracted for at all, or which, though containing some proportion of the article ordered, is an adulterated mixture, he is guilty of falsehood, fraud, and wilful imposition (Macdonald's *Criminal Law of Scotland*). This passage may be compared with the private frauds cited above. (E. R.)

FRAUENBURG, a town of Prussia, province of East Prussia, government district of Königsberg, is situated on the Frische Haff, and at the mouth of the Baude, 41 miles S.W. of Königsberg. It is the seat of the Roman Catholic bishop of Ermeland. The cathedral, which stands on an eminence, possesses six towers, and forms a kind of fortress. The astronomer Copernicus was canon at Frauenburg, and there is a monument to him in the cathedral. He is said to have constructed the tower containing machinery for supplying the town and neighborhood with water. The tower is no longer used for this purpose. The population of Frauenburg is about 2500.

FRAUENFELD, a town of Switzerland, capital of the canton of Thurgau (or Thurgovia), is situated in a beautiful and fertile district on the Murg, 23 miles N.E. of Zurich. It is the artillery dépôt for east Switzerland, and possesses an old castle with a tower belonging to the 10th century, an old Capuchin monastery, a townhouse, an armory, and a canton school. The chief industries are spinning and the manufacture of cotton cloth, but many of the inhabitants are engaged in agriculture. After the extinction of the countship of Alt-Frauenfeld, the town came into the possession of the counts of Kyburg, and subsequently into that of Austria. In 1799 a battle was fought there between the French and Austrians. The population in 1870, including the adjoining villages of Kurzdorf and Langdorf, was 4261.

FRAUENLOB, the name by which a German poet of the 13th century is almost exclusively known, though his real name was Heinrich von Meissen. How he acquired the sobriquet has not been decided,—whether it was from his song in honor of the Virgin (*Die Heilige Jungfrau*), or because in another of his pieces he defended the use of the word *Frau* instead of *Wieb*, or simply because he sang much in praise of women. The last explanation is the one that has received the stamp of popular acceptance. Frauenlob was born in 1260 of a humble burgher family. His youth was spent in straitened circumstances, but he gradually acquired reputation as a singer at the various courts of the German princes. In 1278 we find him with Rudolph I. in the Marchfeld, in 1286 he was at Prague at the knighting of Wenceslaus II., and in 1311 he was present at a knightly festival celebrated by Waldemar of Brandenburg before Rostock. After this he settled in Mainz, and there, according to the popular account, founded the first school of Meister-singers. He died in 1318, and was buried in the cloisters of the cathedral at Mainz. His grave is still marked by a copy made in 1783 of the original tombstone of 1318; and in 1842 a monument by Schwanthaler was erected by the ladies of the city in another part of the cloisters. Frauenlob's poems make a great display of learning, and their versification abounds in tricks of rhyme. Ettmüller published a very full edition in 1843.

See Von der Hagen's *Minnesinger*, vol. iv.; Bartsch, *Meisterlieder der Kolmarer Handschrift;* and Schröer in Bartsch's *Germanist. Studien.* An English translation of Frauenlob's *Cantica Canticorum* by A. E. Kroeger appeared in 1877 at St. Louis, United States.

FRAUNHOFER, JOSEPH VON (1787–1826), a celebrated optician, was born at Straubing in Bavaria, March 6, 1787. His father, a poor glazier, having died in 1798, young Fraunhofer in August of the following year was apprenticed to Weichselberger, a glass-polisher and looking-glass maker. Having by day no time that he could call his own, he studied the few old books that he possessed during leisure snatched from sleep. On the 21st of July, 1801, he nearly lost his life by the fall of the house in which he lodged, and the elector of Bavaria, Maximilian Joseph, who was present at his extrication from the ruins, gave him 18 ducats. With a portion of this sum he obtained release from the last six months of his apprenticeship, and with the rest he purchased a glass-polishing machine. He now employed himself in making optical glasses, and in engraving on metal, devoting his spare time to the perusal of works on mathematics and optics. In 1806 he obtained the place of optician in the mathematical institute which in 1804 had been founded at Munich by Joseph von Utzschneider, G. Reichenbach, and J. Liebherr; and in 1807 arrangements were made by Utzschneider for his instruction by Pierre Louis Guinand, a skilled optician, in the fabrication of flint and crown glass, in which he soon became an adept (see R. Wolf, *Gesch. der Wissench. in Deutschl.*, bd. xvi. p. 586). With Reichenbach and Utzschneider, Fraunhofer established in 1809 an optical institute at Benedictbeuern, near Munich, of which he in 1818 became sole manager. The institute was in 1819 removed to Munich, and on Fraunhofer's death came under the direction of G. Merz. Amongst the earliest mechanical contrivances of Fraunhofer was a machine for polishing mathematically uniform spherical surfaces. He was the inventor of the stage-micrometer, and of a form of heliometer; and in 1816 he succeeded in constructing for the microscope achromatic glasses of long focus, consisting of a single lens, the constituent glasses of which were in juxtaposition, but not cemented together. The great reflecting telescope at Dorpat was manufactured by Fraunhofer, and so great was the skill he attained in the making of lenses for achromatic telescopes that, in a letter to Sir David Brewster, he expressed his willingness to furnish an achromatic glass of 18 inches diameter. For his researches, published in the *Denkschriften der Münchener Akadamie* for 1814–15, by which he laid the foundation of solar and stellar chemistry, Fraunhofer is especially known. The dark lines of the spectrum of sunlight, earliest noted by Dr. Wollaston (*Phil. Trans.*, 1802, p. 378) were independently discovered, and, by means of the telescope of a theodolite, between which and a distant slit admitting the light a prism was interposed, were for the first time carefully observed by Fraunhofer, and have on that account been designated "Fraunhofer's lines." He constructed a map of as many as 576 of these lines, the principal of which he denoted by the letters of the alphabet from A to G; and by ascertaining their refractive indices he determined that their relative positions are constant, whether in spectra produced by the direct rays of the sun, or by the reflected light of the moon and planets. The spectra of the stars he obtained by using, outside the object-glass of his telescope, a large prism, through which the light passed to be brought to a focus in front of the eye-piece. He showed that in the spectra of the fixed stars many of the dark lines were different from those of the solar spectrum, whilst other well-known solar lines were wanting; and he hence concluded that it was not by any action of the terrestrial atmosphere upon the light passing through it that the lines were produced. He further expressed his belief that the dark lines D of the solar spectrum coincide with the bright lines of the sodium flame, a fact subsequently established by Brewster, Foucault, and Miller, and successfully accounted for by Kirchhoff. Fraunhofer was a member of the Academy of Sciences at Munich, and of the university of Erlangen. In 1823 he was appointed conservator of the Physical Cabinet at Munich, and in the following year he received from the king of Bavaria the civil order of merit. He died at Munich, June 7, 1826, and was buried near Reichenbach, whose decease had taken place eight years previously. On his tomb is the inscription "Approximavit sidera." His scientific papers were published in the *Denkschriften der Münchener Akadamie*, Gilbert's *Annalen der Physik*, and Schumaker's *Astronomische Nachrichten.*

See OPTICS; J. von Utzschneider, *Kurzer Umriss der Lebensgeschichte des Herrn Dr. J. von Fraunhofer*, Munich, 1826; and Merz, *Das Leben und Wirken Fraunhofers*, Landshut, 1865.

FRAUSTADT, a garrison town, and the chief town of a circle in the government district of Posen, Prussia, is situated in a flat sandy country 50 miles S.S.W. of Posen. It has an orphanage, a reformatory, a royal real-school of the first class, a higher ladies' school, and an agricultural school. Its manufactures include woollen and cotton goods, hats, morocco leather, and gloves, and it has a considerable trade in corn, cattle, and wool. Fraustadt was founded by the Dutch, and until 1343 belonged to the principality of Glogau. Near the town the Swedish general Reenskiöld defeated the Saxons on the 13th of February, 1706. The population in 1875 was 6435.

FRAYSSINOUS, DENIS ANTOINE LUC, COMTE DE (1765–1841), a Gallician prelate and Bourbonist minister, distinguished as an orator and as a controversial writer, was born of humble parentage at Curières, in the department of Aveyron, on the 9th of May, 1765. After a course of training, first at the diocesan seminary of Rodez and afterwards in Paris under the priests of Saint Sulpice, he was ordained priest in 1789. In 1801 he began to give private lectures on dogmatic theology in the Faubourg Saint Jacques, and at the same time to deliver, in the church of the Carmelites, a series of "catechetical lectures," which afterwards developed into the "conferences" of Saint Sulpice, to which admiring crowds were attracted by his lucid exposition and by his graceful and glowing oratory. The freedom of his language in 1809, when Napoleon had arrested the pope and declared the annexation of Rome to France, led to a prohibition of his lectures; and the dispersion of the congregation of Saint Sulpice in 1811 was followed by his temporary retirement from the capital. He returned with the Bourbons, and resumed his conferences, in 1814; but the events of the Hundred Days again compelled him to withdraw into private life, from which he did not emerge until February, 1816. As court preacher and almoner to Louis XVIII., he now entered upon the period of his greatest public activity and influence. His *Panégyrique de Saint Louis*, his *Oraison Funèbre du Prince de Condé*, and other orations are said to have profoundly impressed the public mind, and their effect was still further deepened by the publication of his *Essai sur l'Indifference en Matière Religieuse* (1818). In connection with the controversy which had been raised by the signing of the reactionary concordat of 1817, he published, also in 1818 a treatise entitled *Vrais Principes de l'Église Gallicane sur la Puissance Ecclésiastique*, which though unfavorably criticised by the Ultramontane Lamennais, was received with favor by the civil and ecclesiastical authorities. The consecration of Frayssinous as bishop of Hermopolis "in partibus," his election to the French Academy, and his appointment to the grand-mastership of the university, followed in rapid succession. In 1824, on the accession of Charles X., he became minister of public instruction and of ecclesiastical affairs under the administration of Villèle; and about the same time he was created a peer of France with the title of count. His term of office was chiefly marked by the recall of the Jesuits. In 1825 he published his conferences under the title *Défense du Christianisme*. The work passed through 15 editions within 18 years, and was translated into several European languages. In 1828 he, along with his colleagues in the Villèle ministry, was compelled to resign office, and the subsequent revolution of July, 1830, led to his retirement to Rome. Shortly afterwards he became tutor to the duke of Bordeaux at Prague, where he continued to live until 1838. The remaining years of his life were passed in great privacy on his native soil. He died at St. Géniez on the 12th of December, 1841. His biography by Henrion was published in 1842, and a posthumous volume, containing some of his earlier "conferences," appeared in 1843 (*Conférences et Discours Inédits*).

FREDERICIA, or FRIDERICIA, a fortified town of Denmark, near the south-east corner of Jutland, on the shores of the Little Belt opposite the island of Funen, about 15 miles S. of Veile. It has railway communication with both south and north, and steamboats ply regularly across the Belt. It is well built, and possesses a handsome town-hall, four churches, and a synagogue. There is a considerable shipping trade, and the industries comprise the manufacture of tobacco, salt, and chicory, and of cotton goods and hats. The population in 1870 was 7186. A small fort was erected on the site of Fredericia by Christian IV. of Denmark, and his successor, Frederick III., determined about 1650 to make it a powerful fortress. Free exercise of religion was offered to all who should settle in the new town, which at first bore the name of Frederiksodde, and only received its present designation in 1664. In 1657 it was taken by storm by the Swedish general Wrangel, and in 1659, after the fortress had been dismantled, it was occupied by Frederick William of Brandenburg. It was not till 1709–10 that the works were again put in a state of defence, and the place even then continued to be of but little importance. In 1848 an attempt was made by the Danes to oppose the Prussians, who entered on May 3, and maintained their position against the Danish cannon-boats. During the armistice of 1848–9 the fortress was strengthened, and soon afterwards it stood a siege of two months, which was brought to a glorious close by a successful sortie. In memory of the victory several monuments have been erected in the town and its vicinity, of which the most noticeable are the bronze statue of the Danish Land Soldier by Bissen (one of Thorwaldsen's best pupils), and the great barrow over 500 Danes in the cemetery of the Holy Trinity Church, with a bas-relief by the same sculptor. On the outbreak of the war of 1864, the fortress was again strengthened by new works and an entrenched camp; but the Danes suddenly evacuated it on 28th April after a siege of six weeks. The Austro-Prussian army partly destroyed the fortifications, and kept possession of the town till the conclusion of peace.

FREDERICK, in German FRIEDRICH, the name, signifying Rich in Peace, borne by a considerable number of European (principally German) sovereigns. The most important of these, including the compound names Frederick Augustus and Frederick William, are noticed here in the following order:—the emperors, the electors of Brandenburg and kings of Prussia, the electors and kings of Saxony, and the electors palatine.

FREDERICK I. (1123–1190), surnamed by the Italians Barbarossa, Holy Roman emperor, and one of the greatest of German sovereigns, was the son of Frederick the One-eyed of Hohenstaufen, duke of Swabia, and of Judith, daughter of Henry the Black, duke of Bavaria, and was born most probably in 1123. He succeeded his father as duke of Swabia in 1147, and in the same year accompanied his uncle Conrad III. on his disastrous crusade. As in addition to his exceptional personal qualities Frederick possessed the advantage of uniting in himself the blood of the two great rival families, the Guelphine and the Ghibelline, Conrad III., though possessing an infant son, nominated him as his successor. On the death of Conrad this choice was unanimously ratified by the assembly at Frankfort, March 4 or 5, 1152, and on the 9th of the same month Frederick received the crown of Germany at Aix-la-Chapelle. During the reign of Conrad, the Italian and imperial rights claimed by the German kings had been almost in abeyance, and it was to establish their reality that Frederick devoted the chief energies of his life. After settling various disputes among the German princes, and making arrangements for an alliance with Manuel emperor of the East against King William of Sicily, he, in October, 1154, descended with his army through the vale of Trent to hold the diet of his imperial feudatories on the plains of Roncaglia. Before this diet the Milanese had treated with contempt his messenger sent to warn them against continuing to oppress the citizens of Lodi; and when he witnessed afterwards, on his march to Piedmont, the desolation that had been caused by the Milanese, he began to sack and burn their dependencies, and after crossing the Po razed Tortona to the ground. Then having appeared, with the iron crown on his head, in the church of St. Michael's, Pavia, he set out over the Apennines to receive the imperial crown at Rome. After apprehending Arnold of Brescia as an earnest of his intentions to support the papal cause, and adjusting certain ceremonial differences with the pope, he was crowned emperor June 18, 1155; but immediately after quelling the insurrection in Rome which followed his coronation, he was compelled, by the sudden appearance of a pestilence in his army, to march towards Lombardy, and without accomplishing more than the capture of Spoleto he disbanded his troops and returned home.

For the next three years a great variety of matters detained him in Germany. Immediately on his return from Italy he put vigorous measures into execution against the robber knights; and in September, 1156, he reconciled Henry the Lion by the restoration of the duchy of Bavaria, while at the same time he pacified Henry *Jasomirgott*, his rival, by raising Austria to the rank of a duchy. Adelaide, whom he married in 1147, he had divorced in 1153 on the pretext of kinship; and, having in 1156 married Beatrice, daughter of the count of Burgundy, he received at Besançon in 1157 the homage of the Burgundian nobles. In the same year he was successful in compelling King Boleslaus of Poland to acknowledge him as his feudal lord, obtained by persuasion the same allegiance from King Geisa of Hungary, and rewarded Duke Ladislaus of Bohemia for his faithful services by giving him the rank of a king. About this time he published a manifesto against the pretensions of the pope to confer *beneficia* upon him; and when Frederick in the beginning of 1158 was preparing for a second campaign in Italy, the pope sent an embassy to explain that he did not use the word in its feudal sense.

Frederick's chief purpose in this expedition was to quell the pride of Milan. Descending into Italy by four different roads, with an army of 100,000 foot and 15,000 horse, he in 1158 laid siege to the city, which, after defying for a month his persistent and furious attacks, was compelled from scarcity of provisions to surrender, and with humiliating forms to take the oath of allegiance. He then held another diet at Roncaglia, at which, besides settling a number of standing disputes, he recovered the right of instituting *podestas* to administer justice in the cities, assumed the nomination of the consuls, and deprived the cities and barons of the right of going to war. The adoption of these regulations—which if within the legal prerogatives of the emperor had nevertheless fallen into abeyance, and were utterly opposed to the strong spirit of independence struggling into existence in the cities—may be said to mark the first stage of his waning influence in Italy. And a second stage was reached when, on the death of Pope Adrian IV. in 1159, he determined to support the anti-pope Victor IV.; for from that time he had to contend with the ceaseless opposition and intrigues of Pope Alexander III., who fulminated against him a sentence of excommunication, March 24, 1160. It is true that Frederick in 1162 was able to spread terror throughout Lombardy by the capture and demolition of Milan; but in 1164 the cities of Verona, Vicenza, Padua, Treviso, and Venice formed a defensive league, and expelled the *podestas* and other foreign oppressors from their territories. In 1163 Frederick had punished the rebellion of Mainz against its archbishop by razing its walls and filling up its trenches; but having, on the death of Victor IV., promoted the election of the new anti-pope Pascal III., he was detained by fresh religious and political contentions in Germany till the end of 1166. Disregarding the embers of conflagration in the north of Italy, he now pushed on towards Rome, to which Alexander had returned the previous year. Doubtful as to the propriety of at once attacking the city, he laid siege to Ancona; but when he learned that the Roman citizens had rashly allowed themselves to be defeated at Tusculum, he raised the siege, and going to Rome took forcible possession of part of the Leonine city, and attacked and captured the Vatican. On the following Sunday (August 1, 1167,) the empress received in St. Peter's the imperial diadem from Pascal III., and Frederick the circlet of gold which was the sign of patrician dignity. Meanwhile behind him the cities of Lombardy had formed their famous league; even Lodi was forced to yield its assent to the alliance; and Milan springing into existence almost as by the wand of an enchanter, gave evidence of its defiant and unquenchable hostility by the demolition of the castle of Trezzo, which contained the emperor's treasure. Even at Rome his position was far from enviable, for Alexander III., having taken refuge in the Colosseum, was prepared to offer a desperate resistance. Accordingly Frederick fell upon the curious expedient of proposing that both Alexander and Pascal should resign, and another pope be elected. The citizens clamorously supported the proposal, but Alexander prevented its accomplishment by suddenly leaving Rome for Benevento. Immediately on his departure, and, to the superstitious fancies of the time, as if in token of the wrath of heaven at his expulsion, and at the sacrilegious violence done to the most sacred edifice of the holy city, suddenly, in the midst of a day of burning and sultry splendor, the whole German army with scarcely an exception was smitten by a pestilence of unexampled virulence, to which the terrors of superstition imparted both additional horror and a more deadly fatality. Frederick led the haggard and terror-stricken crowd of survivors with great difficulty to Pavia, whence at the end of the year he set out for Germany attended by about 30 horsemen; and at Susa he only saved himself from death at the hands of the citizens by escaping during the night on foot accompanied by two followers. For nearly seven years after this luckless flight he remained in Germany. On the death of Pascal III. in September, 1168, he supported the new anti-pope Calixtus III., but by doing so he only lent additional vigor to the Lombard league, who this year had founded the city which in honor of their patron Alexander III. they named Alexandria; and in 1173 they took an oath not to leave off waging war against the emperor till they drove him out of Italy. Resolved, however, on a final effort, Frederick, having collected an immense army, set out in October, 1174, on his fifth and last Italian expedition. He burned Susa to the ground, and captured Asti; but failing in a treacherous attack on Alexandria, made after he had granted it a truce, he endeavored to negotiate a peace with the League. Final terms could not, however, be agreed upon, and notwithstanding the crushing blow which his fortunes at this time sustained through the defection of Henry the Lion, he resolved when recruited by a new army from Germany to risk the battle at Lignano, which resulted in his total defeat, 29th May, 1176. Having in this battle been crushed beneath his horse, he was believed to have fallen, either wounded or dead, into the hands of the confederates; but on the third day afterwards he arrived at Pavia unhurt, but so worn out by hunger and fatigue as to be scarcely recognizable. Finding his case now desperate, he at last agreed to acknowledge the pontificate of Alexander, and also at Venice, 25th July, 1177, concluded a truce of six years with the cities. He then turned his attention to Henry the Lion, who owned himself vanquished in 1181, and was banished to England. On the expiry of the treaty of Venice, the famous treaty of Constance was signed, 25th June, 1183, by which, while the supremacy of the empire was formally recognized, the independent jurisdiction of the cities was substantially guaranteed. Henceforth, Frederick resolved to rule Italy more by conciliation than by compulsion, and while re-establishing his influence in Lombardy by granting such favors to the Milanese as secured their lasting alliance and friendship, he virtually placed Sicily under his immediate government by arranging a marriage between Constance, heiress of that kingdom, and Henry his eldest son, who, having been elected King of the Romans in his infancy, received the crown of Italy on the day of his marriage, 27th June, 1186, from the patriarch of Aquileia.

Having thus at last brought his long life-struggle to an honorable if not very triumphant close, it might have been expected that Frederick would now have been content to doff his armor, and to pass his remaining days in peace. But hearing in 1187 of the victorious progress of Saladin against the Christians in Syria, his martial ardor was again kindled, and he resolved to enter the lists against the redoubtable Saracen conqueror. This purpose he was, however, unable to carry fully out, for after two successful battles in Asia Minor, he was drowned before reaching Syria while crossing a small river in Pisidia, June 10, 1190.

Frederick I. is said to have taken Charlemagne as his model; but the contest in which he engaged was entirely different both in character and results from that in which his great predecessor achieved such a wonderful temporary success. Though Frederick failed to subdue the republics, the failure can scarcely be said to reflect either on his prudence as a statesman or his skill as a general, for his ascendency was finally overthrown rather by the ravages of pestilence than by the might of human arms. In Germany his resolute will and sagacious administration subdued or disarmed all discontent, and he not only succeeded in welding the various rival interests into a unity of devotion to himself against which papal intrigues were comparatively powerless, but won for the empire a prestige such as it had not possessed since the time of Otto the Great. The wide contrast between his German and Italian rule is strikingly exemplified in the fact that, while he endeavored to overthrow the republics in Italy, he held in check the power of the nobles in Germany, by conferring municipal franchises and independent rights on the principal cities. Even in Italy, though his general course of action was warped by wrong prepossessions, he in many instances manifested exceptional practical sagacity in dealing with immediate difficulties and emergencies. Possessing great physical beauty, frank and open manners, untiring and unresting energy, and a prowess which found its native element in difficulty and danger, he seemed the embodiment of the chivalrous and warlike spirit of his age, and was the model of all the qualities which then won highest admiration. Stern and ambitious he certainly was, but his aims can scarcely be said to have exceeded his prerogatives as emperor; and though he had sometimes recourse when in straits to expedients almost diabolically ingenious in their cruelty, yet his general conduct was marked by a clemency which in that age was exceptional. His quarrel with the papacy was an inherited conflict, not reflecting at all on his religious faith, but the inevitable consequence of inconsistent theories of government, which had been created and could be dissipated only by a long series of events. His interference in the quarrels of the republics was not only quite justifiable from the relation in which he stood to them, but seemed absolutely necessary. From the beginning, however, he treated the Italians, as indeed was only natural, less as rebellious subjects than as conquered aliens; and it must be admitted that in regard to them the only effective portion of his procedure was, not his energetic measures of repression nor his brilliant victories, but, after the battle of Lignano, his quiet and cheerful acceptance of the inevitable, and the consequent complete change in his policy, by which if he did not obtain the great object of his ambition, he at least did much to render innoxious for the empire his previous mistakes.

The principal contemporary authorities for the reign of Frederick I. are the chronicle of Otto bishop of Freisingen, to which is prefixed a letter of Frederick containing a summary of the early events of his reign; the continuation of this chronicle from 1158 to 1160 by Radevic, one of the canons of Otto; the chronicle of Otto Morena of Lodi, continued from 1162 to 1167 by his son Acerbus; and the life of Pope Alexander III. by the cardinal of Aragon. The chief modern writers are Muratori, *Annali d'Italia;* Sismondi, *Histoire des Républiques Italiennes;* H. v. Bünau, *Leben und Thaten Friedrichs I.*, Leipsic, 1722; Cherrier, *Histoire de la lutte des papes et des empereurs de la maison de Sonabe*, etc., 2d edition, Paris, 1856; F. von Raumer, *Geschichte der Hohenstaufen und ihrer Zeit*, 4th ed., Leipsic, 1871; P. Scheffer-Boichorst, *Friedrichs letzter Streit mit der Curie*, Berlin, 1866; K. Fischer, *Der Kreuzzug Friedrichs I.*, Leipsic, 1870; H. Prutz, *Kaiser Friedrich I.*, 3 vols., Dantzic, 1871–73; Fr. X. Wegele, *Kaiser Friedrich I. Barbarossa, ein Vortrag*, Nordlingen, 1871; Dettloff, *Der erste Römerzug Kaiser Friedrichs I.*, Göttingen, 1877; Bryce, *Holy Roman Empire;* Milman, *History of Latin Christianity;* C. Vignati, *Storia diplomatica della lega Lombarda*, Milan, 1866; Teste, *History of the Wars of Frederick I. and the Communes of Lombardy*, English translation, 1877; and E. A. Freeman in his first series of *Essays.* (T. F. H.)

FREDERICK II. (1194–1250), Holy Roman Emperor, surnamed the Hohenstaufen, the most remarkable historic figure of the Middle Ages, grandson of the preceding, and son of Henry VI. and of Constance, heiress of the throne of Sicily, was born at Jesi, near Ancona, 26th December, 1194. He was elected king of the Romans in 1196; and, his father having died 28th September, 1197, he was in May, 1198, crowned king of Sicily, his mother obtaining for him the recognition and support of Pope Innocent III. by acknowledging the feudal supremacy of the papacy, by the sacrifice of certain ecclesiastical rights, and by the payment of a yearly tribute. Dying the same year, she bequeathed his guardianship to the pope; but for some time after this Sicily was the scene of hopeless political anarchy, and the custody of the young king at Palermo was the occasion of continual and complicated intrigues, and of a confused and protracted civil war which had very varying results. The pope could thus only fulfil his trust imperfectly, but the education of his ward, so far from suffering on this account, was exceptionally thorough and complete; and the different nationalities with which he came into contact contributed each its quota to the instruction and development of his strong and many-sided character.

Though crowned in infancy king of the Romans, he actually inherited from his father no other throne than that of Naples and Sicily. In 1208 he entered upon the personal government of his kingdom, and in the following year he was married to Constance of Aragon. About this time, Otto, second son of Henry the Lion, had, on account of the murder of Philip of Hohenstaufen by Otto of Wittelsbach, obtained undisputed possession of the throne of Germany; but immediately after his coronation at Rome in 1209 the inevitable jealousy between pope and emperor led to the usual results, and when Otto was meditating the subjugation of Naples and Sicily, he was met in 1211 by a bull of excommunication. At a diet held at Nuremberg in October of the same year it was resolved to offer the crown of Germany to the young king of Sicily. Innocent III. on certain conditions gave his sanction to the offer; and to Frederick, even had he seen in it nothing to incite his imaginative ardor, it must have appeared almost in the form of an unexpected deliverance from impending ruin. Having therefore resolved to dispute his ancestral throne with his rival, he set out in the spring of 1212 on his romantic and hazardous quest. Landing at Genoa on the 1st of May accompanied by only a few adherents, he made his way over the Alps by unfrequented passes to Coire, and learning at St. Gall that Otto was about to occupy Constance, he by great good fortune was able to anticipate him by three hours. The town at once declared in Frederick's favor, and Otto, without seriously attempting to resist his progress in southern Germany, retired to Saxony. In November of the same year Frederick made a treaty with Philip of France, and in December he was elected king at Frankfort, and crowned at Mainz. By inherent force of character, aided by his unrivalled diplomatic skill and his bold and rapid movements, he had won success almost without striking a blow; and his task was at least denuded of all difficulty through Otto's disastrous defeat by Philip at Bouvines, near Tournay, 27th July, 1214. Any further organized resistance was thus rendered impossible against the progress of the Hohenstaufen, who in July, 1215, ascended the marble throne of Charlemagne at Aix-la-Chapelle, and received the silver crown. At a solemn ceremony which followed he took the cross; but even after the death of Otto in May, 1218, he was fully occupied in establishing his influence in Germany. In 1220 he succeeded in obtaining the election of his son Henry to the German throne, but the favor was dearly rewarded by the charter which by the independent privileges it conferred upon the princes virtually dissolved the unity of the kingdom. The election was contrary to a promise made to Pope Innocent III. to appoint Henry king of Sicily, but Pope Honorius III., anxious for the success of the crusade, was pacified without much difficulty, and Frederick leaving Germany in the autumn of 1220 was crowned emperor at Rome on the 22d November, renewing at the same time his oath to set out on the crusade with all possible speed. His absence in Germany had permitted the growth of disorder and confusion in his southern kingdom; and to restrain the license of the Apulian nobles he now established at Capua a tribunal to revise their privileges, while, to deliver the Christians in Sicily from the attacks to which they were continually exposed from the Saracen mountain tribes, he transferred 2000 Saracens to Lucera, an expedient which also established in Italy a convenient instrument of resistance to the papal power.

The departure of the crusade, at first fixed for 1223, was deferred till 1225, and even then it was found necessary to delay it for two years longer; but, his wife Constance having died in 1222, he gave a pledge that his ambition coincided with the papal wishes by marrying in 1225 Yolande, daughter of King John of Jerusalem; and he also bound himself by heavy penalties to set out with a stipulated force in August, 1227. The hostilities between him and the Lombard league, begun in 1226, were suspended through the intercession of Pope Honorius in February, 1227, and the Lombards agreed to furnish a certain number of knights for the expedition. In March Honorius died, and was succeeded by Gregory IX., who on the very day of his accession addressed a new and imperative warning to the emperor against delay in the fulfilment of his oath. Frederick actually set out at the time agreed upon, but returned three days afterwards, and, asserting as his reason a serious illness, permitted the armament to be dissolved, whereupon Gregory without further negotiation launched against him, September 30, the solemn bull of excommunication. The appeal to Christendom with which Frederick met the church's fulmination is remarkable in that, so far from contenting himself with defending his own conduct, he, besides denouncing the temporal pretensions of the pope as menacing the whole of Christendom with an "unheard-of tyranny," asserted that instead of rolling in wealth and aspiring to worldly influence the church's representatives ought to cultivate the simplicity and self-denial of the early Christians. In resolving to set out on the crusade, notwithstanding his excommunication, Frederick was therefore actuated, not merely by the wish to take possession of a secular throne, or to demonstrate the sincerity of his purpose to keep his oath, but by the determination to assert his right still to act as the temporal head of the church. His preparations were not delayed by the death of his wife Yolande in April, 1228, and he set sail from Otranto on the 29th June. Meanwhile, by securing the favor of the Frangipani and the other Roman patricians, he procured the expulsion of Gregory from Rome; but the subtle spiritual influence of the papal ban was not affected by this seeming victory, and tidings of his excommunication reaching the Holy Land almost simultaneously with his arrival, the Knights of the Temple and the Hospital refused to take part in the crusade. Frederick, however, by mere diplomatic tact succeeded in persuading the sultan of Egypt to agree to a treaty, by which the church obtained possession of Jerusalem and the holy places on granting to the Saracens, besides various other privileges, free access to Bethlehem; and on the 18th March, 1229, he, without any religious ceremony, crowned himself with his own hands king of Jerusalem. Such a striking and unexpected success wrought almost immediately throughout Europe a complete revolution of opinion in his favor; and when shortly afterwards he succeeded in defeating the papal forces which had invaded his dominions the pope deemed it expedient to come to terms, and released him from the ban of excommunication 28th August, 1230.

In the interval of peace which followed, Frederick occupied himself in forming for his Sicilian kingdom a code of laws, the main features of which were the superseding of irresponsible feudal and ecclesiastical jurisdictions by a uniform civil legislation administered under direct imperial control; the toleration extended to Jews and Mahometans, and the severe enactments against schismatics; the provisions for the emancipation of the peasants; the regulations for the encouragement of commerce, which contain perhaps the first enunciation of the modern doctrine of free trade; and the establishment of annual parliaments, consisting of barons, prelates, and representatives from the towns and cities. He also devoted much of his attention to the advancement of learning and of the arts and sciences. The university of Naples, founded in 1224, but whose operations had been for some time suspended, he now restored and liberally endowed; at the medical schools of Salerno he provided Arab, Latin, Greek, and Hebrew teachers for the students of these different nationalities; and he caused the translation into Latin of the works of Aristotle and of other philosophers both Greek and Arabic. He himself was learned both in Mussulman arts and sciences and in Christian scholasticism and philosophy; he knew Latin, Greek, French, German, Arabic, and Hebrew. He had a great interest in architecture, and he fostered the infancy of Italian sculpture and painting; he and his minister Peter de Vinea were among the first cultivators of Italian poetry; he also devoted much attention to natural history, and besides forming large collections of rare and curious animals wrote a treatise on the art of falconry, which shows a minute acquaintance with the habits of birds. With the influences of Western civilization there was conjoined at his castles on the Apulian shore an Oriental luxury and splendor; and in the harem of the Christian emperor his accusers found a convenient corroboration of their insinuation regarding his secret enmity to the Christian faith.

The short period of peaceful progress was broken in 1234 by the rebellion of Frederick's son Henry, who, secretly instigated by the pope, joined the Lombard league. The revolt was, however, suppressed on the arrival of the emperor in Germany in 1235, and Henry was sent as a prisoner to the castle of San Felice in Apulia. In the same year Frederick married Isabella, sister of Henry III. of England. Conrad, second son of the emperor, was chosen king by the German princes in January, 1237; and Frederick, after the disastrous defeat of the Lombards at Cortenuova, November 27th of this year, appointed, in October, 1238, his natural son Enzio king of Sardinia. Alarmed at the success of the imperial arms, Gregory, in March, 1239, renewed against the emperor the ban of excommunication; but the latter advancing into the states of the church, captured Ravenna, Faenza, and Benevento; and after gaining, through the help of Enzio, a brilliant victory over the Genoese fleet, was nearing Rome when Gregory died, August 21, 1241. After the short pontificate of Celestine IV. and an interregnum of eighteen months, Cardinal Sinibald Fiesco, up to this time one of the emperor's chief friends, became pope as Innocent IV. in June, 1243. At once negotiations were entered into for an arrangement between them; but the papal demands were too humiliating to permit of their acceptance; and Innocent, suddenly making his escape to Lyons, not only renewed, July 17, 1245, the church's ban against the emperor, but declared his throne vacant. Henry Raspe of Thuringia, elected by the papal party king of the Romans in May, 1246, gained a victory over Conrad at Frankfort on the 5th August, but, suffering a total defeat near Ulm, February 17, 1247, died shortly afterwards; and between his successor William of Holland and Conrad the struggle was carried on with indecisive results. In this same year Peter de Vinea, the minister and most intimate friend of Frederick, was discovered plotting against his life; on 18th February, 1248, Frederick's army in Italy was surprised and utterly routed by a sally of the citizens of Parma; in May, 1249, his son Enzio was defeated and captured by the Bolognese; and, although in 1250 various successes in the north of Italy and the prospect of new and powerful alliances seemed to promise him a speedy and complete triumph, his strength had been so worn out by his arduous struggle, and his spirit so broken by such a succession of disasters, that he died somewhat suddenly on the 13th December, at his hunting lodge of Fiorentino (also called Firenzuola), near Lucera.

The general contemporary opinion regarding Frederick II. is expressed in the words *stupor mundi*; and whatever amount either of approbation or censure may be bestowed upon his career, wonder and perplexity are the predominant sentiments which its contemplation even yet awakens. It was not merely that his mental endowments were exceptionally great, but that, owing to his mingled German and Italian blood, the various influences to which he was subjected in his early years, the strange times in which he lived, and the events with which destiny had connected him, his character was exhibited in such multiform aspects and in such an individual and peculiar light that in history we look in vain for his parallel. As to the nature of his religious faith there are no data for arriving at a certain conclusion. The theory of M. Huillard-Bréholles that he wished to unite with the functions of emperor those of a spiritual pontiff, and aspired to be the founder of a new religion, is a conjecture insufficiently supported by the isolated facts and statements and the general considerations on which it is made to rest. Indeed the character of Frederick seems to have been widely removed from that of a religious enthusiast; and at every critical period of his life he was urged to daring and adventurous projects rather by external circumstances than by either the promptings of ambition or the consciousness of any divine commission. On any theory his enactments in reference to religion are, however, somewhat enigmatical. His persecution of heretics may not have been entirely due to a desire to vindicate his orthodoxy before his Christian subjects; but although his ideas regarding freedom of conscience were either inconsistent or hampered in their action by a regard to expediency, his toleration of the Jews equally with the Mahometans prevents us ascribing his toleration of the latter either to secret sympathy with that form of faith or wholly to political considerations. He was in all probability a believer in astrology, and he shared in many of the other superstitious ideas of his time; but there is no indication that he dreaded any other than temporal consequences from the ban of the church; and if certain features of the Christian system had perhaps an attraction for him, yet both from his reported jests and serious conversation it is evident that his Christian belief, if he possessed one, bore little resemblance to that current in his age. In the extravagant accusations of cruelty, perfidy, and licentiousness with which the church has assailed his memory there is some nucleus of truth; but a candid judgment will arrive at the conclusion that few exposed to such pernicious influences have shown such a decided preference for goodness and truth, and that there have been almost none who against such immense difficulties have wrought to such wise purpose in behalf of human progress and enlightenment, or have fought such a resolute and advantageous battle in behalf of spiritual freedom. In this contest he was not an immediate victor; and indeed the dissolution of the imperial power in Italy which followed his death must be chiefly traced to the fact that his policy was governed by principles too much in advance of his age. But although the beneficial results of his reign are not at a first glance so palpable and undeniable as some of its injurious results, yet so far was he from being a mere untimely precursor of the new era which dawned in Europe more than two centuries after his death that, perhaps in a greater degree than any other, he was instrumental in hastening its arrival, both by sowing the first seeds of the Renaissance in Italy, and by giving to the old system of things a shock which was felt throughout Europe, and continued to work silently long after its reverberations had passed away.

After the death of Frederick the followers of Abbot Joachim continued to assert that he was still alive, and both in Sicily and Germany impostors sprang up who attempted to personate him. The superstition that the "emperor continued to haunt the castle of Kyffhäuser," at one time thought to refer to Frederick Barbarossa, has now been shown to have had its origin in the tradition that

Frederick II. still lived after he had ceased to exercise the functions of emperor.[1]

The contemporary documents bearing on the reign of Frederick are unusually numerous. Most of those not contained in the *Fœdera* of Thomas Rhymer, the *Annales eccles. post Baronium* of Raynaldus, or the historical collections of Muratori, Bouquet, Böhmer, or Pertz will be found in the great work of Huillard-Bréholles, *Historia Diplomatica Frederici Secundi*, 12 vols., Paris, 1852–1861. The principal ancient chronicles are the *Historia Major Angliæ* of Matthew Paris; the chronicle of the Franciscan monk Salimbene, first published in *Monumenta ad provincias Parmensem et Placentinam spectantia*, Parma, 1857; the *Life of Gregory IX.*, by the Cardinal of Aragon; the *Annales Mediolanenses, 1230–1402;* the *Chronicon Rerum per Orbem Gestarum* (1159–1242) of Richard de San Germano; and the *Chronicon Placentinum* and *Chronicon de rebus in Italia gestis,* published in one volume by M. Huillard-Bréholles, Paris, 1856, the former printed from the copy in the Imperial Library, Paris, and the latter never before published, and printed from the copy in the British Museum. The chief modern authorities are Muratori, Cherrier, Von Raumer, Milman, Freeman as above under FREDERICK I.; Giannone, *Storia del Regno di Napoli*, 1723; Hoeffer, *Kaiser Frederich II.*, Munich, 1844; the great work of Huillard-Bréholles, and also his *Vie et Correspondance de Pierre de la Vigne*, Paris, 1866; T. L. Kington, *History of Frederick the Second, Emperor of the Romans*, London, 1862; Schirrmacher, *Kaiser Friedrich II.*, 4 vols., Göttingen, 1859–65; Winkelmann, *Geschichte Kaiser Friedrichs II. und seiner Reiche*, vol. i., Berlin, 1863, vol. ii., Revel, 1865, and a continuation for the years 1239–41 in the *Forschungen zur deutschen Geschichte*, xii. 261–294, 521–566; A. del Vecchio, *La legislazione di Federico II. Imperatore*, Turin, 1874; and Reuter, *Geschichte der religiösen Aufklärung im Mittelalter*, vol. ii., Berlin, 1877. (T. F. H.)

FREDERICK III. (1286–1330), surnamed the Fair, son of King Albert I. of Germany, duke of Austria, and rival for the German crown with Louis IV. the Bavarian. See LOUIS IV.

FREDERICK IV. (1415–1493), German king, as emperor Frederick III., son of Duke Ernest of Styria, was born at Innsbruck, September 21, 1415. Along with his brother Albert the Prodigal he assumed in 1435 the government of Styria, Carinthia, and Carniola, and, having been elected in 1440 to succeed Albert II. as king of Germany, he was crowned at Aix-la-Chapelle in 1442. He devoted his chief attention to the study of astrology, alchemy, and botany, and was so undecided in his purposes and so deficient in energy and force of character that he almost passively submitted to the anarchy and petty external wars which during the whole of his reign disturbed the peace of the empire. At the beginning of his reign he was attacked by his brother Albert, who reigned in Upper Austria, and he found it necessary to pacify him by the payment of a large sum of money; in 1443 he was attacked by the Swiss, and called to his aid the Armagnacs from France, who, however, after their defeat by the Swiss at St. Jakob in 1444, joined his enemies against him, and in 1449 he was compelled to agree to an unfavorable treaty; from 1445 to 1452 Austria was invaded by the Hungarians; in 1447 Sforza successfully usurped the government of Milan; from 1449 to 1456 a war was carried on between Albert of Brandenburg and the city of Nuremberg assisted by the "Eidgenossen;" and from 1449 to 1462 a succession war raged in the Rhenish Palatinate. Frederick, who hoped by cultivating the friendship of the Papacy to win back some of the ancient imperial rights, concluded in 1448 the concordat of Vienna with Pope Nicholas V., and was crowned emperor in 1452. On the death of Ladislaus duke of Austria in 1457, he laid claim to the whole of Austria, and also to the crown of Bohemia and Hungary; but not only was George Podiebrad made king of Bohemia and Matthias Corvinus king of Hungary, but Sigismund of Tyrol obtained part of Carinthia, and Frederick's brother Albert, besides seizing Upper Austria in 1462, took possession of Vienna. On the death of Albert in 1463, Frederick obtained possession of the whole of Austria, with the exception of Carinthia. Nothwithstanding that Frederick in 1468 went to Rome to concert measures with the pope against the Turks, they in 1469 penetrated without resistance to Carniola, and in 1475 advanced nearly to Salzburg. In 1473 he suddenly broke off a negotiation with Charles the Bold at Treves for the marriage of Charles's daughter with his son Maximilian, but the marriage finally took place after the death of Charles, and Maximilian thus became king of the Netherlands. The changeful and crooked policy of the emperor in reference to Poland and Hungary led the kings of both countries to turn their arms against him, and in 1485 Matthias of Hungary drove him from his hereditary dominions, of which he did not regain possession till after the death of Matthias in 1490. Frederick died in 1493.

FREDERICK WILLIAM (1620–1688), elector of Brandenberg, was born in Berlin in 1620. He is usually called "The Great Elector," and next to Frederick the Great he was the chief founder of the power of Prussia. A man of immense energy and determination, he devoted himself to his country, missing no opportunity, whether by intrigue or by force of arms, of adding to its extent and its influence. When at the age of twenty (1640) he succeeded to the electorate, he found it almost ruined. His father, George William, being of feeble and vacillating character, had been unable to prevent the inroads of the contending armies during the Thirty Years' War; and they had laid waste nearly the whole land, and treated the inhabitants with horrible cruelty. Frederick William, by skilful management, succeeded in getting rid of these barbarous hordes, and by slow degrees collected an army of about 30,000 men, which very effectually secured for him the respect of his neighbors. It was universally admitted that he was the true heir of the dukes of Pomerania, whose line died out in 1637; but at the Peace of Westphalia the lion's share of their territory was ceded to Sweden, Frederick William receiving only the eastern half of the country, shorn of Stettin. But he also obtained the bishoprics of Halberstadt, Minden, and Camin, with a promise of the archbishopric of Magdeburg. In 1655 war broke out between Sweden and Poland. Charles Gustavus, king of Sweden, compelled Frederick William to join him, and to do homage for Prussia, which had formerly been held in fief of Poland. After a battle of three days at Warsaw, the Poles were defeated (1656). In the following year the elector turned round and concluded an alliance with the Poles, receiving, by the treaty of Wehlau, in return for the promise of his aid, an acknowledgment of the complete independence of Prussia. Charles Gustavus uttered fierce threats of vengeance, but was prevented by sudden death from attempting to execute them. Frederick William had much trouble in inducing the states of Prussia to do homage to him as their sole lawful sovereign; but by a happy mingling of severity and kindness, he overcame in the end all opposition. As duke of Prussia he was now an absolutely independent sovereign, although still owing allegiance to the emperor for his other dominions. In 1666 he received, by the settlement of the Jülich-Cleve dispute, the duchy of Cleve proper, and the counties of Mark and Ravenstein; while Jülich and Berg were to fall to Brandenburg in the event of the Pfalz-Neuburg line dying out. When Louis XIV. invaded the Netherlands in 1674, Frederick William saw the danger which threatened Germany, and his own territories in particular; he therefore persuaded the emperor, various German princes, and the king of Denmark to form an alliance against the French. He soon withdrew from this contest, but in the war which began with the second French invasion of the Netherlands in 1674 he took a leading part. The Swedes sided with France, and were persuaded by Louis XIV. to invade Brandenburg, which they easily overran and devastated. The elector was unable to leave the seat of war for some time, but at last, in the summer of 1675, set out from Franconia, hastening forward with his cavalry, directing the infantry to follow as speedily as possible. Halting at Magdeburg, he heard that the Swedes were divided into three parties, and that the middle party was not more than forty miles off. Although overtaken only by a small body of his infantry, he rapidly advanced on this middle party, and on June 18, at Fehrbellin, after a severe struggle, decisively defeated it. The rest of the Swedes were then easily disposed of. He drove them not only from Brandenburg but from Pomerania, of which he became complete master. Between three and four years afterwards (about Christmas,

1678) they invaded Prussia, threatening Königsberg. In the dead of winter Frederick started from Berlin with a powerful force, and in the middle of January, 1679, finally beat them, crossing the Frische Haff with 4000 men on sledges. After all, however, he did not obtain Pomerania, for when the peace of St. Germain-en-Laye was concluded in 1679, Louis XIV. insisted on its being restored to his ally, the king of Sweden. Frederick William, indignant at Austria for allowing this, maintained for a time an alliance with France; but he had ultimately to cultivate the friendship of the emperor, from whom he hoped to obtain the Silesian principalities of Liegnitz, Brieg, and Wohlau, which, after 1675, he claimed as his by inheritance. He received the circle of Schwiebus, in Silesia (1686), on condition that he should withdraw his claim and send 8000 men to the help of the emperor in his war with the Turks. Two years afterwards he died. Although famous as a soldier, he was even greater as an administrator. He was the most economical ruler of his age, yet did no injustice to any branch of the state service. Among the most important of his public works may be named the canal between the Oder and the Spree, which still bears his name. After the revocation of the edict of Nantes, he welcomed large numbers of French refugees to his dominions; and long before that time he had offered every encouragement to Flemish settlers, thus giving a powerful impulse to industry and commerce. He was twice married,—his first wife, Louise Henrietta, being a pious and energetic lady, endowed with so clear and penetrating an understanding that her husband took no important step without consulting her.

FREDERICK I. (1657–1713), the first king of Prussia, was born at Königsberg, 1657. He was the son of the Great Elector by his first marriage. In consequence of a fall from the arms of his nurse his spine was so seriously injured that he was deformed for life. His stepmother intrigued against him incessantly in the interests of her children; and she succeeded in persuading her husband to make a will whereby Frederick should receive only the electoral title and the electoral lands, the remaining territories being divided among his half-brothers. On his accession in 1688 this will was set aside, with the sanction of the emperor, whose support he had obtained beforehand by signing away in his father's lifetime his rights in Schwiebus, a proceeding which, he afterwards maintained, restored his claim to the Silesian principalities. Frederick, having a strong love of pomp and show, strove hard to make his court an imitation of that of Louis XIV. Although without his father's firmness and energy, he seized every occasion of increasing his dominions by purchase; and he obtained, partly in virtue of certain claims inherited from his mother, partly through the influence of William III. of England, the principality of Neufchatel. It had been the intention of the Great Elector to give William III. vigorous support both in his struggle for the English crown and in the wars with France which were seen to be inevitable. Frederick gave effect to this purpose, and his troops played an important part in the battle of the Boyne. In the course of his reign he exercised considerable influence on European politics by placing auxiliary forces at the disposal of friendly princes. The accession of Augustus the Strong of Saxony to the throne of Poland fired his ambition, and for years he endeavored to induce the emperor Leopold I. to recognize him as king of Prussia. At last, in November, 1700, the emperor consented, insisting, however, on various strict conditions, one of which was that in the approaching war of the Spanish succession Prussia should contribute a force of 10,000 men to the Austrian army. Immediately after receiving the imperial sanction, Frederick started with his whole court for Königsberg, where, on January 18, 1701, with much ceremony he crowned himself. He sent 20,000 men into the war of the Spanish succession, and a portion of them did excellent service at the battle of Blenheim. In 1706 Prince Leopold of Dessau led 6000 Prussians to victory at Turin. Frederick died on the 25th February, 1713. By his extravagance he not only exhausted the treasure amassed by his father, but burdened his country with heavy taxes. He was not, however, an unpopular sovereign, and by making Prussia a kingdom he undoubtedly advanced it several stages towards its future greatness. He founded the university of Halle and the Berlin Academy of Sciences, and was fond of protecting enlightened men who suffered persecution. He was three times married, his second wife, Sophie Charlotte, sister of George I. of England, being well known as the friend of Leibnitz and as one of the most cultivated princesses of the age.

FREDERICK WILLIAM I. (1688–1740), king of Prussia, son of Frederick I. by his second marriage, was born in 1688. He spent a considerable time in early youth at the court of his grandfather, the elector of Hanover. On his return to Berlin he was placed under General von Dohna, who trained him to the energetic and regular habits that ever afterwards characterized him. He was soon imbued with a passion for military life, and this was deepened by acquaintance with the duke of Marlborough and Prince Eugene, whom he visited during the siege of Tournay. In nearly every respect he was the opposite of his father, having frugal, simple tastes, a passionate temper, and a determined will. He intensely disliked the French, and highly disapproved the imitation of their manners by Frederick I. and his courtiers. When he mounted the throne, his first act was to dismiss from the palace every unnecessary official, and to regulate the royal household on principles of the strictest parsimony. In 1715 he was forced, in alliance with Russia, Saxony, and Denmark, into a war with Charles XII. of Sweden, in consequence of which, in return for two million thalers paid to Sweden, he obtained the islands of Wollin and Usedom, Stettin, and part of Swedish Pomerania. This was his only war. All through his reign he strenuously insisted on his right to Jülich and Berg in the event of the Pfalz-Neuburg line dying out (which it seemed certain to do), and his anxiety respecting these duchies gives the key to most of his foreign policy. For some time he inclined to an understanding with England and Hanover; but in 1726 he formed an alliance with Austria, and in the Polish war of succession (1733-35) aided her with 10,000 men. Ultimately, however, he perceived that the emperor was not acting honorably by him, and withdrew from the alliance, occupying himself solely with the internal affairs of his kingdom. He despised many things which the modern world holds in high esteem, and was often coarse, violent, and fond of hideous practical jokes. Nevertheless Prussia profited immensely by his reign. He saw the necessity of rigid economy not only in his private life but in the whole administration of the state; and the consequence was that he paid off the debts incurred by his father, and left to his successor an overflowing treasury. He did nothing for the higher learning, and even banished the philosopher Wolf at 48 hours' notice, "on pain of the halter," for teaching, as he believed, fatalist doctrines; but he established many village schools, and he encouraged industry by every means in his power, particularly agriculture. Under him the nation flourished, and although it stood in awe of his vehement spirit, it respected him for his firmness, his honesty of purpose, and his love of justice. He was devoted to his army, the number of which he raised from 48,000 to 83,500; and there was not in existence a more thoroughly drilled or better appointed force. The Potsdam guard, made up of giants collected from all parts of Europe, sometimes kidnapped, was a sort of toy with which he amused himself. The reviewing of his troops was his chief pleasure; but he was also fond of meeting his friends in the evening in what he called his "tobacco college," where he and they, amid clouds of tobacco smoke, discussed affairs of state. He died on the 31st May, 1740, leaving behind him his widow, Sophie Dorothea of Hanover, and a numerous family.

See Morgenstern, *Ueber Friedrich Wilhelm I.* (Brunswick, 1793); J. C. Droysen, *Friedrich Wilhelm I., König von Preussen* (2 vols., Leipsic, 1869); Carlyle, *History of Friedrich II. of Prussia.*

FREDERICK II. (1712–1786), king of Prussia, born on the 24th January, 1712, was the son of Frederick William I., and is usually known as Frederick the Great. He was brought up with extreme rigor, his father devising a scheme of education which was intended to make him a hardy soldier, and prescribing for him every detail of his conduct. So great was Frederick William's horror of everything which did not seem to him practical, that he strictly excluded Latin from the list of his son's studies. Frederick, however, had free and generous impulses which could not be restrained by the sternest system. Encouraged by his mother, and under the influence of his governess, Madame de Roucoulle, and of his first tutor Duhan, a French refugee, he acquired an excellent knowledge of French, and a taste for literature and music. He even received secret lessons in Latin, which his father had invested with all the charms of forbidden fruit. As he grew up he became extremely dissatisfied with the dull and monotonous life he was compelled to lead; and his discontent was heartily shared by his sister, Wilhelmina, a bright and intelligent young princess for whom Frederick had a warm affection. Frederick William, seeing the divergence of his son's tastes from his own, gradually conceived for him an intense dislike, which often found expression in violent outbursts of anger. So harsh was his treatment that Frederick frequently thought of running away and taking refuge at the court of his uncle, George II. of England; and he at last resolved to do so during a journey which he made with the king to South Germany in 1730, when he was eighteen years of age. He was helped by his two friends, Lieutenant Katte and Lieutenant Keith; but by the imprudence of the former the secret was found out. Frederick was placed under arrest, and the king abused him so cruelly on board a yacht at Frankfort that some courtiers had to interfere, and to separate them. Warned by Frederick, Keith escaped; but Katte delayed his flight too long, and a court martial decided that he should be punished with two years' fortress arrest. The king changed this sentence into one of death, and the young soldier was executed outside the fortress of Cüstrin, in which Frederick was kept a close prisoner. On the way to the place of execution Katte had to pass the crown prince's window. "Pardonnez moi, mon cher Katte," cried Frederick, who was broken-hearted at the fate he had brought upon his friend. "La mort est douce pour un si aimable prince," replied Katte. The same court-martial which had judged him decided that as a lieutenant-colonel attempting to desert, the crown prince had incurred the legal penalty of death. For some time the king actually thought of giving effect to the sentence; and he at last relented only in consequence of grave expostulations from the emperor and the kings of Sweden and Poland.

For about fifteen months Frederick now lived in the town of Cüstrin, having an establishment of his own, but serving as the youngest councillor at the Government board there. He took great care not to offend his father, and was partially restored to favor. In 1732 he was made colonel commandant of a regiment in Ruppin, and in the following year he married, in obedience to the king's orders, the Princess Elizabeth Christina, daughter of the duke of Brunswick-Bevern. The palace of Rheinsberg in the neighborhood of Ruppin was built for him, and there he lived until he succeeded to the throne. These years were perhaps the happiest of his life. He discharged his duties with so much spirit and so conscientiously that he ultimately gained the esteem of Frederick William, who no longer feared that he would leave the crown to one unworthy of wearing it. At the same time the crown prince was able to indulge to the full his personal tastes. He carried on a lively correspondence with Voltaire and other French men of letters, and was a diligent student of philosophy, history, and poetry. Two of his best known works were written at this time,—*Considérations sur l'état présent du corps politique de l'Europe* and his *Anti-Macchiavel.* In the former he calls attention to the growing strength of Austria and France, and insists on the necessity of some third power, by which he clearly means Prussia, counterbalancing their excessive influence. The second treatise, which was issued by Voltaire in Hague in 1740, contains a generous exposition of some of the favorite ideas of the 18th century philosophers respecting the duties of sovereigns.

In 1740 he became king. He maintained all the forms of government established by his father, but ruled in a far more liberal and enlightened spirit; he tolerated every form of religious opinion, granted considerable freedom to the press even in political discussion, was most careful to secure an exact and impartial administration of justice, and allowed every one with a genuine grievance free access to his presence. The Potsdam regiment of giants was disbanded, but the real interests of the army were as carefully studied by Frederick as by Frederick William. On the year of his accession, the emperor Charles VI. died. Frederick at once began to make extensive military preparations, and it was soon clear to all the world that he intended to enter upon some serious enterprise. He had made up his mind to take possession of Silesia. For this resolution he is often abused still by historians, and at the time he had the approval of hardly any one out of Prussia. He himself, writing of the scheme in his *Mémoires,* laid no claim to lofty motives, but candidly confessed that "it was a means of acquiring reputation and of increasing the power of the state." He firmly believed, however, that he had inherited lawful claims to the Silesian principalities; and although his father had recognized the Pragmatic Sanction, whereby the hereditary dominions of Charles VI. were to descend to his daughter, Maria Theresa, Frederick insisted that this sanction could refer only to lands which rightfully belonged to the house of Austria. He could also urge that, as Charles VI. had not fulfilled the engagements by which Frederick William's recognition of the Pragmatic Sanction had been secured, Prussia was freed from her obligation. Frederick cannot fairly be charged with having let loose the elements of war which desolated Europe during the next few years, for, independently of him, the elector of Bavaria instantly protested against the Pragmatic Sanction, and there can be no doubt that in any case France would have taken advantage of so favorable a chance of breaking the power of Austria.

Frederick sent an ambassador to Vienna, offering, in the event of his rights in Silesia being conceded, to aid Maria Theresa against her enemies. The queen of Hungary, who regarded the proposal as that of a mere robber, haughtily declined; whereupon Frederick immediately invaded Silesia with an army of 30,000 men. His first victory was gained at Mollwitz on the 10th of April, 1741. Under the impression, in consequence of a furious charge of Austrian cavalry, that the battle was lost, he rode rapidly away at an early stage of the struggle,—a mistake which gave rise for a time to the groundless idea that he lacked personal courage. A second Prussian victory was gained at Chotusitz, near Czeslau, on the 17th May, 1742, by which time Frederick was master of all the fortified places of Silesia. Maria Theresa, in the heat of her struggle with France and the elector of Bavaria, now Charles VII., and pressed by England to rid herself of Frederick, concluded with him, on the 11th June, 1742, the peace of Breslau, conceding to Prussia Upper and Lower Silesia as far as the Oppa, together with the county of Glatz. Frederick made good use of the next two years, fortifying his new territory, and repairing the evils inflicted upon it by the war. By the death of the prince of East Friesland without heirs, he also gained possession of that country. He knew well that Maria Theresa would not, if she could help it, allow him to remain in Silesia; accordingly, in 1744, alarmed by her victories, he arrived at a secret understanding with France, and pledged himself, with Hesse-Cassel and the palatinate, to maintain the imperial rights of Charles VII., and to defend his hereditary Bavarian lands. Frederick began the second Silesian war by entering Bohemia in August, 1744, and taking Prague. By this brilliant but rash venture he put himself in great danger, and soon had to retreat; but in 1745 he gained the battles of Hohenfriedberg, Sorr, and Hennersdorf; and Leopold of Dessau ("Der alte Dessauer") won for him the victory of Kesselsdorf in Saxony. The latter victory was decisive, and the peace of Dresden (December 25, 1745) assured to Frederick a second time the possession of Silesia.

Frederick had thus, at the age of thirty-three, raised himself to a great position in Europe, and henceforth he was the most conspicuous sovereign of his time. He was a thoroughly absolute ruler, his so-called ministers being mere clerks whose business was to give effect to his will. To use his own famous phrase, however, he regarded himself as but "the first servant of the state;" and during the next eleven years he proved that the words expressed his inmost conviction and feeling. All kinds of questions were submitted to him, important and unimportant; and he is frequently censured for having troubled himself so much with mere details. But in so far as these details related to expenditure he was fully justified, for it was absolutely essential for him to have a large army, and with a small state this was impossible unless he carefully prevented unnecessary outlay. Being a keen judge of character, he filled the public offices with faithful, capable, energetic men, who were kept up to a high standard of duty by the consciousness that their work might at any time come under his strict supervision. The Academy of Sciences, which had fallen into contempt during his father's reign, he restored, infusing into it vigorous life; and he did more to promote elementary education than any of his predecessors. He made canals between the Oder and the Elbe, and the Oder and the Havel, and all kinds of manufacture, particularly silk manufacture, owed much to his encouragement. To the army he gave unremitting attention, reviewing it at regular intervals, and sternly punishing negligence on the part of the officers. Its numbers were raised to 160,000 men, while fortresses and magazines were always kept in a state of readiness for war. The influence of the king's example was felt far beyond the limits of his immediate circle. The nation was proud of his genius, and displayed something of his energy in all departments of life. Lessing, who as a youth of twenty came to Berlin in 1749, composed enthusiastic odes in his honor, and Gleim, the Halberstadt poet, wrote of him as of a kind of demi-god. These may be taken as fair illustrations of the popular feeling long before the Seven Years' War.

He despised German as the language of boors, although it is remarkable that at a later period, in a French essay on German literature, he predicted for it a great future. He habitually wrote and spoke French, and had a strong ambition to rank as a distinguished French author. Nobody can now read his verses, but his prose writings have a certain calm simplicity and dignity, without, however, giving evidence of the splendid mental qualities which he revealed in practical life. To this period belong his *Mémoires pour servir à l'histoire de Brandebourg*, and his poem *L'Art de la Guerre*. The latter, judged as literature, is intolerably dull; but the former is a narrative of some value, throwing considerable light on his personal sympathies as well as on the motives of important epochs in his career. He continued to correspond with French writers, and induced a number of them to settle in Berlin, Maupertuis being president of the Academy. In 1752 Voltaire, who had repeatedly visited him, came at Frederick's urgent entreaty, and received a truly royal welcome. The famous Hirsch trial, and Voltaire's vanity and caprice, greatly lowered him in the esteem of the king, who, on his side, irritated his guest by often requiring him to correct bad verses, and by making him the object of rude banter. The publication of *Doctor Akakia*, which brought down upon the president of the Academy a storm of ridicule, finally alienated Frederick; while Voltaire's wrongs culminated in the famous arrest at Frankfort, the most disagreeable elements of which were due to the misunderstanding of an order by a subordinate official.

The king lived as much as possible in a retired mansion, to which he gave the name of Sanssouci,—not the palace so called, which was built after the Seven Years' War, and was never a favorite residence. He rose regularly in summer at five, in winter at six, devoting himself to public business till about eleven. During part of this time, after coffee, he would aid his reflections by playing on the flute, of which he was passionately fond, being a really skilful performer. At eleven came parade, and an hour afterwards, punctually, dinner, which continued till two, or later, if conversation happened to be particularly attractive. After dinner he glanced through and signed cabinet orders written in accordance with his morning instructions, often adding marginal notes and postscripts, many of which were in a caustic tone. These disposed of, he amused himself for a couple of hours with literary work; between six and seven he would converse with his friends or listen to his reader (a post held for some time by La Mettrie); at seven there was a concert; and at half-past eight he sat down to supper, which might go on till midnight. He liked good eating and drinking, although even here the cost was sharply looked after, the expenses of his kitchen mounting to no higher figure than £1800 a year. At supper he was always surrounded by a number of his most intimate friends, mainly Frenchmen; and he insisted on the conversation being perfectly free. His wit, however, was often cruel, and any one who responded with too much spirit was soon made to feel that the license of talk was to be complete only on one side.

At Frederick's court ladies were seldom seen, a circumstance that gave occasion to much scandal for which there seems to have been no foundation. The queen he visited only on rare occasions. She had been forced upon him by his father, and he had never loved her; but he always treated her with marked respect, and provided her with a generous income, half of which she gave away in charity. Although without charm, she was a woman of many noble qualities; and, like her husband, she wrote French books, some of which attracted a certain attention in their day. She survived him by eleven years, dying in 1797.

Maria Theresa had never given up hope that she would recover Silesia; and as all the neighboring sovereigns were bitterly jealous of Frederick, and somewhat afraid of him, she had no difficulty in inducing several of them to form a scheme for his ruin. Russia and Saxony entered into it heartily; and France, laying aside her ancient enmity towards Austria, joined the empress against the common object of dislike. Frederick, meanwhile had turned towards England, which saw in him a possible ally of great importance against the French. A convention between Prussia and Great Britian was signed in January, 1756, and it proved of incalculable value to both countries, leading as it did to a close alliance during the administration of Pitt. Through the treachery of a clerk in the Saxon foreign office, Frederick was made aware of the future which was being prepared for him. Seeing the importance of taking the initiative, and, if possible, of securing Saxony, he suddenly, on the 24th August, 1756, crossed the frontier of that country, and shut in the Saxon army between Pirna and Königstein, ultimately compelling it, after a victory gained over the Austrians at Lowositz, to surrender. Thus began the Seven Years' War, in which, supported by England, Brunswick, and Hesse-Cassel, he had for a long time to oppose Austria, France, Russia, Saxony, and Sweden. Virtually, the whole Continent was in arms against a small state which, a few years before, had been regarded by most men as beneath serious notice. But it happened that this small state was led by a man of high military genius, capable of infusing into others his own undaunted spirit, while his subjects had learned both from him and his predecessors habits of patience, perseverance, and discipline. In 1757, after defeating the Austrians at Prague, he was himself defeated by them at Kolin; and by the shameful convention of Closter-Seven, he was freely exposed to the attack of the French. In November, 1757, however, when Europe looked upon him as ruined, he rid himself of the French by his splendid victory over them at Rossbach, and in about a month afterwards, by the still more splendid victory at Leuthen, he drove the Austrians from Silesia. From this time the French were kept well employed in the west by Prince Ferdinand of Brunswick, who defeated them at Crefeld in 1758, and at Minden in 1759. In the former year Frederick triumphed, at a heavy cost, over the Russians at Zorndorf; and although, through lack of his usual foresight, he lost the battle of Hochkirchen, he prevented the Austrians from deriving any real advantage from their triumph, Silesia still remaining in his hands at the end of the year. The battle of Kunersdorf, fought on August 12, 1759, was the most disastrous to him in the course of the war. He had here to contend both with the Russians and the Austrians; and although at first he had some success, his army was in the end completely broken. "All is lost. Save the royal family," he wrote to his minister Friesenstein; "the consequences of this battle will be worse than the battle itself. I shall not survive the ruin of the Fatherland. Adieu for ever!" But he soon recovered from his despair, and in 1760 gained the important victories of Liegnitz and Torgau. He had now, however, to act on the defensive, and, fortunately for him, the Russians, on the death of the czarina Elizabeth, not only withdrew in 1762 from the compact against him, but for a time became his allies. On October 29 of that year he gained his last victory over the Austrians at Freiberg. Europe was by that time sick of war, every power being more or less exhausted. The result was, that, on February 15, 1763, a few days after the conclusion of the peace of Paris, the treaty of Hubertusburg was signed, Austria confirming Prussia in the possession of Silesia.

It would be difficult to overrate the importance of the contribution thus made by Frederick to the politics of Europe. Prussia was now universally recognized as one of the great powers of the Continent, and she definitely took her place in Germany as the rival of Austria. From this time it was inevitable that there should be a final struggle between the two nations for predominance, and that the smaller German states should group themselves around one or the other. Frederick himself acquired both in Germany and Europe the indefinable influence which springs from the recognition of great gifts that have been proved by great deeds.

His first care after the war was, as far as possible, to enable the country to recover from the terrific blows by which it had been almost destroyed; and he was never, either before or after, seen to better advantage than in the measures he adopted for this end. Although his resources had been so completely drained that he had been forced to melt the silver in his palaces and to debase the coinage, his energy soon brought back the national prosperity. Pomerania and Neumark were freed from taxation for two years, Silesia for six months. Many nobles whose lands had been wasted received corn for seed; his war horses were within a few months to be found on farms all over Prussia; and money was freely spent in the re-erection of houses which had been destroyed. The coinage was gradually restored to its proper value, and trade received a favorable impulse by the foundation of the Bank of Berlin. All these matters were carefully looked into by Frederick himself, who, while acting as generously as his circumstances would allow, insisted on everything being done in the most efficient manner at the least possible cost. Unfortunately, he adopted the French ideas of excise, and the French methods of imposing and collecting taxes,—a system known as the Regie. This system secured for him a large revenue, but it led to a vast amount of petty tyranny, which was all the more intolerable because it was carried out by French officials. It was continued to the end of Frederick's reign, and nothing did so much to injure his otherwise immense popularity. He was quite aware of the discontent the system excited, and the good-nature with which he tolerated the criticisms directed against it and him is illustrated by a well known incident. Riding along the Jäger Strasse one day, he saw a crowd of people. "See what it is," he said to the groom who was attending him. "They have something posted up about your Majesty," said the groom, returning. Frederick, riding forward, saw a caricature of himself: "King in very melancholy guise," says Preuss (as translated by Carlyle), "seated on a stool, a coffee-mill between his knees, diligently grinding with the one hand, and with the other picking up any bean that might have fallen. 'Hang it lower,' said the king, beckoning his groom with a wave of the finger; 'lower that they may not have to hurt their necks about it.' No sooner were the words spoken, which spread instantly, than there rose from the whole crowd one universal huzzah of joy. They tore the caricature into a thousand pieces, and rolled after the king with loud '*Lebe Hoch*, our Frederick for ever,' as he rode slowly away." There are scores of anecdotes about Frederick, but not many so well authenticated as this.

There was nothing about which Frederick took so much trouble as the proper administration of justice. He disliked the formalities of the law, and in one instance, "the Miller-Arnold case," in connection with which he thought injustice had been done to a poor man, he dismissed the judges, condemned them to a year's fortress-arrest, and compelled them to make good out of their own pocket the loss sustained by their supposed victim,—not a wise proceeding, but one springing from a generous motive. He once defined himself as "l'avocat du pauvre," and few things gave him more pleasure than the famous answer of the miller whose windmill stood on ground which was wanted for the king's garden. The miller sturdily refused to sell it. "Not at any price?" said the king's agent; "could not the king take it from you for nothing, if he chose?" "Have we not the Kammergericht at Berlin?" was the answer, which became a popular saying in Germany. Soon after he came to the throne Frederick began to make preparations for a new code. In the year 1749–51 his grand-chancellor, Von Cocceji, a man of wide knowledge and solid judgment, finished "The Project of the Corporis Juris Fridericiani," which was afterwards made the basis of a legal system drawn up by the grand-chancellor Von Cramer—a system that came into operation in 1794 under Frederick's successor.

Looking ahead after the Seven Years' War, Frederick saw no means of securing himself so effectually as by cultivating the good will of Russia. In 1764 he accordingly concluded a treaty of alliance with the empress Catherine for eight years. Six years afterwards, unfortunately for his fame, he joined in the first partition of Poland, by which he received Polish Prussia, without Dantzic and Thorn, and Great Poland as far as the Netzefluss. Prussia was then for the first time made continuous with Brandenburg and Pomerania. Frederick would have run great risks had he refused to take part in this arrangement; but it was none the less a shameful violation of international law, the full penalty for which has perhaps not even yet been paid.

The emperor Joseph II., being of an ardent and impulsive nature, greatly admired Frederick, and visited him at Neisse, in Silesia, in 1769, a visit which Frederick returned, in Moravia, in the following year. The young emperor was frank and cordial; Frederick was more cautious, for he detected under the respectful manner of Joseph a keen ambition that might one day become dangerous to Prussia. Ever after these interviews a portrait of the emperor hung conspicuously in the rooms in which Frederick lived, a circumstance on which some one remarked. "Ah yes," said Frederick, "I am obliged to keep that young gentleman in my eye." Nothing came of these suspicions till 1777, when, after the death of Maximilian Joseph, elector of Bavaria, without children, the emperor took possession of the greater part of his lands. The elector palatine, who lawfully inherited Bavaria, came to an arrangement, which was not admitted by his heir, the duke of Zweibrücken, afterwards King Maximilian I. of Bavaria. The latter appealed to Frederick, who, resolved that Austria should gain no unnecessary advantage, took his part, and brought pressure to bear upon the emperor. Ultimately, greatly against his will, Frederick felt compelled to draw the sword, and in July, 1778, crossed the Bohemian frontier at the head of a powerful army. No general engagement was fought, and after a great many delays, the treaty of Teschen was signed on the 13th May, 1779. Austria received the circle of Burgau, and consented that the king of Prussia should take the Franconian principalities. Frederick never abandoned his jealousy of Austria, whose ambition he regarded as the chief danger against which Europe had to guard. He seems to have had no suspicion that evil days were coming in France. It was Austria which had given trouble in his time; and if her pride were curbed, he fancied that Prussia at least would be safe. Hence one of the last important acts of his life was to form, in 1785, a league of princes (the "Fürstenbund") for the defence of the imperial constitution, believed to be imperilled by Joseph's restless activity. The league came to an end after Frederick's death; but it is of considerable historical interest, as the first open attempt of Prussia to take the lead in Germany.

Frederick's chief trust was always in his treasury and his army. By continual economy he left in the former the immense sum of 70 million thalers; the latter, at the time of his death, numbered 200,000 men, disciplined with all the strictness to which he had throughout life accustomed his troops. He died at Sanssouci on the 17th August, 1786; his death being hastened by exposure to a storm of rain, stoically borne, during a military review. He passed away on the eve of tremendous events, which for a time obscured his fame; but now that he can be impartially estimated, he is seen to have been in many respects one of the greatest figures in modern history.

He was rather below the middle size, in youth inclined to stoutness, lean in old age, but of vigorous and active habits. An expression of keen intelligence lighted up his features, and his large, sparkling, gray eyes darted penetrating glances at every one who approached him. In his later years an old blue uniform with red facings was his usual dress, and on its breast was generally some Spanish snuff, of which he consumed large quantities. He shared many of the chief intellectual tendencies of his age, having no feeling for the highest aspirations of human nature, but submitting all things to a searching critical analysis. Of Christianity he always spoke in the mocking tone of the "enlightened" philosophers, regarding it as the invention of priests; but it is noteworthy that after the Seven Years' War, the trials of which steadied his character, he sought to strengthen the church for the sake of its elevating moral influence. He cannot be truly described as an atheist, for he regarded the world as probably the creation of a demiurgus,—of a demiurgus, however, who could not be supposed to take interest in the petty affairs of men. In his judgments of mankind he often talked as a misanthrope. He was once conversing with Sulzer, who was a school inspector, about education. Sulzer expressed the opinion that education had of late years greatly improved. "In former times, your Majesty," he said, "the notion being that mankind were naturally inclined to evil, a system of severity prevailed in schools; but now, when we recognize that the inborn inclination of men is rather to good than to evil, schoolmasters have adopted a more generous procedure." "Ah, my dear Sulzer," replied the king, "you don't know this damned race" ("Ach, mein lieber Sulzer, er kennt nicht diese verdammte Race"). This fearful saying unquestionably expressed a frequent mood of Frederick's; and he sometimes acted with great harshness, and seemed to take a malicious pleasure in tormenting his acquaintances. Yet he was capable of genuine attachments. He was beautifully loyal to his mother and his sister Wilhelmina; his letters to the duchess of Gotha are full of a certain tender reverence; the two Keiths found him a devoted friend. But the true evidence that beneath his misanthropical moods there was an enduring sentiment of humanity is afforded by the spirit in which he exercised his kingly functions. Taking his reign as a whole, it must be said that he looked upon his power rather as a trust than as a source of personal advantage; and the trust was faithfully discharged according to the best lights of his day. He has often been condemned for doing nothing to encourage German literature; and it is true that he was supremely indifferent to it. Before he died a tide of intellectual life was rising all about him; yet he failed to recognize it, declined to give Lessing even the small post of royal librarian, and thought *Götz von Berlichingen* a vulgar imitation of vulgar English models. But when his taste was formed, German literature did not exist; the choice was between Racine and Voltaire on the one hand and Gottsched and Gellert on the other. He survived into the era of Kant, Goethe, and Schiller, but he was not of it, and it would have been unreasonable to expect that he should in old age pass beyond the limits of his own epoch. As Germans now generally admit, it was better that he let their literature alone, since, left to itself, it became a thoroughly independent product. Indirectly he powerfully promoted it by deepening the national life from which it sprang. At a time when there was no real bond of cohesion between the different states, he stirred among them a common enthusiasm; and in making Prussia great he laid the foundation of a genuinely united empire.

In 1846–57, Frederick William IV. caused a magnificent edition of Frederick's writings to be issued by the Berlin Academy, under the supervision of Preuss. It is in 30 volumes, of which 6 contain verse, 7 are historical, 2 philosophical, and 3 military, 12 being made up of correspondence.

See Carlyle, *History of Friedrich II. of Prussia*; Droysen, *Friedrich der Grosse* (2 vols., Leipsic, 1874–76, forming Part v. of his *Geschichte der Preussischen Politik*); F. Förster, *Friedrich der Grosse, geschildert als Mensch, Regent, und Feldherr* (4th ed., Berlin, 1860); Rigollot, *Frédéric II., Philosophe* (Paris, 1875); Schröder, *Friedrich der Grosse in seinen Schriften* (3 vols., Leipsic, 1875–76). (J. SI.)

FREDERICK WILLIAM II. (1744–1797), king of Prussia, was the nephew of Frederick the Great. His father, Augustus William, the second son of Frederick William I., having died in 1757, Frederick William was nominated by the king successor to the throne. He was of an easy-going nature, fond of pleasure, and without the capacity for hard work that characterized his foremost predecessors. His loose mode of life alienated from him the sympathies of his uncle, into whose presence he was not admitted for several years. In the war of the Bavarian succession in 1778, however, he received an expression of approval from Frederick in consequence of an act of personal courage. When he mounted the throne, Prussia held a high place on the Continent; her military fame was splendid; and the national finances were in a flourishing condition. The young king had some good impulses, and made himself popular for a time by lightening a few of the burdens of the people, abolishing the tyrannical method of collecting taxes which Frederick had instituted, and encouraging trade. He gave himself up, however, to the advice of unworthy favorites, and soon lost the goodwill both of his subjects and of Europe. For a time he continued the decided policy of his uncle towards Austria, vigorously supporting Turkey against her in 1790. But in the same year he concluded the Reichenbach convention, whereby a nominally good understanding was effected between the two countries, various difficulties being removed during a personal interview of Frederick William with the emperor Leopold II. at Pillnitz in 1791. In 1792, associating himself with the emperor in the war with France, Frederick William sent across the Rhine an army of 50,000 men under the duke of Brunswick. A separate peace was concluded by Prussia in 1795. The dilatoriness with which he prosecuted this war was due to jealousy respecting the policy of Austria and Russia towards Poland. He had formally recognized in 1790 the integrity of Poland; but in 1793, after a vast amount of intrigue, he took part with Russia in the second partition, gaining thereby what is now called South Prussia, with Dantzic and Thorn. The following year brought the third partition, which extended Prussia from the Niemen to Warsaw. Some time before these partitions, in consequence of an understanding with the margrave, signed December 2, 1791, the king had gained possession of the principalities of Baireuth and Anspach. The size and population of Prussia were thus largely increased under Frederick William II.; but, except in the case of Baireuth and Anspach, he attained his aims by means which the more intelligent class of his subjects did not approve, and by his vacillating policy he greatly lowered the state in the esteem of the world. He not only exhausted the resources accumulated by Frederick the Great, but imposed on the country a burden of debt; and he excited much ill-feeling by introducing a severe censorship of the press, and by subjecting the clergy to laws conceived in a spirit of the narrowest orthodoxy. He died on the 16th November, 1797. His first wife having been divorced in 1769, he married the Princess Louise of Hesse-Darmstadt, by whom he had five sons.

FREDERICK WILLIAM III. (1770–1840), king of Prussia, was the eldest son of Frederick William II., and was born on the 3d August, 1770. He was carefully trained under the supervision, in early youth, of his grand-uncle, Frederick the Great. As crown prince he accompanied his father in 1791, to the interview with the emperor at Pillnitz, and in the following year visited with him the army in the Rhine country which was making war with France. In 1793 he married the Princess Louise, daughter of the duke of Mecklenburg-Strelitz. She became a highly popular queen, and thoroughly deserved the affection and respect with which she was regarded. Simple and unostentatious in manner, she was of a refined and gentle disposition, yet endowed with a quick and keen intelligence, and with an heroic spirit which the greatest disasters could not break. Her husband's character was not nearly so interesting. He was rather dull and slow; but he had a sincere desire for the welfare of his people; was capable in emergencies of undertaking a great enterprise, and allowed himself to be freely influenced by the loftier impulses of his wife. When he succeeded to the throne he at once removed the principal grievances due to the weakness of his father, and called to his aid capable and honest ministers. By the treaty of Lunéville, in 1801, he was obliged to concede to Napoleon his territory on the left bank of the Rhine; but he received some compensations. In 1805 he was brought for a short time into conflict with England for accepting Hanover from Napoleon in return for certain concessions. Up to this time he had remained at peace with France; but the formation of the Confederation of the Rhine in 1806 filled him with alarm and indignation, and, giving way to a sudden impulse, he demanded that all French troops should forthwith quit German soil. The result was the battles of Jena and Auerstädt, followed by those of Eylau and Friedland; and on July 9, 1807, he had to sign the treaty of Tilsit, which deprived him of half his kingdom. Early in the war he had been obliged to leave Berlin with the queen, and not till the end of 1809 were they able to return. In 1810 the queen died. Meanwhile, under the guidance of the great minister Stein, who was succeeded by Hardenberg, he had begun thoroughly to reorganize the state; while, through the exertions of Scharnhorst and Gneisenau, the army, in which the traditions of a past age had survived too long, was raised to a state of high efficiency. The king was forced in 1812 to conclude an alliance with Napoleon, and to aid him with an auxiliary corps in his expedition to Russia; but seeing the disastrous retreat of the French from Moscow, Frederick William appealed to the country to undertake a war of liberation. In due time the appeal was followed by the battle of Leipsic and the battle of Waterloo. After the conclusion of peace he labored sincerely, with the aid of competent ministers, to undo many of the evils caused by the confusion of the previous years; but he forgot that in his time of need he had promised to set up a constitutional system of government. He only instituted (1817) provincial estates; and after the July Revolution he proved himself an uncompromising and bitter opponent of liberal ideas. He died on the 7th of June, 1840.

See W. Hahn, *Friedrich Wilhelm III. und Louise* (2d ed., Berlin, 1876); Duncker, *Aus der Zeit Friedrichs des Grossen und Friedrich Wilhelms III.* (Leipsic, 1876).

FREDERICK WILLIAM IV. (1795–1861), king of Prussia, the son of Frederick William III., was born on the 15th October, 1795. He took an active part in the War of Liberation, and in 1814 spent some time in Paris, in whose museums and picture galleries he acquired a warm love of art. On returning to Berlin he cultivated his artistic tastes under the guidance of Rauch and Schinkel, receiving at the same time instruction in jurisprudence and finance from Savigny and other distinguished teachers. He married Princess Elizabeth of Bavaria in 1823, but had no children. As he was known to be cultivated, intelligent, and generous, high hopes were formed respecting his reign; and these hopes were fostered by his first acts as king, for he conceded greater freedom of the press than had been allowed under his father, granted an amnesty to political prisoners, and invited to his capital some of the leading writers and artists of the day. He soon, however, disappointed popular expectations. He was a lover rather of large phrases than of great actions, being very willing to benefit his subjects, but on condition that they should accept what he offered them as the gift of an absolute ruler. In 1847 he assembled at Berlin a united diet, made up of representatives of the provincial diets established by his father, and created intense discontent by proclaiming that he would not allow a constitution to stand between him and his people. The revolutionary movement of 1848 took him wholly by surprise, and he was so alarmed that he not only promised to institute parliamentary government, but placed himself at the head of the agitation for the unity of Germany. When, however, in 1849 the national assembly at Frankfort offered him the title of emperor, he declined it. He formed an alliance with Hanover and Saxony for the purpose of creating a new German constitution, and summoned a national parliament at Erfurt. Austria insisted on the old Frankfort diet being re-established, and for a time war appeared to be imminent. Ultimately, by the treaty of Olmütz (1850) Austria prevailed. In 1850 the Prussian constitution was proclaimed, but it was interpreted in a narrow sense, and under the reactionary ministry of Manteuffel some of its most essential provisions were soon changed. In 1848 Neufchatel had been incorporated with Switzerland. Certain royalists having attempted in 1856 to secure it again for the king of Prussia, they were seized by the Swiss authorities and accused of high treason. After some angry negotiations they were given up, and Frederick William then formally resigned all claims to the country. On his way back from Vienna in the summer of 1857 he had a stroke of paralysis in Dresden; in October of the same year he had a second stroke in Berlin. From this time, with the exception of brief intervals, his mind was clouded, and the duties of government were undertaken by his brother William, who on October 7, 1858, was formally recognized as regent. The king spent the winter of 1858–59 in Rome, where his health occasionally improved, but when he returned to Berlin in November, 1860, his end was seen to be near, and he died at Sanssouci on the night of January 2, 1861.

See Varnhagen von Ense's *Blätter aus der Preussischen Geschichte* (5 vols., Leipsic, 1868–69); and *Briefwechsel Friedrich Wilhelms IV. mit Bunsen* (Leipsic, 1873).

FREDERICK I. (1369–1428), elector and duke of Saxony, surnamed the Pugnacious, eldest son of Landgraf Frederick the Severe of Thuringia and of Catherine countess of Henneberg, was born at Altenburg, March 29, 1369. On the death of his father in 1381, he and his two brothers succeeded to the inheritance under the guardianship of their mother, but were compelled to grant a portion of it to their father's two brothers. The death of one of their father's brothers in 1407 occasioned a renewal of the inheritance dispute with the remaining brother, and an amicable settlement was not arrived at till 1410. Previous to this Frederick had distinguished himself in wars against the Lithuanians, Hungary, and King Wenzel of Germany; and having in 1420 collected an army against the Hussites, he was for a time so uniformly successful, that in 1423 the emperor Sigismund, in recognition of his valuable services, created him elector and duke of Saxony. With these honors, however, Sigismund also laid upon him the whole burden of the Hussite war; and the result was that, by an overwhelming defeat at Aussig in 1426, nearly all the Saxons capable of bearing arms were either killed or placed *hors de combat.* Frederick did not long survive this disaster, dying at Altenburg, 4th January, 1428. The university of Leipsic was founded by Frederick in 1409.

See life by Spalatin in Mencke's *Scriptores rerum Germ.*; and life by Horn, Leipsic, 1733.

FREDERICK II. (1411–1464), elector and duke of Saxony, surnamed the Meek, son of the former and of Catherine of Brunswick, was born August 22, 1411, and succeeded his father in 1428. His reign is remarkable only for his long-continued dispute with his uncles and brothers regarding the partition of Saxony—a dispute which, though finally settled in 1451 by the interposition of the emperor in Frederick's favor, led, in 1455, to the famous attempt by a knight named Kunz von Kaufungen to abduct the two sons of Frederick, Ernst and Albert. A graphic description of the plot and its accidental frustration will be found in a paper on the "Prinzenraub" in Mr. Carlyle's *Miscellaneous Works.* Frederick died at Leipsic, 7th September, 1464.

For the literature connected with the "Prinzenraub," see W. Schäfer, *Der Montag vor Kiliani*, 1855; and J. Gersdorf, *Einige Actenstücke zur Geschichte des Sächsischen Prinzenraubes*, 1855.

FREDERICK III. (1463–1525), elector and duke of Saxony, surnamed the Wise, grandson of the preceding and son of Duke Ernst, was born at Torgau, January 17, 1463. On the death of his father in 1486, he succeeded him in the sole government of Saxony, but divided the other possessions of the Ernestine line with his brother John the Constant. Frederick founded the university of Wittenberg in 1502, and appointed Melanchthon and Luther to two of its chairs. Though he never formally adopted the principles of the Reformation, he granted to the Reformers his friendly countenance, and in 1521 he secured the safety of Luther during the diet of Worms, and afterwards sheltered him in the castle of Wartburg. In 1493 Frederick made a pilgrimage to the Holy Land, and was made in Jerusalem a knight of the Holy Sepulchre. He was three times imperial vicar, and on the death of Maximilian I. he was offered the imperial throne but declined it, and, in accordance with his recommendation, it was bestowed on Charles V. Frederick died at Lochau, 5th May, 1525.

See life published from Spalatin's manuscript by Neudecker and Preller, 1851, and another by Tutzschmann, 1848.

FREDERICK AUGUSTUS I., elector of Saxony. See Augustus II., of Poland, vol. iii. p. 74.

FREDERICK AUGUSTUS II., elector of Saxony. See Augustus III., of Poland, vol. iii. p. 74.

FREDERICK AUGUSTUS I. (1750–1827), king of Saxony, son of Elector Frederick Christian, was born at Dresden, 23d December, 1750, succeeded his father, under the guardianship of Prince Xavier, in 1763, and was declared of age in 1768. In the following year he married Princess Maria-Amelia of Deux-Ponts. On account of the claims of his mother on the inheritance of her brother, the elector of Bavaria, he sided with Frederick the Great in the short Bavarian succession war of 1778 against Austria; and he afterwards joined the league of German princes formed by that monarch. In 1791 he declined the crown of Poland. He refused to join the league against France in 1792, but when war was declared his duty to the German empire necessitated his taking part in it. He maintained his neutrality during the war between France and Austria in 1805, but in the following year he joined Prussia against France. After the disastrous battle of Jena he concluded a treaty of peace with Napoleon at Posen, 11th November, 1806, and, assuming the title of king, he joined the Rhenish confederation. Having taken part in the subsequent wars of Napoleon, he fell into the hands of the allies after the entry into Leipsic, 19th October, 1813; and although he regained his freedom after the congress of Vienna, he was compelled to give up the province of Wittenberg to Prussia. The remainder of his life was spent in developing the agricultural, commercial, and industrial resources of his kingdom, reforming the administration of justice, establishing hospitals and other charitable institutions, encouraging art and science, and promoting education. He had a special interest in botany, and originated the beautiful botanical garden at Pillnitz. His reign throughout was characterized by justice, probity, moderation, and prudence. He died May 5, 1827.

See lives by Weisse, Leipsic, 1811; Herrmann, Dresden, 1827; and Pölitz, Leipsic, 1830.

FREDERICK AUGUSTUS II. (1797–1854), king of Saxony, eldest son of Prince Maximilian and of Caroline-Maria Theresa of Parma, was born May 18, 1797. The unsettled times in which his youth was passed necessitated his frequent change of residence, but care was nevertheless taken that his education should not be interrupted, and he also acquired through his journeys in foreign states and his intercourse with men of eminence, a special taste for art and for natural science. He was twice married—in 1819 to the Duchess Caroline, eldest daughter of the emperor Francis I. of Austria, and in 1833 to Maria, daughter of Maximilian I. of Bavaria. In 1830 a rising in Dresden led to his being named joint regent of the kingdom along with King Antony; and in this position his popularity and his wise and liberal reforms speedily quelled all discontent. On June 1, 1836, he succeeded his uncle on the throne. Though he administered the affairs of his kingdom with enlightened liberality, Saxony did not escape the political storms which broke upon Germany in 1848; and an insurrection in Dresden in May, 1849, compelled him to call in the help of Prussian troops. From that time, however, his reign was tranquil and prosperous. His death occurred accidentally through the upsetting of his carriage between Imst and Wenns, in Tyrol, 9th August, 1854. Frederick devoted his leisure hours chiefly to the study of botany. He made botanical excursions into different countries, and *Flora Marienbadensis, oder Pflanzen und Gebirgsarten gesammelt und beschrieben*, written by him in conjunction with Goethe, was published at Prague in 1837.

FREDERICK I. (1425–1476), elector palatine, surnamed the Victorious, second son of Elector Louis III., was born in 1425. He inherited a part of the palatinate on the death of his father in 1439, but delivered it up to his brother Louis IV. On the death of Louis in 1449, he became guardian of the infant heir Philip, and administrator of the kingdom. In 1452, on account of the threatening relation in which the neighboring princes stood to the palatinate, he resolved to assume the office of elector for life, on the understanding that his children should not hold the rank of princes, and that his nephew should be his successor. This led to a combination against him headed by the emperor Frederick III., but he managed to defend himself against all attacks, and in 1462 defeated at Seckenheim a combined army sent against him under the command of elector Albert Achilles of Brandenburg, after which he remained in undisturbed possession of his kingdom till his death, 12th December, 1476. Under him the palatinate received an addition of more than 60 fortresses and towns. Through his marriage with the daughter of a citizen of Augsburg he had two sons, the elder of whom, Frederick, adopted the ecclesiastical profession, and the younger, Louis, was the founder of the family of the princes and counts of Löwenstein.

See lives by Kremer, in 2 vols., Frankfort and Leipsic, 1765; and by Menzel, from 1454 to 1464, Munich, 1861.

FREDERICK II. (1482–1556), elector palatine, surnamed the Wise, fourth son of Philip the Noble-minded, was born in 1482, and succeeded his brother Louis as elector in 1544. During the siege of Vienna by Sultan Soliman II. in 1529, he held the command of the army of the empire. In 1535 he married Dorothea daughter of Christian II., ex-king of Denmark. Through the persuasion of Melanchthon he embraced the principles of the Reformation and joined the Smalkald League, but he afterwards signed the Augsburg Interim, and became reconciled with Charles V. He died in 1556.

FREDERICK III. (1515–1576), elector palatine, surnamed the Pious, eldest son of John II., palatine of Simmern, was born in 1515, succeeded his father in 1556, and became elector palatine on the death of Otto Henry in 1559. On his marriage in 1537 to the Lutheran princess Maria of Brandenburg-Baireuth, he adopted the Protestant faith, and in 1560 he replaced the Lutheran confession and worship by that of the Reformed or Calvinistic, on which account an unsuccessful attempt was made in 1566 by several of the Lutheran princes to obtain an imperial edict against him. He died 26th October, 1576.

See Kluckhohn, *Friedrich der Fromme*, Nördlingen, 1878. Two volumes of his letters were previously edited by Kluckhohn.

FREDERICK IV. (1574–1610), elector palatine, surnamed the Upright, son of Elector Louis VI. and of Elizabeth of Hesse, was born in 1574, succeeded his father under the guardianship of his uncle John Casimir in 1583, and after the death of the latter in 1592 ruled as independent governor. His reign is chiefly of importance for the steadfast and firm support he rendered to the Protestant cause. Under his auspices the Protestant union of Germany was formed in 1601. Mannheim, which had greatly increased through the influx of Protestant refugees, was raised by him to the rank of a town. He died in 1610

FREDERICK V. (1596–1632), elector palatine and king of Bohemia, son of Frederick IV. and of Louisa Julia, daughter of William of Orange, was born in Amberg in 1596, and succeeded his father in 1610, under the guardianship of Duke John of Deux-Ponts. In 1613 he married Elizabeth, daughter of James I. of England; and on undertaking the government of his palatinate two years afterwards, he became the head of the Protestant union of German princes, on which account, and because of his connection with England, he was in 1619 chosen king of Bohemia. He shrank from this difficult position, but at last accepted it, partly owing to his wife's influence, but mainly in deference to the entreaties of a number of landless princes who had great power over him. When his forces were confronted at Prague, November 8, 1620, by those of the emperor under Tilly, his courage so utterly forsook him that he fled in panic from the field before the battle had commenced, and ignominiously took refuge in Holland from the dangers and difficulties of his position—the general ridicule with which he was regarded being indicated by dubbing him with the title "Winter-King." The remainder of his life was spent in vain endeavors to enlist the help of various European sovereigns to enable him to wrest his palatinate from Duke Maximilian of Bavaria, who had been invested with its sovereignty by the emperor. Frederick died at Mainz, November 19, 1632.

FREDERICK CITY, the capital of Frederick county, Maryland, U. S., is situated on Carroll's Creek, a tributary of the Monocacy, 45 miles N.W. of Washington. It is well and regularly built, and most of its houses are of brick or stone. It has a considerable agricultural trade, and its industries include iron, wood, leather, paper, and the preserving of fruit and vegetables. Among its educational institutions are the college established by the State in 1797, the female seminary, the academy connected with the convent of the Visitation nuns, and the deaf and dumb institution. During the civil war the city was occupied on different occasions by the opposing armies. The population of Frederick in 1860 was 8142, and in 1870, 8526, of whom 1822 were colored.

FREDERICKSBURG, a city of Spottsylvania county, Virginia, U. S., on the S.W. side of the Rappahannock river, 110 miles above its mouth in Chesapeake Bay, and 61 miles N. of Richmond. The river, which is tidal up to this point, is here closed by a dam 900 feet long. It supplies motive-power for flour and other mills, and affords facilities for transportation of grain, marble, and freestone. Near the city is an unfinished monument, begun in 1833, over the grave of the mother of Washington. At Fredericksburg the Federal troops sustained a repulse by the Confederate forces, December 13, 1862. The population in 1860 was 5022, and in 1870, 4046, of whom 1331 were colored.

FREDERICKSHALD, or FREDERICKSHALL, a maritime town of Norway, stift of Christiania, at the junction of the Iddefjord with the Tistedals, 57 miles S.S.E. of Christiania. It has an excellent harbor, and considerable trade in tobacco, sugar, iron, and wood. A regular line of steamers connects it with Christiania. Frederickshald is noted for its strong castle of Fredericksteen, which stands on a perpendicular rock 350 feet high overhanging the sea, and is considered one of the strongest fortresses in Europe. It was at the siege of this fortress that Charles XII., king of Sweden, was killed on 11th December, 1718. The town itself is not walled. Its old name was Halden, and it received the addition of Frederick from Frederick III. of Denmark and Norway after its successful defence against the Swedes in 1665. It was almost totally destroyed by fire in 1759, and has since been rebuilt in a neat and regular manner. The castle surrendered to the Swedish crown-prince Bernadotte in 1814, and its capture was speedily followed by the conquest of the kingdom and its union with Sweden. The population in 1875 was 9956.

FREDERICKSTAD, a fortified town of Norway, stift of Christiania, is situated at the mouth of the Glommen, 48 miles S.E. of Christiania. The principal buildings are the church, the town-hall, the arsenal, and the magazine. It has manufactures of hardware, pottery, and brandy, and a considerable shipping trade and commerce in wood. About a mile and a half distant is the fall of the Glommen known as Sarpfos. Frederickstad was founded by Frederick II. in 1567. It was for a long time strongly fortified, and in 1716 Charles XII. of Sweden made a vain attempt to capture it. The population in 1875 was 9562.

FREDERICTON, a city and port of entry of New Brunswick, Canada, capital of the province, is situated on the St. John river, 88 miles from its mouth. It stands on a plain bounded on one side by the river, which is here three-fourths of a mile broad, and on the other by a range of hills which almost encircle the town. It is regularly built with long and straight streets, and contains some handsome public buildings, among which are the province hall, the government house, the county court-house, the cathedral church, the university, and several other educational establishments. Fredericton is the principal commercial entrepôt with the interior of the province, and has also a large trade in lumber. The river is navigable for large steamers up to the city, and above it transport is effected in vessels of lighter draughts. A steam-ferry across the river connects the city with the town of St. Mary. Fredericton was incorporated in 1849. Population in 1852, 4458, and in 1871, 6006.

FREE CHURCH OF SCOTLAND, THE, is the name of a well-known ecclesiastical organization which includes a considerable proportion of the inhabitants of Scotland. In one sense the Free Church dates its existence from the Disruption of 1843, in another it claims to be the rightful representative of the National Church of Scotland as it was reformed in 1560.[1] In order to indicate the nature of the grounds on which this claim is made, it will be necessary briefly to point out how the leading facts of the ecclesiastical history of Scotland during the last 320 years are accentuated and construed by those who read them in a Free Church sense.

In that history the Free Churchman sees three great reforming periods. In his view these deserve to be called reforming on many accounts, but most especially because in them the independence of the church, her inherent scriptural right to exercise a spiritual jurisdiction in which she is responsible to her Divine Head alone, was both earnestly asserted and practically maintained. The first reformation extended from 1560, when the church freely held her first General Assembly, and of her own authority acted on the First Book of Discipline, to 1592, when her Presbyterian order was finally and fully ratified by the parliament. The second period began in 1638, when after 20 years of suspended animation, the Assembly once more shook off Episcopacy, and terminated in 1649, when the parliament of Scotland confirmed the church in her liberties in a larger and ampler sense than before. The third period began in 1834, when the Assembly made use of what the church believed to be her rights in passing the Veto and Chapel Acts. It culminated in the Disruption of 1843.

The fact that the church, as led first by Knox and afterwards by Melville, claimed an inherent right to exercise a spiritual jurisdiction is notorious. More apt to be overlooked is the comparative freedom with which that right was actually used by the church irrespective of state recognition. That recognition was not given until after the queen's resignation in 1567;[2] but, for several years before it came, the church had been holding her Assemblies and settling all questions of discipline, worship, and administration as they arose, in accordance with the first book of polity or discipline, which had been drawn up in 1560. Further, in 1581 she, of her own motion, adopted a second book of a similar character, in which she expressly claimed an independent and exclusive jurisdiction or power in all matters ecclesiastical, "which flows directly from God and the Mediator Jesus Christ, and is spiritual, not having a temporal head on earth, but only Christ the only king and governor of his church;" and this claim, though directly negatived in 1584 by the "Black Acts," which included an Act of Supremacy over estates spiritual and temporal, continued to be asserted by the Assemblies, until at last it also was practically allowed in the Act of 1592.[3] This legislation of 1592, however, did not long remain in force. An Act of Parliament in 1606, which "reponed, restored, and reintegrated" the estate of bishops to their ancient dignities, prerogatives, and privileges, was followed by several Acts of various subservient assemblies, which, culminating in that of 1618, practically amounted to a complete surrender of jurisdiction by the church itself. For twenty years no Assemblies whatever were held. This interval must necessarily be regarded from the Presbyterian point of view as having been one of very deep depression. But a second reformation, characterized by great energy and vigor, began in 1638. The proceedings of the Assembly of that year, afterwards tardily and reluctantly acquiesced in by the state, finally issued in the Acts of Parliament of 1649, by which the Westminster standards were ratified, lay-patronage was abolished, and the coronation oath itself framed in accordance with the principles of Presbyterian church government. Another period of intense reaction soon set in. No Assemblies were permitted by Cromwell after 1653; and, soon after the Restoration, Presbytery was temporarily overthrown by a series of rescissory Acts. Nor was the Revolution Settlement of 1690 so entirely favorable to the freedom of the church as the legislation of 1649 had been. Prelacy was abolished, and various obnoxious statutes were repealed, but the Acts rescissory were not cancelled; presbyterianism was re-established, but the statutory recognition of the Confession of Faith took no notice of certain qualifications under which that document had originally been approved by the Assembly of 1647;[4] the old rights of patrons were again discontinued, but the large powers which had been conferred on congregations by the Act of 1649 were not wholly restored. Nevertheless the great principle of a distinct ecclesiastical jurisdiction, embodied in the Confession of Faith, was accepted without reservation, and a Presbyterian polity effectively confirmed both then and at the ratification of the treaty of Union. This settlement, however, did not long subsist unimpaired. In 1712 the Act of Queen Anne, restoring patronage to its ancient footing, was passed in spite of the earnest remonstrances of the Scottish people. For many years afterwards (until 1784) the Assembly continued to instruct each succeeding commission to make application to the king and the parliament for redress of the grievance. But meanwhile a new phase of Scottish ecclesiastical politics commonly known as Moderatism had been inaugurated, during the prevalence of which the church became even more indifferent than the lay patrons themselves to the rights of her congregations with regard to the "calling" of ministers. From the Free Church point of view, the period from which the secessions under Erskine and Gillespie are dated was also characterized by numerous other abuses on the Church's part which amounted to a practical surrender of the most important and distinctive principles of her ancient Presbyterian polity.[5] Towards the beginning of the present century there were many circumstances, both within and without the church, which conspired to bring about an evangelical and popular reaction against this reign of "Moderatism." The result was a protracted struggle, which is commonly referred to as the Ten Years' Conflict, and which has been aptly described as the last battle in the long war which for nearly 300 years had been waged within the church itself, between the friends and the foes of the doctrine of an exclusive ecclesiastical jurisdiction. That final struggle may be said to have begun with the passing in 1834 of the "Veto" Act, by which it was declared to be a fundamental law of the church that no pastor should be intruded on a congregation contrary to the will of the people,[1] and by which it was provided that the simple dissent of a majority of heads of families in a parish should be enough to warrant a presbytery in rejecting a presentee. The question of the legality of this measure soon came to be tried in the civil courts; and it was ultimately answered in a sense unfavorable to the church by the decision (1838) of the Court of Session in the Auchterarder case, to the effect that a presbytery had no right to reject a presentee simply because the parishioners protested against his settlement, but was bound to disregard the veto (see CHALMERS, vol. v. pp. 326, 327). This decision elicited from the Assembly of that year a new declaration of the doctrine of the spiritual independence of the church. The "exclusive jurisdiction of the civil courts in regard to the civil rights and emoluments secured by law to the church and the ministers thereof" was acknowledged without qualification; and continued implicit obedience to their decisions with reference to these rights and emoluments was pledged. At the same time it was insisted on "that, as is declared in the Confession of Faith of this National Established Church, 'the Lord Jesus Christ, as King and Head of the church, hath therein appointed a government in the hand of church officers distinct from the civil magistrate;' and that in all matters touching the doctrine, discipline, and government of the church her judicatories possess an exclusive jurisdiction, founded on the Word of God, which power ecclesiastical" (in the words of the Second Book of Discipline) "flows immediately from God and the Mediator the Lord Jesus Christ, and is spiritual, not having a temporal head on earth, but only Christ, the only spiritual King and Governor of His Kirk." And it was resolved to assert, and at all hazards defend, this spiritual jurisdiction, and firmly to enforce obedience to the same upon the office-bearers and members of the church. The decision of the Court of Session having been confirmed by the House of Lords early in 1839, it was decided in the Assembly of that year that the church, while acquiescing in the loss of the temporalities at Auchterarder, should reaffirm the principle of non-intrusion as an integral part of the constitution of the Reformed Church of Scotland, and that a committee should be appointed to confer with the Government with a view to the prevention, if possible, of any further collision between the civil and ecclesiastical authorities. While the conference with the Government had no better result than an unsuccessful attempt at compromise by means of Lord Aberdeen's Bill, which embodied the principle of a dissent with reasons, still graver complications were arising out of the Marnoch and other cases, the nature of which has been briefly indicated in vol. v. as above.[2] In the circumstances it was resolved by the Assembly of 1842 to transmit to the Queen, by the hands of the lord high commissioner, a "claim, declaration and protest," complaining of the encroachments of the Court of Session,[3] and also an address praying for the abolition of patronage. The home secretary's answer (received in January, 1843) gave no hope of redress. Meanwhile the position of the evangelical party had been further hampered by the decision of the Court of Session declaring the ministers of chapels of ease to be unqualified to sit in any church court. A final appeal to parliament by petition was made in March, 1843, when, by a majority of 135 (211 against 76), the House of Commons declined to attempt any redress of the grievances of the Scottish Church.[4] At the first session of the following General Assembly (18th May, 1843) the reply of the non-intrusion party was made in a protest, signed by upwards of 200 commissioners, to the effect that since, in their opinion, the recent decisions of the civil courts, and the still more recent sanction of these decisions by the legislature, had made it impossible at that time to hold a free Assembly of the church as by law established, they therefore "protest that it shall be lawful for us and such other commissioners as may concur with us to withdraw to a separate place of meeting, for the purpose of taking steps for ourselves and all who adhere to us—maintaining with us the Confession of Faith and standards of the Church of Scotland as heretofore understood—for separating in an orderly way from the Establishment, and thereupon adopting such measures as may be competent to us, in humble dependence on God's grace and the aid of His Holy Spirit, for the advancement of His glory, the extension of the gospel of our Lord and Saviour, and the administration of the affairs of Christ's house according to His holy word." The reading of this document was followed by the withdrawal of the entire non-intrusion party to another place of meeting, where the first Assembly of the Free Church was constituted, with Dr. Thomas Chalmers as moderator. This Assembly sat from the 18th to the 30th of May, and transacted a large amount of important business. On Tuesday the 23d, 396[5] ministers and professors publicly adhibited their names to the Act of Separation and Deed of Demission by which they renounced all claim to the benefices they had held in connection with the Establishment, declaring them to be vacant, and consenting to their being dealt with as such. By this impressive proceeding, the signatories voluntarily surrendered an annual income amounting to fully £100,000.

---

[1] "It is her being free, not her being established, that constitutes the real historical and hereditary identity of the Reformed National Church of Scotland." See *Act and Declaration*, etc., of Free Assembly, 1851.

[2] In the Act *Anent the true and holy Kirk, and of those that are declared not to be of the same*. This Act was supplemented by that of 1579, *Anent the Jurisdiction of the Kirk*.

[3] The Second Book of Discipline was not formally recognized in that Act; but all former Acts against "the jurisdiction and discipline of the true Kirk as the same is used and exercised within the realm" were abolished; and all "liberties, privileges, immunities, and freedoms whatsoever" previously granted were ratified and approved.

[4] The most important of these had reference to the full right of a constituted church to the enjoyment of an absolutely unrestricted freedom in convening Assemblies. This very point on one occasion at least threatened to be the cause of serious misunderstandings between William and the people of Scotland. The difficulties were happily smoothed, however, by the wisdom and tact of Carstares.

[5] See *Act and Declaration* of Free Assembly, 1851.

The first care of the voluntarily disestablished church was to provide incomes for her clergy and places of worship for her people. As early as 1841 indeed the leading principle of a "sustentation fund" for the support of the ministry had been announced by Dr. Candlish; and at "Convocation," a private unofficial meeting of the members of the evangelical or non-intrusion party held in November, 1842, Dr. Chalmers was prepared with a carefully matured scheme according to which "each congregation should do its part in sustaining the whole, and the whole should sustain each congregation." Between November, 1842, and May, 1843, 647 associations had been formed; and at the first Assembly it was announced that upwards of £17,000 had already been contributed. At the close of the first financial year (1843–44) it was reported that the fund had exceeded £61,000. It was participated in by 583 ministers; and 470 drew the full equal dividend of £105. Each successive year showed a steady increase in the gross amount of the fund; but owing to an almost equally rapid increase of the number of new ministerial charges participating in its benefits, the stipend payable to each minister did not for many years reach the sum of £150 which had been aimed at as a minimum. Thus in 1844–45 the fund had risen to £76,180, but the ministers had also increased to 627, and the equal dividend therefore was only £122. During the first ten years the annual income averaged £84,057; during the next decade £108,643; and during the third £130,246. The minimum of £150 was reached at last in 1868; and since then the balance remaining after that minimum has been provided has been treated as a surplus fund, and distributed among those ministers whose congregations have contributed at certain specified rates per member. In 1878 the total amount received for this fund was upwards of £177,000; in this 1075 ministers participated. The full equal dividend of £157 was paid to 766 ministers; and additional grants of £36 and £18 were paid out of the surplus fund to 632 and 129 ministers respectively.[1]

---

[1] This principle had been asserted even by an Assembly so late as that of 1736, and had been invariably presupposed in the "call," which had never ceased to be regarded as an indispensable prerequisite for the settlement of a minister.

[2] According to the Free Church "Protest" of 1843 it was in these cases decided (1) that the courts of the church were liable to be compelled to intrude ministers on reclaiming congregations; (2) that the civil courts had power to interfere with and interdict the preaching of the gospel and administration of ordinances as authorized and enjoined by the church; (3) that the civil courts had power to suspend spiritual censures pronounced by the courts of the church, and to interdict their execution as to spiritual effects, functions, and privileges; (4) that deposed ministers, and probationers deprived of their license, could be restored by the mandate of the civil courts to the spiritual office and status of which the church courts had deprived them; (5) that the right of membership in ecclesiastical courts could be determined by the civil courts; (6) that the civil courts had power to supersede the majority of a church court of the Establishment in regard to the exercise of its spiritual functions as a church court, and to authorize the minority to exercise the said functions in opposition to the court itself and to the superior judicatories of the church; (7) that processes of ecclesiastical discipline could be arrested by the civil courts; and (8) that without the sanction of the civil courts no increased provision could be made for the spiritual care of a parish, although such provision left all civil rights and patrimonial interests untouched.

[3] The narrative and argument of this elaborate and able document cannot be reproduced here. In substance it is a claim "as of right" on behalf of the church and of the nation and people of Scotland that the church shall freely possess and enjoy her liberties, government, discipline, rights, and privileges according to law, and that she shall be protected therein from the foresaid unconstitutional and illegal encroachments of the said Court of Session, and her people secured in their Christian and constitutional rights and liberties. This claim is followed by the "declaration" that the Assembly cannot intrude ministers on reclaiming congregations, or carry on the government of Christ's church subject to the coercion of the Court of Session; and by the "protest" that all Acts of the Parliament of Great Britain passed without the consent of the Scottish church and nation, in alteration or derogation of the government, discipline, rights, and privileges of the church, as also all sentences of courts in contravention of said government, discipline, rights, and privileges, "are and shall be in themselves void and null, and of no legal force or effect."

[4] The Scottish members voted with the minority in the proportion of 25 to 12.

[5] The number ultimately rose to 474.

To provide for the erection of the buildings which, it was foreseen, would be necessary, a general building fund, in which all should share alike, was also organized, and local building funds were as far as possible established in each parish, with the result that at the first Assembly a sum of £104,776 was reported as already available. By May, 1844, a further sum of £123,060 had been collected, and 470 churches were reported as completed or nearly so. In the following year £131,737 was raised, and 60 additional churches were built. At the end of four years considerably more than 700 churches had been provided.

During the winter session 1843–44 the divinity students who had joined the Free Church continued their studies under Dr. Chalmers and Dr. Welsh; and at the Assembly of 1844 arrangements were made for the erection of suitable collegiate buildings. The New College, Edinburgh, was built in 1847 at a cost of £46,506; and divinity halls have subsequently been set up also in Glasgow and Aberdeen. In 1878 there were 13 professors of theology, with an aggregate of 230 students,—the numbers at Edinburgh, Glasgow, and Aberdeen respectively being 129, 69, and 32.

A somewhat unforeseen result of the Disruption was the necessity for a duplicate system of elementary schools. At the 1843 Assembly it was for the first time announced by Dr. Welsh that "schools to a certain extent must be opened to afford a suitable sphere of occupation for parochial and still more for private teachers of schools, who are threatened with deprivation of their present office on account of their opinions upon the church question." The suggestion was taken up with very great energy, and with the result that in May, 1845, 280 schools had been set up, while in May, 1847, this number had risen to 513, with an attendance of upwards of 44,000 scholars. In 1869 it was stated in an authoritative document laid before members of parliament that at that time there were connected with and supported by the Free Church 598 schools (including two normal schools), with 633 teachers and 64,115 scholars. The school buildings had been erected at a cost of £220,000, of which the committee of privy council had contributed £35,000, while the remainder had been raised by voluntary effort. Annual payments made to teachers, etc., as at 1869, amounted to £16,000. The total sum expended by the Free Church since the Disruption, for educational purposes, has been not less than £600,000. In accordance with certain provisions of the Education Act of 1872 most of the schools of the Free Church were voluntarily transferred, without compensation, to the local school boards.

It has been already seen that during the period of the Ten Years' Conflict the non-intrusion party strenuously denied that in any one respect it was departing from acknowledged principles of the National Church. It continued to do so after the Disruption. In 1846, however, it was found to have become necessary, "in consequence of the late change in the outward condition of the church," to amend the "questions and formula" to be used at the licensing of probationers and the ordination of office-bearers. These were amended accordingly; and at the same time it was declared that, "while the church firmly maintains the same scriptural principles as to the duties of nations and their rulers in reference to true religion and the Church of Christ for which she has hitherto contended, she disclaims intolerant or persecuting principles, and does not regard her Confession of Faith, or any portion thereof when fairly interpreted, as favoring intolerance or persecution, or consider that her office-bearers by subscribing it profess any principles inconsistent with liberty of conscience and the right of private judgment." The main difference between the "formula" of the Free Church and that of the Established Church is that the former refers to the Confession of Faith simply as "approven by General Assemblies of this Church," while the latter describes it as "approven by the General Assemblies of this National Church, and ratified by law in the year 1690, and frequently confirmed by divers Acts of Parliament since that time." The former inserts an additional clause,—"I also approve of the general principles respecting the jurisdiction of the church, and her subjection to Christ as her only Head, which are contained in the Claim of Right and in the Protest referred to in the questions already put to me;" and also adds the words which are here distinguished by italics,—"And I promise that through the grace of God I shall firmly and constantly adhere to the same, and to the utmost of my power shall in my station assert, maintain, and defend the said doctrine, worship, discipline, and government of this church by kirk-sessions, presbyteries, provincial synods, and general assemblies, *together with the liberty and exclusive jurisdiction thereof;* and that I shall, in my practice, conform myself to the said worship and submit to the said discipline [and] government, *and exclusive jurisdiction*, and not endeavor directly or indirectly the prejudice or subversion of the same."[2] In the year 1851 an Act and Declaration anent the publication of the subordinate standards and other authoritative documents of the Free Church of Scotland was passed, in which the historical fact is recalled that the Church of Scotland had formally consented to adopt the Confession of Faith, catechisms, directory of public worship, and form of church government agreed upon by the Westminster Assembly; and it is declared that "these several formularies, as ratified, with certain explanations, by divers Acts of Assembly in the years 1645, 1646, and particularly in 1647, this church continues till this day to acknowledge as her subordinate standards of doctrine, worship, and government."[3]

In 1858 circumstances arose which, in the opinion of many, seemed fitted to demonstrate to the Free Church that her freedom was an illusion, and that all her sacrifices had been made in vain. Mr. John Macmillan, minister of Cardross, accused of immorality, had been tried and found guilty by the Free Presbytery of Dumbarton. Appeal having been taken to the synod, an attempt was there made to revive one particular charge, of which he had been finally acquitted by the presbytery; and this attempt was successful in the General Assembly. That ultimate court of review did not confine itself to the points appealed, but went into the merits of the whole case as it had originally come before the presbytery. The result was a sentence of suspension. Mr. Macmillan, believing that the Assembly had acted with some irregularity, applied to the Court of Session for an interdict against the execution of that sentence; and for this act he was summoned to the bar of the Assembly to say whether or not it was the case that he had thus appealed. Having answered in the affirmative, he was deposed on the spot. Forthwith he raised a new action (his previous application for an interdict had been refused) concluding for reduction of the spiritual sentence of deposition, and for substantial damages. The defences lodged by the Free Church were to the effect that the civil courts had no right to review and reduce spiritual sentences, or to decide whether the General Assembly of the Free Church had acted irregularly or not. Judgments adverse to the defenders were delivered on these points; and appeals were taken to the House of Lords. But before the case could be heard there, the lord president took an opportunity in the Court of Session to point out to the pursuer that, inasmuch as the particular General Assembly against which the action was brought had ceased to exist, it could not therefore be made in any circumstances to pay damages, and that the action of reduction of the spiritual sentence, being only auxiliary to the claim of damages, ought therefore to be dismissed. He further pointed out that Mr. Macmillan might obtain redress in another way, should he be able to prove malice against individuals. Very soon after this deliverance of the lord president, the case as it had stood against the Free Church was withdrawn, and Mr. Macmillan gave notice of an action of a wholly different kind. But this last was not persevered in. The appeals which had been taken to the House of Lords were, in these circumstances, also departed from by the Free Church. It is perhaps to be regretted, from the legal point of view, that the case did not advance sufficiently to show how far the courts of law would be prepared to go in the direction of recognizing voluntary tribunals and a kind of secondary exclusive jurisdiction founded on contract.[1] But, whether recognized or not, the church for her part continued to believe that she had an inherent spiritual jurisdiction, and remained unmoved in her determination to act in accordance with that resolution "notwithstanding of whatsoever trouble or persecution may arise."[2]

---

[1] Congregations, it ought to be noted, are permitted, and indeed expected, by collections or otherwise, each to "supplement" the income which its pastor derives from the general sustentation fund.

[2] It may be added that, while the Free Church requires elders to subscribe the same formula as ministers, the Established Church requires them to sign an older and shorter one.

[3] By this formal recognition of the qualifications to the Confession of Faith made in 1647 the scruples of the majority of the Associate Synod of Original Seceders were removed, and 27 ministers, along with a considerable number of their people, joined the Free Church in the following year.

In 1863 a motion was made and unanimously carried in the Free Church Assembly for the appointment of a committee to confer with a corresponding committee of the United Presbyterian Synod, and with the representatives of such other disestablished churches as might be willing to meet and deliberate with a view to an incorporating union. Formal negotiations between the representatives of these two churches were begun shortly afterwards, which resulted in a report laid before the following Assembly. From this document it appeared that the committees of the two churches were not at one on the question as to the relation of the civil magistrate to the church. While on the part of the Free Church it was maintained that he "may lawfully acknowledge, as being in accordance with the Word of God, the creed and jurisdiction of the church," and that "it is his duty, when necessary and expedient, to employ the national resources in aid of the church, provided always that in doing so, while reserving to himself full control over the temporalities which are his own gift, he abstain from all authoritative interference in the internal government of the church," it was declared by the committee of the United Presbyterian Church that, "inasmuch as the civil magistrate has no authority in spiritual things, and as the employment of force in such matters is opposed to the spirit and precepts of Christianity, it is not within his province to legislate as to what is true in religion, to prescribe a creed or form of worship to his subjects, or to endow the church from national resources." In other words, while the Free Church maintained that in certain circumstances it was lawful and even incumbent on the magistrate to endow the church and on the church to accept his endowment, the United Presbyterians maintained that in no case was this lawful either for the one party or for the other. Thus in a very short time it had been made perfectly evident that a union between the two bodies, if accomplished at all, could only be brought about on the understanding that the question as to the lawfulness of state endowments should be an open one. The Free Church Assembly, by increasing majorities, manifested a readiness for union, even although unanimity had not been attained on that theoretical point. But there was a minority which did not sympathize in this readiness, and after ten years of fruitless effort it was in 1873 found to be expedient that the idea of union with the United Presbyterians should for the time be abandoned. Other negotiations, however, which had been entered upon with the Reformed Presbyterian Church at a somewhat later date proved more successful; and a majority of the ministers of that church with their congregations were united with the Free Church in 1876.

The total income of the Free Church for the year 1877–78 was £575,718. This included (1) sustentation fund, £177,659; (2) local building fund, £99,480; (3) missionary and educational, £91,895; (4) congregational and miscellaneous, £190,775. Since 1843 an aggregate amount of nearly £13,000,000 has been raised. In 1878 the number of congregations was 997, with a total membership of 270,000. 1075 ministers participated in the equal dividend. There were also 59 missionaries employed at 21 principal mission-stations in India, Africa, Syria, and Polynesia.

Literature.—An authorized edition of the *Subordinate Standards* of the Free Church, including the *Claim of Right* and *Protest*, was published in 1851 in an easily accessible form, along with the *Act and Declaration* of that year. Of these "standards" (the Holy Scriptures being held supreme as the "rule of faith and manners") the most important is the *Confession of Faith*, which alone is imposed by subscription. The *Catechisms* (*Larger* and *Shorter*) are "sanctioned as directories for catechising;" and the *Directory for Public Worship*, the *Form of Church Government*, and the *Directory for Family Worship* are "of the nature of regulations rather than of tests." A practical application of the doctrine of the *Confession*, called the *Sum of Saving Knowledge*, is also included among the "standards." The general subject of Scottish church history is handled in a considerable number of well-known works, which need not be enumerated here. Among books professedly dealing with the Free Church question, the most valuable are Sydow's *Die Schottische Kirchenfrage* (Potsdam, 1845), and *The Scottish Church Question* (London, 1845); Buchanan's *Ten Years' Conflict* (1849); Hanna's *Life of Chalmers* (1852); and Taylor Innes on *The Law of Creeds in Scotland* (1867). See also Cockburn, *Memorials of His Time* (Continuation, 1874); Walker, *Dr. Robert Buchanan: an Ecclesiastical Biography* (1877); *Annals of the Disruption* (published by authority of a committee of the Free Church, 1876–77). (J. S. BL.)

FREEHOLD, in the English law of real property, is an estate in land, not being less than an estate for life. An estate for a term of years, no matter how long, was considered inferior in dignity to an estate for life, and unworthy of a freeman (see ESTATE). "Some time before the reign of Henry II., but apparently not so early as Domesday, the expression *liberum tenementum* was introduced to designate land held by a freeman by a free tenure. Thus freehold tenure is the sum of the rights and duties which constitute the relation of a free tenant to his lord."[3] In this sense freehold is distinguished from copyhold, which is a tenure having its origin in the relation of lord and villain (see COPYHOLD). Freehold is also distinguished from leasehold, which is an estate for a fixed number of years only. By analogy the interest of a person who holds an office for life is sometimes said to be a freehold interest. The term *customary freeholds* is applied to a kind of copyhold tenure in the north of England, viz., tenure by copy of court-roll, but not, as in other cases, expressed to be at the will of the lord.

FREE IMPERIAL CITIES is the ordinary English translation of *Freie Reichs-Städte*, a technical expression in German history. In Germany, as in other countries of Europe, a considerable number of towns succeeded, in the midst of the dynastic confusion of the Middle Ages, in maintaining or acquiring more or less complete independence of the state or sovereign within whose territory they were situated. This they effected partly by forming defensive leagues with each other, and partly by procuring, in return for service or money, privileges and protection from the successive occupants of the imperial throne. Of these free towns a certain proportion rose by commerce and industry to a position of great influence, and ultimately took rank along with kingdoms and principalities as integral members of the body politic of the empire. They first appear distinctly in this character in the reign of Henry VII. (1308–1313). Their number was continually fluctuating, for their liberties were almost as easily lost as they were with difficulty acquired. Most of them had to maintain a continual conflict by war or diplomacy with the ecclesiastical or secular potentates of their district, and not unfrequently their interests were betrayed by the emperors themselves. Mainz, which in the 13th century was at the head of the *Rheinisches Städtebund*, or confederation of the cities of the Rhine, was conquered in 1462, and subjected to the bishop's see; Zwickau, Altenburg, and Chemnitz, put in pawn first by Frederick II. and afterwards by several of the later emperors, thus fell into the hands of the dukes of Saxony; other free cities placed themselves of their own accord under the control of prince or bishop; some, as Donauworth, were deprived of their privileges by the emperors on account of real or alleged offences; others again were separated from the empire by foreign conquest, as Hainault or Hagenau, Colmar, Schlettstedt, Weissenburg, Landau, and Besançon by Louis XIV.; and Basel notably preferred to cast in its lot with the rising confederation of Switzerland. At the diet of Augsburg in 1474 the free imperial cities divided themselves for the first time into two benches, the Rhenish and the Swabian, the former also including those of Alsace, Wetterau, Thuringia, and Saxony, and the latter those of Franconia. They were formally constituted the third collegium of the diet by the peace of Westphalia in 1648. At the time of the French Revolution they still numbered 51,—the Rheuish bench comprising Cologne, Aix-la-Chapelle or Aachen, Lübeck, Worms, Spires, Frankfort-on-the-Main, Goslar, Bremen, Hamburg, Mühlhausen, Nordhausen, Dortmund, Friedberg, and Wetzlar; and the Swabian bench, Ratisbon or

[2] The language of Dr. Buchanan, for example, in 1860 was (*mutatis mutandis*) the same as that which he had employed in 1838 in moving the Independence resolution already referred to.

[3] Digby's *History of the Law of Real Property*.

Regensburg, Augsburg, Nuremberg, Ulm, Esslingen, Reutlingen, Nördlingen, Rothenburg on the Tauber, Schwäbisch-Hall, Rothweil, Ueberlingen, Heilbronn, Gmünd, Memmingen, Lindau, Dinkelsbühl, Biberach, Ravensburg, Schweinfurt, Kempten, Windsheim, Kaufbeuern, Weil, Wangen, Isny, Pfullendorf, Offenburg, Leutkirchen, Wimpfen, Weissenburg in the Nordgau, Giengen, Gengenbach, Zell on the Hammerbach, Buchhorn, Ahlen, Buchau, Bopfingen. A large proportion of these towns had then at least as little claim to their exceptional position as the pocket-burghs of England before the passing of the Reform Act. By the decision of the imperial deputation of 1803 (*Reichsdeputationshauptschluss*) Cologne, Aix-la-Chapelle, Worms, and Spires were assigned to France; only six, Hamburg, Lübeck, Bremen, Augsburg, Frankfort-on-the-Main, and Nuremberg were allowed to retain their *Reichsfreiheit*, or, in other words, to hold directly of the empire. On the dissolution of the empire in 1806, Augsburg and Nuremberg were given to Bavaria, and Frankfort was made the seat of Count Dahlberg, the archbishop and electoral prince of Mainz, who was appointed primate of the confederation of the Rhine. On the establishment of the German confederation in 1815, Hamburg, Lübeck, Bremen, and Frankfort were recognized as free cities, and the first three still hold that position in the new German empire; but Frankfort, in consequence of the part it took in the war of 1866, has been degraded to the rank of an ordinary Prussian town.

In the earlier centuries of their existence the free cities of the empire were under the jurisdiction of two imperial officers, one of whom, the imperial advocate or *Reichsvogt*, took charge of criminal cases, and the other, the imperial procurator or *Reichs-Schultheiss* or *Schuldheiss*, dealt with the civil cases. As time went on many of the cities purchased the right of filling these offices with members of the principality; and in several instances the imperial authority fell practically into desuetude except when it was roused into action by peculiar circumstances, such as a dispute between the citizens and their magistrates. The internal constitution of the cities was organized after no common type; but there were several of them whose privileges were drawn up in imitation of those of Cologne, which had been one of the very first to assert its independence.

Wendt, *Beschreibung der kaiserl. freien Reichsstädte*, Leipsic, 1804; G. W. Hugo, *Die Mediatisirung der deutschen Reichsstädte*, Carlsruhe, 1838; Waitz, *Deutsche Verfassungsgeschichte*.

FREEMASONRY (*Fr.* Franc-maçonnerie, *Ger.* Freimaurerei) is the name given to that system of ritual and rules which Freemasons observe. It may also be applied to the masonic art, or the practice of masonic ritual and rule. The institution is not older than the beginning of the 18th century, but it has been lately said to include more than 10,000 lodges and more than 1,000,000 members. Before considering the history and actual position of the modern society itself, however, a few words are due to the really interesting and much-debated question of its origin and antecedents. It is, of course, easy to point out vague analogies between Freemasonry and the great secret organizations having social aims, which existed in antiquity. The Pythagoreans, the Eleusinians, the Essenes, and the Carmathites and Fedavi (the mystic Rationalists of Islam) have all been appealed to by uncritical masonic writers in the hope of giving to their craft the doubtful authority and prestige of ancient descent. If the resemblances were more numerous and striking than they are, they would not prove an historical connection between organizations so widely removed from one another in time, and they would admit of explanation by the general doctrine of psychical identity, one of the most important results of anthropological science. Besides this, the superficial resemblances are accompanied by radical differences. The mere conception of Freemasonry implies cosmopolitan brotherhood, and was therefore impossible in the ancient world. If indeed the genuine legends of the craft were followed, its origin would be traced to the creation, the flood, or at least the building of Solomon's temple. Accordingly, one of the most popular and voluminous masonic writers of the 19th century, the Rev. George Oliver, informs the world that Moses was a grand master, Joshua his deputy, and Aholiab and Bezaleel grand wardens. Again, a likeness, sometimes real and sometimes fanciful, between the sets of symbols and ceremonies used has led many writers to see an organic connection between Freemasonry and the Assassins, the Rosicrucians, the Templars, the Illuminati, the Carbonari, and the Hetairia, and other social and political secret societies, old and young, of the most widely differing aims. It is possible that Freemasonry copied an older ritual, which was again imitated by younger societies, who also endeavored to utilize masonic lodges as stations for proselytizing work. But these facts themselves show discontinuity of life. The true historical precursors of the modern fraternity of Freemasons were the mediæval building corporations. Of these the most distinctive type is to be found in the stone masons (*Steinmetzen*) of Germany. It is a further and more difficult question what were the relations between these mediæval societies and the Roman collegia not struck at by the law *De Collegiis Illicitis*, D. 47, 22. Krause in his *Die drei ältesten Kunsturkunden der Freimaurerbrüderschaft*[1] points out that these collegia had an exchequer, an archive, patrons, religious ceremonies, an oath, a benefit and burial fund, and a register. They had such officers as magistri, decuriones, tabularii, censores, and they instructed their apprentices to a certain extent in secret. No doubt such *sodalitia* existed for centuries in Gaul and Britain, and they may have deposited in the civilization of these countries some of their ideas and habits. Again, at a later period, there was a distinct invitation sent from the West to the building corporations of Byzantium; the movement westward was increased by the iconoclasm of Leo. But the European building societies were undoubtedly distinct growths. The *cæmentarii* or *liberi muratores* at first grouped themselves round the monasteries, especially of the Benedictine order. The abbots were in many cases the architects who employed the masons on ecclesiastical buildings and repairs. As architecture developed, and with increasing wealth the church gradually undertook larger and nobler works, these societies of craftsmen also assumed a more definite and more durable form. The taste and science of Gothic architecture were to a large extent the possession of the *Bauhütten*, or wooden booths where the stone-cutters during the progress of the work kept their tools, worked, held their meetings, and probably also took their meals and slept. In the 12th century there are distinct traces of a general association of *Bauhütten* throughout Germany, acknowledging one set of *Ordnungen* or craft laws, one set of secret signs and ceremonies (*Heimlichkeiten*) and to a certain extent one central authority in the Haupthütte of Strasburg.[2] Albertus Magnus (1205-1280) is supposed to have introduced many of the Jewish and Arabian symbols which were popular in the craft. The privileges which a *Bauhütte* was able to give to its masters, parlierer (speakers), and journeymen, were chiefly "a share in the administration of justice, in the election of officers, in the banquets, and in works of charity." The trade customs and symbolic forms of these associations have been described by Fallou in his *Mysterien der Freimaurer* (1859), Winzer in his *Deutschen Brüderschaften des Mittelalters* (1859), and Fort, *Early History and Antiquities of Freemasonry* (Philadelphia, 1877). The initiation is said to be copied from a Benedictine consecration. Instruction was given to all apprentices in both architecture and its allegory. When he had served his time and finished his "Wanderjähre," every man was entitled, if of good character, to receive the *Wortzeichen* or *der Gruss*. He took the oath of secrecy on the Bible, the compass, and the square, and drank the *Willkommen*. The three great lights,[3] the hammer or gavel, the gold, azure, and white colors, the sacred numbers 3, 5, 7, and 9, and the interlaced cords, all had their traditional meaning. The obligation to secrecy, however, probably applied to the apprentice even before initiation. See the *Constitutions of Masonry* (Halliwell's edition, l. 279-282)—

> "The prevystye of the chamber telle he no mon,
> Ne yn the logge whatsever they done;

---

[1] See also Rebold, *Hist. Gén. de la Franc-maçonnerie*, 1851, of which there is an American translation by Brennan, Cincinnati, 1868.

[2] The importance of this was first pointed out in Abbé Grandidier's letter, which forms App. xvii. to De Luchet's *Essai sur la Secte des Illuminés*, Paris, 1789.

[3] These candles have been derived from the cabalistic triangle formed of the *Sephiræ*, splendors or attributes proceeding from the Yodh, the En-Soph, or central point of light (see Ginsburg *On the Cabala*). The masonic MS. attributed to Henry VI. refers to the faculty of Abrac, *i. e.*, of the adorable name worshipped by the Basilidian heretics.

> Whatsever thou heryst, or syste hem do,
> Tell hyt no mon, whersever thou go.”

It has been observed by Brentano,[1] that the working arrangements of the building trades at this time differed when a cathedral or palace was being built, the architect being then master of the lodge with foremen under him; and when a dwelling-house was built, the owner then engaging both masters and workmen. There was thus a nearer approach to the modern factory system; and in fact the well-known English statutes against combinations, congregations, and chapters of workmen (34 Edw. III. c. 9, and 3 Hen. VI. c. 1) were directed against the excessive wages of journeymen. The separate interests of this class found expression in the contemporary French institution of Compagnonnage.[2] The atmosphere of these societies seems, even at an early date, to have been favorable to liberty of thought and religious toleration. Hence they were prohibited by the council of Avignon in 1326. The authority of the *Haupthütte* was recognized at the great assemblies of Ratisbon and Strasburg in 1459, the statutes of which received imperial confirmation. It was legally destroyed by an edict of 1731, long before which time its practical vitality had ceased. England imported much of her lodge organization and learning from Germany. The York charter, on which she based her claim to a native system in the time of Athelstan, is a much later document. This charter contains the famous legend of the craft which derives the seven liberal sciences (masonry being a part of geometry) from the family of Lamech. This science, preserved on a stone pillar from the flood, was taught by Euclid to the Egyptians, and carried by Israel to the building of the temple. Maymus Græcus brought it to Charles Martel and to England. The early history of the English mason lodges has been illustrated by the works of Wm. J. Hughan,—*Constitutions of the Freemasons, History of Freemasonry at York*, etc.[3] The first instance of a gentleman or amateur being “accepted” is that of the antiquary Elias Ashmole (afterwards Windsor Herald under Charles II.), who, along with Colonel Manwaring, was entered at Warrington in 1646. The causes which led to the introduction of a new class of members, and gradually converted operative into speculative masonry, are well stated by Findel, the learned editor of the German masonic journal *Die Bauhütte*, whose *History of Freemasonry* (translated into English in 1869) is by far the most scientific and complete work upon the subject. In the first place the old secrets of Gothic masonry were rendered less valuable by the spread of Augustan and Renaissance architecture, which Inigo Jones and his patron Lord Pembroke had been studying on the Continent. Jones was patron of the Freemasons from 1607 to 1618. He invited several Italian artists to join the body. Then the disorder of the civil wars prevented meetings and broke up the masonic connection. Again the growing spirit of the Reformation in religion gave men a freedom of speech which superseded the marks and caricatures in which the old masons exposed the vices of the church. Toleration was soon a political fact. Science, too, took a new departure from the time of Bacon. The interrogation of nature was preferred to legend and allegory. At the same time a perfectly distinct current of ideas was originated by the Arabian mysticism of Paracelsus and Rosenkreuz, which, after being popularized on the Continent by one of its most decided opponents, Valentine Andreæ, was preached to the people of England by Robert Fludd in his *Tractatus Theologico-Philosophicus*. Works like Bacon's *New Atlantis* and Depuy's “History of the Condemnation of the Templars” (in his *Traitez concernant l'Histoire de France*, 1651) fostered the idea of a new humanitarian society, and at the same time suggested the adoption of ancient symbols of fellowship. The same thing is seen in the *Pantheisticon* of Toland. It was under the impulse thus communicated that a general assembly of masons was held in 1663, at which the old catechisms were revised, and a series of new statutes passed. The reconstruction of London after the fire, the building of St. Paul's, and the patronage of Sir Christopher Wren, kept up the interest in the movement; and at last a formal resolution was passed that the masonic privileges should no longer be confined to operative masons.

England.—Modern or speculative masonry may be said to have begun in London on June 24, 1717, “the high noon of the year, the day of light and of roses,” when the four London lodges, having erected themselves into a grand lodge, named their first grand master. The leading spirits in this revival were Desaguliers, the well-known popularizer of natural science, and James Anderson, a Scotch Presbyterian minister, who compiled the *Book of Constitutions*, containing the ancient regulations and charges of the craft. This book is quite uncritical. It is said that the mechanical tastes and the Huguenot principles of Desaguliers are both traceable in the subsequent organization of the society. From this time new lodges could be formed only by warrant from the grand lodge, but they were empowered to create masters and fellow crafts. In 1721 the duke of Montagu was elected grand warden. He was the first noble who obtained that office. In the strange society of Gormogones, subject to the “sub-œcumenical volgi” at Rome, it is supposed that the Jesuits made a final effort to secure English Freemasonry as a channel for their political influence. At this time, also, the committee of charity was formed, which has since raised and expended very large sums for the relief of distressed brethren, and built the boys' and girls' masonic schools at Battersea Rise and Tottenham. Provincial grand masters were appointed, and charters granted to many foreign lodges. In the latter part of the 18th century the ancient York Lodge, backed by several old masons who had been indulging in irregular initiations, put forward a rival claim to be grand lodge or supreme authority. This claim was rested on the fable of an assembly at York in the year 926. The York people had also a new ritual, described in the *Book of Laws or Ahiman Rezon*, and also in *Jachin and Boaz, The three distinct Knocks*, and *Hiram Adonham or the Grand Master Key*[4] (1762). On the orthodox or London side appeared the well-known *Illustrations of Masonry*, by Preston, the pupil of Ruddiman. The schismatics introduced the red color of the royal arch degree, which they represented as something more exalted than the blue degrees of St. John. It belongs to the order of Templars, the legend referring to the second building of the temple. Another branch of Templarism, the grand chapter of Harodim, was founded in London in 1787. Just at the end of the century the publication of Abbé Barruel's *Memoirs pour servir à l'histoire du Jacobinisme*, translated into English by Clifford (who applied his author's principles to the United Irishmen and other Corresponding Societies of the time) and of Professor Robinson's *Proofs of a Conspiracy*, translated into French and German, made Freemasonry the subject of considerable suspicion.[5] The Act of 1799 directed against seditious societies, however, makes an exception in favor of the masonic lodges, which, according to the Act, meet chiefly for benevolent purposes. In 1813 a union was at last brought about by the dukes of Sussex, Kent, and Athole between the rival grand lodges of London and York, henceforth known as the United Grand Lodge of England. This patronage of aristocratic blood gave an impetus to Freemasonry, and in 1832 Mr. Crucefix, the editor of the *Freemason's Quarterly Review*, succeeded in founding the Freemason's Asylum. The brotherhood showed their good sense in deciding about this time that Jews might become members of the craft. They also built a hall, established their archæological institute and “The London Literary Union,” and started the *Freemason's Magazine* and the *Freemason*, in which periodicals a record may be found of the most recent masonic opinion and history. Besides 60 provincial grand lodges and 1200 lodges, England has a grand chapter for the royal arch degree, a grand lodge for the mark masters, a grand conclave of the knights templars, and a superior grand council of the ancient and accepted rite of the 33 degrees.

Ireland.—The first Irish lodge of speculative masonry seems to have been opened at Dublin in 1730. The English constitutions were adopted wholesale. Nothing of interest occurs in the Irish history. A characteristic liking is shown for the most sonorous of the high degrees:—the knights of the sword, the east, and the sun, the rosicrucian or mason prince, the kadosh or philosophical mason, and the grand general inspector. Power to grant these degrees was absurdly enough obtained from "Mother Kilwinning," a Scotch lodge which has always laid claim to a fabulous antiquity. The disputes between the grand chapter and grand consistory of Dublin have been frequent and violent. Ireland has now 350 lodges. The grand lodge, which supports two orphan schools, has an income of about £4000. A statement of the Ultramontane argument in modern Ireland will be found in Gargano's *Irish and English Freemasons*, Dublin, 1878, which is largely founded on Mgr. Dupanloup's *Study of Freemasonry* and *Secret Warfare against Church and State*. Gargano strongly urges the injustice done by the secret preference given by masons to one another in the ordinary civil and commercial relations of life. His book also contains an explanation of the pass-grip and real-grip for the three ordinary degrees, and for the mark master, the royal arch, and the knight templar, and a minute description of the modern initiation, with the text of the oaths.

[3] See also Dallaway, *Historical Account of Master and Freemason.*

[4] The Jewish legend of the assassination of and search for Hiram, which still appears in the business of a lodge, resembles the Scandinavian story of Baldur.

[5] The earliest book of this class was Abbé Larudan's *Franc-maçon Écrasé*, 1746.

Scotland.—In Scotland the history of Freemasonry closely resembles what took place in England. Before the 16th century there is not much trace of special legislation about masons.[1] Like the other crafts they enjoyed, under the Act of 1424, the right of nominating their own deacon or master-man. The deacon gave place to the warden, who represented rather the public than the trade interest. In 1493 the masons and wrights are denounced as oppressors of the lieges, because they had agreed that "they sall have fee alsweill for the haile day as for the wark day," and "that quair ony begiennis ane mannis warke ane uther sall not end it." A severe blow was struck against their privileges by an Act of 1540, which rendered legal the employment of unfreemen builders, but Queen Mary restored the jurisdiction from the trade visitors to the deacons, and confirmed their ancient right of self-regulation. In 1598–99 we have the celebrated statutes and ordinances to be observed "by all master masons, set down by William Shaw, master of work to his majesty, and general warden of the craft." These documents, one of which was preserved in the charter chest of the Eglinton family, are printed in Mr. Murray Lyon's learned *History of Freemasonry in Scotland*, Edin., 1873. They are confined to trade regulation, and do not deal with benefits. They fix the number of apprentices, the examination on entrance, the subscription to the box, the election of officers, provision for the safety of craftsmen, etc. The "Old Buik" of the Kilwinning Lodge was not really a Scotch document. It was a version of the English masonic legend and charges. The ceremony of initiation was at this time very simple; but the speaking plack, the dinner, and the pitcher of ale were exacted. The system of degrees was not developed. There was probably a pass-word, such as the squaremen word used in the "brithering" of the wrights and slaters. The individual "marks" chosen by entrants were carefully registered, but they did not indicate status. The mark degree, revived in 1869, and made the subject of a conference in 1871, was not known before 1789. In fact, the apprentices were originally present at and concurred in most of the business of the lodge. This word "lodge" occurs for the first time in a "statute anent the government of the master mason of the College Kirk of St. Giles," 1491, which is to be found in the burgh records of Edinburgh. It would appear that the deacon of the civil trade incorporation was often *ex officio* head of the lodge. The quartermaster and the intender or instructor were also officers in the old lodge. *Cowans, i.e.*, strangers, were stringently provided for in Shaw's *Statutes*. The traces of female membership are explained by the custom of the widows and daughters of freemen being admitted, at least to finish the contracts of the deceased. The Hay MSS. in the Advocates' Library contain two charters or letters of jurisdiction, dated in 1601 and 1628, by the freemen masons and hammermen in favor of the St. Clairs of Rosslyn, in virtue of which the head of that family for a long time acted as the patron, protector, and judge of the early masonic lodges. This has sometimes been inaccurately represented as a heritable conveyance of a grand mastership. As in England, there are traces of amateurs or non-operative members being gradually admitted to full privileges even in the 17th century, though such persons were charged higher entrance fees. This was called the theoric or geomatic as opposed to the domatic or operative element. Boswell of Auchinleck was a member so early as 1600. The first years of the 18th century were marked by movements of insubordination among the journeymen, who considered themselves entitled to a larger share of control over the common purse. The original theory of the lodge was that only masters, and not fellowcrafts or apprentices, were members. In 1721 the enthusiastic Desaguliers appeared in Edinburgh; and on November 30, 1736, the first general assembly of symbolical masons was held, and a grand lodge for Scotland formed. The representative of the St. Clair family then resigned his hereditary office and was elected first grand master. St. Andrew's day was substituted for the day of St. John the Baptist. Provincial grand masters were soon added, and there was a general adhesion of Scotch lodges to the new organization. The subsequent history of the brotherhood is not eventful. In Scotland they have been more remarkable for conviviality, or "refreshment," as it is technically called, than for comprehensive charity. Their gloves, aprons, sashes, and jewels are well known in festival or funeral processions. Their political relations have been peaceful. In 1757 the Associate Synod excommunicated all persons taking the secret oath, but this was only a part of the general defiance which Cameronianism gives to civil duty. In 1800, when intercourse with some Irish regiments had introduced the templar degrees to some of the Ayrshire lodges, an attempt was made by the law officers of the crown to convict certain templars at Maybole of sedition and the administration of unlawful oaths. The case only resulted in the disclosure of the extremely absurd ceremonies connected with the two degrees of this royal order, viz., Heredom of Kilwinning and Rosy Cross. One of them consisted in drinking porter out of a human skull. Again, when political feeling ran high at the beginning of the present century, the authority of the grand lodge was seriously shaken by the revolt of the associated lodges headed by Canongate Kilwinning. The Court of Session, Lawson *v.* Gordon, July 7, 1810, F. C., refused to recognize a masonic lodge as a corporation, and in another case they rejected the argument that lodges certified by the grand lodge were alone entitled to the protection of the excepting clause in the Act of 1799. The quarrel was speedily arranged. In 1811 a supreme grand royal arch chapter of Scotland was founded at Edinburgh, but its degrees were denounced and have never been recognized by the grand lodge. Scotland has altogether 400 lodges.[2]

France.—The astronomer Lalande, in his article on this subject in the *Encyclopédie*, says that the first masonic lodge in France was founded by Lord Derwentwater at Hurre's Tavern, Paris, in 1725. The movement was at first largely patronized by the nobility. Louis XV. attempted to suppress it in 1737, and next year Clement XII. issued the bull *In Eminenti*, which denounces the *liberi muratori* and all secret societies, as the council of Trent had done before (xxv. c. 20). It is amusing to trace through the later bulls the inflated phrase of papal indignation,—*Providas* issued by Benedict XIV. in 1751, which, oblivious for the moment of the Society of Jesus, says, "honesta semper publica gaudent;" *Ecclesia a Jesus*, by Pius VII. in 1814, which refers especially to the Carbonari; *Quo Graviora*, by Leo XII. in 1826, which mourns over the corruption of the universities; and *Quanta Cura* by Pius IX. in 1864, which says, briefly but emphatically, *damnantur clandestinæ societates*. In France the tone of masonry was low. Admissions were sold at a fixed price without inquiry as to character. Salé invented a Freemason's dance for six. The order of *La Felicité* was disorderly; and the *Mopses* was invented to evade the papal prohibition. The Chevalier Ramsay in his *Relation Apologique* introduced the nonsensical *hauts grades*, with *novices*, *profès*, and *parfaits*, which he said were derived from the knights St. John of Malta, and had been preserved by "Mother Kilwinning." All this was probably a Jacobite propaganda. The nine high degrees, including Irish architect and Scotch apprentice, though discountenanced by the *Grande Loge Anglaise de France* in 1743, became very popular. The *Parfait Maçon* was published in 1744, and next year the *Maçonnerie Adonhiramique Devoilée* disclosed the intricacies of the "strict observance." There is a tradition that Prince Charles Edward himself founded the *Chapitre Primordial de Rosecroix* at Arras. The Clermont ritual, which was elaborated under Jesuit influence, added three French degrees, which were founded on the story of the templars having taken refuge from the persecution of Philip IV. in the island of Mull. One of these degrees was *Chevalier de l'Aigle Élu*. In 1766, under the auspices of a new *Grande Loge Nationale* of France, afterwards called the *Grand Orient*, a representative system was at last adopted in which the "Souverain Conseil" was merged, and some degree of subordination among the various lodges was obtained. The confusion at this time between Dresden and Scotch rituals, between the old and simple forms of St. John and the wildest complications of Rosicrucian superstition, was increased by the appearance of Cagliostro and other systematic impostors. Cagliostro, as every one knows from Carlyle's famous essay, was the *Grand Cophta*[1] of the Egyptian system, a product of his own fertile brain. With the view of weeding the brotherhood of such rascals, the *Grand Orient* in 1777 introduced the *Mot de Semestre*, or biennial pass-word. The rivalry of such romantic systems as Martinism[2] was still, however, keenly felt, and in 1781 the Grand Orient adopted four of the higher degrees, viz., *élu*, *chevalier d'orient*, *écossais*, and *chevalier rosecroix*. All this while an active hostility was kept up between the Orient and the original Grand Lodge, each of which was supported by a separate Rosicrucian organization besides its own proper lodges. The work of both was suspended during the Revolution, but in 1799 a national union was effected by Roettiers. No sooner, however, was this done, and the statutes, originally based on the English constitutions, thoroughly revived, than French masonry again suffered from an invasion of mysticism,—first, in the form of the Scottish Philosophic Rite (including such profundities as the luminous ring and the white and black eagle), and, secondly, in the American Ancient and Accepted Scotch Rite of 33 degrees, which the charlatan De Grasse-Tilly expounded with great success, but which in 1804 was amalgamated with the *Grand Orient*, the great marshals Masséna and Kellermann being then the leading members of the two bodies. The union did not last, as Napoleon disliked the constitution of the *Suprême Conseil*, which was largely influenced by the aristocracy. His brother Joseph, assisted by Murat and Cambacérès, was allowed to take office in the older organization. An order of templars appeared in 1804, and was followed by the absurd *Rite Misraim*, which contains 90 degrees of the most fantastic kind. The French clergy in their denunciations of Freemasonry set an example of bigotry, which the masons themselves followed in their treatment of Clavel, author of *Histoire Pittoresque de la Franc-maçonnerie*, one of the few rational books on the subject in the language. During the reactionary Catholic policy of the grand master Murat the younger (1852-62), the liberties of the *Orient* were greatly interfered with and its funds almost exhausted. Since then it has slowly recovered. It has now 292 lodges; and the *Suprême Conseil*, which has become more democratic in constitution, has 50. The *Grand Orient* has lately ceased to require belief in a personal God as a test of membership.

---

[1] As may be seen from the "marks" on Melrose Abbey, the older Scotch churches owe much to the skill of the Frenchman John Moreau and other foreign masons.

[2] An insight into the practical working of Freemasonry in Britain may be got from Oliver's *Institutes of Masonic Jurisprudence*, London, 1859, and from the other works of that prolific author. The *Freemason's Magazine and Masonic Mirror* is published weekly.

Space does not admit of a detailed description of the advances of Freemasonry in other parts of Europe and in America. In Germany, where the chief lodge at Berlin is known as the grand royal mother lodge, *Zu den drei Welt-Kugeln*, it was patronized by Frederick the Great, and opposed by Maria Theresa. Its relations with the illuminati of Weishaupt are of extreme historical interest; and the question of the higher degrees was discussed at the great conference of Wilhelmsbad in 1782. The cause was helped by the adhesion of such great men as Lessing in his *Ernst und Falk, Gespräche für Freimaurer;* Herder in his *Adrastea;* Fichte in his *Briefe an Constant* and *Eleusinians of the 19th Century;* and Goethe, who wrote several masonic songs, and whose *Wilhelm Meister* is a favorite book among the craft. Germany has now 314 lodges, some of them, however, under the Swedish rite. The critical history of the institution and much of its general literature has been written there. The chief historians are Schröder, Krause, Fessler, and Findel. Kloss has published a bibliography which is supplemented by the American Barthelmess and by Findel. Marbach, Ritterhaus, and Löwe are the poets of the order in Germany, as Morris is in America. One of the most recent German publications is *Sarsena, oder der Vollkommene Baumeister*, Leipsic, 1874. As regards America it is sufficient to refer to the great anti-masonic movement of 1826, which was caused by the kidnapping and supposed murder by masons of a man called Morgan of Batavia, and which continued for some time to influence the presidential elections. Convictions for abduction were obtained. There have for more than a century been negro lodges in the United States. In Brazil in 1876 the hostility between masonry and the Catholic Church was shown in the production of the play *Os Mason e os Jesuitas*, in which the dishonesty of the priest is contrasted with the manly virtue of the mason.

As regards the future of Freemasonry, it is impossible, at least for outsiders, to say much. The celebration of the brotherhood of man, and the cultivation of universal good-will in the abstract, seem rather indefinite objects for any society in this unimaginative age. There is, on the one hand, a tendency to degenerate into mere conviviality; while, if schools, or asylums, or other charities are supported, to that extent of course the society becomes local and even exclusive in its character. In the mean time, masonry is to blame for keeping afloat in the minds of its members many of the most absolutely puerile ideas. A more accurate knowledge of its own singular and not undignified history would tend more than anything else to give worth and elevation to its aims. No one now believes the stupid slander that freemasons are engaged in any definite conspiracy against the state, religion, or social order. There is, however, something in their fundamental principles, the fraternity of men and their indifference to theological belief, and also in their recent movements, which perhaps justifies the suspicion, and even hatred, with which they are regarded by the Ultramontane party. Masonry in each country of course takes its coloring from the state of thought and feeling by which it is surrounded. But it cannot be disputed that the German, Dutch, Belgian, and French magazines of the craft occasionally exhibit a tone which is not favorable to Christianity regarded as a special revelation. The tendency of political opinion in such an association is also necessarily democratic; and while it would be absurd to make the brotherhood answerable for the opinions of Mazzini or the outrages of the commune, and while the majority of brethren are loyal subjects, and probably also orthodox Christians (in the theological sense), the institution itself undoubtedly "makes for" liberty in matters both civil and spiritual.

The singular myth that modern freemasonry is derived through Scotland from the historical order of the Templars has been treated in great detail and finally destroyed by Wilcke in his *History* of the Order, 2 vols., Halle, 1860. The claim was rested on (1) the *Charta transmissionis* or *tabula aurea Larmenii*, alleged to have been written in 1324 by Larmenius, the successor of grand-master Molay, who suffered in the persecution; (2) an old parchment copy of Templar statutes; (3) several alleged relics of the martyred Templars—all preserved in the archives of the Masonic Templars at Paris. An abstract of the controversy will be found in the appendix to Findel's *History*, which also contains the form of examination of a German Steinmetz, the Constitutions of the Masons of Strasburg (1459), including the Statutes of Parlierers and Fellows, and the Regulations of Apprentices; the Examination of the English Masons; a series of the old English Charges or Exhortations; the General Regulations of 1721; and the spurious Cologne Charter. The appendix of Mr. Fort's work contains the *Règlements sur les Arts et Métiers de Paris*, of the 13th century, as collected by Étienne Boileau, provost under Louis IX. The masonic legend of *Die heiligen vier Gekrönten* is supposed to relate to the martyrdom, in the time of Diocletian, of four stonecutters named Claudius, Nicostratus, Sinforiamus, and Simplicius, to whose memory the small church *Quattro Santi Coronati* at Rome was sacred. In the second part of Mr. Fort's work will be found an accumulation of interesting facts relating to the early organization of masonic societies, their ceremonies, crypts and lodges, or places of meeting, and costumes; the payment of wages by warden, and the power of superintendence by master; the symbolic meaning of the hammer, the columns, the cord, the shoe; and the various uses of marks.

The word freemason has been derived from the Norman

---

[1] See Goethe's comedy of this name.

[2] Martin was connected with the *Chevaliers Bienfaisants*, *Amis Réunis*, and *Philosophes Inconnus*. He was a disciple of Jacob Boehme, and believed masonry to be divinely inspired. The system resembled that invented by the *Philalèthes*, of which Court de Gebelin, the Camisard historian, was a member.

French *Frère Maçon*, brother mason, and also from the expression freestone mason. The origin of the word mason is itself uncertain. The low Latin *macio* may be the German *Metz;* but Diez regards it as a modification of *marcio*, from *marcus*, a hammer. Littré suggests that the Latin *maceria*, a stone wall, may contain a radical *mac*, from which *macio* has been formed. This is rendered more probable by the Italian *macine* or *macigno*, a stone lap mill, where the root idea of mace or hammer, used for pounding corn, is referred to. Tiler, the name of a masonic officer stationed at the door of the lodge, obviously comes from *tailleur de pierre*, the lapidicine of several mediæval charters.

(W. C. S.)

FREEPORT, a city of Illinois, United States, the capital of Stephenson county, is situated on the Pekatonica river, 110 miles W.N.W. of Chicago. It is a rapidly increasing town, and possesses woollen and carpet manufactories, a foundry, a tannery, a beet-root sugar factory, and various kinds of agricultural instrument factories. The principal buildings are the court-house and the Presbyterian college, which was instituted in 1872. The population in 1850 was 1436, and in 1870, 7889.

FREETOWN, a town of West Africa, capital of the British colony of Sierra Leone, stands on the south side of the estuary of the Sierra Leone river, about 5 miles from the cape of that name in 8° 29′ N. lat. and 13° 10′ W. long. It is situated on a plain which slopes up gradually from the river, and is closed in behind by a succession of wooded mountains. The town is divided into several quarters, the best of which is inhabited by Europeans, half-castes, and immigrants, who are either tradesmen or artificers, and the remainder solely by the black population, who congregate together in separate tribes. From the fact that both the houses in the best quarter and also the negro huts are surrounded by a court-yard or garden, the town covers an unusually large amount of space for the number of its inhabitants. The decomposed vegetable matter which is carried down the river, and driven back to the town by the tide, renders it very unhealthy, and unsuited for European residents, of whom there are only a small number. Freetown is the chief seat of the Sierra Leone trade, and a considerable sum of money has lately been expended on the construction of a new wharf. The principal buildings are the governor's residence and government offices, the barracks, the cathedral, the missionary institutions, and the grammar school. About two miles above Freetown, at Fourah Bay, the English Church Missionary Society has its principal West-African College, built in 1840, the ground having been purchased in 1827, and the work commenced in a temporary building. In 1876 the college was reorganized and affiliated to Durham university. The population is about 18,000.

FREE TRADE. This expression has been appropriated, in a somewhat technical manner, to denote an unimpeded intercourse between such manufacturing and commercial communities as, having reciprocal interests, are under separate governments, and thereupon have separate financial systems. Thus the term is not applied to the facilities which town and country, laborer and capitalist, have obtained for reciprocal exchange, though these facilities have been acquired only in comparatively recent times. It is not used to describe the commercial intercourse of the three kingdoms, though restraints on the trade between Scotland and Ireland on the one side and England on the other were remitted, long after a political union between the three kingdoms had been effected, very grudgingly and very cautiously. Again, if we speak of free trade in land or free trade in banking, we use the term in a different sense from that in which it has been employed since the time of Adam Smith. But the phrase is technically used to designate such a commercial intercourse between any particular country, its colonies, and foreign countries, as gives the maximum of facilities for reciprocal exchange, and in the least degree attempts to make a fiscal system the means for stimulating and assisting domestic industry by protective enactments.

Free trade in the sense given to it above is advocated on two principal grounds, the one economical, the other political; and all arguments alleged in favor of it can be brought under one or other of these topics. It is resisted similarly for economical and political reasons,—not, indeed, in contradiction to those which are adduced in its favor, for these are absolutely irrefragable, but on the grounds that the industries of a country ought not to be defined by merely economical reasons, and that there are political interests which will not indeed annul, but must materially modify the universal and undeviating application of the free-trade principle. It will be the object of the present article to give a brief account of the controversy between the advocates of commercial freedom and those of commercial restraint, and to show how events, due to opinions which have long become obsolete, have strengthened the position of those who urge that the restraint of trade is and should be part of the function of Government. It is perhaps necessary, however, to meet an objection at once which might be taken, if it were not anticipated. Every civilized Government rightly and properly undertakes the supervision of contracts,—prohibiting some altogether, regulating others with less or greater strictness, and assuming the right to give an equitable interpretation to all; the application of the principles of equity to contracts being the most important improvement which modern civilization has induced on jurisprudence. Thus the law of civilized nations forbids any contract which would reduce one of the contracting parties to permanent slavery, though it compels the fulfilment of bargains which involve the temporary servitude of one of the parties. Again, it nullifies immoral bargains, though it does not profess to follow the consequences which a bargain that is *prima facie* innocent may have. Again, it subjects some callings to a police, either by exacting, in the case of certain professions, evidence of the individual's capacity, or by guarding continuously against any abuse which may arise from the exercise of a calling specially open to abuse, as in the case of houses for public entertainment, and the issue of paper money by banks. Furthermore, it subjects even simple contracts to revision—as, for example, cases in which exorbitant charges are made for loans. In these instances, and in others like them, a Government is only carrying out its primary duty in protecting its people from force or fraud, by controlling the free action of those who may inflict a serious injury on others. To define the extent indeed, to which such interference is necessary or desirable, is one of the hardest questions in what may be called the casuistry of politics. A country may be so over-governed by a watchful administration as to lose, to a greater or less extent, the spirit of enterprise or initiation, and thereby to be weakened in the legitimate rivalry of nations. But, on the other hand, it may be still more seriously weakened by the destruction of credit or confidence,—a result which is very likely to ensue when fraud is successful and unpunished.

Similarly a Government may control or prohibit intercourse between nations. If individuals have rights at all, one of the most obvious and important of these rights is that of choosing a market for their labor. But a Government would be admittedly justified in prohibiting the emigration of such artisans as are employed in the manufacture of munitions of war to a country with which itself was at war. It does more when it does not allow its harbors to be a refuge or a market for belligerents' ships, and prevents private individuals from supplying munitions of war to combatants. *A fortiori*, it would not allow its subjects to sell such goods to its enemies as might enable those enemies to protract their defence. It is a question whether it is not entitled to prohibit, or at least restrain, the exportation of that over which it is able to exercise a monopoly, though it is very seldom, if, indeed, it is ever the case, that any country is in so advantageous a position. And, lastly, it is allowed that a Government may make the commercial intercourse of its subjects a matter of bargain with the Government of other countries, though such expedients, from an economical point of view, have been subjected to very adverse criticism. Free trade, then, must be innocuous and not hostile to the general public good.

Between nations, free trade represents the well-known principle of the Division of Employments. The advantages which result from the natural or spontaneous division of employments, and the loss which ensues from a forced division of employments are the commonplaces of economists. But the fact that exactly the same principle rules the distribution of production over such parts of the world as are occupied by industrial agents is not so frequently insisted on. That there are several commodities which a country cannot produce at all, or can only produce under circumstances so disadvantageous as to involve disproportionate expense or loss, is admitted by every Government, however anxious it may be to develop native industry by protective regulations. No European Government, however imperfectly civilized, would attempt to direct its home industries into the production of tea, coffee, and chocolate, or to domesticate elephants for the sake of their ivory, or to breed ostriches for the sake of their plumes, or to maintain a race of wild hogs in order to obtain a due supply of bristles from native sources. But there are in most countries a number of industries the continuity of which Governments have attempted, and still attempt, to promote, by hindering the free entrance of foreign-made articles of the same kind. It will be found that, historically, this practice has had its origin in what is now understood to be a delusion as to the true functions of the currency.

The restraint of production and trade was a policy which ancient civilization never adopted. The great statesman of Athens congratulates his audience on the fact that, thanks to the extended commerce of their country, they are as familiar with the use of foreign products as they are with those of domestic industry, and use them even as freely as the country of their origin does. The public opinion of Greece was profoundly shocked when, as a measure of political animosity, Athens excluded a Greek city, Megara, from its market. The oldest public document preserved in the Roman archives was a commercial treaty with Carthage (Polybius, xii. 22), in which Roman merchants are indeed restrained from traffic in certain districts, more, we may be certain, from fear of the Carthaginian occupation of Italy than for other reasons, for the treaty expressly exempts traffic from tolls, and prescribes that Carthage shall build no factories in Latium. Nor is there any record of restraint put upon the distribution of the precious metals, except in one oration of Cicero, where the orator, defending his client from a charge of extorting money from the Asiatic Jews, comments on the public policy of hindering this people from disturbing the money market by sending great remittances of specie to Jerusalem.

Perhaps the explanation of the fact that the civilization of antiquity did not interfere with the process of international exchange is to be found in the prevalence of slavery. Setting aside for a moment the historical origin of modern protection, the influence and apparent truth of the mercantile system of which we shall speak immediately, there is a radical difference between ancient and modern civilization,—that in the former slavery was deemed natural, in the latter it has been seen to be mischievous and felt to be detestable. In modern societies, therefore, the free laborer is a factor in the interpretation of economical forces; in ancient ones he counted for nothing, or next to nothing. To have prohibited free trade in the products of foreign labor at Athens would have been to give advantage to one class of slave-holders in opposition or in contrast to another class of slave-holders, and was not to be thought of. To prohibit free trade between England and France, or England and the United States, is, in appearance at least, to assist the home labor of the country which adopts protection against the rivalry of free labor in another country which might undersell its rivals. Protection in ancient times would have been seen to be naked selfishness; in modern times it may seem to be a genuine and disinterested patriotism. And it may be observed that, for this and for other reasons, most slave-holding countries have been indifferent to protective regulations, or even unfriendly to them. This fact is sufficiently illustrated by the contrast of opinion in the northern and southern States of the American Union before the war of secession.

The control of production and trade in modern Europe is historically due to the development of what Adam Smith called the Mercantile System, *i.e.*, the effort of Government to secure as far as possible the largest possible amount of specie within the country whose affairs it administered. It is easy to discover the origin of this policy. To a Government which spends, but does not produce, the possession of treasure is of the greatest utility and service. To an individual who produces and trades, still more to one who trades only, treasure is, as a rule, the least valuable instrument of traffic, as it is an article from which, as it is affected by the least possible variation in value, the least amount of profit can be anticipated by those who deal in it as an article of trade. A trader in the Middle Ages would have readily accepted the doctrine that money was wealth as far as regarded every one but himself; as far as he was concerned, he wished to get rid of his money as soon as he could, in exchange for goods, on which he might secure his profits. The doctrine that the machinery of international trade supplied the process by which the precious metals were distributed, and that therefore, if trade were to exist, the attempts of Government to restrain the exportation of money were mischievous or nugatory, was argued as early as the middle of the 14th century by Sanuto the Venetian, and by Oresme the bishop of Lisieux, in language as precise as any used by Turgot or Adam Smith. The reasonings, however, by which protective theories were upheld, the mean and malignant arguments of restraint, as Adam Smith calls them, were always strengthened in England up to thirty years ago, by suggesting the hideous consequences which would come on the nation from a drain of gold. Protection had its origin in the reputed duty of Government towards the currency. Once established, it created artificial interests whose existence was a loss to the whole community, but whose maintenance seemed to be the satisfaction of a contract entered into between the Government and the industry which the Government had called into being or had stimulated.

It will be clear that if any particular industry is of such a character as to be very conveniently carried out by the inhabitants of a particular community or district, if the producer fears no rival in the home market, and still more if he dreads no competition in a foreign market, any protection accorded to his industry must be wholly superfluous. He might even contemplate an export duty with equanimity, though of course an export duty would be destructive of his foreign market if he had real rivals, and he would generally find that such a duty would not only limit the consumption of his produce, but would call a rivalry into existence. It is equally clear that if a protective duty were imposed on the importation of foreign commodities into a country which has already a marked superiority over other countries in these commodities, the regulation would have no effect in increasing either the profits of the producer or the cost of the article to the consumer,—that, in short, the enactment would be absolutely nugatory. It will be also plain that, in every country, there are certain commodities which are effectually shielded from foreign rivalry by the cost of carriage, and that such commodities possess the superiority which other products enjoy from the peculiar facilities which a particular country has in manufacturing them. A protective system then is inevitably concerned with such products as are liable to foreign rivalry, and a foreign rivalry can only be defeated at the cost of the consumer. But as the protective regulation can affect prices in that country only which imposes the regulation, it is obvious that the only person who can be made to bear the increased cost which the protective restraint imposes will be the home consumer. If the produce could find a market at home, there would be no need of the assistance; if it cannot subsist at home without a machinery which guarantees the profit of the producer, the domestic consumer is the only person who can be made to contribute the fund from which the profit is made.

The positions stated above receive a significant but complete illustration from the economical history of England. A century ago the English landowners were free traders, the English merchants protectionists. Adam Smith rested all his hopes of a better system on the former class, but despaired of any co-operation from the latter. Twenty years after the *Wealth of Nations* was published, the mercantile and manufacturing classes, with few exceptions, were free traders; the landowners, with few exceptions, were protectionists. The explanation of the change in sentiment is to be found in the change of interests. Up to the middle of the 18th century England exported considerable quantities of agricultural produce,—sometimes naturally, at other times under the wholly indefensible stimulus of a bounty on exportation. Now it needs very little intelligence to discover that the profits of an exporter, or at any rate the extension of his trade, depend largely on the variety of imports which he can obtain in exchange for his goods. A country which puts no hindrance on imports always deals to the greatest advantage, and the advantage decreases with restraint. If a country refused to admit any import but one, *i.e.*, money, it would sell its exports in the worst possible market, and for the least possible value, receiving in return an article which the machinery of its trade takes the most effectual possible means to depreciate. Hence the landowners of the 18th century, like the agriculturists of the western and southern States of America now, were free-traders, because free trade was their best hope of profit. The manufacturers, on the other hand, were profoundly afraid of foreign rivalry, even the rivalry of the British colonies, even the rivalry of Ireland. Perhaps the most grotesque illustration of this fear was the law which directed under strict penalties that the dead should be buried in woollen, in order to encourage the woollen manufactures.

The change of sentiment was due to the great mechanical industries of the 18th century. The discoveries of Arkwright, of Watt, of Hargreaves, of Crompton, gave England a practical monopoly of textile fabrics, and subsequently of other products nearly as important. No doubt the Berlin and Milan decrees interfered with the Continental trade of England, though it is well known that Napoleon's soldiers were clothed, in spite of these decrees, in the produce of north-eastern and west country looms. But in other parts of the world England had no rivals, while her supremacy on sea, after the great victory of Trafalgar, guaranteed her traffic. Hence, when the merchant and manufacturer, especially the latter, discovered that protection had ceased to be an advantage to them, and discovered also, for the reasons given above, that the restraint of imports was a disadvantage to production and exportation, the principles of free trade made rapid progress in the manufacturing districts of England. But on the other hand, the very reverse opinion influenced the minds of the landowners. Owing partly to the succession of late harvests, partly to the rapid growth of population consequent upon manufacturing enterprise, partly to the restriction of Continental supply, the result of war, of the great drain which war made on the agricultural population of Europe, and of hindrances put on the import of food,—rents and farmers' profits rose with amazing rapidity, and the Corn Law of 1815 was enacted in order to secure, if possible, the permanence of such rents and profits. The partisans of free trade and protection were only by accident allied to the great historical parties of English public life. The struggle for free trade was really one between town and country, as hereafter efforts in the same direction will get their advocates from the same classes.

It may be believed that, in England at least, the question of protection to manufactures is finally settled, though there are not wanting persons who advocate reciprocity, co-ordinate taxation on foreign products, retaliatory duties on reputed bounties, and the like. But the traditions of legislation are too firmly fixed, and the benefits of free trade experienced during the past thirty years are so generally admitted, that the advocacy of the exploded theory of protection is looked on as a harmless whim which has no chance of popularity. It is not perhaps equally clear that the English people are quite safe against the revival of protection to agriculture under the pretence of sanitary restraint, for that which is the inevitable result of protection to manufacture, the limitation of voluntary consumption, is not so markedly developed from the protection which may be accorded to articles of necessary consumption.

When trade is restrained in those articles of foreign origin which may be produced, though under less advantageous circumstances, at home, and the product is an article in which the use may, to a limited extent only, be economized, the following results ensue:—Prices rise, and profits rise,—of course, at the expense of the consumer; wages, however, do not rise, for in so far as wages are determined by the competition of employers for services, the tendency is towards a reduction of wages, seeing that the use of the product is not increased but rather stinted. Now, the extra profits which protection accords might be secured to those who are already employed in the particular industry thus favored only if the producers have a natural monopoly in the produce of their calling, as was practically the case with the English landowners during the existence of the corn laws, or if the law restrains other persons from competing against them, as was the case in England with Eastern produce during the continuance of the East India Company's chartered trade. If such an advantage be not accorded, capital makes its way to the favored industry; or, to be more accurate, an increasing number of employers compete for the exceptional profit. Such an operation may in some degree raise the rate of wages, though here again, unless the labor be protected by some arrangement, such as apprenticeship, or by the machinery of a strict trade union, the same cause which attracted the energies of the employer will rapidly, even more rapidly, supply what may be needed in the way of labor. Generally, indeed, the check to such a decline in wages is supplied by trades unions, which are, as the industrial experience of the United States has proved, the inevitable outcome of a protective system in a country where combinations of labor are not prohibited by law. In England up to 1824 they were prohibited.

In course of time then, and generally at an early period, the advantage which the protective system accorded to a special industry ceases, by being distributed among a larger number of producers. To this rule there is but one exception, protection accorded to the produce of land. Here, if the commodity produced be one which cannot be dispensed with, and for which no substitute is found, the fact that the supply procurable falls short of the demand may greatly increase the value of the article, and through the farmer's profits raise rents. But the advantage is soon found to be only partial. In civilized and fully settled countries, agriculture is a complex process, in which success depends upon a just balance being struck between tillage proper and stock-keeping. An excessive price of corn, or rather of wheat, due to the machinery of a protective system, apart from the extraordinary fluctuations in price which it induces on the price of wheat, discourages the use of meat, and even of the inferior kinds of grain; for it is a law in prices that any notable exaltation in the value of one of the items which contribute to a joint product invariably depresses the value of the other items; just as it is an equally invariable law in prices that when there is a notable scarcity of any commodity the greatest rise in price always takes place in that form or quality of the article which was cheapest before. Hence there is always a natural remedy, though it is by no means a compensating one to the consumer, for any artificial exaltation in the value of agricultural produce. The principles referred to may be proved by the analysis of facts. Since the repeal of the English corn laws the price of agricultural land has steadily risen; for though the average price of wheat has fallen, that of other kinds of grain, as is found by the tithe averages, has risen, while meat and dairy produce have much more than doubled in value since the period referred to.

It is chiefly, however, in relation to manufactures that the operation of protective regulations is significant or important, for most countries have abandoned all or nearly all restraint on the importation of food. The employer gets no advantage from the regulation, nor the laborer, and the consumer suffers a loss. But the removal of protection would, however great, in most cases be a benefit to the consumer, and inflict considerable loss on employers and laborers, since they would be subjected to a competition in which it is probable they would be worsted; for it may be concluded that the manufacturer cannot, or believes he cannot, subsist without protection, since he would repudiate it if he saw that it was superfluous. Hence it is exceedingly difficult and invidious to alter a system to which capital and labor have accommodated themselves; and it may be stated generally that all the arguments by which an existing protection is defended, however plausible and convenient they may be, are mere sophistry, though very often unconscious sophistry; while the prospect that the sudden suspension of protection to manufactures would seriously disturb the relations of employers and laborers, and would very probably lead to a great destruction of property, points to a real difficulty, which the advocates of free trade will always find confronting them. In practical politics, in so far as they are connected with economical subjects, the difficulty is enormous, for the defence of imperilled interests is always more watchful and energetic than attack on them, and can always count on a co-operation and concentration which is far less fully developed in those who criticise or challenge the privilege. There is a well-known passage in Mr. Mill's political economy in which this author conceives it expedient that protection should be given to certain industries in new countries, provided that the country had good natural resources for the successful prosecution of such an industry, and the protection accorded be only temporary. But apart from the fact that new countries never possess a superfluity of capital and labor, and therefore are least of all well advised in directing these elements of wealth into channels where they would be less advantageously employed than they would be in others; apart from the considerations that all countries have a natural protection in the cost of carriage, and in the comparative ease with which they can interpret demand; and apart from the fact that good natural advantages for any particular industry are sure to suggest that industry at the very earliest time at which it will be expedient to undertake it,—the circumstances which invariably affect a protected industry render it impossible that Mr. Mill's rule of a temporary protection should be applicable. Who is to determine at what time the protection should be removed? Not the consumer, as represented in the legislature, for he would naturally object to the protection from the beginning, since the regulation inflicted a loss on him at the very instant that it came into operation. Not the manufacturer, for until the time comes in which he dreads no rivalry, he believes that the regulation is the guarantee of his ordinary profit, and that its removal will expose him to certain loss. The probability that he may come to such a state as to render the protection manifestly superfluous depends on his making some great, sudden, and lasting stride in the efficiency of the industry which he exercises. But protection discourages all kinds of improvement, and indeed it does not appear that the phenomenon of sudden, vast, and permanent progress has ever been witnessed in economical history except during the latter half of the 18th century in England. Not the laborer who is engaged in producing the favored product, for the wages of labor are adversely affected, in the fall of prices, at an earlier stage than any other object into which gross value is distributed, and are advantageously affected, on the other hand, at a later period than that in which any other interest, other than that of manual labor, is benefited. Loaned or floating capital is most easily extricated from a declining trade, and most easily attracted to a growing trade; fixed capital, and such capital as gives efficiency to fixed capital, is attracted less easily, and by parity of reasoning, is less easily accumulated or appropriated; while the supply of labor is decreased with the greatest loss to the laborer, and increased with the smallest gain.

It may be concluded then that, while Mr. Mill has given a doubtful defence for the adoption of a temporary protection, his limits to the protection so accorded will be found to be practically nugatory, and that in fact the adoption of the system will confer the minimum of good, while the abolition or abandonment of it will inflict the maximum of injury. This result then,—the creation of factitious industries, which cannot be assisted by the operations of Government without loss to the consumer, but which cannot be abandoned by Government without ruin real or apparent to the consumers,—is substantially the apology and defence for the protective systems of Continental Europe. For there is nothing which characterizes modern systems of government more than the tenderness which all parties show towards imperilled interests. There is a growing disposition towards treating them as vested,—that is, as equitably entitled to compensation if their continuity is disturbed or even threatened. Of course there must be a limit to this consideration, for no Government has yet ventured on admitting, however democratic may be its institutions, the vested interests of manual labor, or allowed that it should be compensated, if events required that a change be made in legislation which might interfere with the continuity of its wages. But if the project which is in favor with certain schools of socialism in France and Germany, that the state should assist labor (and of course it could assist only special kinds of labor) with Government subventions, the doctrine of vested interests would assuredly be applied to such assisted callings. It was, perhaps still is, a contention with some public men in England that poor-law relief is of the nature of a vested interest to labor, or that it is the indefeasible heritage of the poor.

It has been very fairly shown by Mr. Fawcett, in his recently published essay on free trade, that many circumstances assisted towards making the acceptance of this great political change in the United Kingdom,—notwithstanding the vehement passions which were excited against those who carried on the struggle for the repeal of all taxes on food. Mr. Fawcett has not by any means exhausted all the facts which aided the advocates of this change, nor has he enumerated all the motives which influenced those who gradually became reconciled to the change, and who even, from being opponents, were converted into partisans of the movement. For the principles of free trade had been accepted by Lord Liverpool in 1820, and had been cautiously tried by Mr. Huskisson in certain directions and with marked success. In fact, the first modifications of the tariff were agreeable to the landowners and the farmers, were acceptable to the manufacturers and small traders, and were objected to, as similar reforms were objected to in Walpole's time, by the great mercantile houses, who were enabled by their capital to retain almost a monopoly of the wholesale trade as against less opulent dealers. But even here a significant law of prices, never indeed formulated, but recognized, effectively enough reconciled the great houses to the remission of taxation on raw materials and on those foreign products against which no home production competed. It is that a remission of taxation, in all consumable articles, and notably in those of extended demand, is followed by a rise in the price of the untaxed articles. This law is a constant refutation of the policy which imposes taxes on imports, and operates still more emphatically when taxes on exports are imposed, as they sometimes are by ignorant and needy Governments. Hardly a voice, therefore, was raised against the bold measures which Peel adopted between 1842 and 1846. They could not possibly harm the landowners; they were a positive boon to the manufacturers and the consumers. So much was this the case that for some time, as has been already stated, the remission of a vast number of small taxes on consumption was made the apology for retaining the income tax.

But the case was very different when the taxes on food produced abroad, and in competition with that produced at home, and on sugar imported from other places than the British colonies, were assailed by the logic of the English free-traders. Here it was seen at once that the most powerful interests were imperilled. For very obvious reasons, the landed interest in England has always wielded far more power, political and financial, than any other. During the Middle Ages it controlled the monarchy, deposed kings, altered the succession, till, up to the beginning of the 17th century, the general appellation which Continental nations gave the English was that of "disloyal." The landed gentry and free-holders fought the wars of the Long Parliament, and subverted the monarchy. The Restoration was a compromise between them and the courtiers, and one of the first results of the Restoration was the enactment of stringent provisions against the importation of foreign food. For centuries the policy, the legislation, the finance of England had been defined by the interests, real or supposed, of the landed gentry, the yeomanry, and the tenant farmers. They were now threatened with a complete reversal of this traditionary policy, and such a reversal seemed to purpose their ruin. Those who lived through this time will easily recall to mind how violent were the passions which the anti-corn law movement excited; how Whigs of the Melbourne school denounced the free-trade movement as folly; how such a man as Lord Brougham, who was conceived, ten years or more before, to have carried the reform agitation to the very verge of sedition, now declared, and perhaps with perfect good faith, that the movement in favor of free trade was unconstitutional; how Sir Robert Peel believed that the opponents of protection were the instigators of a plot against his life; and how, long after the victory was won, it was a commonplace to accuse the leaders of the movement with the most sinister designs against property. And yet the tax on food was in the last degree invidious. It was avowedly imposed in the interest of the landowners, and with a view to maintaining rents. It was allowed that free trade in the abstract was just, protection in the abstract indefensible. There were of course reasons alleged in favor of protection, analogous to those which are now current in the United States and elsewhere, as to the wisdom of a nation being self-supporting; as to the disturbance of the exchanges in the presence of bad harvests; as to the incapacity of domestic industry to compete against the low-priced labor of semi-barbarous countries; as to the destruction of national industries, and the extinction of the best and most patriotic of English craftsmen. But these alarms were either heedless or interested rhetoric, never put forward by really competent critics. Nearly thirty years ago, Mr. Gladstone informed the writer of this article that he never had but one objection to the repeal of the corn law, during the early period of his connection with Peel's Government, and that was the fear that he entertained as to the consequences which would ensue to an interest which seemed, and seemed naturally, to be the very centre of English national life. Statesmen may well be excused from venturing on economical changes of a vast and extended character, even though the propriety of the change may be proved to demonstration; for a period of change, however beneficient it may be in the end, is almost invariably accompanied by temporary and severe loss.

Already, however, there were far-sighted men who predicted that this loss, if loss did ensue from the change, would be a minimum. They discovered or anticipated this in pursuance of that other fundamental law of prices already hinted at. When the products of any industry are numerous, and all are in demand, such an alteration in the cost of producing one of these products as makes it, from being the most profitable branch of the calling, the least, is followed by an exaltation in the value of the other products. Thus it is constantly the case that the bye-products of a complex industry are found to be the sole source of business profits. Such at least is said to be the fact in the manufacture of gas and soda ash, and it is alleged that even if a substitute be found for gas as a means of lighting, the value of the bye-products in the manufacture is so great, and the use of them so indispensable in the economy of society, that the manufacture would still be necessary and profitable. But there is no illustration of the law which is so exact and invariable as that supplied by agriculture. During the existence of the corn laws, the profits of the farmer and the rents of the landowner were estimated in wheat. It was from the probable decline in the value of wheat that all the sinister predictions as to the future of the landed interest were derived. So entirely did grain, especially wheat, form the measure of agricultural values that ten years before the repeal of the corn laws the commutation of tithes took no account of any other kind of agricultural produce than the three principal cereals, although in that commutation interests, lay and clerical, of not less, in capital value, than 150 millions sterling were involved. Even here, however, the tithe-owner has suffered no loss by the change, for though the price of wheat has fallen, the decline has been more than compensated by the upward movement in the price of barley and oats. Since the repeal of the corn laws, the tithe rent charge has been 2½ per cent. above par value. Far greater, however, has been the consequence of the change on the price of other agricultural products, especially meat and dairy produce, the value of which has nearly, if not quite, doubled during the last forty years. Now this result was anticipated in a rough manner by the shrewder heads among landowners and occupiers, and therefore reconciled many whose interests might seem to be imperilled to a change, which, while it threatened a superficial and temporary loss, might easily determine in a permanent and increasing profit. And finally, the farmers learnt by demonstration and experience that, whoever might gain by restrictions on the trade in food, they did not; and that in some unexplained manner the machinery of a law which seemed to be intended for their profit either turned out to be a loss, or was wholly inadequate to secure the results intended. And yet, though the people were starved, manufacture was unprofitable, foreign trade was declining, and the revenue had been constantly insufficient for the expenses of government, it needed the catastrophe of the Irish famine in order to give effect to an agitation more prolonged, more costly, and more popular than any which has happened in the history of a civilized nation, to effect a peaceful repeal of laws, which did no person whatever any good, which were no advantage whatever to the parties for whose special benefit they were enacted, and which inflicted prodigious losses on the two most important classes in the community, the producer and the consumer.

The history of the movement which led to the repeal of the English corn laws in 1846 has been sketched at some length, in order to show that if, in a case where the impolicy and the injury of the law was proved to demonstration, it was so arduous a task to effect a change, the difficulty is far greater in those countries where it is not possible to array such formidable forces against the continuance of a protective system. It is easy to show that the law of prices above referred to applies with the same cogency to the collective industries of any country whatever as it does to such industries as necessarily supply varied products, and that any artificial attempts to direct the home and foreign trade of a country into special channels are sure to bring about a factitious exaltation of one set of values, and a factitious depreciation of another set of values. Various Governments in Europe, in the New World, and in the British colonies have striven to start special industries. They will succeed in the attempt, however injudicious the attempt may be, if there be a demand for the product which they determine to artificially foster. But from two consequences they cannot escape. The consumer of the produce thus stimulated into an unnatural or premature existence must pay for the policy of the Government in enhanced prices, and the producer of goods must offer more of his goods for sale in order to effect an exchange in that which the Government permits to be imported, but hinders either in kind or quality with a protective tax. But it by no means follows that, when the consequence of this policy is exhibited, when its mischief is demonstrated, when its futility is exposed, nay, even when it is proved that, on pretence of doing a special service to the Government and the people which it is intended to aid, it deliberately gives the maximum of advantage to the foreign exporter, and inflicts the maximum of loss on the domestic consumer, the country which makes the discovery will reverse its policy. For, apart from the considerations which have been dwelt on above, the fact, namely, that the revocation of a protective duty which is efficient in raising prices must be followed by a loss to the producer, the existing practice may always be defended by a number of plausible arguments, held, it should admitted, with perfect good faith by those who promulgate them, however shallow and erroneous they may seem to others, whose passions and interests are not stimulated to defend such a practice. With the same sincerity of conviction the defence may be further supplemented by appeals to an irrelevant patriotism, or by an imputation of sinister motives on the part of assailants, or by a bold assertion that the social condition of other countries differs radically from that of the district in which protection is maintained. And finally, in all political and economical movements, it must be repeated, the forces of defence are far more manageable than those of attack. For, as the defenders are in possession, and the sentiment of civilized societies is always favorable to existing interests, the defence can urge, if not with truth, at least with great effect, that it is dangerous to relinquish what is actual, and under which society has long existed, for that which is hypothetical, problematical, experimental; and it can always threaten its assailants with the indefinite danger of the discontent which may come from a great and far-reaching change. Those who remember the history of the free-trade movement in England are well aware that all these expedients were used against the promoters of the movement, though the position which the defence occupied was singularly untenable. But it is certain that in countries which have adopted protection the defence will be more stubborn, and the struggle more protracted than it was in England more than thirty years ago. And in illustration of this fact, it may be observed that it took all the forces at the disposal of the personal Government of the second French empire, and all the threats of a power which was then at the highest of its reputation for military prowess and domestic control, to impose upon the French manufacturers, even in view of great reciprocal advantages to the most important and natural among the domestic industries of France, the very moderate concessions of the commercial treaty with England. The Government of Napoleon actually went to the length of informing the iron manufacturers of France that they would be held personally responsible for the effects of any discontent that might arise by any act of theirs towards their workmen which might be taken in view of the contemplated changes; and the menace was effectual, because it was not doubted that it would be followed by action, and that this action would be irresistible.

As the origin of protective enactments was a desire that a nation should profit by the losses of another nation, and as the extension of this feeling is the primary motive of war, so a permanent or persistent division of international interests, with the object of sustaining or promoting municipal or rather particular interests, is a fruitful source of international difficulties. It is, in fact, what Thucydides calls, speaking of the caution with which commercial intercourse was carried on in the days which preceded the great Peloponnesian war, an unproclaimed war. Many forms of patriotism, falsely so called, have inflicted grievous and ineffaceable injuries on mankind. The war for empire between the old and new notions of government, which was at the root of the Peloponnesian war, was the ruin of Greek civilization. But each of the combatants appealed to the patriotism of race, and the defence of repugnant institutions. The Thirty Years' War threw back Europe for two centuries, and left behind it memories, jealousies, policies, the effects of which are even now dominant in the attitude of the great European powers, and in the forms of European government. Still the Thirty Years' War was a struggle between anarchy and despotism, interminable disunion and forcible unity, and could appeal to some noble passions in the midst of a mass of ignoble aims, to some generous purposes in the confusion of a host of sordid and mean impulses. But wars for the monopoly of trade and production have done nothing but mischief, have not been varied by any worthy purpose, have been, as Adam Smith described them with honest energy and undeniable truth, mean and malignant. Not much better is the temper which carries on a furtive war against the general industry and the general good of mankind under the spurious name of a patriotic protection. But it must be admitted that no tendency of civilized societies is so inveterate, because none is defended with more ingenious and more unconscious sophistry, and none appears to be more necessary for the maintenance of existing interests.

Nations accommodate themselves, but with losses which may be easily described, though they cannot perhaps be numerically calculated, to protective restraints on trade. But it is a penalty on having been in the right that any departure from the right into the wrong is more mischievous than it is to remain in the wrong. The people of England are, as far as manufactures and trade are concerned, fairly committed to free trade. The world admits that England has prospered under free trade; indeed, it is difficult to deny the fact, and equally difficult to assert that the prosperity which the country has reached has been achieved in spite of free trade. It might be shown that the very circumstances which, thirty years ago or more, were adduced as conditions under which free trade would be ruinous to England have now been alleged in order to explain why it has been exceptionally beneficial. The growth of population has given a practical refutation to the alarms of Malthus, though it has not rebutted and could not rebut the abstract principles on which that theory was founded. The repeal of the corn laws has modified the Ricardian theory of rent, and has reduced it to the explanation of the cause which measures the difference between the rent paid for the same superficial extent in two pieces of ground. The same fact has been a cure for the currency crazes which the old sliding scale used to foster, for the notion that we might be impoverished by a drain of gold, and for the dread that the country would be ruined if the balance value in the imports exceeded that of the exports. A thousand economical fallacies still dominant in the minds of those who are in the darkness of protection have been dissipated in the light of free trade. The English people were, as far as the fundamental principles of social economy were concerned, in the cave of Plato, mistaking shadows for realities, and constrained to get their impression of the shadow from the false mirror of an artificial system. But free trade has put English industry into the daylight, and with the daylight the country has gradually become familiar. More or less violent reconstructions of society, the socialism with which much of civilized Europe is pestered, the paternal theory of government in its most grotesque form under which the American republic attempts to control and distribute the occupation of its free citizens, are to Englishmen as extinct as the animal worship of Egypt, the nature worship of Greece, and the other strange beliefs, which have been popular in the infancy of the world and of its knowledge. That English trade and manufactures are open to dangers which may check or diminish their prosperity must be admitted, but those dangers are of a totally different kind from those which menace the progress of such countries as imagine that protection is a safeguard.

The great advantage which free trade has bestowed on English manufacture consists in the fact that it has enabled the producer to interpret accurately the cost of production, and therefore to discover the prospect which his industry has of a remunerative market. It is superfluous to protect an industry which is strong enough to assert itself in the rivalry of competition. It is similarly superfluous to protect an industry the products of which, by reason of their bulk and cheapness, are shielded from competition by the costs of carrying the same products from foreign parts, or even from remote districts within the same political system. It may be inferred, therefore, that protection is not demanded except in cases where the industry would be exposed to the dangerous or successful rivalry of the foreign manufacturer, and therefore is carried on under circumstances which, by increasing the cost of production, render the employment of labor and capital on the industry in question a less advantageous outlay than they could be in other objects. If it comes to pass that under favorable circumstances the protected industry can cope with unprotected rivals in a common market, it is clear that the necessity for protection has passed away, and that the existence of the restraint is needless and vexatious. Thus, for example, if it be true that American cotton cloth can successfully compete against Manchester goods in China, or Japan, or Central Africa, it can, *a fortiori*, compete successfully against Manchester goods in the United States themselves. But it also follows that, if this position be not attained, the existence of the restraint is a constant impediment to its being attained, because the industry, as estimated by the cost at which its product is attained, invariably accommodates itself to the circumstances which naturally or artificially control its production, especially in reference to the amount of capital and labor devoted to it, and the rate of profit which the manufacturer enjoys. There is no reason to believe that in the protected manufactures of Germany, France, and the United States the profit of the manufacturers is greater than is derived from unprotected industries,—that, for example, the French ironmaster or cotton-spinner gains a greater advantage from his calling than the wine-grower does. On the contrary, the loudest complaints of declining trade, and the baneful influence of foreign rivalry, are heard from the industries which have successfully demanded the assistance of protective duties. It is always the case, and it always will be the case, that the opulence and prosperity of a country will depend on the success with which its natural industries are prosecuted, and on the prudence which it shows in hitting the proper time in which other industries may be attempted with a reasonable prospect of remunerative profit. For just as weakly plants and animals are the first to succumb to those climatal or atmospheric conditions which are unfavorable to health and vigor, as in the struggle for existence feeble stocks disappear and more energetic forms occupy their place, so industries which need artificial support are the first to feel commercial adversity, and the last to recover from it. It is stated, and the statement is not seriously controverted, however much the true interpretation of the facts is disguised or resisted, that during the period of commercial depression which began after 1874, the countries in which the greatest efforts have been made to sustain artificial industries have suffered more than England, which has conceded no such assistance whatever.

But it is not only in the fact that the producer is able in an atmosphere of free action to interpret the prospects of his own market best, and to solve most readily the problem as to what is the relation between cost of production and possible profit, that the value of free-trade principles is discerned. The same principles which in England have been happily recognized as fundamental have indirectly done more to soften the differences between employer and laborer than anything else. No civilized country has had more reason to fear the consequences of hostility between capital and labor than England has. For nearly five centuries the legislature of this country strove to regulate the rate of wages in the interest of employers. To the numberless and severe statutes of laborers, which began with 1350 and were continued in full force up to 1825, when they were relaxed rather than repealed, we owe the English poor law in the first place and the trade union in the second. It was natural, when the English Government had been attempting for so long a time to keep down wages by law, and looked with so much hostility on any organization among the working classes which seemed likely to better their lot, that when the severity of these laws was relaxed the laborers should eagerly adopt the machinery from the use of which they had been so long debarred. But deplorable as has been the combat between labor and capital, and blameworthy as many acts have been on both sides, no one who has given any attention to the subject can fail of noticing that the aims of the trade unions are simple and intelligible, that the representatives of these combinations court debate, criticism, and sympathy from the public to which they appeal, and that the struggle is carried on with increasing mildness and forbearance. The English unions do not aim at reconstructing society, nor demand subventions from the state as a means by which they may resist the power of the capitalist, nor adopt those projects which give from time to time such trouble to Continental Governments. The fact is, the English parliament has withdrawn all artificial aids from the capitalist, and the workman is content to stand on the same level with his employer as far as the state is concerned. But where, as in other parts of the civilized world, the state, for some reason or the other, has determined on fostering the existence of an industry which cannot exist without state help, or does not think it can, the workman is sure to attempt, with what success he can, either to appropriate a part of the extraordinary profit which the Government in the early stages of its action accords to the capitalist, or to demand that an analogous benefit should be conferred on him by the operation of law. The protective system of Continental Europe is the source and the strength of European socialism, and is responsible for its fallacies and its excesses. Those Englishmen who lived through and watched the simultaneous energies of the Chartist movement and the free-trade agitation had abundant opportunities for inferring what turned out to be the fact, that the success of the latter movement would be a death-blow to the former project. When at the outbreak of the civil war in the United States a rigidly protective tariff was imposed on the Union in lieu of a more moderate system, those who had busied themselves with the phenomena of production and the social relations of economical forces were able to predict that, apart from the more obvious evils which ensue from a false step in the political economy of a nation, the attitude of labor towards capital would be aggressive, distrustful and menacing, and that the mischief, when once generated, would be growing and permanent. Government in England interferes very little with the action of individuals, but this is possible because Government in England abstains as much as possible from meddling with those relations which can be made to adjust themselves. In England the adage of Mr. J. S. Mill, that "the best remedy for the evils of liberty is more liberty," may be a wise generalization, but when the liberty of labor is curtailed, it is not quite so clear that a Government can with safety to itself dispense with that control from which English social life is happily free.

The adoption of protectionist principles in civilized and industrial communities is undoubtedly an injury to such other communities as have adopted free-trade principles, because it curtails their market and induces an uncertainty as to whether the produce of their labor will find a sale. This mischief is exaggerated when the prohibitory or protecting tax is a variable amount. Thus during the existence of the English corn laws the foreign agriculturist was unable to foresee whether the demand for his produce in England, under the pressure of scarcity, would be admissible for him at remunerative rates, and he was consequently deterred from anticipating this demand. If indeed the demand did arise, his gains might be enormous, provided he had it in his power to satisfy the demand. For example, at one time the sliding scale was fixed so high that foreign corn was admitted duty free only when the market prices in England marked 84s. a quarter. If such a price were reached and the importer was in possession of a considerable stock, which he had been able to store in bond at 35s., he could instantly take advantage of the situation and greatly to his own advantage. It is true that such an occasional contingency did not compensate for the general insecurity of his industry, and the risk which he ran in waiting on a market into which he might never be able to enter. Hence the repeal of the English corn laws has given a very powerful stimulant to agricultural industry over the whole world.

Fixed duties do not operate so disastrously on foreign trade, even when the fixed duty is levied on such products as vary in quantity, and therefore in price, with the seasons. For in the vast majority of products values conform generally to the cost of production, and even in those which, like food, are determined also by the relations of demand and supply the wider the area is from which they are derived, the less are they liable to variation in supply, the element of demand being nearly a uniform quantity. Still it must be remembered that all duties on imports check consumption, and, by implication, discourage production. The proof of this is seen in the fact that the reduction of any duty on an article in general demand is always followed by a rise in price, which continues till supply corresponds to the new demand. If therefore duties levied for the purposes of revenue have this effect, then, *a fortiori*, duties designedly imposed for the sake of protection will have a similar effect. If the protective enactment has any force at all, it must diminish the market of the country against which it is levelled. It may not be wholly effective, but it must have some effect. Thus, when under the Berlin and Milan decrees the first Napoleon strove to expel all British manufactures, and all the produce of the British colonies, from such parts of Europe as he could control, it is unquestionable that these decrees were a hindrance to British commerce, though to a considerable extent English manufacturers were able to elude them.

Still the country which adopts free trade has a great advantage in trade over such countries as adopt protection even in its commercial intercourse with them. There is no country which wishes to curtail the export of its raw materials, in the production of which it has natural advantages, and of course it is equally willing to export its protected manufactures. Now it is plain that it would prefer to deal with a country which, unlike itself, imposes the least possible restraint on importation, and that the most advantageous market would be that in which no restraint at all was put. In order to use this market then, it will be content to offer its goods on the most favorable terms, and under the conditions of the strictest competition. It knows that a country which adopts free trade is best able to interpret its own demands, and its own power to satisfy the demand of other countries. Hence a free-trade country is a national entrepôt, in which foreign goods are procurable at the lowest rates. In addition, as has been stated before, the country which puts no artificial restraint on its power of general purchase has always a great advantage in all commercial transactions over a country which does put such a restraint on itself.

Free trade then, as understood in England, means such a liberty of production and exchange as is unfettered by any of the restraints which have been imposed, in order that special industries may be artificially stimulated, by the machinery of a fiscal system. But there are other uses of the term which may be touched on, and in particular the application of it to labor and land. It was stated at the commencement of this article that Governments, in pursuance of their standing duty, that of protecting the weak against the strong, may and should put limits on free action as regards labor. and it is alleged that the expression free trade in land is a misnomer. We shall attempt, in concluding this article, to give a brief explanation of the historical and other circumstances which have brought about the present state of things in England, and to define the economical conditions under which the relations of labor to production, and land to agriculture, are capable of an economical estimate.

As the policy of ancient states did not attempt to control trade in the interest of their own citizens, so it did not hinder the individual in the prosecution of any industry. There is no evidence that the professions were practised by persons specially licensed for that purpose, and it is certain that the craftsmen of antiquity were not compelled to pass through a period of apprenticeship before they could follow their calling. In modern times, however, the practice of licensing the members of certain professions, and of exacting a period of servitude in all crafts and trades, under the name of apprenticeship, has been nearly universal. Up to comparatively recent times the same legal instrument was employed as a preliminary to the study of law and physic as was demanded from the trader and the artisan. The origin of the custom, which was assailed on principle by Adam Smith, is to be found in the history of the charters which were obtained by towns. These charters were purchased from sovereigns or such lay and spiritual proprietors as possessed towns in fee. The privileges which such instruments conferred were considerable and valuable, were eagerly sought after and guarded with jealousy. Among the most important of these in England was the right of assuring, after a short uninterrupted residence within a walled town, the franchise of a free man to the resident serf. It was therefore expedient, and in order to avoid arousing any suspicion that the franchises of the town were abused, that some significant limit should be put on the acquisition of these privileges by individuals. Hence, at a very early period, guilds were established in chartered towns; enrolment in some guild became a necessary prelude to sharing the franchises of the town; and apprenticeship was made the condition under which persons could ordinarily enter the guild and practise the craft or trade. There is reason to believe that the customs of these trading companies put it into the power of those who administered the affairs of these companies to exercise a large and arbitrary control over all the members of the guild. The practice of apprenticeship began, in all likelihood, at an early date, but the earliest instruments which the writer has seen are of the 15th century. It is only, of course, by accident that any have been preserved, since they had only a temporary and personal interest. In course of time the legislature exacted the condition of apprenticeship from all artisans and traders, notably by the 6th of Elizabeth, for during a long period it was the policy of the English parliament to put every possible hindrance on the migration of the agricultural laborer to the towns, and the most successful expedient by which this migration could be checked was that of imposing the servitude of apprenticeship on every one besides the agricultural laborer. A custom then, which commenced with the interest which the trading company had in its chartered monopoly, and which closely resembled the machinery of the regulated companies for foreign trade, was strengthened and finally enforced by the parliament itself. In course of time the legislature abandoned its ancient policy, except in so far as it exacted from certain professions the equivalent of apprenticeship, on the ground that by so doing it protected the public against incompetence and fraud. The retention of apprenticeship in certain kinds of manual labor is due to the action of trade unions, voluntary associations which occupy a somewhat similar position to the guild companies of the Middle Ages, and which exercise an influence over a far larger number of persons than are formally contained in the association. The object of apprenticeship in handicrafts is to maintain a high rate of wages by stinting the number of persons who are engaged in the occupation. Hence, and for the same reason, artisans object to the importation of foreign labor, especially in such callings as are protected by apprenticeship. On no other ground, at least, would it be consistent to acquiesce in the importation of the products of labor and, by free trade in food, of what may be called the raw material of labor, and to object to the free circulation of labor itself.

It is a question of merely speculative interest to ask whether a Government does wisely in restraining the practice of certain callings to those who have been certified to have passed through a preparatory training for the calling. It is only a little over sixty years since it put the restraint on medical practice, and the limits which have similarly been imposed on the legal profession originated in the recognition of certain persons only in certain courts of law. But there is no theoretical defence for the privilege accorded to such certified persons, except it be that by these means the public is protected from the danger of employing incompetent practitioners. The police which the legislature exercises over unlicensed persons must not be supposed to be in the interests of those who are permitted to practise, but in that of those who employ professional services. There is, however, a tendency towards increasing the area over which this police is exercised, and latterly some public teachers, for example, who are employed in primary schools are made liable to the obligation of satisfying some public authority as to their competence for the work which they undertake. On the other hand, there are writers who argue that all such restraints are mischievous, not only because they control the choice of occupation, and are, therefore, invasions of natural and innocent liberty, but because they do not and cannot supply any proof of practical ability on the part of those who are certified, and because they weaken the habit of caution and prudence which all persons should possess as far as possible in selecting those in whom they may place their confidence. Why, it may be asked, they say, should a lawyer be certified to carry on his calling on the ground that the trust reposed in him makes it expedient that the law should exercise a control over this calling, and a similar restraint be not extended over bankers, whose relations to their customers are even more delicate and confidential than those of lawyers?

Again, there are callings in which no restraint is put on the choice of the calling, but an energetic control is exercised over the practice of the calling, a control which sometimes extends so far as to prohibit some practices which are historically connected with the calling. Thus, since 1844, no new English bank is allowed to issue and circulate notes payable to bearer, such a note being virtually a cheque payable at sight, and drawn by the banker on his own assets. The motive for putting this disability on bankers was to prevent the undue extension of a paper currency. But even though it may be doubted whether such a result was effected, or even that there was danger of such a result, the restraint on free action can be defended on the ground that the acceptance of such a note puts a risk on the holder to which he should not be subject, and that the refusal to accept such notes suggests a suspicion that the issuing parties are of doubtful solvency. Again, there are certain callings over which a police is exercised in the interests of the revenue, as on those persons who are engaged in the manufacture of excisable articles. There can be no doubt that such a supervision is a hindrance to trade, and some persons who advocate direct taxation have alleged, as one of the strongest arguments in favor of their theory, that the abandonment of all excise and customs regulations would make England a free port for the whole world, would greatly extend its commerce and its manufacturing energy, and widen its markets. And lastly, there are certain callings which are permitted, but watched and controlled in the interests of morality. Of these the most notable is the occupancy of houses where intoxicating liquors are sold, and of other places of public entertainment. Few persons doubt that an efficient and incessant supervision should be exercised over these places, though they differ widely as to the extent and character of the control, and the agencies by which the control should be put into operation. The regulation of public houses is the oldest form of domestic police over occupations in England, for it can be traced back to the manorial inspection which was general after the Conquest, even if it did not exist in the Anglo-Saxon village. English law, therefore, exercises a control or restraint of trade over industries which are laudable, or innocent, or legal, because it is found, or is thought to be found, that they may be abused to serious public inconvenience or mischief. Some amusing illustrations of the extent to which the privilege of unlimited issue of bankers' paper may be abused are afforded in the history of what was called "wild-cat banking" in the Western States of the American Union. It is remarkable that the United States, which have adopted, and to a great extent with evident sincerity, extreme views in favor of the policy of protection against foreign rivals, have also permitted from time to time, and with scarcely any check, extreme license in the conduct of business within the limits of the Union itself.

With the exception of these and analogous instances,—when the safety and morals of the public justify, to a larger or smaller extent, the supervision of the state over the free choice of industry,—the concession of that free trade in labor which puts the minimum of hindrance on the field of employment and the character of employment which the producer selects is quite as important to the wellbeing of a state as the concession of a free agency to its capital and a free market for its products. For as all wealth is the produce of labor, and as the efficiency of labor is the first and last condition of national progress, as the efficiency of labor is primarily brought about by the division of employments, and as the division of employments knows no limit as long as the market of products is extended, so it is of the highest interest to the efficiency of labor that the field of its operations should be as open and free as possible. But here it is to the purpose to observe that the natural distribution of labor very often masks the effect of a mischievous economical system. There is no country in which this fact has been so systematically ignored as in the American Union. In the United States, economists who have steadily maintained, with the best arguments at their disposal, that the growth and progress of their country have been assisted by the adoption of a protective system, have omitted, in all their estimates of what constitutes the material progress of the Union, the fact that, in whatever other directions they have regulated industry and commerce on a protectionist basis, they have always, and to an extent that no other country has done, accepted and insisted on free trade in labor. They have not only welcomed all comers,—some little irritation at Irish labor, and a more serious objection to Chinese immigration excepted,—but they have imposed no tariff on the importation of labor, nor even contemplated such an extension of protection to American industry. It would not, however, be difficult to show that, on the grounds ordinarily taken by American statesmen and publicists, they would be consistent in denouncing the immigration of aliens. They have, however, with a happy inconsistency, not only not taken this step, but they have wisely and advantageously insisted that the Old World notion of indefeasible allegiance shall be relaxed, at least on behalf of those who have made the United States their home. Here they have been free traders without stint. And it has been fortunate for America that they have not extended such prohibitions to alien humanity as they have to the products of that labor which alien humanity has offered them for sale. For several years the United States received about 200,000 emigrants annually from the Old World. It is a moderate estimate that each of these persons represented an outlay of at least £150 in his bringing up, or in other words that, had he been born in the United States, he would have cost at least as much as this sum to bring him into that state of efficiency which he carries to his new home. The Old World has therefore been bestowing a voluntary tribute of £30,000,000 annually on the United States, a contribution which is quite sufficient to balance the mischievous effects of economical fallacies, though it is possible that these fallacies may be so disastrous as to neutralize the value of this branch of American imports, or even to check the importation altogether. Not, indeed, that the effects of unwise economical action are easily or rapidly discovered. The present advantage of restraint for the benefit of the producer is obvious; the consumer is left out of sight, and is commonly unconscious of the process which is narrowing his powers. At last, when the consequences do come, sophistry and self-interest are both active in assigning the facts to other causes than those which are really dominant, and in resenting and resisting all change.

When it is said that the principles of free trade should be applied to land, it is meant that a natural object, the products of which are of supreme necessity to mankind, is not rendered accessible to purchasers, or not rendered so profitable to occupiers as the interest of the public requires. Land in populous countries is, relative to the community, very limited in amount, and as it is the *locus standi* of all industries, its distribution, as is alleged, should not be so restrained as to induce a restraint on the efficiency of industry. No economist worthy of the name has ever disputed the sacredness of private property. To do so would be to undermine the very foundations of his science. No economist, even though he may be betrayed into heresies as to the nature and extent of free exchange, has ever doubted that within certain geographical limits the fullest freedom of innocent production and trade should be accorded. No American protectionist has yet argued that it is expedient, in order to develop at the earliest period the possible manufactures of the Western States, that these States should be allowed to restrain by prohibitive duties the cotton and hardware of New England. All discussions therefore about free trade in any commodity, and among others in land, must presuppose that property should be respected, and exchange should be free. If the so-called economist denies the name of property to that which must be secured to its owner, in order that industry may be exercised in the best possible way, he has abandoned the principles of his science. And if, on the other hand, it be insinuated that, while he is seeking to point out the manner in which industry may be most productive, he is assailing the ownership of that kind of property on which all industry is exercised, the criticism is invidious and unfair. It needs no proof that the success of industry and the material progress of society cannot be expected, except under the guarantee of private property in land, as well as in its products. And furthermore, there is no reason for objecting on economical grounds to the process by which the distribution of land in England is restrained, unless it can be shown that the existing system is a check to industry, or a hindrance to supply, or an impediment to the effective development of agricultural skill.

It cannot be denied that, if the claim to free trade in land is intended to imply that, under existing circumstances, a very small portion of that which would be distributed by sale is brought into the market, the fact corresponds with the statement. The custom of primogeniture directly tends towards the restraint of distribution, and the power of settlement acts more energetically in the same direction. Nor can any one doubt that there are circumstances under which the custom and the power operate disadvantageously. When the owner of land is virtually bankrupt, it would clearly be far better if the estate which he cannot improve were in the hands of those who can improve it, for the misuse of a necessary industrial instrument has worse effects on the economy of society than the ill use of the products of industry. The one is the same as inducing artificial barrenness on a portion of that which is limited in amount and is of supreme utility, and the other is the waste of that which is practically unlimited, and which can be supplemented from other sources. Again, the ill use of land is a total loss; but the prodigality of one who squanders the produce of labor is only a partial waste, for much of the wealth which seems to be expended on the pleasures and follies of individuals is really transferred to those who are capable of making a better use of it than its original possessor does. Hence, when land is in the hands of bankrupt proprietors to such an extent as seriously to hinder its adequate occupancy, it has not been thought a violation of the rights of property to dispossess the bankrupt owner by a compulsory sale, and to put a new and more competent proprietor in his place. Such a step was taken, and with very satisfactory results, in Ireland, and there is reason to believe that similar powers might on many occasions be exercised with advantage in England. In a minor degree charges on land are a hindrance to its adequate improvement, for the means of the proprietor of a burdened estate are diminished, while if the land were in other hands its resources would be developed. Analogous to these inconveniences are the costs of conveyance, and the demand of superfluous guarantees of title.

But the phrase "free trade in land" has been obscured by its connection with another aspect of the relations between the owner of land and its adequate cultivation, the interpretation, namely, which divers disputants give to the freedom which accompanies contracts for the occupancy of land. In England, as is well known, the owner and the occupant of land are, unlike the case in most other countries, almost universally different persons. Such a difference began very early in English society, that is, towards the latter end of the 14th century, and has no doubt become more marked by the peculiar customs which affect the ownership of land in England. Now it is alleged that under existing circumstances no true freedom of contract exists on the part of the occupant,—that the power which custom has given to the owner, and which law has strengthened, is so great that the occupier is virtually helpless; that the legitimate progress of agriculture is checked; and that a supply which skill could make almost indefinite, and which might be made to satisfy the wants of the population, is wholly inadequate for the purpose, the deficiency being wastefully supplemented from foreign importations. For it is asserted that one of the contracting parties has it in his power, by the extent of his resources, to reduce the other party to the most disadvantageous terms of a precarious occupancy, and that, though the occupant may be blamed for submitting to such terms, or at least be held responsible for the bargain which he has voluntarily made, the public is interested to a very serious extent in a better and freer relation between owner and occupier. And it is further urged that freedom of contract is not to be limited to the moment in which the bargain is struck, but must in continuous relations be so continuously present that neither of the contracting parties should be able to inflict a permanent loss on the other,—or, in other words, that contracts cannot be called free unless they are constantly liable to an equitable revision. The controversy has been carried on in England and Scotland in the form of an attack in the latter kingdom on the local law of hypothec, in the former, and to a less extent in the latter, under the claim of compensation for unexhausted improvements. As yet no legislation of a practical character has been the result of a controversy in which some intelligent tenant farmers on the one hand, and principally on the other the duke of Argyll, have been the disputants.

It is probable that on the whole successful agriculture, that is, the production of the largest quantity in value from the soil at the least cost, has made more progress in the

United Kingdom than in any other country. This has been especially the case with stock breeding, the pre-eminence of the United Kingdom being marked and admitted in this department of agriculture. But this fact itself, as the occupier is less within the power of the owner as a stock-breeder than he is as a mere cultivator, seems to suggest that the relations of the two parties need a better understanding than they have yet received, or that their contracts will at some time or the other require the interpretation of law. The difficulties, however, of any question as to the limits and control of freedom in the contracts entered into between the subjects or citizens of the same Government are great and nice. There is but little difficulty in showing that the best interests of the whole human race are consulted when the fullest freedom is given to the exchange of products, however much the process is hindered by passion or self-interest, and however great may be the practical hindrances in the way of a principle which few men have the hardihood to deny in the abstract. But there are serious difficulties in interpreting the relations in which capitalist and laborer, owner and occupier, stand to each other, and in deciding how the just rights of property may be harmonized with the just claims of industry, and the paramount consideration of the public good. (J. E. T. R.)

FREEWILL BAPTISTS, a denomination of Baptists in the United States and Canada, holding similar doctrines to those of the General Baptists of England. Founded in 1780 by Benjamin Randall, a Baptist preacher, who had been censured for teaching anti-Calvinistic doctrines, it soon made considerable progress, and in 1827 a general conference, meeting every three years, was instituted. Besides erecting numerous schools of different grades, the Freewill Baptists have established three colleges, one at Lewiston, Me., one at Ridgeville, Md., and a third at Hillsdale, Mich., to which both sexes, and colored people as well as whites, are admitted. A fourth college is being erected at Rio Grande, Ohio. In 1877 the denomination had 1464 churches in the United States, with 1295 preachers, and 74,651 communicants. In Nova Scotia and New Brunswick there is a separate conference, the membership connected with which is upwards of 9000.

FREIBERG, or FREYBERG, a town of Saxony, is situated on the Münzbach, not far from its confluence with the Mulde, and 19 miles S. W. of Dresden. It is well built, and is still surrounded by its old walls. It is the seat of the general administration of the mines throughout the kingdom, and its celebrated academy of mines, founded in 1765, is frequented by students from all parts of Europe. Connected with the academy are extensive collections of minerals and models, a library of 18,000 volumes, and in a separate building laboratories for chemistry, metallurgy, and assaying. Among its distinguished scholars it reckons Werner (who was also a professor there), Humboldt, Mohs, and Jameson. Freiberg has extensive manufactures of gold and silver lace, woollen cloths, linen and cotton goods, iron, copper, and brass wares, shot, gunpowder, and white-lead. It has also several large breweries. In the vicinity are numerous mines of silver, lead, copper, and cobalt, affording employment to about 6000 miners. The old castle of Freudenstein or Freistein, situated in one of its suburbs, is now used as a corn magazine. In the grounds of the castle a monument was erected to Werner in 1851, and one to those who fell in the Franco-German war was erected in 1874. The cathedral, an elegant Gothic edifice, founded in the 12th century, and rebuilt in the 15th century, after its almost complete destruction by fire, has a richly adorned portal in the Byzantine style, called the Golden Gate. It contains numerous monuments, among which is one in memory of Prince Maurice of Saxony, who fell in the battle of Sievershausen in 1553. In the lady chapel adjoining are the remains of Henry the Pious and his successors down to John George IV. who died in 1694. Among the other public buildings are the old town hall, dating from the 15th century, the gymnasium, the real school, the female burgher school, the new law courts, the cavalry barracks, the antiquarian museum, and the natural history museum. Freiberg owes its rise to the discovery of its silver mines in the 12th century. The castle of Freudenstein was erected for its defence about 1175, and the town was surrounded by walls in 1187. It was a long time one of the summer residences of the Saxon princes. The population in 1875 was 23,559.

FREIBURG, or FRIBOURG (the French form of the name), a canton of Switzerland, is situated in the district to the S. E. of the Lake of Neuchâtel and the N. E. of the Lake of Geneva. At no point do its boundaries actually touch on the Lake of Geneva, but in two places they come within two or three miles of its shores. Owing to the refusal of the cantonal authorities in 1802 to incorporate the Reformed districts of Payerne and Avenches, it has a very irregular outline towards the Lake of Neuchâtel, and indeed breaks up into *enclaves* which are completely surrounded by the territory of Vaud or Waadt. The only other canton with which it is conterminous is Bern, which lies to the north and east. With very slight exceptions in the south the whole canton belongs to the basin not of the Rhone but of the Rhine, being traversed throughout its entire length from south to north by the Sarine or Saane, which rises in the Sanetsch in Bern and ultimately joins the Aar below Güminen. The surface of the country has considerable variety of relief, but can hardly, in such a region as Switzerland, be described as mountainous. The canton, however, is the very heart of pastoral Switzerland, and the home of the "ranz des vaches." The southern portion is occupied with offshoots of the Bernese Alps, presenting such heights as the Moléson, 6578 feet; the Dent de Vüdetze or De Lys, 6609 feet; the Vanil des Arzes, 6513; the Cape au Moine, 6376; the Dent de Broc, 5986; Brenleyre, 7724; Folliéran, 7685; and the Vanil Noir, 7825. The last is the highest elevation in the canton, and is situated in the south on the Bernese frontier to the right of the valley of the Sarine. The western and north-western districts belong to the system of the Jorat or Jurten, the most important massif being Mount Gibloux, which attains an altitude of 3945 feet. Besides the Sarine there are two considerable streams which flow partly through Freiburg territory,—the Singine or Sense, which, deriving one of its head streams from Freiburg and the other from Bern, forms throughout the greater part of its course the boundary between the two cantons, and the Broye or Brux, which rises in the south-west near Semsales, and after traversing the outskirts of Freiburg and Vaud enters the Lake of Morat or Murten, and thus finds its way to the Lake of Neuchâtel. There are a few small lakes in the canton, the most noteworthy being that of Seedorf, which was lowered about 11 feet by draining operations undertaken in 1871–73 for reclaiming the marshy land around it. Mineral waters occur at Lac Noir or Schwarzsee, at Wyler-vor-Bad, at Montbarry near Gruyère, and at Bonn not far from the town of Freiburg. Out of a total area of about 340,705 acres, about 9880 may be regarded as unproductive, 57,432 are occupied by forests, upwards of 84,100 furnish pasture, 91,876 are meadow land, 104,925 are arable fields, and 675 are vineyards. The forests are of great value to the canton, firewood and timber being among its principal exports. Though the cereals are pretty extensively cultivated, the production of grain is far under the consumption. Tobacco is an important article in the commerce of the canton, and the manufacture of *Kirschwasser* is widely distributed. The district of Gruyère, extending from the Singine to the Veveyse, is famous for its cheese, of which upwards of 49,000 cwts. is produced annually. With the exception of tanning and straw plaiting there are no industries that give employment to any great number of people; but there are glass works at Semsales, a paper mill at Marly, and kilns for hydraulic lime at Tour de Trême and Chatel, and watches are made at Morat and Montilier. The canton is divided into seven districts or prefectures, and there are 277 communes and 118 Catholic and 8 Protestant parishes. The district of the Sarine numbers 25,544 inhabitants, and includes the capital of the canton; the district of the Singine, lying towards the east, numbers 16,375, and has its administrative centre at Tavers or Tafels; the district of the Gruyère, to the south of those already named, has 19,337 inhabitants, and includes the chief town Bulle, with the ancient palace of the bishops of Lausanne, Tour de Trême, Vuadens, with a model cheese-dairy, Gruyère, with the old manor of its counts, Marsens, the seat of the cantonal lunatic asylum, the convent of Valsainte, the monastery of Pont-Dieu, and the castle and village of Corbières; the district of the Lake numbers 14,839 inhabitants, and its chief town is Morat, the scene of the famous battle of 1476; the district of the Glane has 13,176 inhabitants, and its chief town is Romont, with an ancient castle and ramparts and towers; the district of the Broye has 13,706 inhabitants, and its chief town is Estevayer, a busy little place on the Lake of Neuchâtel, to which it sometimes gives its name; and lastly, in the far south the district of Veveyse numbers 7855, and besides its chief town, Châtel-St.-Denis, contains the village of Semsales. The canton is traversed from north-east to south-west by the railway from Bern to Lausanne; another line proceeds from the town of Freiburg westward by the Lake of Neuchâtel, and a third unites Romont and Bulle. Freiburg returns, according to its population, six representatives to the national council of Switzerland. Its own administration consists of a great council, to which a member is furnished by every 1200 inhabitants, a state council of seven members, and a judicial council of nine. According to the census of 1870, out of a total population of 110,900, 94,000 were Catholics and 16,800 Protestants, the latter being most numerous in the district of the Lake. The Catholics are under the jurisdiction of the bishop of Lausanne, who has his residence at Freiburg. Though the official language is French, which is generally spoken in the towns, public documents are also published in German, which holds its ground in the district of the Singine, in part of the district of the Lake, and in the commune of Bellegarde in Gruyère. In the rest of Gruyère, as well as in the districts of the Veveyse, the Glane, the Sarine, and the Broye, a patois of the French stock is the prevailing speech.

History.—The history of Freiburg practically begins with the counts of Zähringen, who, under the emperors, held considerable possessions in this part of Switzerland. In 1179 Berthold IV. founded the town of Freiburg, as his uncle Berthold III. had already been the founder of Freiburg in the Breisgau, and as his son and successor was not long afterwards to be the founder of Bern. He not only bestowed on it all the territory which he held for three leagues round—a district afterwards known as the "old lands," or the "twenty-four parishes," but he also, by a charter or *Handfeste*, granted a number of privileges similar to those of Cologne, which in that unsettled period soon attracted what was then a considerable population of artisans, peasants, and traders from the neighboring countries. On the death of Berthold V., the last duke of Zähringen, in 1218, his possessions passed to his sister Anne, wife of Ulrich of Kyburg; and the Kyburgs were accordingly lords of Freiburg till 1264, when they also became extinct in the male line. Anne of Kyburg, who had married Eberhard of Hapsburg, sold Freiburg to Rudolph of Hapsburg for 3000 marks; and thus the town was subject to the house of Austria for 188 years. During that long period it had to fight many a battle for its existence, more especially against the neighboring town of Bern and the counts of Savoy. At length abandoned by Austria, it was obliged in 1452 to swear fidelity to Louis of Savoy, to whom it had become indebted for vast sums of money. In spite of all the difficulties of its position, it was in this first part of the 15th century that it maintained a considerable trade with France, Italy, and Venice in its leather and cloth. As many as 18,000 or 20,000 pieces of cloth were stamped with the town's seal in the course of a year. The reign of the Savoy dynasty was of short duration, for when Yolande, widow of Amadeus, entered into alliance with Charles the Bold of Burgundy, Freiburg joined Bern against the Burgundians, and took part in the battles of Morat and Grandson. At length, in the diet of Stanz in 1481—thanks mainly to the advocacy of Brother Claus (Nicholas von der Flüh)—it was admitted a member of the Swiss Confederation. Considerable additions of territory were effected in the 15th and 16th centuries. In 1475 Illens, Planfayon, and the castle of Chenaux were acquired, and, along with the Bernese, the people of Freiburg wrested Morat from the house of Savoy. In 1478 the lordship of Montagny was purchased for 6700 florins, and in 1482 Farvagny and Pont. Bellegarde was added in 1502, Wallenbuch in 1504, Font in 1508, and in the course of 1536 Vuippens, Estevayer, Corserey, Bulle, Vuissens, Châtel St. Denis, Bossonnens, Surpierre, Romont, Rue, La Molière, and St. Aubin. Corbières was bought for 8000 florins in 1553; and in 1555 Bern and Freiburg forced Michel, the last count of Gruyère, to abdicate, and paid 80,500 crowns for his countship. The people of Freiburg had to endure very heavy taxation to raise their proportion of the sum. Meanwhile, in the 16th century, the original democratic government gave place to an exclusive oligarchy, which succeeded in maintaining its supremacy in spite of the pretensions of the papal power and the bishop of Lausanne on the one hand, and the dissatisfaction of the people on the other. The French occupation of 1798 brought its government to a close; but in 1814 it was partially restored, 108 of the 144 seats of the great council being assigned to members of the patrician families. On December 2, 1830, the people rose and demanded equality of rights for all the citizens of the canton; and in January, 1831, a democratic constitution was drawn up, and a representative government established. In 1846 Freiburg joined the Sonderbund, and in the following year it was consequently invaded by the federal forces. In 1848 the constitution was revised and rendered more liberal in regard to religious matters. Several attempts were made by the Catholic party to recover their supremacy; but their efforts were defeated, and Bishop Marilley and other of their leaders were exiled. In 1857, however, the great council decided for another revision of the constitution in a reactionary sense, and their proposal was adopted by the people. Since then there has been no alteration of the general tendency, and the Catholic clergy are in possession of unbounded influence.

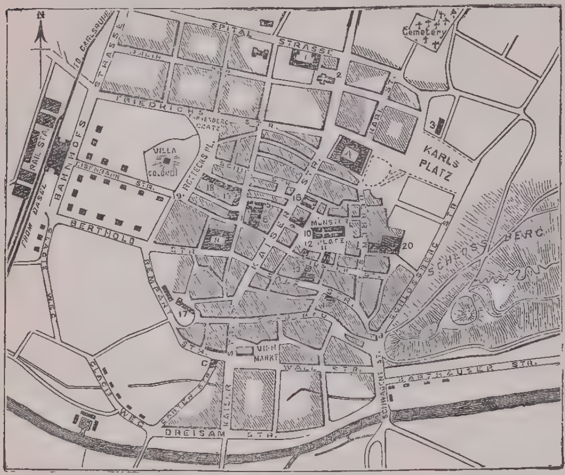
Freiburg, the chief town of the above canton, with a station on the line between Bern and Geneva, occupies a highly picturesque situation in the valley of the Sarine, part of it lying in the bottom of the ravine and part of it climbing the irregular eminences on the left. It is divided into four districts—the Bourg or central town, the Quartier des Places or the upper town, and the districts of the Auge and the Neuveville, which, together with the Planche, constitute the lower town. The principal ecclesiastical building of Freiburg, the collegiate church of St. Nicholas, commenced about 1283 and finished in the second half of the 15th century, is worthy of notice, not only for the noble belfry 245 feet in height, but also for the organ, which was constructed between 1824 and 1834 by Aloys Mooser, a native of the town, and is one of the most famous instruments of its kind. The various buildings belonging to the municipal and cantonal Governments, the conventual establishments of the Cordeliers, the Ursuline nuns, and other fraternities and sisterhoods, the college of St. Michel and the lyceum, with the cantonal museum, and the civic hospital and other beneficent institutions, are the most important of the public edifices. In front of the town-hall grows a linden tree which is said to have been planted by a soldier from the battle of Morat, 22d June, 1476. The ravine of the Sarine is crossed by several bridges, of which the most notable is the suspension bridge constructed by M. Challey about 1834, which has a span of 871 feet, and consists mainly of four cables each composed of 1056 distinct wires, individually not more than a tenth of an inch in diameter. About three miles to the north of the town, the river valley is crossed by the great railway viaduct of Grandfey, which dates from 1862, is a girder structure 1095 feet in length and 260 feet high, contains about 3100 tons of metal, and cost 2,500,000 francs. Immediately above the town a vast dam was thrown across the river-bed by Ritter the engineer in 1871–3; and the fall thus obtained yields a water power of from 2600 to 4000 horse-power. A motive force of 600 horse-power secured by turbines in the stream is conveyed to the plateau of Pérolles by "telodynamic" cables more than 2295 feet in length, for whose passage a tunnel has been constructed in the rock of the ravine. The industrial establishments are still comparatively few and unimportant. Population in 1870, 10,904.

FREIBURG, or **Freyburg**, usually distinguished as Freiburg in the Breisgau, is a city formerly of the Austrian dominions but now in the grand-duchy of Baden, about 12 miles E. of the Rhine, at the foot of the Schlossberg, one of the heights of the Black Forest range. It is one of the stations on the railway between Basel and Mannheim, and lies about 40 miles northwards from the former city. The town is for the most part well built, having several wide and handsome streets and a number of spacious squares. It is kept clean and cool by the waters of the Dreisam, which flow through the streets in open channels; and its old fortifications have been replaced by public walks, and, what is more unusual, by vineyards. Since 1827 Freiburg has been the seat of an archbishop who has authority over the bishops of Mainz, Fulda, Rottenberg, and Limberg; and it possesses a famous Catholic university, the *Ludovico Albertina*, which owes its origin to Albert VI., archduke of Austria, and dates from 1454, 1456, or 1457. This was at one time a very wealthy institution, having been endowed by its founder with extensive lands in the Breisgau, Upper Alsatia, and Würtemberg; but since the French Revolution it has lost nearly all its estates, and the revenue derived from those still held in Baden is not sufficient for its expenses. In 1876 it had 41 professors, ordinary and extraordinary, and 9 privat-docenten, and the students numbered 290, of whom 141 were foreigners. The library contains upwards of 250,000 volumes; and among the other auxiliary establishments are an anatomical hall and museum and botanical gardens. The Freiburg minster is considered one of the finest of all the Gothic churches of Germany, being remarkable alike for the symmetry of its proportions, for the taste of its decorations, and for the fact that it may more correctly be said to be finished than almost any other building of the kind. The period of its erection probably lies for the most part between 1122 and 1252; but the choir was not built till 1513. The tower, which rises above the western entrance, is 386 feet in height, and it presents a skilful transition from a square base into an octagonal superstructure, which in its turn is surmounted by a pyramidal spire of the most exquisite open work in stone. In the interior of the church are some beautiful stained glass windows, both ancient and modern, the tombstones of several of the dukes of Zähringen, statues of archbishops of Freiburg, and paintings by Holbein and by Hans Balding, surnamed Grün. Among the other noteworthy buildings of Freiburg are the palaces of the grand duke and the archbishop, the town-hall, the theatre, the *Kaufhaus* or merchants' hall, a 16th-century building with the front painted red, the Protestant church, formerly the church of the abbey of Thennenbach, removed thither in 1839, the hall of art and harmony, and the barracks, erected by the Austrian Government in 1776, and capable of containing 5000 men. The charitable institutions include a foundling hospital, an orphan asylum, a blind asylum, and a military hospital. In the centre of the fishmarket square is a fountain surmounted by a statue of Duke Berthold III. of Zähringen, the founder of the city; in the Franciskaner Platz there is a monument to Schwarz, the traditional discoverer of gunpowder; the Rotteck platz takes its name from the monument of Rotteck, the historian, which formerly stood on the site of the Schwarz statue; and in Kaiser Wilhelm Strasse a bronze statue was erected in 1876 to the memory of Herder, who in the early part of the 19th century founded in Freiburg an institute for draughtsmen, engravers, and lithographers, and carried on a famous bookselling business. On the Schlossberg above the town there are massive ruins of two castles which were destroyed by the French in 1744; and about two miles to the N.E. stands the castle of Zähringen, the original seat of the famous family of counts. Situated on the ancient road which runs by the Höllenpass between the valleys of the Danube and the Rhine, Freiburg early acquired commercial importance, and it is still the principal centre of the trade of the Black Forest. It manufactures chicory, chemicals, starch, leather, tobacco, silk thread, paper, and hempen goods, as well as beer and wine. The population is rapidly increasing. In 1864 it numbered 19,085, inclusive of the suburbs of Herdern and Wiehre, and in 1875 no less than 30,531. About a sixth of the whole are Protestants.



Plan of Freiburg in Baden.

1. Hospital.
2. Evangelical Church.
3. Art Hall.
4. Barracks.
5. St. Martin's Church.
6. Franciscan Monastery.
7. Chemical Laboratory.
8. University.
9. Museum.
10. Cathedral or Minster.
11. Merchants' Hall.
12. Archbishop's Palace.
13. Grand-Ducal Palace.
14. Theatre.
15. Town Hall.
16. Post Office.
17. Barracks.
18. Town Hospital.
19. Rotteck's Monument.
20. Convent.

Gates—A. Martin's Thor; B. Schwaben Thor; C. Breisacher Thor.

Freiburg was founded, as has been already stated, by Count Berthold III. of Zähringen. In 1120 it became a free town, with privileges similar to those of Cologne; but in 1219 it fell into the hands of a branch of the family of Urach. After it had vainly attempted to throw off the yoke by force of arms, it obtained its freedom in 1366 for a sum of 20,000 silver marks; but as it was unable to reimburse the creditors who had advanced the money, it was, in 1368, obliged to recognize the supremacy of the house of Hapsburg. In the 17th and 18th centuries it played a considerable part as a fortified town. It was captured by the Swedes in 1632, 1634, and 1638; and in 1644 it was seized by the Bavarians, who shortly after, under General Marcey, defeated in the neighborhood the French forces under Enghien and Turenne. The French were in possession from 1677 to 1697, and again in 1713–14 and 1744; and when they left the place in 1748, at the peace of Aix-la-Chapelle, they dismantled the fortifications. The Baden insurgents gained a victory at Freiburg in 1848, and the revolutionary Government took refuge in the town in June, 1849, but in the following July the Prussian forces took possession, and did not leave till 1851.

See Schreiber, *Geschichte und Beschreibung des Münster zu Freiburg*, 1820 and 1825; *Geschichte der Stadt und Universität Freiburgs*, 1857–59; *Der Schlossberg bei Freiburg*, 1860.

FREIBURG, distinguished as Freiburg unter dem Fürstenstein, a garrison town in the government district of Breslau, Silesia, is situated on the Polsnitz, 35 miles S.W. of Breslau. Its industries include the making of regulator watches, linen weaving, starch manufacture, and distilling. A higher burgher school was erected in 1874. In the neighborhood are the old and modern castles of the Fürstenstein family. At Freiburg on July 22, 1762, the Prussians defended themselves successfully against the superior forces of the Austrians. The population of the town in 1875 was 7853.

FREIDANK, FREIGEDANK, or in Middle High German VRÎDANC, the name by which a certain German didactic poet of the 13th century is usually known. It has been disputed whether the word, which is equivalent to freethought, is to be regarded as the poet's real family name or only as a pseudonym; according to Pfeiffer the former is the case. Little is known of Freidank's life. He certainly accompanied Frederick II. on his crusade to the Holy Land, where a portion at least of his work was composed; and it is said that on his tomb (if indeed it was not the tomb of another Freidank) at Treviso there was inscribed, with allusion to the character of his style, "he always spoke and never sang." Wilhelm Grimm started the hypothesis that Freidank was to be identified with Walther von der Vogelweide; but it found almost no acceptance from other German scholars, and was formally refuted by Franz Pfeiffer in his *Zur Deutschen Literatur-Geschichte*, Stuttgart, 1855, and his *Germania*, 1857, 2d vol.

Freidank's work bears the name of *Bescheidenheit, i. e., Discretio*, Correct Judgment, and consists of a collection of proverbs, pithy sayings, moral reflections, and stories arranged under general heads. Its popularity till the end of the 16th century is shown by the great number of MSS. still extant; and Sebastian Brandt published it again and again in modified forms. Wilhelm Grimm's edition of *Vridances Bescheidenheit* appeared at Göttingen in 1834, and Bezzinberger's at Halle in 1872; the old Latin translation, *Fridangi Discretio*, was printed by Lemcke at Stettin, 1868; and there are two translations into modern German, A. Bacmeister's, Reutlingen, 1861, and Simrock's, Stuttgart, 1867. Compare also H. Paul, *Ueber die Ursprüngliche Anordnung von Freidank's Bescheidenheit*, Leipsic, 1870.

FREILIGRATH, FERDINAND (1810–1876), a popular German poet, was born June 17, 1810, at Detmold, where his father was a teacher in the Stadtschule. He was educated at the gymnasium of his native town, and at the age of fifteen was apprenticed to an uncle who kept a grocer's shop in Soest. Freiligrath had no great liking for trade. He was an insatiable reader, especially of books of travel and adventure, and from his childhood a scribbler of verse. At Soest he devoted some hours daily to the study of English, French, and Italian, and towards the end of his five years' apprenticeship was writing verses for several small Westphalian papers, such as the *Gunloda* and *Mindener Sonntagsblatt*. Having spent other five years (1831–6) as clerk in a bank at Amsterdam, Freiligrath returned to Soest, published his translations of Victor Hugo's *Odes* and *Twilight Songs* (1836), and started, conjointly with his friends Ignaz Hub and A. Schnezler, a journal, entitled *Rheinisches Odeon* (1836–8). In 1837 he went to Barmen as bookkeeper in a mercantile house, about which time also his fugitive pieces, still appearing in Westphalian papers, among which were the *Morgenblatt* and *Deutscher Musenalmanach*, had the good fortune to be praised by the poet Chamisso. A year later appeared his first volume of *Gedichte*, which became immediately and widely popular. Finding himself at the age of twenty-eight one of the favorite poets of his day, Freiligrath now gave up his situation of bookkeeper in Barmen, and spent the next year at Unkel on the Rhine, where he wrote his *Roland's Album* (1840), and in connection with Levin Schücking compiled *Das malerische und romantische Westfalen* (1840–42). He married in 1841 Ida Melos, daughter of Professor Melos of Weimar, and removed first to St. Goar, where, with his friends Simrock and Matzerath, he edited the *Rheinisches Jahrbuch* (1840–41), and in 1842 to Darmstadt, where he published, conjointly with Duller, a poem, *Zum Besten des Kölner Doms*, and endeavored also to start a periodical, to be called *Britannica: für Englisches Leben und Englische Literatur*, for which Dickens and Bulwer had promised their assistance. This scheme, however, failed, and Freiligrath returned to St. Goar, there to complete his *Karl Immermann, Blätter der Erinnerung an ihn* (1842). In the same year he received a pension of 300 thalers from King William IV. Up to this time, Freiligrath's poetry had borne no trace of the politician. Among the *Gedichte*, so popular in German households, were his *Moos-thee, Die Auswanderer, Der Blumenrache, Prinz Eugen, Der Bilderbibel, Löwenritt*, and many others written before 1840, all purely imaginative in their character, and still, from a literary point of view, unquestionably the poet's masterpieces. When, after his return to St. Goar, Freiligrath was drawn irresistibly into the political controversies of the day, he still endeavored to keep clear of party feeling, declaring that the poet stood "*auf einer höheren Warte als auf den Zinnen der Partei*." But he was soon obliged to vacate this position and descend among the politicians; and in 1844 he threw up his royal pension, published his *Glaubensbekenntniss*, and finally joined the democratic party. From this time forward he boldly proclaimed the democratic cause in verse, till, as the author of *Trotzalledem* (a translation of Burns's *A Man's a Man for a' that*), *Jacta est Alea, Die Freiheit! Das Recht!, Hamlet, England an Deutschland*, and other equally daring effusions, he was forced to seek safety in exile, and retired first to Belgium and then to Switzerland. There he prepared for press a volume of *Englische Gedichte aus neuerer Zeit* (1846), containing translations from Mrs. Hemans, L. E. L., Southey, Tennyson, Longfellow, and others, and also a volume of political songs entitled *Ça Ira!* The publication of this last led to his flight to England, and for the next two years he lived in London, as foreign correspondent to a mercantile house. In 1848 he was on the point of emigrating with his family to America, there to join Longfellow and other literary friends, when the Revolution broke out, and the amnesty of March 19 allowed him to return to Germany. He now took up his post at the head of the democratic party at Düsseldorf, but was shortly afterwards imprisoned on account of his poem *Die Todten an die Lebenden*. On being liberated by verdict of the jury, he removed to Cologne, to assist in the management of the *Neue Rheinische Zeitung*. During this year also he published his *Februarklänge* and *Die Revolution*. *Zwischen den Garben, eine Nachlese älterer Gedichte*, appeared in 1849, and *Neue politische und sociale Gedichte* in 1850. Fresh impeachments drove Freiligrath again to London in 1851, and he once more returned for a livelihood to the prosaic existence of the desk and office-stool, still, however, devoting his leisure hours to literature, and specially to those translations from the English poets which in Germany have earned him a position equal to Rückert's as a translator of English verse. In 1854 he published a selection of translations from English, Scotch, and Irish literature, entitled *The Rose, Thistle, and Shamrock*; also *Dichtung und Dichter, eine Anthologie*. His translation of Longfellow's *Hiawatha* appeared 1857. He also translated *Cymbeline* and the *Winter's Tale* for a German edition of Shakespeare, edited by Bodenstedt. In 1866 a national testimonial, which ultimately reached the sum of 60,000 thalers, was set on foot in Germany, for the purpose of providing a pension for the poet in his old age; and when, two years later, a general amnesty was granted to political offenders, Freiligrath returned to his native country, and was received with public enthusiasm. He now settled in Stuttgart, where, at the beginning of the Franco-German war, he wrote some since popular songs, such as *Hurrah Germania!* and the *Trompete von Gravelotte*. He removed to Cannstadt in 1875, and died there, March 18, 1876. An edition of his collected works was published at Stuttgart (6 vols. 1870, 2 vols. 1871, and since) and there is also a Tauchnitz edition, containing a selection of some of Freiligrath's best known poems, translated into English by various authors, and edited by his daughter Mrs. Freiligrath Kroeker (1869 and 1871).

Powerful as Freiligrath's poetry is, and masterly as his diction and rhythm are admitted to be, he is yet wanting in the tenderness of a Chamisso, or the exquisite subtlety of a Heine. The principal charm of his poetry lies in its entire originality. He came, belonging to no school of versifiers, at a time when old tastes were being cast off, and novelty was restlessly desired, and he has been fitly christened a *bahnbrechendener Poet*. He was original in style of thought and choice of subject, while in many of his poems, such as his *Iceland Moss Tea, Skating Negro, Revenge of the Flowers, Lion's Ride*, and many of his grim, revolutionary parables, there is even an element of the fantastic—the bizarre. And it was a part of this native originality of mind which made Freiligrath so eminently a cosmopolitan poet. He was no traveller, and spent the greater part of his days in a dusty counting house; yet, few as his sources of inspiration could have been,—he himself acknowledges the old *Bilderbibel* of his childhood as one, while others have traced them to the busy docks and strange cargoes of a seaport town,—his fancy was rarely contented with lingering among the scenery and legends at home, but branched rather into new paths, into the distant parts of the earth,—into the *Weltferne*. This love of the *Weltferne*, however, predominates only in his earlier *Gedichte*, to which the intense patriotism of his later muse is a strange contrast. In England Freiligrath's political poetry is of secondary interest; for to the British intellect it is scarcely comprehensible how such effusions—grim, outspoken, as they are—should be a sufficient cause for imprisonment, or an almost life-long exile; and as poems of occasion—although that occasion was a revolution—they rank lower with the literary critic than the purely imaginative poetry of his youth. But by most Germans Freiligrath is best remembered as the political poet; while among the countrymen of his own party, old political friends and fellow exiles, he has been called a poet-martyr, the "bard of freedom," and "inspired singer of the revolution." (F. M.)

FREIND, John (1675–1728), English physician, was born in 1675 at Croton in Northamptonshire. He made great progress in classical knowledge under Dr. Busby at Westminster, and at Christ Church, Oxford, under Dr. Aldrich, and while still very young, produced, along with Foulkes, an excellent edition of the speeches of Æschines and Demosthenes on the affair of Ctesiphon. After this he began the study of medicine, and having proved his scientific attainments by various treatises was appointed professor of chemistry at Oxford in 1704. In the following year he accompanied the English army, under the earl of Peterborough, into Spain, and, on returning home in 1707, wrote an account of the expedition which attained great popularity. Two years later he published his *Prelectiones Chimacæ*, which he dedicated to Sir Isaac Newton. In 1711 he was elected fellow of the Royal Society. Shortly after his return in 1713 from Flanders, whither he had accompanied the British troops, he took up his residence in London, where he soon obtained a great reputation as a physician. In 1716 he became fellow of the college of physicians, of which he was chosen one of the censors in 1718, and Harveian orator in 1720. In 1722 he entered parliament as member for Launceston in Cornwall, but, being suspected of favoring the cause of the exiled Stuarts, he spent half of that year in the Tower. During his imprisonment he conceived the plan of his most important and valuable work, *The History* *of Physic*, of which the first part appeared in 1725, and the second in the following year. In the latter year he was appointed physician to Queen Caroline, an office which he held till his death, 26th July, 1728. A complete edition of his Latin works, with a Latin translation of the *History of Physic*, edited by Dr. Wigan, was published in London in 1732. A monument was erected to Freind in Westminster Abbey.

FREIRE, Francisco Joze (1713–1773), a Portuguese historian and philologist, was born at Lisbon in 1713. He belonged to the monastic society of St. Philip Neri, and was a zealous member of the literary association known as the Academy of Arcadians, in connection with which he adopted the pseudonym of Candido Lusitano. He contributed much to the improvement of the style of the Portuguese prose literature, but his endeavor to effect a reformation in the national poetry by a translation of Horace's *Ars Poetica* was less successful. The work in which he set forth his opinions regarding the vicious taste pervading the current Portuguese prose literature is entitled *Maximas sobre a Arte Oratorio*, and is preceded by a chronological table forming almost a social and physical history of Portugal. His best known work, however, is his *Vida do Infant D. Henrique*, which has given him a place in the first rank of Portuguese historians. He also wrote an account of the great earthquake of 1775, and his *Réflexions sur la Langue Portugaise* was published in 1842 by the Lisbon society for the promotion of useful knowledge. He died in 1773.

FREISCHÜTZ is, in German folklore, a marksman who by a compact with the devil has obtained a certain number of bullets destined to hit without fail whatever object he wishes. As the legend is usually told, six of the *Freikugeln* or "free bullets" are thus subservient to the marksman's will, but the seventh is at the absolute disposal of the devil himself. Various methods were adopted in order to procure possession of the marvellous missiles. According to one the marksman, instead of swallowing the sacramental host, kept it and fixed it on a tree, shot at it, and caused it to bleed great drops of blood, gathered the drops on a piece of cloth and reduced the whole to ashes, and then with these ashes added the requisite virtue to the lead of which his bullets were made. Various vegetable or animal substances had the reputation of serving the same purpose. Stories about the Freischütz were especially common in Germany during the 14th, 15th, and 16th centuries; but the first time that the legend was turned to literary profit is said to have been by Apel in the *Gespensterbuch* or "Book of Ghosts. It has become universally known as the basis of Weber's opera *Der Freischütz* (1821), the libretto of which was written by Friedrich Kind, who had suggested Apel's story as an excellent theme for the composer. The name by which the Freischütz is known in French is Robin des Bois. According to some mythologists, the legend is to be traced back to the great solar myth.

See Kind, *Freyschützbuch*, Leipsic, 1843; *Revue des Deux Mondes*, February, 1855; Grässe, *Die Quelle des Freischütz*, Dresden, 1875.

FREISING, Freysing, or Freisingen, a town of Bavaria, district of Upper Bavaria, is situated on the Isar, 20 miles N.N.E. of Munich. It has breweries, distilleries, dyeworks, sawmills, and machine factories. Among the principal buildings are the cathedral (famous for its crypt), erected in the end of the 12th century, the town-hall, the lyceum, and the gymnasium. Freising is a very ancient town, and is said to have been founded by the Romans. It at any rate existed as early as 444 A.D., and was made the seat of a bishop in 724. In 1802 the bishopric was united to the newly-created archbishopric of Munich, whose occupant bears the title of Freising as well as Munich. The population of Freising in 1875 was 8252.

FREIWALDAU, a town in Austrian Silesia, circle of Troppau, is situated in a pleasant valley 40 miles W.N.W. of Troppau. It was formerly a protection-town of the archbishopric of Breslau, and possesses an old castle and a large church. Its industries are linen and cotton weaving, flax-spinning, and wax-bleaching. About a mile and a half distant is the well-known hydropathic establishment of Gräfenberg. In 1869 the population of Freiwaldau, including suburbs, was 5242.

FRÉJUS, the ancient *Forum Julii*, a town of France, department of Var, about a mile from the Mediterranean, and 15 miles S.E. of Draguignan. It is the seat of a bishop, and has some handsome modern buildings, among which are the cathedral and the episcopal palace, both of Gothic architecture, and constructed partly of the remains of Roman edifices. It possesses manufactures of cork and soap, and among the minerals of the neighborhood are coal, pumice stone, porphyry, jasper, and amethyst. Fréjus took its name from Julius Cæsar, who is said to have established a Roman colony there. It was improved by Augustus, and in the time of the subsequent emperors it became an important naval station. Among the remains of the ancient town are a triumphal arch, a ruined amphitheatre, traces of two moles which formed the entrance of the port, and portions of a fine aqueduct, which brought the waters of the Siagne into the town from a distance of 20 miles. Traces of the old walls of the town are also visible. The port, which communicated with the sea by means of a canal, has been dried up, and its site is now occupied by gardens. At St. Raphael, a fishing village about a mile and a half distant, Napoleon disembarked on his return from Egypt in 1799, and re-embarked for Elba in 1814. The population of Fréjus in 1876 was 2791. See Texier, *Mémoires sur la ville et le port de Fréjus*, 1847.

FREMONT, a city of the United States of America, capital of Sandusky county, Ohio, is situated on the Sandusky river at the head of navigation, 30 miles east of Toledo by rail. Steamers ply between the city and the principal ports of Lake Erie, and it has manufactories of woollens, sashes, and blinds, flour mills, and engineering works. The late Mr. Burchard bequeathed to the city land for two public parks, and $50,000 for a public library, the building for which is to be erected on the Fort Stephenson property, the scene of the gallant and successful defence of General Crogher against a superior force of the British and Indians, August 1st and 2d, 1813. The population of Fremont in 1870 was 5455.

FRENCH, Nicholas (1604–1678), an Irish political pamphleteer, was born in Wexford in 1604. After receiving ordination at Louvain, he became Roman Catholic priest at Wexford, and in 1643 he was appointed bishop of Ferns. Having taken a prominent part in the political disturbances of this period, he deemed it prudent, after the universal submission which followed the storming of Wexford by Oliver Cromwell, to retire to Brussels, where, in 1652, he published his attack on Ormond, entitled *The Unkind Deserter of Loyal Men and True Friends*, and shortly afterwards *The Bleeding Iphigenia*. The most important of his other pamphlets is the *Sale and Settlement of Ireland*. Shortly before his death, which took place August 23, 1678, he was nominated coadjutor-archbishop of Ghent. The *Historical Works* of Bishop French, comprising the pamphlets above named and several others, were published at London in 1846 in 2 vols., and a notice of him will be found in T. D. M'Gee's *Irish Writers of the 17th Century*, London, 1846.

FRERE, John Hookham (1769–1841), an English diplomatist and author, was born in London, May 21, 1769. His father, John Frere, a gentleman of a good Suffolk family, had been educated at Caius College, Cambridge, and would have been senior wrangler in 1763 but for the powerful competition of Paley; his mother, daughter of Mr. John Hookham, a rich London merchant, was a lady of no small ability and culture, accustomed to amuse her leisure with the pleasures of versification; and his father's sister Ellinor was married to Sir John Fenn, the learned editor of the *Paston Letters*, and contributed with her own pen to the formation of a library of fiction for children. Young Frere was sent to Eton in 1785, and there began that intimacy with Canning which so greatly affected his after life. From Eton he went to his father's college at Cambridge, and graduated B.A. in 1792 and M.A. in 1795. He entered public service in the foreign office under Lord Grenville, and sat from 1796 to 1802 as member of parliament for the close borough of Looe in Cornwall. From his boyhood he had been a warm admirer of Pitt, and along with Canning he entered heart and soul into the defence of his Government, and contributed freely to the pages of the *Anti-Jacobin*. On Canning's removal to the board of trade in 1799 he succeeded him as under secretary of state; in October, 1800, he was appointed envoy extraordinary and plenipotentiary to Lisbon; and on September, 1802, he was transferred to Spain, where he remained for two years. He was recalled on account of a personal disagreement he had with the "Prince of Peace," but his conduct was approved by the ministry, and in 1808 he was again sent out as plenipotentiary to Ferdinand VII. The condition of Spain rendered his position a very responsible and difficult one, but had it not been for one unfortunate step he would have left the country with greatly increased reputation. When Napoleon began to advance on Madrid it became a matter of supreme importance to decide whether Sir John Moore, who was then in the north of Spain, should endeavor to anticipate the occupation of the capital or merely make good his retreat, and if he did retreat whether he should do so by Portugal or by Galicia. Frere was strongly of opinion that the bolder was the better course, and he urged his views on Sir John Moore with an urgent and fearless persistency that on one occasion at least overstepped the limits of his commission. After the disastrous retreat to Corunna, the public accused Frere of having by his advice endangered the British army, and though no direct censure was passed upon his conduct by the Government, he was called home, and the Marquis of Wellesley was appointed in his place. Thus ended Frere's public life. He afterwards refused to undertake an embassy to St. Petersburg, and twice declined the honor of a peerage. In 1816 he married Elizabeth Jemima, dowager countess of Erroll, and in 1820, on account of her failing health, he went with her to the Mediterranean. There he finally settled in Malta, and though he afterwards visited England more than once, the rest of his life was for the most part spent in the island of his choice. In quiet retirement he devoted himself to various literary labors, studied his favorite Greek authors, and taught himself Hebrew and Maltese. His hospitality was well known to many an English guest, and his charities and courtesies endeared him to his Maltese neighbors; and when he died in 1841, his loss was evidently regarded by rich and poor as a common calamity.

Frere's literary ability was early displayed. He was a contributor at Eton to the school magazine known as the *Microcosm*, and gained the members' prize at Cambridge in 1792 by an essay on the strange question, "Whether it were possible to hope for improvement in morals and the cultivation of virtue in the rising republic of Botany Bay?" During the first period of his public life he was one of the chief writers in the *Anti-Jacobin*, contributing, among other pieces, "The Loves of the Triangles," a clever parody of Darwin's "Loves of the Plants," and sharing with Canning the honor of "The Needy Knife-Grinder" and "The Rovers." In 1817 he published a mock-heroic poem entitled, *Prospectus and Specimen of an intended National Work by William and Robert Whistlecraft, of Stow-Market, in Suffolk, Harness and Collar makers, intended to comprise the most interesting particulars relating to King Arthur and his Round Table.* It attracted considerable attention at the time, and though it was afterwards comparatively forgotten, it served to bring again into fashion the octave stanza of the Italians, and formed, as far at least as its versification was concerned, the acknowledged model of Byron's *Beppo*. Much greater importance attached to the translations of Aristophanes, by which indeed Frere occupies an almost unrivalled position in English literature. The principles according to which he conducted his task were elucidated in an article on Mitchell's *Aristophanes*, which he contributed to *The Quarterly Review*, vol. xxiii. The translations of *The Acharnians*, *The Knights*, *The Birds*, and *The Frogs* were privately printed, and were first brought into general notice by Sir G. Cornewall Lewis in the *Classical Museum* for 1847. They were followed some time after by *Theognis Restitutus, or the personal history of the poet Theognis, reduced from an analysis of his existing fragments.* Frere's complete works were published in 1871, with a memoir by his nephews, W. E. and Sir Bartle Frere, and reached a second edition in 1874. Compare also an article in the *North American Review*, vol. cvii., 1868.

FRÉRET, NICOLAS (1688–1749), a French scholar, one of the most learned men of his age, was born at Paris, February 7 or 15, 1688. His father was *procureur* to the parliament of Paris, and destined him to the profession of the law. His passion for knowledge declared itself almost from his birth; and so early did he apply himself to studies of the most diverse kind, and accumulate vast stores of information, that he scarcely seemed to have any childhood. His precocity in learning and literary labor appears to rival even that of John Stuart Mill. He had for his tutors the historian Rollin and Father Desmolets. Amongst his early studies history, chronology, and mythology held a prominent place. To please his father he studied law and began to practise as a pleader; but the force of his genius soon carried him into his own path. At nineteen he was admitted to a society of learned men who sought more freedom of discussion than was to be had within the Academy, and he read before them memoirs on the religion of the Greeks, on the worship of Bacchus, of Ceres, of Cybele, and of Apollo. The astonishing reputation which he gained for learning, and the influence of the eminent men whose friendship he enjoyed, opened the way for his recognition by the Academy. He was hardly twenty-six years of age when he was admitted as pupil to the Academy of Inscriptions. One of the first memoirs which he read was a learned and critical discourse *Sur l'Origine des Français*. His views, well-grounded, unusual, and audacious, excited great indignation in the Abbé Vertot, who had written on the same subject in a manner more flattering to the vanity of Frenchmen, and he denounced Fréret to the Government as a libeller of the monarchy. A *lettre de cachet* was issued, and Fréret was sent to the Bastille. He was thus silenced on the perilous subject, and his memoir even remained unpublished till nearly fifty years after his death. During his six months of confinement—"a solitude," he says, "whose tranquillity there was nothing to disturb"—he devoted himself to the study of the works of Xenophon, the fruit of which appeared later in his memoir on the *Cyropædia*. The assertion, frequently repeated, that he was allowed to read nothing but Bayle's famous *Dictionary*, and that he nearly learnt it by heart and imbibed all its scepticism, is entirely untrue and unjust. From the time of his liberation in June, 1715, his life was uneventful. It was a life of the most simple, pure, and complete devotion to knowledge, with absolute indifference to fame. In January, 1716, he was received associate of the Academy, and in December, 1742, he was made perpetual secretary. He lived and labored without intermission for the interests and the honor of the Academy, not even claiming any property in his own writings, which almost all remained unpublished till after his death. The list of his memoirs occupies four columns of the *Nouvelle Biographie Générale*. They treat of a large variety of subjects, chiefly in the fields of history, chronology, geography, mythology, and religion. Throughout he appears as the keen, learned, and original critic; examining into the comparative value and credibility of documents, distinguishing between the mythical and the historical, and separating traditions with an historical element from pure fables and legends. He rejected the extreme pretensions of the chronology of Egypt and China, and at the same time controverted the scheme of Sir Isaac Newton as too limited. He investigated the mythology not only of the Greeks, but of the Celts, the Germans, the Chinese, and the Indians, and was a vigorous opponent of "euhemeristic" interpretation. He was one of the first scholars of Europe to undertake the study of the Chinese language: and in this he was engaged at the time of his committal to the Bastille. In addition to these labors and acquirements Fréret made himself master of modern literature, and was intimately acquainted with the dramatic works of the French, Italian, English, and Spanish poets. His multifarious pursuits left him no time for carrying on the publication of the *Mémoires* of the Academy, an enormous arrear of which had to be made up by his successor. He died at Paris, March 8, 1749.

Long after his death several works of an atheistic character were falsely attributed to him, and were long believed to be his. These were the *Examen critique des apologistes de la religion chrétienne* (1766), *Lettre de Thrasybule à Leucippe*, printed in London about 1768, and a few others. They were republished under the title of *Œuvres philosophiques* in 1776. It is now believed that they were put forth in Fréret's name by Holbach, Naigeon, and Lagrange, and that Fréret had nothing whatever to do with them. A very defective and inaccurate edition of Fréret's works was published in 1796–1799. A new and complete edition was projected by Champollion-Figeac, but of this only the first volume appeared (1825). His manuscripts, after passing through many hands, were deposited in the library of the Institute.

FRÉRON, ÉLIE CATHERINE (1719–1776), a French critic and controversialist, was born at Quimper in 1719. He was educated by the Jesuits, and made such rapid progress in his studies that before the age of twenty he was appointed professor at the college of Louis-le-Grand. On resigning his connection with the Jesuits in 1739, he was employed by the Abbé des Fontaines as a contributor to his *Observations sur les Écrits Modernes*. After the death of the latter in 1746 he founded a similar journal of his own, entitled *Lettres de la Comtesse de * * **. It was suppressed in 1749, but he immediately replaced it by *Lettres sur quelques écrits de ce temps*, which, with the exception of a short suspension in 1752, on account of an attack on the character of Voltaire, was continued till 1754, when it was succeeded by the more ambitious *L'Année Littéraire*. His death at Paris on the 10th March, 1776, is said to have been hastened by the temporary suppression of this journal. Fréron is now remembered solely for his attacks on Voltaire and the Encyclopedists, and the fame of his criticisms is not due to their inherent merits, which, notwithstanding a certain clever malignity, are very slight, but to the retaliations they provoked on the part of Voltaire, who, besides attacking him in epigrams, and even incidentally in some of his tragedies, directed against him a virulent satire entitled *Le Pauvre Diable*, and also made him the principal personage in a comedy *L'Écossaise*, in which the journal of Fréron is designated *L'Âne Littéraire*.

Besides conducting the serials already mentioned, Fréron is the author of *Ode sur la bataille de Fontenoy*, 1745; *Histoire de Marie Stuart*, 1742, in 2 vols.; and *Histoire de l'empire d'Allemagne*, 1771, in 8 vols. See Ch. Nisard, *Les Ennemis de Voltaire*, 1853; Despois, *Journalistes et journaux du XVIII*^{e} *siècle*; Barthélemy, *Les Confessions de Fréron*; Ch. Mouselet, *Fréron, ou l'illustre critique*, 1864; *Fréron, sa vie, souvenirs*, etc., 1876.

FRÉRON, Louis Stanislas (1765–1802), a French Revolutionist, son of the preceding, was born at Paris in 1765. His name was, on the death of his father, attached to *L'Année Littéraire*, which was continued till 1790, and edited successively by the Abbés Royou and Geoffroy. On the outbreak of the Revolution, Fréron, who was a schoolfellow of Robespierre and Camille Desmoulins, established the violent journal *L'Orateur du Peuple*. Commissioned along with Barras in 1793 to establish the authority of the Convention at Marseilles and Toulon, he distinguished himself equally with his colleague in the atrocity of his reprisals, but both afterwards joined the Thermidoriens, and Fréron became the leader of the *Jeunesse Dorée*. He then made his paper the official journal of the reactionists, and being sent by the Directory on a mission of peace to Marseilles he published in 1796 *Mémoire historique sur la réaction royale et sur les malheurs du midi*. He died in 1802 at St. Domingo, where he was for a few months subprefect.

FRESCO. Fresco-painting is the art of mural painting upon freshly-laid plaster lime whilst it remains damp, with colors capable of resisting the caustic action of the lime with which they are mixed or brought into contact. Fresco-painting might be called lime-painting, lime being the vehicle with which the colors are fixed, but the term would not be sufficiently distinctive, because colors mixed with lime may be applied under certain conditions to plaster which has been allowed to dry, an art which the Italians call painting "a secco," to distinguish it from "a fresco" or painting on newly-laid and still wet plaster. The art of painting with colors mixed with lime is very ancient; it was in use in Egypt from the remotest periods of the monumental history of that country; but as it was carried to perfection by the Italians, it is needless to trace its development elsewhere than in Italy, where the most primitive examples—those existing in Etruscan sepulchral chambers dug in tufa—are marked by technical peculiarities which survive in fresco-painting to this day. The walls of tufa were prepared by being whitewashed with lime,—a method revived in mediæval mural pictures; and the outlines of the figures were drawn with a metal point or stylus, and subsequently colored on the whitewash, which from the percolation of water through the tufa remained permanently damp. In examples at Chiusi this outline is found limited exclusively to the external forms of the figures, a custom which reappears in mediæval pictures of the school of the neighboring Siena, whilst drawing on wet plaster with the stylus belongs to this art in every age. The colors used were earths, which were mixed with lime and laid on in flat tints, and earths for the most part are the colors still employed in fresco-painting. The Romans, probably owing to Greek influence and example, carried the art much further than their Etruscan predecessors, and established real fresco-painting in Italy. Vitruvius remarks, "Colors when carefully applied on moist stucco do not therefore fade, but last for ever. Stuccoed walls, when well executed, do not easily become dirty, nor do they lose their colors when they require to be washed, unless the painting was carelessly done, or executed after the surface was dry." This is emphatically descriptive of fresco-painting. In this art it is essential that a given amount of plaster be laid for the painter at one time,—in modern practice only enough for a day's work,—and therefore frescoes are readily recognized by the joinings in the plaster, most frequently following the outlines of the figures or other objects. These joinings vary in distinctness in different works according to the skill of the plasterer. Sometimes they are clearly perceptible, at other times they are only discoverable on minute examination. It has been observed on painted walls in Pompeii that such joinings exist, but they are further apart and less frequent than in modern works generally, suggesting either that the ancient artists painted more rapidly, or that several worked together on the same sheet of plaster, or that they knew how to keep the plaster fresh for more than one day, which, considering their great technical skill, is not improbable. Such wide divisions are found in the fragments of a mural painting of the 14th century existing in Sta. Croce, and in others by Paolo Uccello, but this is explained by the completion of these pictures in distemper, whilst the Pompeian paintings are in fresco; for besides the joinings, which are not inconsistent with the presence of tempera, there are also marks showing the use of the stylus on damp plaster, and by experiments made by the late Sir Humphrey Davy, it has been shown that all the colors employed contain lime; therefore they are fresco and not tempera.

It may be doubted whether any works of art produced in later times could have withstood the trials to which the mural paintings of Pompeii have been subjected from the action of heat and damp, the latter for centuries, without serious damage. The expression of Vitruvius that they would last for ever has been so far justified. The processes of the ancients were not limited to fresco-painting; they were familiar with others of great beauty and durability, but these do not enter within the scope of the present notice. The construction of the walls and the system of plastering then in use are more important subjects of inquiry in connection with fresco. Those unsurpassed builders, the Romans, faced walls intended to be painted, with a lining of bricks set on edge, detached by a small space from the main structure, to which it was secured with leaden clamps. This was a precaution against damp well worthy of imitation. Generally, three preparatory coats of plaster were laid on this brick facing or on any other description of wall, the first consisting of lime mixed with pounded brick and pozzolana, the other two with lime and pozzolana. The finishing coat was frequently composed of lime and pounded marble, which was susceptible of an exquisite polish, after which it was painted by durable processes, the secret of which is now lost. For fresco-painting the last coat or intonaco consisted of lime mixed with sand only. A long gap now occurs in the progress of mural painting. Its practice is feebly illustrated in tombs and catacombs, interesting historically, but of little value technically. Finally it was displaced for a time by mosaic, but it was again revived in the 13th century, that great epoch of the resuscitation of the fine arts. The works of Giunta Pisano and some of his contemporaries in the upper church of St. Francis at Assisi, executed in the first half of the 13th century, clearly indicate a knowledge of a system of fresco. In a history of the practice of this art these mural paintings, with those of Cimabue and his colleagues or assistants, and those by Giotto and his followers, deserve special consideration. They illustrate the early processes of fresco and mural painting upon which all the methods subsequently followed were based. It is evident from the structure of the interior of the beautiful upper church of St. Francis that the architect did not provide for its being painted internally. It was complete in its admirable masonry, and when it was determined to paint it, the only preparatory process possible was to cover the aslar with a thin coat of intonaco about one-eighth of an inch in thickness. Any plan of preparatory coats of plaster in the Roman manner would have buried the string courses and other mouldings, and ruined the proportions of the piers. True fresco-painting under such conditions was consequently very difficult, for the thin intonaco, laid on a stone wall which could not be soaked with water, of necessity dried rapidly. The mixed art of fresco and distemper which was thus made imperative at Assisi prevailed in mural painting, with certain modifications, for a long period everywhere.

The following is a brief statement of the methods of Giunta Pisano and Cimabue. Both artists practised, if they did not inaugurate, the system of outlining their subjects on the walls, which continued for two centuries, till it was abandoned for the better plan of preparing cartoons. A sketch was first made, and was squared in the usual manner with vertical and horizontal lines drawn to scale. The space to be painted was then squared proportionately, and, guided by the squares, the artist outlined his subject full size with charcoal on the wall. This done, with a hair pencil and some ochre mixed with water he passed over the general lines, and then brushed off the charcoal; he next marked in the entire composition with red "terra rossa" mixed with water only, this time entering more into detail, and even indicating the chiaroscuro. Where the ancient intonaco has fallen off, these red outlines are visible; they have a mysterious grandeur, and those by the hand of Cimabue prove the possession on his part of freedom and power of drawing. Over these outlines the intonaco was spread in portions, and on it the artist marked the squares once more, and drew the outlines of the figures he meant to paint. That the intonaco was prepared in sections is proved, not only by the visible lines in the plaster, but also by the falling off of the leg of a figure, showing the cut made by the artist when he had finished his work. The cut follows the outline of the limb, and this process suffices to show that fresco-painting was practised in the first half of the 13th century, if any doubt should be entertained. The intonaco being spread, the artist painted his subject in a slight manner with terra rossa, laying in the chiaroscuro and details, after which the plaster was allowed to dry. The picture thus prepared was then colored in distemper, and completed in every part. By the aid of Vasari and of Cennino Cennini a pupil of the school of Giotto, who completed his treatise on painting on the 31st July, 1437, we have clear statements of the methods of mural painting followed by the Byzantine artists, and subsequently by the Italians. Cennino, in the most express terms, states that mural pictures, although commenced in fresco, were *always* finished in distemper. The distempers used were a mixture of egg, including both the albumen and the yolk, with the milky fluid which exudes from twigs of the fig tree; size made from glue or from gum tragacanth is also mentioned. A list of the colors employed by Giotto and his pupils and successors is given below; and the same, there can be little doubt, were in use on the part of Giunta, of Cimabue, and their contemporaries. Amongst these white lead played an important part in painting on panels and on walls. All who are familiar with old pictures must have frequently seen those of black Madonnas and saints, held in especial veneration for their sanctity and antiquity. The colors with which they were painted were freely mixed with white lead and with the yolk and albumen of egg, which darkens whilst the white lead oxidizes; hence their present state.

This partially explains the singular appearance presented by the mural pictures of Giunta at Assisi, in which the shadows are red executed in fresco, and the lights painted in distemper are black. The explanation is not entirely satisfactory, however, for the change is not universal, and in a considerable number of the pictures the colors have not changed; but wherever damp has penetrated, the paintings have become very dark; the microscope would probably show that this is due to the presence of fungus, the produce of the egg distemper. As the works attributed to Cimabue are for the most part in better preservation than those given to Giunta, they suggest that this great artist, who did so much for design, also improved the technical processes of mural art. He undoubtedly carried fresco-painting further, although on thin intonaco; but he prepared for the finishing processes as his predecessors had done. This statement is based upon the examination of a Madonna and Child with Angels in the lower church of St. Francis, which is executed in the same manner as the pictures in the upper church ascribed to Giunta. This fragment is so noble in design, the heads are so beautiful, the whole work is so much better than the picture of the Borgo Allegri, now in St. Maria Novella, Florence, that although in its method it is like the works of Giunta, in design it is far beyond his powers. Cimabue's method of outlining on the wall has been described; but there are traces of his use of the stylus, to which he had recourse when he wished to alter an outline after the work was begun, and it is therefore evident that the plaster was damp when he had recourse to this instrument. His preparations in fresco being dry, he proceeded to paint the shadows of flesh with terra vert in distemper, and then modelled the features with the requisite colors. That he heightened the lights with white lead is apparent, for these have become black even in places which damp did not reach. A glaring example of this is the table-cloth in a picture of the Marriage at Cana in Galilee, which, once white, is now an intense black; the plates, viands, and vases upon it are unchanged in color; these no doubt are in pure fresco, which explains the difference.

We can form no idea now of the splendid appearance which the paintings in the interior of St. Francis presented when newly done. There are abundant traces of the use of a mordant for gilding, showing that the high lights upon dresses and the edges of folds were gilt, as well as embroideries on the borders, and on the aureoles of saints. It is obvious that such ideas were derived from mosaics, in which the lights sparkle with gold. Regarded simply as decorative art, these paintings at Assisi, with their clear bright coloring, the rich gilding, and with the windows filled with colored glass, must have been magnificent. The art was very conventional, still the beginnings are perceptible of a higher imitative system, and of a growing appreciation of truth to nature. The heads of angels are characterized by expressive beauty; the bride in the Marriage at Cana has a very pleasing face, and even the idea of portraiture is observable; the look of surprise in the countenance of the husband is naturally expressed, and with good taste. Those who have not seen these paintings, and only judge of the merits of Cimabue by his altar-pieces at Florence, can have little conception of the ability of this remarkable artist.

Beneath the paintings of Cimabue, and under the gallery which represents a triforium, range the mural pictures of Giotto and his contemporaries or pupils. By Giotto the art of fresco received a new impetus; he continued the mixed method then prevalent, but with a more moderate use of distemper, and laid the foundation of the system carried to perfection by his greatest successors. The part of the wall which was assigned to him apparently admitted of thicker plastering, for he caused preparatory coats of plaster to be spread with due care; on the last of these, when dry, he no doubt made his outlines according to the manner of his predecessors, and over these the intonaco was distributed with singular dexterity. Plastering in his time was a branch of fine art, so that it is at all times difficult to discover the joinings in the works of Giotto and his followers. An account of his method of mural painting will convey a clear idea of the technical processes improved by him and followed by other artists after him.

The lime prepared for the intonaco having been kept till it had parted with much of its caustic quality, was mixed with sand in the proportion of two of sand to one of lime. The pigments used were:—White—biancosangiovanni, or lime carefully ground with pure water and dried in the sun in the form of cakes; black—charcoal of vinewood, a black chalk, or lamp black; red—cinabrese, a red earth of intense color, and sinopia, a lighter red, also an earth, and burnt ochre; amatista—not now known by this name, but a fine purple red; green—terra vert; yellow—two qualities of ochre, dark and light, and giallolino, which resembled Naples yellow in tone. This is a very moderate palette, but it was supplemented by the colors subsequently applied in distemper. These were orpiment, cinabro (a red oxide), German blue (apparently a cobalt), vermilion, lake, verdigris, indigo, and white lead. When the picture was commenced in fresco, particular grounds were laid on the wet plaster in preparation for the colors which were to follow: for instance, the sky to be painted blue in distemper was prepared with a deep red (cinabrese)in fresco. The virgin's blue robe was first grounded with black mixed with red, and then painted with blue mixed with size prepared from glue, for red of egg would have made it green. The blue, however, has frequently become a bright green, spite of this care. There are numerous examples of these methods in pictures, extending from the age of Giotto to that of Raphael. In a painting by Lippo Memmi at Assisi a dark rich red in distemper is laid over a preparation of light red in fresco. By Ghirlandajo a brown robe has been colored in tempera over pale gray in fresco. The dark purple robe of the Cardinal Bonaventura in the fresco called the Dispute on the Sacrament, by Raphael, is spread over a preparation of red. Many other cases might be cited were it necessary. The most singular of all was the preparation for painting trees and bushes by a ground in fresco of black, on which the leaves, branches, sprays, buds, and flowers were executed of the proper colors in distemper. Illustrations of this custom are observable in pictures by Orcagna, Pietro Laurati, Simone Memmi, Masolino, Paolo Uccello, and many other artists; it did not survive the 15th century, and it is due to Masaccio to point out that he appears to have been the first to escape from this commonplace conventionality.

The methods of mixing colors and tints and their use in painting were reduced to system, whether for painting drapery or the nude. It was usual to prepare three pots of each color carefully graduated. Thus, for instance, in the preparation of a flesh tint, a certain quantity of lime, biancosangiovanni, was mixed with red; in another pot the same red, with much more lime; two equal portions of these tints were mixed in the third pot: thus three equal gradations were secured. A head, hand, or any part of the body being drawn on the wet plaster with fine lines with the brush, the shadows were painted with terra vert, then, the lightest flesh tint being taken, the lights were put in. This done, the middle tint was applied, the junctions between the two tints being carefully softened; next the darker color was laid in, all these tones being fused together in a proper way. The operations were repeated till sufficient solidity —impasto—was obtained. Another and much lighter tone served to mark the high lights, such as those on the nose, chin, and parts of the ears; lastly, the small and most brilliant points of light were touched with pure white, and the whites of the eyes were painted. The artist next outlined the nostrils, eyelids, and apertures of the ears with black, touched in the lower eyelids and the eyebrows with shades of sinopia, and with the same color the nostrils, upper lip, and the line between the lips. The hair was broadly shaded with terra vert, and washed over with light ochre; then the locks were defined with dark ochre, and the lights pencilled with a much lighter tint of the same; lastly, the outlines were strengthened with sinopia. Such usually were the methods pursued by Giotto and his followers. It is evident that painting thus, according to a fixed system, a master and his trained pupils could act together and harmonize their work in a manner otherwise unattainable. At the same time the individuality of the artist was not obliterated by this prevalence of rule. In the frescoes attributed to Giotto and his followers or compeers, it is not difficult to distinguish the different handiwork. In some the green shadows are modified with a warmer tint; in others the results are cold and formal; some paint with soft gradations, others in a harder manner, but the difference between the artists is still more observable in the drawing and proportions of the figures. As guiding cartoons were not prepared by the master, probably the assistants or pupils were only provided with his sketches, which they enlarged on the wall with such skill as they possessed; hence the varieties of proportion which are so remarkable.

Draperies were painted with graduated colors prepared in the same way; the lights, according to the usage of the Tuscan school, were heightened with pure white, and the shadows were glazed with washes of unmixed color, showing that the intonaco must have been damp when these were applied or they would not have adhered. Thus in these pictures the most important part of the work was pure fresco, whilst the tempera, although undoubtedly used, was less freely applied by Giotto than by his master Cimabue and his predecessors, judging from the mural paintings at Assisi. To the taste and genius of Giotto was owing this great improvement in the technical processes of mural painting.

The architectural details, where they occur as accessories or backgrounds, are carefully drawn and painted with infinite grace, and as architectural designs they are singularly beautiful, especially in the works of Giotto. It is true that they are invariably too small in proportion to the figures,—a peculiarity which they probably owe to the imitation of similar adjuncts in ancient Roman bassi-rilievi. The conventional routine of thus designing backgrounds lasted for rather more than a hundred and fifty years. There is an appearance of perspective, showing observation, but no knowledge of optical laws. The method was in every respect analogous to that which regulated the drawing of very similar details in ancient Roman art.

These mediæval mural pictures in Italy place painting much more upon an equality with the sister arts of architecture and sculpture than was the case in other parts of Europe; they exhibit intense thought, sentiment, and ascetic religious expression. They have not the weird grandeur and sublimity of the designs of Cimabue, nor do they show efforts like his to represent ideal beauty; but they approach much more nearly towards the representation of familiar nature, and the expression of human emotion. Still this art was conventional; of the infinite and beautiful variety of inanimate nature, or of its effects of sunshine and shade, the artists had no perception whatever.

The idea that painting possessed such a power had not yet been awakened; but at the beginning of the 15th century a genius was born who led it into new paths, and exercised a good influence upon it, which produced the most beneficial results. Tommaso da San Giovanni, called Masaccio, was this great painter. Another artist, at the present time of a more widespread reputation, divides the honors of the first portion of the 15th century with Masaccio, to whom, however, he was far inferior in originality or perception of nature's variety and beauty. This was Fra Beato Angelico (see FIESOLE). He continued the technical processes of the artists of the preceding century, and in his work mediæval painting culminated and became perfect technically; but before he left the scene of his loving labors he was so far influenced by the rising wave of the revival that he abandoned Gothic forms in his accessories for timid imitations of classic architecture.

In practice Fra Beato adhered to the last to the precepts of the older school, but with a freshness of color, a beauty of form, and a grace of manipulation all his own. He finished his mural pictures with solid distemper of such peculiar excellence—very probably employing gum tragacanth, so insoluble is the mixture—that it remains comparatively unchanged; and he transmitted to his successors the old schemes of preparatory grounds in fresco for the subsequent finishing coats in tempera, which for so long a period characterized monumental art. This is observable in many of his numerous works, and especially in his great mural painting of the Crucifixion in the chapter house of St. Mark's, Florence. In conformity with traditional custom, he laid in the sky in deep red in preparation for blue, which, however, has never been applied. It is to be regretted that the pious artist did not finish this his most important work, but it illustrates in a very remarkable way how far he carried fresco before having recourse to distemper.

The great and gifted painter Masaccio relinquished the precepts which had guided his predecessors and were practised by his contemporary Fra Beato, as he departed from their methods of composition, drawing, and chiaroscuro. His insight into the true appearances of nature was that of genius, and he painted these with fidelity, and not conventionally, like the older masters. His art was a revelation: he burst through the routine by which painting had hitherto been bound; it may be said that he anticipated all that was to be done after him, and that no artist, however great, of those who followed him could escape finding in the works of this wonderful originator anticipations of his own qualities as an artist. They were studied as models by the greatest artists of succeeding times, by Michelangero, and by Raphael, who imitated him to the extent of plagiarism. Standing before the frescoes of Masaccio we are introduced to new rules destined at a future time to regulate the practice of the art. No frescoes hitherto painted had been so pure; they are not entirely free from retouching in distemper, but this was reduced to a minimum, yet with the attainment of a richness of color and a force of chiaroscuro never surpassed. Masaccio could paint the effects of sunlight with extraordinary power and brilliancy; when he chose he could rival the finish and refinement of Leonardo da Vinci; he created the art of characteristic portraiture, whilst he could rise to a lofty ideal. He shadowed forth the power of form of Michelangelo, the natural dignity of Raphael, the brilliant chiaroscuro of Correggio, and the rich color of Titian. He cast behind him the conventional pattern-like landscape of his predecessors, and hinted at a new and true idea of representing scenery. Technically he painted with an impasto and a freedom hitherto unthought of, except by his reputed master Masolino da Panicale, who had sufficient insight in moments of his existence to escape from formalism and to feel the influence of nature. It is not to be wondered at that with such qualities as these Masaccio's frescoes should have been objects of study and admiration to generations of artists. An aberration in modern criticism and a fantastic and somewhat weak devotion to mediæval forms give a transient preference to the works of his devout contemporary; but in those of Masaccio the great principles of the revival rise brilliantly above the horizon; in those of Fra Beato the ideas of the Middle Ages set with pure and tranquil ray.

With the advancement of the art of painting we have a discreditable decline in the requisite structural preparations, which has produced disastrous effects on many noble works of art. Frescoes were only too frequently painted upon ill-built rubble walls, with unequal surfaces, which were not brought to a level by careful preparatory coats of plaster. This is unfortunately exemplified in the frescoes of Masaccio. The results of uneven surfaces are the accumulation of dust on the pictures and of other impurities, seldom removed, and the removal of which is accompanied by a certain risk. The careful structure of the Romans was known to their Italian successors, and was described by Leon Battista Alberti and other architects, but apparently with little effect. It is absolutely necessary that walls intended to be painted upon should be very carefully constructed; the Pompeian system is excellent, and to it may be added thin beds of asphalt at the bases and summits of the stone or brick work. It must never be forgotten that damp is a deadly enemy to fresco-painting, and that unequal surfaces are unsightly as well as destructive.

The history of mural painting may next be illustrated by reference to the works of Benozzo Gozzoli. As a pupil of Fra Beato Angelico it might be expected that he would continue to use distemper painting extensively, and such was the case. Greatly excelling his master in power of drawing, although with less sentiment, endowed with prolific fancy and capable of unwearied exertion, he has left very important mural pictures, which were begun in fresco, but were so entirely finished with distemper as to be in fact distemper pictures. The joinings of the intonaco in his works present a somewhat unusual appearance. They are for the most part carefully concealed, but in one of his compositions at Pisa they are very observable, and they are invariably cut at some distance from the outlines of the figures; they are not unlike the joints between the polygons which form an Etruscan wall. Thus they include considerable portions of the background. Other artists, notably Masolino, and at a later period Michelangelo, frequently included parts of the background in the day's painting, which artists will readily recognize as, where possible, important in principle. The objection, however, is obvious. The joinings which do not follow the outlines disfigure the surface, unless carefully concealed by the help of distemper painting, which in modern times would be considered objectionable. When the paintings are so far from the eye that the joinings are invisible, as in the Capella Sistina, the method is valuable. Towards the close of the 15th century Filippino Lippi in his works further illustrates the history of mural painting. He was employed to finish Masaccio's fresco in the Brancacci Chapel, representing the Raising of the King's Son, and he showed himself to be in every respect worthy of the honorable commission. He painted in the centre of the picture a group of eight figures, the heads of which in truth to nature and refined execution literally never have been excelled. He lacks the force of Masaccio; he did not see the effect of sunlight in the same way; he rather painted twilight; but he introduced into fresco a variety in the management of flesh tints and grace of technical execution which unfortunately diminished in his later works. These were his characteristics when he painted in competition with Masaccio. His method was also to prepare the draperies of the figures in fresco, and then to glaze them copiously with distemper color. Whilst Masaccio invariably painted hands in fresco, Filippino as invariably painted them in tempera over the draperies. This may have saved trouble, but was not otherwise commendable. It is to be remarked that apparently he first shaded them with terra vert like the mediæval painters, subsequently adding the flesh tints. Domenico Ghirlandajo follows as an important and very able mural painter. He also commenced his works in fresco, in which he painted admirably with a large effective manner combined with finish. He used distemper extensively; and as an unctuous glazing has been found upon frescoes by his brother Rodolfo, it is possible that a new process of retouching was introduced by these brothers. It may have been in their studio that Michelangelo when a boy learnt to retouch fresco in tempera; he undoubtedly retained in his method some impressions derived from his first teachers.

Pietro Perugino excelled in the art of fresco-painting as it was understood in his time. His works illustrate two very different methods. He painted in pure fresco; and it may be observed that, whilst his oil pictures are marked by such rich and powerful coloring, some of his frescoes are like delicate water-color drawings. A glance at the wall paintings of Masaccio would have shown him how far color can be obtained in fresco. No doubt he had his motives, and when he wished to produce force and color, like all other artists of the time he had recourse to retouching in distemper. His famous frescoes in the Sala del Cambio at Perugia, are thus retouched all over, and consequently the usual and unequal darkening of the colors has taken place. They have force, but they have lost all brilliancy, and they illustrate in a remarkable way the inexpediency of a manner of painting which would suffer from the mephitic atmosphere of a crowded place of meeting. Pure frescoes would have remained clear or could have been cleaned, whilst retouched frescoes darkened without remedy.

Another remarkable contemporary artist, Bernardino Pinturicchio may be said to have carried distemper painting over fresco to the most extravagant degree of any master of his time. He fell back on the primitive conventions of gilt rilievo ornaments in stucco in his paintings, on hatching with gold, and other barbaric splendors of early art. His mural pictures at Siena resemble illuminations in choral books. They are in excellent preservation, having escaped damp and bad air within the well-built library of the cathedral.

It is obvious that the progress made in oil-painting in the 15th century must have produced important effects upon fresco and ideas connected with it. Some oil painters transferred to their art the light brilliancy of wall painting, and notably Michelangelo in his oil picture for Angelo Doni. Leonardo da Vinci estimated more justly the capabilities of the more powerful vehicle. Tempera, after a brief struggle, sank before it, and disappeared from amongst the processes of art, whilst in mural painting the habits long prevalent of retouching and glazing with strong distempers were confirmed for a time, and new methods were invented to make fresco rival the splendor and force of oil. It is to be regretted that it was not seen that this could be adequately attained, as had been demonstrated by Masaccio, with little aid from extraneous means. Leonardo da Vinci evidently thought that fresco-painting was unequal to produce the effects which he desired, and he executed his great mural picture of the Battle of Anghiari in encaustic, and his still more celebrated work, the Last Supper, in oil, with what disastrous results need not be recorded here except as a warning to artists to avoid methods not sanctioned by experience and not tested by time.

A period is now reached, the close of the 15th and first years of the 16th centuries, when modifications were made in the technical preparations for fresco. Benozzo Gozzoli was probably one of the last of the artists who drew the outlines of his mural pictures upon the preparatory coat of plaster. Writers upon fresco have only noticed one illustration of this custom in the ruins of a fresco by Pietro di Orvieto at Pisa, but it was a generally established method from the 13th to the close of the 15th century.

The account which we have in Vasari of the preparation of the cartoons by Leonardo da Vinci and Michelangelo for their rival mural pictures in the hall of the municipal palace of Florence brings the history of fresco-painting to an important epoch. The execution of such full-size drawings, and of the previous sketches and studies requisite under the circumstances, involved an amount of thought and care hitherto little contemplated. The drawings in red on walls or rough plaster were freely executed with little study, and were not calculated to improve the artist's skill in the delineation of form; but the preparation of the cartoon was for art the most important step ever taken towards the cultivation of mastery in design, and to the acquisition of that profound knowledge of form which characterized the great painters of the first part of the 16th century, the golden age of art. The cartoonist first prepared his sketch on a small scale, then made his studies from nature, either in separate drawings or in a general delineation of the entire composition. In like manner he considered accessories and details, and made careful studies of drapery. Some artists modelled the whole subject so as to observe the light and shade. This done, the paper for the cartoon was stretched and squared. Pupils were sometimes employed to transfer the sketches to this the working drawing. How carefully such cartoons were sometimes executed is described in the most interesting manner in the history of that famous one which Michelangelo drew with such infinite pains. The wall to be painted was then squared like the cartoon, which was cut into pieces of a convenient size, and so was fitted by the help of the squares to the freshly laid intonaco. The outline was then transferred to the yielding plaster either by the help of the pounce bag, the cartoon having been pricked, or it was marked through the paper with the stylus. It is profoundly interesting to observe the different methods followed by the old masters in preparing the outline. The two greatest of all, Michelangelo and Raphael, were scrupulously careful. They transferred the forms to the wet intonaco with the pounce, after which Michaelangelo marked them in some places with a very sharp cutting point. Soddoma, a great painter, was on the contrary very careless in the preparation of his cartoon and its transfer to the plaster. He frequently altered the drawing whilst painting. Bernardino Luini was content with mere indications of the contours. Pordenone indicates a fiery spirit in his mode of dashing them in with any sharp instrument at hand.

The history of the practice of fresco painting now reached its apex in the works of Michelangelo and Raphael; those of a long line of great mural painters have illustrated in various ways most of the technical processes of this difficult but noble art. Michelangelo was unwilling to paint; he remarked to Pope Julius, "It is not my profession;" yet his frescoes may be taken as perfect types of what ought to be aimed at by every practitioner, so far as method is concerned, apart from the retouching in distemper. The following apparently was his mode of painting. The local color was laid on and modelled into the cool shadow—(the use of terra vert in shadow had now disappeared, and gray taken its place)—with that perfect knowledge of form and truth of gradation habitual to Michelangelo, and observable in all his drawings. The lights were then painted with a full brush and softened into the half tints; then the darker parts of the shadows were added. It is observable in the execution of this great artist that he modelled the color in fresco with all the breadth and impasto which slow drying oil paint makes possible. This distinguishes at a glance his work from that of his assistants, which is laboriously stippled. It has been ascertained beyond a possibility of doubt that Michelangelo was not satisfied with pure fresco-painting; but he did not repaint with distemper,—he merely glazed with a thin coating of a blackish gray mixed with size, which he applied in some places with washes, in others with stippling. This is very different from the older methods of painting over the fresco with solid distemper color.

In the celebrated mural paintings of Raphael in the Vatican changes of method are very observable; yet it may reasonably be inferred that the great artist's wish was to paint in pure fresco. A century before the execution of these works, Masaccio had shown what great results could be achieved without having recourse to extensive retouchings, and Raphael carefully studied his frescoes. In his exquisite early fresco in San Severo in Perugia he showed that he adhered to these principles. In his famous Vatican frescoes he at first partially adhered to the mixed method: besides moderate retouching in the usual manner, he prepared by a coat of red in fresco for painting blue in distemper; but when he executed the noble picture of the School of Athens, he evidently desired to get rid of this old system, and he painted the blues without preparation on the damp intonaco. It was well known from an early period of the art that ultramarine resisted the caustic action of lime. Whatever the blue which Raphael used on this occasion, it has faded more than the other colors in the picture, which is therefore now out of harmony, and his experiment so far failed. At other times the contrary result is observable. In the Aurora by Guido it is the other colors which have faded, and the blues are now too strong, showing that ultramarine if carefully prepared stands better than other colors. Guercino is the artist who has introduced blue in pure fresco with most technical skill, and consequently his works retain a harmony which is very rare. Raphael evidently aimed at pure fresco-painting, but may have been dissatisfied with the results; for he allowed the greatest latitude to his pupils, who employed distemper and apparently other vehicles copiously, when executing portions of their master's works. When he died, charged as they were with the completion of the Stanze, and provided with his designs, they at once commenced on one of the walls of the Hall of Constantine to paint in oil, as if they had been converted by their master's rival Sebastian del Piombo. Such was the admiration excited by these works that Cardinal Dovizza da Bibbiena wrote,—"The pupils of Raphael have executed a specimen of a figure in oil on the wall, which was a beautiful work of art, so much so that no one would look at the rooms painted in fresco by Raphael."

These were idle discussions and idle experiments; each branch of art has its field of operation, and it is to be regretted that the old masters generally were not satisfied with the effect of pure fresco-painting. Masaccio triumphantly illustrated its true powers. In the Brancacci chapel at Florence the perfection to which the noble art may be carried without extraneous aid is amply illustrated. In the efforts made to give fresco the richness of color and force of chiaroscuro of oil-painting, its finest qualities were in fact destroyed. In the attempt there is a manifest confusion of ideas. Fresco-painting is in a special manner the handmaiden of architecture, with which it harmonizes and to which it adapts itself in a manner from which oil-painting seeks to escape. Oil-painting asserts itself, fresco aims rather to adorn and complete the architecture with which it is associated; but its history shows that not all artists understood its true limits or its real mission.

Some lessons taught us by the results now ascertainable of the technical processes of the old masters may be summed up. The importance of careful construction of the wall so as to prevent the action of damp is evident. Undoubtedly the best walls are those of brick with facings in the ancient Roman manner. The ruinous consequences of badly constructed roofs have been shown by the state of the mural paintings at Assisi. That pure fresco is a much more durable art than the mixed method of fresco and distemper-painting is obvious. Of distempers used, those containing animal matter are the worst, especially that prepared from eggs, for when they are assailed by damp, black fungi spread over such pictures and ruin them. It is needless now to point to the disastrous results which must follow the use of white lead; for as a pigment in tempera-painting its great defect is known to all artists. The employment of pozzolana in the preparatory coats of plaster may appear to be favorably supported by ancient examples. Pozzolana is a volcanic ash, which, mixed with lime, forms the famous Roman cement, and has admirable qualities; but it must not be forgotten how Michelangelo suffered from using it, and how mould spread on his frescoes. The ancient masters prepared intonaco in two ways,—with lime and sand, and with lime and marble dust. If the sand used is quartz, the mixture is insoluble, and the fresco painted upon it will be permanent. If marble dust, on the contrary, be preferred, as it was by many old masters from its beauty, it is soluble, and it facilitates the formation of sal nitre on the surface, a common enemy and a dangerous one of frescoes, for it destroys the colors. It is important that lightning conductors should be provided; as at Assisi the action of the electric fluid on the frescoes of the vaults, where it has played over the surface, has blackened them.

The Germans, who have done much for the restoration of fresco in the present century, have added to the list of colors formerly in use, and in doing so have been aided by modern chemistry. They have also experimentally fixed the time requisite for the preparation of the lime for the intonaco, and have greatly improved the structure of walls intended to be painted. They have restored the ancient method of lining walls internally with brick; they have interposed sheets of lead between the bases of those walls and the foundations, and prevent the descent of damp from above in the same way. They consider it enough to keep the lime to be used for from ten to twelve months, whether for the intonaco or for painting with; and the following is a list of the colors which they have added to those employed by the old masters:—Raw and burnt terra di siena, all kinds of burnt ochres, a lake-colored burnt vitriol, a purple burnt vitriol, raw and burnt umber, Cologne earth burnt forming an excellent black, chrome green, cobalt green, and for blue cobalt as now prepared, or imitations of it.

The frescoes of the Venetian masters, and those of Antonio Allegri da Correggio, add little to our knowledge of the technical processes of mural painting. As might be expected, the works of the Venetians, which are comparatively few in number, show more attention to color than to form, and they are slight in execution. The most brilliant are those by Paul Veronese, whose ideas of color and effect in a special manner fitted him to deal with the conditions of monumental art. Correggio illustrates, as might be expected, the magic effects of sunlight alternating with shade, and the beauty of form and feature which distinguish the immortal artist. Technically, his processes resemble those of other Italian masters, and his works have suffered in the same manner and from the same causes.

Enough, it is hoped, has been said to explain the processes of fresco-painting as practised by the greatest masters of the art. Some of these have led to their decay, but a combination of ignorance and carelessness on the part of the Italians themselves has been the chief cause of the widespread ruin of the greatest examples of the art of painting which the genius of any nation has produced.

Modern Fresco-Painting.—The practice of painting in fresco has been continued to the present time in Italy; it has been employed not only for the decoration of churches, public buildings, and private residences, but also for painting exteriors. The traditional habit of painting the exteriors of houses prevalent in Genoa and its neighborhood for centuries, and less frequently in other parts of Italy, still continues, although in a very inferior manner and by painters of a much more ordinary class than formerly. For the execution of interior work excellent fresco-painters are readily found, and the Italians of the present day are in no respect inferior to their predecessors in practical skill, however little they may equal them in the high characteristics of art. Modern Italian masters paint in pure fresco with much force of color, satisfactory execution, and excellent finish; they repudiate the old system of retouching with distemper colors, whilst apart from the practice of fresco they are probably the best painters in distemper in Europe. In this art they paint like the old masters with the egg vehicle, but as a separate art of mural painting, and never as an adjunct to fresco.

Towards the commencement of the present century several German artists resident in Rome studied the art of fresco with much zeal, and laid the foundation of the modern school of fresco-painters in Germany. Some of them acquired a great amount of technical skill, and followed the system of the old masters, by training pupils as assistants with satisfactory results, and thus were enabled to undertake public work with comparative facility and at a reasonable expense. As already noticed, they improved the art in important technical respects, as well as the structure of edifices to be painted, and settled the best methods for preparing the lime for plastering with, and for painting.

In France the art of fresco-painting has not been successfully developed. French artists who practise mural painting with great ability prefer oil or wax-painting, an ancient method which they as well as the Italians and Germans have with much care and ingenuity endeavored to revive. They have not been able to restore the ancient encaustic, but they have devised useful and beautiful modes of mural painting and decoration.

A zealous attempt was made in England to promote the art of mural painting in fresco, in connection with the decoration of the new Houses of Parliament in London. Careful inquiries were made in Germany and Italy, and a valuable amount of information was gathered and published; and, after various experiments, artists of distinction and ability were employed to paint in fresco in the House of Lords and in other parts of the new national edifice. Notwithstanding the difficulties which beset the artists in the practice of an art so new to their experience and so different from their usual habits and experience, a considerable amount of success was achieved, highly creditable to them and to their zeal and perseverance. But fresco-painting has not been domiciled in Great Britain, nor has any great school of mural painters been formed. The excellent artists employed did not form schools as in Germany or in Italy, or as in France in a different branch of art; and without the aid of trained assistants public painting is impossible at a cost which can be brought within reasonable limits.

Before the revival of fresco-painting in London, Mr. Zephaniah Bell, a Scottish artist, who had studied the art in Italy, painted some clever and forcible frescoes at Muirhouse, near Edinburgh, which after the lapse of about forty-five years are still, with the exception of the yellows, fresh and in excellent condition.

Heath Wilson, "Report on Fresco-Painting," in the second *Report of the Commissioners of the Fine Arts*, London, 1843, and the same author's *Life and Works of Michelangelo Buonarroti*, 1876; also the *Reports* of the Commissioners on the Fine Arts, London, from 1842. (C. H. W.)

FRESCOBALDI, Girolamo, a celebrated musical composer, was born at Ferrara in 1587. Little is known of his life except that he studied music at his birthplace under Alessandro Milleville, and owed his first reputation to his beautiful voice. According to one account he went to Belgium, at that time still a centre of the art, where he is said to have lived till 1608, after which period he appears to have settled in Italy, at first in Milan, and from 1627 in Rome, where three years later he obtained the office of organist of St. Peter's Cathedral. At this period he had acquired great fame as a virtuoso on the organ, and according to Baini no less than 30,000 people flocked to St. Peter's on his first appearance there. He also excelled as a teacher, Frohberger, the celebrated German organist and precursor of Bach, being the most distinguished of his pupils. Frescobaldi's compositions show the consummate art of the early Italian school, and his works for the organ more especially are full of the finest devices of fugal treatment. He also wrote numerous vocal compositions, such as canzone, motets, hymns, etc., a collection of madrigals for five voices (Antwerp, 1608) being among the earliest of his published works. The year of his death is not sufficiently established. Fetis conjectures 1654.

FRESNEL, Augustin Jean (1788–1827), an illustrious French physicist, the son of an architect, was born at Broglie, in the department of Eure, in France, May 10, 1788. His early progress in learning was slow, and when eight years old he was still unable to read. At the age of thirteen he entered the École Centrale in Caen, and at sixteen and a half the École Polytechnique, where he acquitted himself with distinction. Thence he went to the École des Ponts et Chaussées. He served as an engineer successively in the departments of Vendée, Drôme, and Ille-et-Villaine; but his espousal of the cause of the Bourbons in 1814 occasioned, on Napoleon's reaccession to power, the loss of his appointment. On the second restoration he obtained a post as engineer in Paris, where much of his life from that time was spent. His researches in optics, continued until his death, appear to have been begun about the year 1814, when he prepared a paper on the aberration of light, which, however, was not published. In 1818 he read his celebrated memoir on diffraction, for which in the ensuing year he received the prize of the Academy of Sciences at Paris. He was in 1823 unanimously elected a member of the Academy, and in 1825 he became a member of the Royal Society of London, which in 1827, at the time of his last illness, awarded him the Rumford medal. In 1819 he was nominated a commissioner of lighthouses, for which he was the first to construct compound lenses as substitutes for mirrors (see Lighthouses). Fresnel died of consumption at Ville-d'Avray, near Paris, July 14, 1827. The undulatory theory of light enunciated by Hooke, and upheld by Huygens and Euler, but first founded upon experimental demonstration by Thomas Young, was extended to a large class of optical phenomena, and permanently established, by the brilliant discoveries and the mathematical deductions of Fresnel. By the use of two plane mirrors of metal, forming with each other an angle of nearly 180°, he avoided the diffraction caused in Grimaldi's experiment on interference by the employment of apertures for the transmission of the light, and was thus enabled in the most conclusive manner to account for the phenomena of interference in accordance with the undulatory theory. With Arago he studied the laws of the interference of polarized rays, and discovered that though when similarly polarized they affect each other as do ordinary rays, yet when rectangularly polarized they have no power of interference. Circularly polarized light Fresnel obtained by means of a rhomb of glass, known as "Fresnel's rhomb," having obtuse angles of 126°, and acute angles of 54°. His labors in the cause of optical science received during his lifetime only scant public recognition, and some of his papers were not printed by the Academy of Sciences till many years after his decease. But, as he wrote to Young in 1824, in him "that sensibility, or that vanity, which people call love of glory" had been blunted. "All the compliments," he says, "that I have received from Arago, Laplace, and Biot never gave me so much pleasure as the discovery of a theoretic truth, or the confirmation of a calculation by experiment." For further details as to the scientific achievements of Fresnel see ARAGO and OPTICS. His papers were published chiefly in the memoirs of the Academy of Sciences, the bulletins of the Société Philomatique, and the *Annales de Chimie*.

See Duleau, "Notice sur Fresnel," *Revue Ency.*, t. xxxix.; Arago, *Œuvres complètes*, t. i.; and Dr. G. Peacock, *Miscellaneous Works of Thomas Young*, vol. i.

FRESNILLO, a town of Mexico, in the state of Zacatecas, is situated 30 miles N.W. of Zacatecas, on a branch of the Santiago river, in the plain which divides the mountains of Santa Cruz and Deganos from the Zacatecas range. It is well built, and its streets are clean and regular. The country in the immediate neighborhood is pretty and fertile, and maize and wheat are cultivated. Fresnillo is noted chiefly for its silver mines situated at the adjacent knoll of Proaño. They were discovered in 1569, and for a long period have been the most productive in the country, the annual yield averaging more than £500,000. A school of mines was founded in 1853. Population about 15,000.

FRESNOY, CHARLES ALPHONSE DU (1611–1665), a painter and writer on his art, was born in Paris, son of an apothecary. He was destined for the medical profession, and well educated in Latin and Greek; but, having a natural propensity for the fine arts, he would not apply to his intended vocation, and was allowed to learn the rudiments of design under Perrier and Vouet. At the age of twenty-one he went off to Rome, with no resources; he drew ruins and architectural subjects. After two years thus spent, he re-encountered his old fellow student Pierre Mignard, and by his aid obtained some amelioration of his professional prospects. He studied Raphael and the antique, went in 1633 to Venice, and in 1656 returned to France. During two years he was now employed in painting altar-pieces in the château of Raincy, landscapes, etc. His death was caused by an attack of apoplexy followed by palsy; he expired at Villiers le Bel, near Paris. He never married. His pictorial works are few; they are correct in drawing, with something of the Caracci in design, and of Titian in coloring, but wanting fire and expression, and insufficient to keep his name in any eminent repute. He is remembered now almost entirely as a writer rather than painter. His Latin poem, *De Arte Graphica*, was written during his Italian sojourn, and embodied his observations on the art of painting; it may be termed a critical treatise on the practice of the art, with general advice to students. The precepts are sound according to the standard of his time; the poetical merits slender enough. The Latin style is formed chiefly on Lucretius and Horace. This poem was first published by Mignard, and has been translated into several languages. In 1684 it was turned into French by Roger de Piles; Dryden translated the work into English prose; and a rendering into verse by Mason followed, to which Sir Joshua Reynolds added some annotations.

FREUDENSTADT, a town of Würtemberg, circle of the Black Forest, on the right bank of the Murg, 42 miles W.S.W. of Stuttgart. It has a large square, a town-house, and a Protestant church of later Gothic architecture, with two naves at right angles to each other, in one of which the male and in the other the female members of the congregation worship separately. The manufactures include woollen cloth, nails, white lead, potash, and Prussian blue; and there is some trade in corn, cattle, and wood. Freudenstadt was founded in 1599 by Protestant refugees from Austria, and at first it received from Duke Frederick the name of Frederickstadt, which on account of the peaceful prosperity of the town was afterwards changed to Freudenstadt. The population in 1875 was 5325.

FREUDENTHAL, a town of Austrian Silesia, circle of Troppau, on the Black Water, 22 miles W. of Troppau. It has a large castle, a Piarist college, an orphan asylum, a head real-school, and an under real-school. Its principal industries are linen and woollen weaving, and the manufacture of leather, chemicals, and metal wares. The population in 1869 was 6243.

FREYA, in Teutonic mythology, one of the Vanen, or spirits of the breathing wind which have their abode in Vansheim, or middle air between the upper and under world. Freya, or Fregga, becomes the wife of Odur or Woden (Odin), and the mother of Jörd, the earth, thus answering to the Greek Demeter. In the myth of Thor, whose hammer is stolen by the giant Thoym, Freya lends her feather garment to Loki, and thus enables him to go in search of it. Thoym refuses to give it up, unless Freya will consent to be his wife; and as Freya will not go, Thor, on the advice of the Heimdall, descends to Jötunheim in the disguise of a bride, and Thoym, taking the god to be Freya, meets his doom at his hands at the moment of his fancied nuptials.

FREYCINET, LOUIS CLAUDE DESAULSES DE (1779–1842), French navigator, was born at Montélimart in Dauphiny, August 7, 1779. In 1793 he entered the French navy. After taking part in several engagements against the English, he joined in 1800, along with his brother Henri Louis (1777–1840), who afterwards rose to the rank of admiral, the expedition sent out under Captain Baudin in the "Naturaliste" and "Géographe" to explore the south and south-west coasts of Australia. Much of the ground already gone over by Flinders was revisited, and new names imposed by this expedition, which claimed credit for discoveries really made by the English navigator (see FLINDERS). In 1805 Louis returned to Paris, and was entrusted by Government with the work of preparing the maps and plans of the expedition. In 1817 he commanded the "Uranie," in which Arago and others went to Rio de Janeiro, to take a series of pendulum measurements. This was only part of a larger scheme for obtaining observations, not only in geography and ethnology, but in astronomy, terrestrial magnetism, and meteorology, and for the collection of specimens in natural history. For three years Freycinet cruised about, visiting Australia, the Marianne, Sandwich, and other Pacific islands, South America, and other places, returning to France, notwithstanding the loss of the "Uranie," with fine collections in all departments of natural history, and with voluminous notes and drawings which form an important contribution to a knowledge of the countries visited. The results of this voyage were published under Freycinet's supervision, with the title of *Voyage Autour du Monde*, etc., in 1725–44, in 8 quarto volumes, and several folio volumes of fine plates and maps. It has not, however, been completed. Freycinet was admitted into the Academy of Sciences in 1825, and was one of the founders of the Paris Geographical Society. He died August 18, 1842.

FREYTAG, GEORG WILHELM FRIEDRICH (1788–1861), Arabist, was born at Lüneburg on the 19th of September, 1788. After the usual preliminary training he entered the university of Göttingen as a student of philology and theology. From 1811 to 1813 he acted as repetent or theological tutor there, but in the latter year he accepted an appointment as sub-librarian, at Königsberg, unable, it is said, any longer to witness the subjection of Hanover to the French. In 1815 he became a chaplain in the Prussian army, and in that capacity visited Paris, where he had ample opportunities for the cultivation of his favorite Oriental studies. On the proclamation of peace he resigned his chaplaincy, but with the sanction and support of his Government continued his researches in Arabic, Persian, and Turkish at Paris, under De Sacy. In 1819 he was appointed to the professorship of Oriental languages in the recently established university of Bonn; and this post he continued to hold until his death, which took place on the 16th of November, 1861. Besides publishing a compendium of Hebrew grammar (*Kurzgefasste Grammatik der Hebräischen Sprache*, 1835), and a treatise on Arabic versification (*Darstellung der Arabischen Verskunst*, 1838), he edited two volumes of Arabic songs (*Hamasæ Carmina*, 1828–52) and three of Arabic proverbs (*Arabum Proverbia*, 1838–43). But his principal work was the laborious and praiseworthy *Lexicon Arabico-Latinum* (1830–37), which rapidly superseded the earlier lexicons, and which, though not to be compared with the magnificent torso of Lane, is likely to remain long in current use as embodying the best results of the labors of De Sacy and his school. An abridgment of the larger work was published in 1837.

FRIAR, from the Latin *frater* through the French *frère* (Ital. *frate* or *fra*, Span. *frayle* or *fray*), a secondary form of a word which is common to all the Aryan languages, is a name commonly applied in English to any lay member of any mendicant order. One who has received ordination is usually dignified with the appellation of father. The church of Rome at present recognizes a considerable number of mendicant orders; but at the time when the word first became current in England, there were practically only four, namely, those which alone had been sanctioned by Pope Gregory X. at the second council of Lyons in 1274. They were the Eremite or Austin Friars, the Carmelites or White Friars, the Dominicans or Black Friars (sometimes also called preaching friars), and the Franciscans, Minors, or Gray Friars. For some estimate of the influence of these begging friars on the intellectual and social life of England, see ENGLAND, vol. viii. pp. 284, 285. They were first brought into Scotland during the reign of Alexander II., but for many years afterwards were subject to the provincials in England. The "Trinity Friars" also had a monastery at Fail in Kyle (Ayrshire); and their provincial had at one time a seat, in virtue of his office, in the Scottish Parliament. Members of the same order, popularly known as "crouched friars" or cross-bearers (fratres cruciferi), began to appear in England also about the year 1244, and occasional reference is made to them in various ecclesiastical constitutions of that and of the following century; but they never attained to any great importance. See MONACHISM, CARMELITES, DOMINICANS, FRANCISCANS.

FRIBOURG. See FREIBURG.

FRICTION is the resistance which every material surface presents to the sliding of any other such surface upon it. This resistance is due to the roughness of the surfaces; the minute projections upon each enter more or less into the minute depressions on the other, and when motion occurs these roughnesses must either be worn off, or continually lifted out of the hollows into which they have fallen, or both, the resistance to motion being in either case quite perceptible and measurable. Friction is preferably spoken of as "resistance" rather than "force," for a reason exactly the same as that which induces us to treat stress rather as molecular resistance (to change of form) than as force, and which may be stated thus:—although friction can be utilized as a moving force at will, and is continually so used, yet it cannot be a primary moving force; it can transmit or modify motion already existing, but cannot in the first instance cause it. For this some external force, not friction, is required. The analogy with stress appears complete; the motion of the "driving link" of a machine is communicated to all the other parts, modified or unchanged as the case may be, by the stresses in those parts; but the actual setting in motion of the driving link itself cannot come about by stress, but must have for its production force obtained directly from the expenditure of some form of energy. It is important, however, that the use of the term "resistance" should not be allowed to mislead. Friction resists the motion of one surface upon another, but it may and frequently does confer the motion of the one upon the other, and in this way causes, instead of resists, the motion of the latter. This may be made more clear, perhaps, by an illustration. Suppose we have a leather strap A passing over a fixed cylindrical drum B, and let a pulling force or effort be applied to the strap. The force applied to A can act on B only at the surfaces of contact between them. There it becomes an effort tending either to move A upon B, or to move the body B itself, according to the frictional conditions. In the absence of friction it would simply cause A to slide on B, so that we may call it an effort tending to make A slide on B. The friction is the resistance offered by the surface of B to any such motion. But the value of this resistance is not in any way a function of the effort itself,—it depends chiefly upon the pressure normal to the surfaces and the nature of the surfaces. It may therefore be either less or greater than the effort. If less, A slides over B, the rate of motion being determined by the excess of the effort over the resistance (friction). But if the latter be greater, no sliding can occur, *i.e.*, A cannot, under the action of the supposed force, move upon B. The effort between the surfaces exists, however, exactly as before,—and it must now tend to cause the motion of B. But the body B is fixed,—or, in other words, we suppose its resistance to motion greater than any effort which can tend to move it,—hence no motion takes place. It must be specially noticed, however, that it is not the friction between A and B that has prevented motion, this only prevented A moving on B,—it is the force which keeps B stationary, whatever that may be, which has finally prevented any motion taking place. This can be easily seen. Suppose B not to be fixed, but to be capable of moving against some third body C (which might, *e.g.*, contain cylindrical bearings, if B were a drum with its shaft), itself fixed,—and further, suppose the frictional resistance between B and C to be the only resistance to B's motion. Then if this be less than the effort of A upon B, as it of course may be, this effort will cause the motion of B. Thus friction causes motion, for had there been no frictional resistance between the surfaces of A and of B, the latter body would have remained stationary, and A only would have moved. In the case supposed, therefore, the friction between A and B is a necessary condition of B receiving any motion from the external force applied to A.

Without entering here on the mathematical treatment of the subject of friction, some general conclusions may be pointed out which have been arrived at as the results of experiment. The "laws" first enunciated by Coulomb (1781), and afterwards confirmed by Morin (1830–34), have been found to hold good within very wide limits. These are—(1) that the friction is proportional to the normal pressure between the surfaces of contact, and therefore independent of the area of those surfaces (*i.e.*, of the intensity of the pressure), and (2) that it is independent of the velocity with which the surfaces slide one on the other. For many practical purposes these statements are sufficiently accurate, and they do in fact sensibly represent the results of experiment for the pressures and at the velocities most commonly occurring. Assuming the correctness of these, friction is generally measured in terms simply of the total pressure between the surfaces, by multiplying it by a "coefficient of friction" depending on the material of the surfaces and their state as to smoothness and lubrication. But beyond certain limits the "laws" stated are certainly incorrect, and are to be regarded as mere practical rules, of extensive application certainly, but without any pretension to be looked at as really general laws.

Coulomb pointed out long ago that the resistance of a body to be set in motion was in many cases much greater than the resistance which it offered to continued motion; and since his time writers have always distinguished the "friction of rest," or static friction, from the "friction of motion," or kinetic friction. He showed also that the value of the former depended often both upon the intensity of the pressure and upon the length of time during which contact had lasted, both which facts quite agree with what we should expect from our knowledge of the physical nature, already mentioned, of the causes of friction. It seems not unreasonable to expect that the influence of time upon friction should show itself in a comparison of very slow with very rapid motion, as well as in a comparison of starting (*i.e.*, motion after a long time of rest) with continued motion. That the friction at the higher velocities occurring in engineering practice is much less than at common velocities has been shown by several modern experiments, most recently by those of Captain Douglas Galton (Brit. Assoc., Dublin Meeting, 1878, and Inst. Mech. Eng., Paris and Manchester Meetings, 1878) on the friction between brake-blocks and wheels, and between wheels and rails. Until quite lately, however, no increase in the coefficient of friction had ever been detected at slow speeds, but the recent experiments of Prof. Fleeming Jenkin (*Phil. Trans.*, 1877, pt. 2) have shown conclusively that at extremely low velocities (the lowest measured was about ·0002 feet per second) there is a sensible increase of frictional resistance in many cases, most notably in those in which there is the most marked difference between the friction of rest and that of motion. These experiments distinctly point to the conclusion, although without absolutely proving it, that in such cases the coefficient of kinetic friction gradually increases as the velocity becomes extremely small, and passes without discontinuity into that of static friction. We know that both at very high and very low pressures the coefficient of friction is affected by the intensity of pressure, and that, just as with velocity, it can only be regarded as independent of the intensity and proportional simply to the total load within more or less definite limits. Recent experiments have not, however, been directed so much to this point as to the influence of velocity, which we have already mentioned. (A. B. W. K.)

FRIEDLAND, a town of Bohemia, the chief town of a circle, is situated in the valley of the Wittich at the confluence of that river with the Rasnitz, 14 miles E. of Zittau. Besides the old town, which is still surrounded by walls, it contains three suburbs. The principal industry is the manufacture of woollen and linen cloth. Friedland is chiefly remarkable for its old castle, which occupies an imposing situation on a small hill commanding the town. The tower of this building was erected in 1014, and the whole structure was completed in 1551. It was several times besieged in the Thirty Years' and Seven Years' Wars. In 1622 it was purchased by Wallenstein, and his likeness, painted in 1626, is included in the list of portraits of former possessors of the castle which adorn its walls. The population in 1875 was 4482.

FRIEDLAND, a town of Germany, in the grand-duchy of Mecklenburg-Strelitz, circle of Stargard, is situated on the Mühlenteich, 35 miles N.E. of Strelitz. It is surrounded by walls, and possesses a fine Gothic church and a gymnasium. It has manufactures of woollen and linen cloths, leather, and tobacco. Friedland was founded in 1244 by the margraves John and Otho III. of Brandenburg. The population in 1875 was 5086.

FRIEDLAND, a town of Prussia, in the government district of Königsberg, province of Prussia, is situated on the Alle, 27 miles S. E. of Königsberg. At Friedland Napoleon gained a victory over the Russians under Bennigsen (June 14) which led to the peace concluded at Tilsit July 7, 1807. The population in 1875 was 3299.

FRIEDLAND, VALENTINE. See TROTZENDORF.

FRIENDLY ISLANDS. The group thus named by Captain Cook, and otherwise called after the name of its chief island Tonga, was discovered by Tasman in 1643. It lies in the South Pacific, on the S. W. limits of the area occupied by the Polynesian race, about 350 miles S. S. W. from Samoa, and 250 E. S. E. from Fiji. The long chain of islands, numbering about 150, though with a collective area hardly exceeding 400 square miles, extends from 18° 5′ to 22° 29′ S. lat., and 173° 52′ to 176° 10′ W. long., and is broken into three groups, viz., the Tonga to the S., Habai (which again is divided into three clusters) in the centre, and Haafulahao or Vavau, to the N. Along the W. side of the N. half of this chain is a line of volcanic action, where the islands (of which three are active volcanoes) are high and wooded, one peak rising over 5000 feet. But the great majority of the islands are level, averaging 40 feet high, with hills rising to 600 feet; their sides are generally steep; they are formed of coral limestone, in some places a compact white rock, and in Vavau occasionally crystalline, and containing stalactitic caves of great beauty. The surface is covered, which is unusual in coral islands, with a deep rich mould, mixed towards the sea with sand, and having a substratum of red or blue clay. The soil is thus very productive, although water is scarce and bad. Running streams are very rare, but streams and basins of clear water occur in the limestone rock below the surface.

Reefs.—Barrier reefs are rare; fringing reefs are numerous, except on the E. side, which is nearly free, and there are many small isolated reefs and volcanic banks among the islands. If the reefs impede navigation they form some good harbors. The best is on the S. W. side of Vavau; another is on the N. of Tonga at Bangaimotu.

Islands.—The most considerable island is *Tonga*, or *Tonga-tabu* (the Sacred Tonga), in the S. group, about 21 by 12 miles, and 128 square miles in area, which contains the capital, Nukualofa. The vegetation is rich and beautiful, but the scenery tame, the land seldom rising above 60 feet. *Eoa*, 9 miles to the S. E. and nearly 12 by 5 miles, is 600 feet high, and much more picturesque, diversified by rocks and woods. *Vavau*, in the N. group, is next to Tonga in size, 42 miles in circumference and 300 feet high. Next to these come *Nomuka* and *Lefuka* in the Habai group, about 19 miles in circumference; *Tofua*, 2846 feet, *Late*, 1820 feet, and *Kao*, 5080 feet high, which are volcanic, and smaller. Vavau and the neighboring islands are higher and more varied in contour than those to the S. The islands of the central group are numerous and very fertile. Earthquakes are frequent; from 1845 to 1857 volcanic eruptions were very violent, and islands once fertile were devastated and nearly destroyed. A new island rose from the sea, and was at once named "Wesley," but disappeared again.

Climate.—The climate is enervating; it is damp, with heavy dews and frequent alternations of temperature, which averages 75°–77° F., though considerably higher in Vavau. Cool S. E. trade winds blow, sometimes with great violence, from April to December. During the rest of the year the winds blow from W. N. W. and N., with rain and occasional destructive hurricanes.

Flora.—The vegetation is similar to that of Fiji, but more definitely Indo-Malayan in character; it embraces all the plants of the groups to the E., with many that are absent there. Ferns abound, some of them peculiar, and tree ferns on the higher islands. There are 4 palms, among them the *Kentia* of Fiji. For the rest, Gramineæ, Rubiaceæ, Ficoideæ, Myrtaceæ, Euphorbiæ, Malvaceæ, and Leguminosæ predominate. All the usual fruit trees and cultivated plants of the Pacific are found. The most valuable timber trees are the tamanu (*Calophyllum Burmanni*), milo (*Thespesia populnea*), futu (*Barringtonia speciosa*), mohemohe, tavaki, and *Casuarina* or iron-wood.

Fauna.—The only indigenous land mammalia are a small rat and a few curious species of bats. The dog and the pig were no doubt introduced by man. Sheep and cattle imported of late years by Europeans do not multiply, owing to insufficient space and pasture. Of birds some 30 kinds are known, an owl being the only bird of prey; parrots, pigeons, kingfishers, honey-suckers, rails, ducks, and other water birds are numerous. There are snakes and small lizards, but no frogs or toads. Of insects there are relatively few kinds; but ants, beetles, and mosquitoes abound. The fishes, of an Indo-Malay type, are varied and numerous. Turtle and sea-snakes abound, as do mollusca, of which a few are peculiar, and zoophytes.

People.—The inhabitants are, intellectually, perhaps the most advanced of the Polynesian race, and exercise an influence over distant neighbors, especially in Fiji, quite out of proportion to their numbers, which do not exceed 20,000 or 25,000. Their conquests have extended as far as Niue, or Savage Island, 200 miles to the E., and to various other islands to the N. In Cook's time Poulaho, the principal chief, considered Samoa to be within his dominions. This pre-eminence may perhaps be due to an early infusion of Fijian blood: Pritchard (*Polynesian Reminiscences*) observed such crosses to be always more vigorous than the pure races in these islands; and this influence seems also traceable in the Tongan dialect, and appears to have been partially transmitted thence to the Samoan. Various customs, traditions, and names of places point to a former relation with Fiji, but Fijian influence in Tonga is insignificant compared with that of Tonga in Fiji (see FIJI). Their prior conversion to Christianity gave the people material as well as moral advantages over their neighbors, and King George, a very remarkable man, and far in advance of his people, has, during a long reign, made the most of these.

Until recently there were, as in Japan, two sovereigns; the higher of these, called Tui Tonga (Chief of Tonga), was greatly reverenced, but for at least the last 200 years has enjoyed little power. The real ruler, and the chief officers of the state, were members of the Toubo family, from which also the wife of the Tui Tonga was always chosen, whose descendants through the female line had, under the title of "tamaha," special honors and privileges, recalling the "vasu" of Fiji.[1] Below these came the Eiki or chiefs, and next to them the class called Matabulé. These were the hereditary counsellors and companions of the chiefs, and conveyed to the people the decisions formed at their assemblies. They also directed the national ceremonies, and preserved the popular traditions. During the long civil wars in the early part of this century, the institution of Tui Tonga lapsed, and various chiefs became independent, but they were gradually subdued, and the whole group united by King George. He commuted for a money payment the service due from the common people to their chiefs, whom he assembles in a sort of Parliament, having in 1862 established a "constitutional government." Taxation is heavy: a poll tax of 4 dollars is levied and strictly enforced.

The limited extent and resources of the islands tends to minimize foreign settlement and interference, but missionary influence is, directly or indirectly, supreme. The régime is accordingly somewhat strained and severe, and restless spirits have to seek a vent for their energies in Fiji or elsewhere. Crime, however, is infrequent, and morality, always above the Polynesian average, is improving; nearly every one can read, and there is a general appearance of order and comfort. The people have strict notions of etiquette and gradations of rank; their natural independence and self-esteem is perhaps fostered by their frequent employment as the teachers of others, for which, however, they show much aptitude; otherwise they are amiable and (especially in the upper ranks) courteous. They are arrogant, lively, inquisitive, and inclined to steal,—their attacks, in earlier days, on Europeans, when not caused by misunderstandings, being due probably to their desire to obtain property which to them was of immense value. They are brave and not devoid of energy, though the soft climate and the abundance of food are against sustained exertion or great industrial progress. They value children, and seldom practise infanticide, and cannibalism only in exceptional cases. Their women are kindly treated, and only do the lighter work. Agriculture, which is well understood, is the chief industry. They are bold and skilful sailors and fishermen; other trades, as boat and house building, carving, cooking, net and mat making, are usually hereditary. Their houses are slightly built, but the surrounding ground and roads are laid out with great care and taste.

---

[1] A similar institution ("tamasa") exists at Samoa.

There are some ancient stone remains here, as in the Caroline Islands, burial places (feitoka) built with great blocks, and a remarkable monument consisting of two large blocks with a transverse one, containing a circular basin in the centre.

The principal diseases are leprosy and elephantiasis, tona (the thoko of Fiji), influenza, ulcers, scrofula, consumption, and ophthalmia. Owing to the absence of swamps, fever of a severe type is rare.

The chief articles of export are cocoa-nut oil and copra; a little sugar, cotton, and coffee, the cultivation of which is encouraged by the king; and fresh provisions for ships, as yams, pigs, and poultry. The chief imports are cloth, cotton prints, hardware, mirrors, etc., but these are not on the increase. Whale fishing (once extensive) is still carried on among the islands by European and American vessels.

Definition.

FRIENDLY SOCIETIES, according to the comprehensive definition of the Friendly Societies Act, 1875, which now regulates such societies in Great Britain and Ireland, are "societies established to provide by voluntary subscriptions of the members thereof, with or without the aid of donations, for the relief or maintenance of the members, their husbands, wives, children, fathers, mothers, brothers or sisters, nephews or nieces, or wards being orphans, during sickness or other infirmity, whether bodily or mental, in old age, or in widowhood, or for the relief or maintenance of the orphan children of members during minority; for insuring money to be paid on the birth of a member's child, or on the death of a member, or for the funeral expenses of the husband, wife, or child of a member, or of the widow of a deceased member, or, as respects persons of the Jewish persuasion, for the payment of a sum of money during the period of confined mourning; for the relief or maintenance of the members when on travel in search of employment, or when in distressed circumstances, or in case of shipwreck, or loss or damage of or to boats or nets; for the endowment of members or nominees of members at any age; for the insurance against fire to any amount not exceeding £15 of the tools or implements of the trade or calling of the members"—and are limited in their contracts for assurance of annuities to £50, and for assurance of a gross sum to £200. They may be described in a more popular and condensed form of words as the mutual assurance societies of the poorer classes, by which they seek to aid each other in the emergencies arising from sickness and death and other causes of distress. A phrase in the first Act for the encouragement and relief of friendly societies, passed in 1793, designating them "societies of good fellowship," indicates another useful phase of their operations.

Origin.

The origin of the friendly society is, probably in all countries, the burial club. It has been the policy of every religion, if indeed it is not a common instinct of humanity, to surround the disposal of a dead body with circumstances of pomp and expenditure, often beyond the means of the surviving relatives. The appeal for help to friends and neighbors which necessarily follows is soon organized into a system of mutual aid, that falls in naturally with the religious ceremonies by which honor is done to the dead. Thus Archdeacon Gray tells us that in China there are burial societies, termed "long-life loan companies," in almost all the towns and villages. Among the Greeks the ἔρανοι combined the religious with the provident element. From the Greeks the Romans derived their fraternities of a similar kind. The Teutons in like manner had their guilds. Whether the English friendly society owes it origin in the higher degree to the Roman or the Teutonic influence can hardly be determined. The utility of providing by combination for the ritual expenditure upon burial having been ascertained, the next step—to render mutual assistance in circumstances of distress generally—was any easy one, and we find it taken by the Greek ἔρανοι and by our own guilds. Another modification—that the societies should consist not so much of neighbors as of persons having the same occupation—soon arises; and this is the germ of our trade unions and our city companies in their original constitution. The interest, however, that these inquiries possess is mainly antiquarian. The legal definition of a friendly society quoted above points to an organization more complex than those of the ancient fraternities and guilds, and proceeding upon different principles. It may be that the one has grown out of the other. The common element of a provision for a contingent event by a joint contribution is in both; but the friendly society alone has attempted to define with precision what is the risk against which it intends to provide, and what should be the contributions of the members to meet that risk.

It would be curious to endeavor to trace how, after the suppression of the religious guilds in the 16th century, and the substitution of an organized system of relief by the poor law of Elizabeth for the more voluntary and casual means of relief that previously existed, the present system of friendly societies grew up. The modern friendly society, particularly in rural districts, clings with fondness to its annual feast and procession to church, its procession of all the brethren on the occasion of the funeral of one of them, and other incidents which are almost obviously survivals of the customs of mediæval guilds. The last recorded guild was in existence in 1628, and there are records of friendly societies as early as 1634 and 1639. The connecting links, however, cannot be traced. With the exception of a society in the port of Borrowstounness on the Firth of Forth, no existing friendly society is known to be able to trace back its history beyond a date late in the 17th century, and no records remain of any that might have existed in the latter half of the 16th century or the greater part of the 17th. One founded in 1666, was extant in 1850, but it has since ceased to exist. This is not so surprising as it might appear. Documents which exist in manuscript only are much less likely to have been preserved since the invention of printing than they were before; and such would be the simple rules and records of any society that might have existed during this interval—if, indeed, many of them kept records at all. How usual is it for a voluntary society of any kind to die away with the generation of men among whom it was founded! On the whole, it seems probable therefore that the friendly society is a lineal descendant of the ancient guild—the idea never having wholly died out, but having been kept up from generation to generation in a succession of small and scattered societies.

Spitalfields refugees.

At the same time, it seems probable that the friendly society of the present day owes its revival to a great extent to the Protestant refugees of Spitalfields, one of whose societies was founded in 1703, and has continued for 176 years among descendants of the same families, whose names proclaim their Norman origin. This society has distinguished itself by the intelligence with which it has adapted its machinery to the successive modifications of the law, and has very recently completely reconstructed its rules under the provisions of the Friendly Societies Acts, 1875 and 1876.

Another is the society of Lintot, founded in London in 1708, in which the office of secretary has for more than half a century been filled by persons of the name of Levesque, one of whom has published a translation of its original rules. No one was to be received into the society who was not a member, or the descendant of a member, of the church of Lintot, of recognized probity, a good Protestant, and well-intentioned towards the queen [Anne] and faithful to the Government of the country. No one was to be admitted below the age of eighteen, or who had not been received at holy communion, and become member of a church. A member should not have a claim to relief during his first year's membership, but if he fell sick within the year, a collection should be made for him among the members. This society has only 50 members, but its funds exceed £2000. The foreign names still borne by a large proportion of the members show that the connection with descendants of the refugees is maintained.

Act of 1793.

The example of providence given by these societies was so largely followed that Sir George Rose's Act in 1793 recognized the existence of numerous societies, and provided encouragement for them in various ways, as well as relief from taxation to an extent which in those days must have been of great pecuniary value, and exemption from removal under the poor law. The benefits offered by this statute were readily accepted by the societies, and the vast number of societies which speedily became enrolled shows that Sir George Rose's Act met a real public want. In the county of Middlesex alone nearly a thousand societies were enrolled within a very few years after the passing of the Act, and the number in some other counties was almost as great. The societies then formed were nearly all of a like kind,—small clubs, in which the feature of good fellowship was in the ascendant, and that of provident assurance for sickness and death merely accessory. This is indicated by one provision which occurs in many of the early enrolled rules, viz., that the number of members shall be limited to 61, 81, or 101, as the case may be. The odd 1 which occurs in these numbers probably stands for the president or secretary, or is a contrivance to ensure a clear majority. Several of these old societies are still in existence, and can point to a prosperous career extending over (in some cases) more than 100 years—a prosperity based rather upon good luck than upon scientific calculation. Founded among small tradesmen or persons in the way to thrive, the claims for sickness were only made in cases where the sickness was accompanied by distress, and even the funeral allowance was not always demanded.

Act of 1819.

The societies generally not being established upon any scientific principle, those which met with this prosperity were the exception to the rule; and accordingly the cry that friendly societies were failing in all quarters was as great in 1819 as in 1869. A writer of that time speaks of the instability of friendly societies as "universal;" and the general conviction that this was so resulted in the passing of the Act of 1819, 59 Geo. III. c. 128. It recites that "the habitual reliance of poor persons upon parochial relief, rather than upon their own industry, tends to the moral deterioration of the people and to the accumulation of heavy burdens upon parishes; and it is desirable, with a view as well to the reduction of the assessment made for the relief of the poor as to the improvement of the habits of the people, that encouragement should be afforded to persons desirous of making provision for themselves or their families out of the fruits of their own industry. By the contributions of the savings of many persons to one common fund the most effectual provision may be made for the casualties affecting all the contributors; and it is therefore desirable to afford further facilities and additional security to persons who may be willing to unite in appropriating small sums from time to time to a common fund for the purposes aforesaid, and it is desirable to protect such persons from the effects of fraud or miscalculation." This preamble went on to recite that the provisions of preceding Acts had been found insufficient for these purposes, and great abuses had prevailed in many societies established under their authority. By this statute a friendly society was defined as "an institution, whereby it is intended to provide, by contribution, on the principle of mutual insurance, for the maintenance or assistance of the contributors thereto, their wives or children, in sickness, infancy, advanced age, widowhood, or any other natural state or contingency, whereof the occurrence is susceptible of calculation by way of average." It will be seen that this Act dealt exclusively with the scientific aspect of the societies, and had nothing to say to the element of good fellowship. Rules and tables were to be submitted by the persons intending to form a society to the justices, who, before confirming them, were to satisfy themselves that the contingencies which the society was to provide against were within the meaning of the Act, and that the formation of the society would be useful and beneficial, regard being had to the existence of other societies in the same district. No tables or rules connected with calculation were to be confirmed by the justices until they had been approved by two persons at least, known to be professional actuaries or persons skilled in calculation, as fit and proper, according to the most correct calculation of which the nature of the case would admit. The justices in quarter sessions were also by this Act authorized to publish general rules for the formation and government of friendly societies within their county. The practical effect of this statute in requiring that the societies formed under it should be established on sound principles does not appear to have been as great as might have been expected. The justices frequently accepted as "persons skilled in calculation" local schoolmasters and others who had no real knowledge of the technical difficulties of the subject, while the restrictions upon registry served only to increase the number of societies established without becoming registered. In 1829, the law relating to friendly societies was entirely reconstructed by the 10 Geo. IV. c. 56, and a barrister was appointed under that Act to examine the rules of societies, and ascertain that they were in conformity to law and to the provisions of the Act. The barrister so appointed was Mr. John Tidd Pratt; and no account of friendly societies would be complete that did not do justice to the remarkable public service rendered by this gentleman. For forty years, though he had by statute really very slight authority over the societies, his name exercised the widest influence, and the numerous reports and publications by which he endeavored to impress upon the public mind sound principles of management of friendly societies, and to expose those which were managed upon unsound principles, made him a terror to evil-doers. On the other hand, he lent with readiness the aid of his legal knowledge and great mental activity to assisting well-intentioned societies in coming within the provisions of the Acts, and thus gave many excellent schemes a legal organization.

Act of 1829.

Acts of 1834 and 1846.

By the Act of 1829, in lieu of the discretion as to whether the formation of the proposed society would be useful and beneficial, and the requirement of the actuarial certificate to the tables, it was enacted that the justices were to satisfy themselves that the tables proposed to be used might be adopted with safety to all parties concerned. This provision, of course, became a dead letter, and was repealed in 1834 by 4 and 5 Wm. IV. c. 40. Thenceforth, societies were free to establish themselves upon what conditions and with what rates they chose, provided only they satisfied the barrister that the rules were "calculated to carry into effect the intention of the parties framing them," and were "in conformity to law." In 1846, by 9 and 10 Vic. c. 27, the barrister certifying the rules was constituted "Registrar of Friendly Societies," and the rules of all societies were brought together under his custody. An actuarial certificate was to be obtained before any society could be registered "for the purpose of securing any benefit dependent on the laws of sickness and mortality." In 1850 the Acts were again repealed and consolidated with amendments (13 and 14 Vic. c. 115). Societies were divided into two classes, "certified" and "registered." The certified societies were such as obtained a certificate to their tables by an actuary possessing a given qualification, who was required to set forth the data of sickness and mortality upon which he proceeded, and the rate of interest assumed in the calculations. All other societies were to be simply registered. Very few societies were constituted of the "certified" class. The distinction of classes was repealed and the Acts were again consolidated in 1855 by 18 and 19 Vic. c. 63. Under this Act, which admitted of all possible latitude to the framers of rules of societies, 21,875 societies were registered, a large number of them being lodges or courts of affiliated orders, and the Act continued in force till the end of 1875.

Act of 1850.

Act of 1855.

Act of 1875.

The law which now regulates friendly societies in Great Britain was passed in 1875 (38 and 39 Vic. c. 60), and amended in 1876 (39 and 40 Vic. c. 32). It still bears the permissive and elastic character which marked the more successful of the previous Acts, but it provides ampler means to members of ascertaining and remedying defects of management and of restraining fraud. The business of registry is under the control of a chief registrar, who has an assistant registrar in each of the three countries, with an actuary. It is his duty, among other things, to require from every society a return in proper form each year of its receipts and expenditure, funds, and effects; a return once every five years of the sickness and mortality it has experienced; and also once every five years a valuation of its assets and liabilities. Upon the application of a certain proportion of the members, varying according to the magnitude of the society, the chief registrar may appoint an inspector to examine into its affairs, or may call a general meeting of the members to consider and determine any matter affecting its interests. These are powers which have been used with excellent effect. Cases have occurred in which fraud has been detected and punished by this means that could not probably have been otherwise brought to light. In others a system of mismanagement has been exposed and effectually checked. The power of calling special meetings has enabled societies to remedy defects in their rules, to remove officers guilty of misconduct, etc., where the procedure prescribed by the rules was for some reason or other inapplicable. Upon an application of a like proportion of members the chief registrar may, if he finds that the funds of a society are insufficient to meet the existing claims thereon, or that the rates of contribution are insufficient to cover the benefits assured (upon which he consults his actuary), order the society to be dissolved, and direct how its funds are to be applied.

Royal Commission.

This legislation was the result of the labors of a Royal Commission of high authority, presided over by Sir Stafford Northcote, which sat from 1870 to 1874, and prosecuted an exhaustive inquiry into the organization and condition of the various classes of friendly societies. Their reports occupy more than a dozen large bluebooks. They divide registered friendly societies into 13 classes.

Classes of societies.

The first class includes the affiliated societies or "orders," such as the Manchester Unity of Odd Fellows, the Ancient Order of Foresters, the Rechabites, Druids, etc. These societies have a central body, either situated in some large town, as in the case of the Manchester Unity, or moving from place to place, as in that of the Foresters. Under this central body, the country is (in most cases) parcelled out into districts, and these districts again consist each of a number of independent branches, called "lodges," "courts," "tents," or "divisions," having a separate fund administered by themselves, but contributing also to a fund under the control of the central body. The Manchester Unity has (1878) 456 districts, 4121 lodges, 526,802 members, and £4,325,000 funds; the Order of Foresters 287 districts, 4414 courts, 521,416 members, £2,497,000 funds. It may give an idea of the great utility of these societies to mention that the various courts of Foresters paid their members 3,197,366 days' sick pay in a single year, and paid burial money on 4666 deaths. Besides these two great orders, there are about forty smaller affiliated bodies, each having more than 1000 members; and the affiliated form of society appears to have great attraction. Indeed, in the colony of Victoria, Australia, all the existing friendly societies are of this class. The orders have their "secrets," but these, it may safely be said, are of a very innocent character, and merely serve the purpose of identifying a member of a distant branch by his knowledge of the "grip," and of the current password, etc. Indeed they are now so far from being "secret societies" that their meetings are attended by reporters and the debates published in the newspapers, and the Order of Foresters has recently passed a wise resolution expunging from its publications all affectation of mystery.

The second class is made up of "general societies," principally existing in London, of which the Commissioners enumerated 8 with nearly 60,000 members, and funds amounting to a quarter of a million; these societies are managed at a cost, on the average, of about 10 per cent. of their income.

The third class includes the "county societies," of which there were 11, 10 of which had £221,955 funds and 29,036 members, and 30 others approaching that type. These societies have been but feebly supported by those for whose benefit they are instituted, having all exacted high rates of contribution, in order to secure financial soundness.

Class 4, "local town societies," is a very numerous one. Among some of the larger societies may be mentioned the "Chelmsford Provident," with £26,403 funds, and 2352 members; the "Brighton and Sussex Mutual," with £35,752 funds, and 824 members; the "Cannon Street, Birmingham," with £66,780 funds, and 8347 members; the "Birmingham General Provident," £37,997 funds, and 3379 members. In this group might also be included the interesting societies which are established among the Jewish community. They differ from ordinary friendly societies partly in the nature of the benefits granted upon death, which are intended to compensate for loss of employment during the time of ceremonial seclusion enjoined by the Jewish law, which is called "sitting shiva." They also provide a cab for the mourners and rabbi, and a tombstone for the departed, and the same benefits as an ordinary friendly society during sickness. Some also provide a place of worship. Of these the "Pursuers of Peace" (enrolled in December, 1797), the "Bikhur Cholim, or Visitors of the Sick" (April, 1798), the "Hozier Holim" (1804), and nearly 50 others, of which 4 are courts of the Order of Foresters, are on the register for Middlesex. Mr. Adler calculates that some 30 or 40 such societies are in existence in London. Two or three societies have been certified (under the earlier Acts) for accumulating by weekly subscriptions a fund for the purchase of flour and the baking of passover cakes.

Class 5 is "local village and country societies," including the small public house clubs which abound in the villages and rural districts, a large proportion of which are unregistered.

Class 6 is formed of "particular trade societies."

Class 7 is "dividing societies." These were before 1875 unauthorized by law, though they were very attractive to the members. Their practice is usually to start afresh every January, paying a subscription somewhat in excess of that usually charged by an ordinary friendly society, out of which a sick allowance is granted to any member who may fall sick during the year, and at Christmas the balance not so applied is divided among the members equally, with the exception of a small sum left to begin the new year with. The mischief of the system is that, as there is no accumulation of funds, the society cannot provide for prolonged sickness or old age, and must either break up altogether or exclude its sick and aged members at the very time when they most need its help. This, however, has not impaired the popularity of the societies, and the Act of 1875, framed on the sound principle that the protection of the law should not be withheld from any form of association, enables a society to be registered with a rule for dividing its funds, provided only that all existing claims upon the society are to be met before a division takes place.

Class 8, "deposit friendly societies," combine the characteristics of a savings bank with those of a friendly society. They were devised by the late Hon. and Rev. S. Best, on the principle that a certain proportion of the sick allowance is to be raised out of a member's separate deposit account, which, if not so used, is retained for his benefit. Their advantages are in the encouragement they offer to saving, and in meeting the selfish objection sometimes raised to friendly societies, that the man who is not sick gets nothing for his money; their disadvantage is in their failing to meet cases of sickness so prolonged as to exhaust the whole of the member's own deposit.

Class 9, "collecting societies," are so called because their contributions are received through a machinery of house-to-house collection. These were the subject of much laborious investigation and close attention on the part of the Commissioners. They deal with a lower class of the community, both with respect to means and to intelligence, than that from which the members of ordinary friendly societies are drawn. The large emoluments gained by the officers and collectors, the high percentage of expenditure (often exceeding half the contributions), and the excessive frequency of lapsing of insurances point to mischiefs in their management. "The radical evil of the whole system (the Commissioners remark) appears to us to lie in the employment of collectors, otherwise than under the direct supervision and control of the members, a supervision and control which we fear to be absolutely unattainable in burial societies that are not purely local." On the other hand, it must be conceded that these societies extend the benefits of life insurance to a class which the other societies cannot reach, namely, the class that will not take the trouble to attend at an office, but must be induced to effect an insurance by a house-to-house canvasser, and be regularly visited by the collector to ensure their paying the contributions. To many such persons these societies, despite all their errors of constitution and management, have been of great benefit. The great source of these errors lies in a tendency on the part of the managers of the societies to forget that they are simply trustees, and to look upon the concern as their own personal property to be managed for their own benefit. These societies are of two kinds, local and general. The Commissioners enumerated 239 local societies, with over 680,000 members, and £203,777 funds; and 20 of the more important general societies, with members estimated at 1,426,023, and funds at £461,605. For the general societies the Act of 1875 makes certain stringent provisions. Each member is to be furnished with a copy of the rules for one penny, and a signed policy for the same charge. Forfeiture of benefit for non-payment is not to be enforced without fourteen days' written notice. The transfer of a member from one society to another is not to be made without his written consent and notice to the society affected. No collector is to be a manager, or vote or take part at any meeting. At least one general meeting shall be held every year, of which notice is to be given either by advertisement or by letter or post card to each member. The balance sheet is to be open for inspection seven days before the meeting, and is to be certified by a public accountant, not an officer of the society. Disputes may be settled by justices, or county courts, notwithstanding anything in the rules of the society to the contrary. These provisions have certainly been found already very beneficial; but much more would be done for the benefit of the classes interested if the regulation which prevents the post office assuring less than £20 were abrogated, and if a general system of collection through the post office were established.

Closely associated with the question of the management of these societies is that of the risk incurred by infant life, through the facilities offered by these societies for making insurances on the death of children. That this is a real risk is certain from the records of the assizes, and from many circumstances of suspicion; but the extent of it cannot be measured, and has probably been exaggerated. It has never been lawful to assure more than £6 on the death of a child under five years of age, or more than £10 on the death of one under ten. Previous to the Act of 1875, however, there was no machinery for ascertaining that the law was complied with, or for enforcing it. This is supplied by that Act, though still somewhat imperfectly. When the bill went up to the House of Lords, an amendment was made, reducing the limit of assurance on a child under three years of age to £3, but this amendment was unfortunately disagreed with by the House of Commons.

Class 10, annuity societies, prevail in the west of England. Six of these societies had, at the date of the last published returns, 719 members, and £79,136 funds. These societies are few, and their business is diminishing. Most of them originated at the time when Government subsidized friendly societies by allowing them £4, 11s. 3d. per cent. per annum interest. Now annuities may be purchased direct from the National Debt Commissioners. These societies are more numerous, however, in Ireland.

Class 11, female societies, are numerous. Many of them resemble affiliated orders at least in name, calling themselves Female Foresters, Odd Sisters, Loyal Orangewomen, Comforting Sisters, and so forth. In their rules may be found such a provision as that a member shall be fined who does not "behave as becometh an Orangewoman." Many are unregistered. In the northern counties of England they are sometimes termed "life boxes," doubtless from the old custom of placing the contributions in a box. The trustees, treasurer, and committee are usually females, but very frequently the secretary is a man, paid a small salary.

Under Class 12 the Commissioners included the societies for various purposes which were authorized by the secretary of state to be registered under the Friendly Societies Act of 1855, comprising working men's clubs, and certain specially authorized societies, as well as others that are now defined to be friendly societies. Among these purposes are assisting members in search of employment; assisting members during slack seasons of trade; granting temporary relief to members in distressed circumstances; purchase of coals and other necessaries to be supplied to members; relief or maintenance in case of lameness, blindness, insanity, paralysis, or bodily hurt through accidents; also, the assurance against loss by disease or death of cattle employed in trade or agriculture; relief in case of shipwreck or loss or damage to boats or nets; and societies for social intercourse, mutual helpfulness, mental and moral improvement, rational recreation, etc., called working men's clubs.

Class 13 is cattle insurance societies.

These are the thirteen classes into which the Commissioners divided registered friendly societies. There were 26,034 societies enrolled or certified under the various Acts for friendly societies in force between 1793 and 1855; and, as we have seen, 21,875 societies registered under the Act of 1855 before the 1st January, 1876, when the Act of 1875 came into operation. The total therefore of societies to which a legal constitution had been given was 47,909. Of these 26,087 were presumed to be in existence when the registrar called for his annual return, but only 11,282 furnished the return required. These had 3,404,187 members, and £9,336,946 funds. Twenty-two societies returned over 10,000 members each; nine over 30,000. One society (the Royal Liver Friendly Society, Liverpool, the largest of the collecting societies) returned 682,371 members. The next in order was one of the same class, the United Assurance Society, Liverpool, with 159,957 members; but in all societies of this class, the membership consists very largely of infants. The average of members in the 11,260 societies with less than 10,000 members each is only 171, showing how small in reality the bulk of Friendly Societies are. There are 58 societies with more than £10,000 funds; 18 with more than £30,000. In these again the Royal Liver heads the list with its £453,418; the next in succession being the Hearts of Oak, a society belonging to the Commissioners' second class, which has £179,995.

Unregistered societies.

Such are the registered societies; but there remains behind a large body of unregistered societies, estimated by the Commissioners to be in England nearly co-extensive with, in Scotland far to surpass in magnitude, the registered bodies. It is to be hoped that, as knowledge is spread of the advantages of registration,[1] and as the true principles upon which friendly societies should be established become better understood, the number of unregistered societies, in comparison with those registered, will become much less. It must be admitted, however, that at present progress is not being made in that direction. The classes among whom friendly societies are formed are greatly averse to any undertaking involving mental labor, and the idea of periodical returns and of the other requirements of the statute is more alarming to them than it need be. It will be the province of those charged with the administration of the statute to endeavor, as far as possible, to combat this tendency, and by wise use of the materials in their hands to seek to show the societies that the registry office is a ready and useful auxiliary to them, and that the trouble it gives them is more than met by compensating advantages.

The description we have given of the various classes of friendly societies, the number of their members, and the amount of their funds leads to the most hopeful conclusions as to their future. Though great loss has been occasioned by the failure of societies and by errors in their constitution and management, the provident habits of the people have survived all discouragement, and a fund has been accumulated which may be loosely estimated at nearly 15 millions sterling, contributed out of the savings of the flower of the working class. On every side there is displayed a desire by the societies to increase the soundness of their position, and to reform anything that may be wrong in their constitution.

Societies in Victoria.

The colonies, also, are following the same course. In that of Victoria, Australia, the report of the Government statist, Mr. H. H. Hayter, shows that on the 31st December, 1876, there were 761 branches, belonging to 34 societies, having 45,957 members, and assuring also sums at the death of 27,919 wives of members. The amount of contribution made by each member is, under ordinary circumstances, 1s. weekly. The benefits consist of sick pay, medical attendance, and funeral allowances. The sickness experienced during the year was 52,817 weeks, or nearly 7 working days per member, the number of members sick having been 8873. The usual sick pay is £1 per week for the first six months, reduced to 10s. or sometimes 13s. 4d. for the next six months, and to 5s. or sometimes 10s. for the remainder of sickness. The deaths were 452, or very nearly 10 in 1000. The amount paid on death of a member is usually £20, and of a member's wife £10. It will be seen that the benefits are greater in amount than is usual in societies in the mother country. The total income of the societies was £163,593, and their funds amounted to £351,284. The number of societies, members, and amount of income have about doubled during 10 years, the amount of funds having accumulated even more rapidly. It may be added that the report in question gives a more complete body of statistics relating to friendly societies than has ever been attempted to be collected elsewhere.

Foreign Countries.

In foreign countries the development of friendly societies has been slow. Belgium has a commission royale permanente des sociétés de secours mutuel, originally presided over by M. Visschers, and since by M. T'Kint de Roodenbeke. In France, under the second empire, a scheme was prepared for assisting friendly societies by granting them collective assurances under Government security. The societies have the privilege of investing their funds in the Caisse des Dépôts et Consignations, corresponding to the English National Debt Commission. In Germany a law was passed on the 7th April, 1876, on registered friendly societies. It prescribes for societies many things which in England are left to the discretion of their founders; and it provides for an amount of official interference in their management that is wholly unknown here. The superintending authority has a right to inspect the books of every society, whether registered or not, and to give formal notice to a society to call in arrears, exclude defaulters, pay benefits, or revoke illegal resolutions. A higher authority may, in certain cases, order societies to be dissolved. These provisions relate to voluntary societies; but it is competent for communal authorities also to order the formation of a friendly society, and to make a regulation compelling all workmen not already members of a society to join it.

---

[1] These may be briefly summed up thus:—(1) power to hold land and vesting of property in trustees by mere appointment; (2) remedy against misapplication of funds; (3) priority in bankruptcy or on death of officer; (4) transfer of stock by direction of chief registrar; (5) exemption from stamp duties; (6) membership of minors; (7) certificates of birth and death at reduced cost; (8) investment with National Debt Commissioners; (9) reduction of fines on admission to copyholds; (10) discharge of mortgages by mere receipt; (11) obligation on officers to render accounts; (12) settlement of disputes; (13) insurance of funeral expenses for wives and children without insurable interest; (14) nomination at death; (15) payment without administration; (16) services of public auditors and valuers; (17) registry of documents, of which copies may be put in evidence.

Actuarial remarks. On the actuarial view of the management of friendly societies the following remarks have been supplied by Mr. William Sutton, actuary of the Friendly Societies' Registry. It is in the highest degree essential to the interests of their members that friendly societies should be financially sound,—in other words, that they should throughout their existence be able to meet the engagements into which they have entered with their members. For this purpose it is necessary that the members' contributions should be so fixed as to prove adequate, with proper management, to provide the benefits promised to the members. These benefits almost entirely depend upon the contingencies of health and life; that is, they take the form of payments to members when sick, of payments to members upon attaining given ages, or of payments upon members' deaths, and frequently a member is assured for all these benefits, viz., a weekly payment if at any time sick before attaining a certain age, a weekly payment for the remainder of life after attaining that age, and a sum to be paid upon his death. Of course the object of the allowance in sickness is to provide a substitute for the weekly wage lost in consequence of being unable to work, and the object of the weekly payment after attaining a certain age, when the member will probably be too infirm to be able to earn a living by the exercise of his calling or occupation, is to provide him with the necessaries of life, and so enable him to be independent of poor relief. There is every reason to believe that, when a large group of persons of the same age and calling are observed, there will be found to prevail among them, taken one with another, an average number of days' sickness, as well as an average rate of mortality, in passing through each year of life, which can be very nearly predicted from the results furnished by statistics based upon observations previously made upon similarly circumstanced groups. Assuming, therefore, the necessary statistics to be attainable, the computation of suitable rates of contribution to be paid by the members of a society in return for certain allowances during sickness, or upon attaining a certain age, or upon death, can be readily made by an actuarial expert. To furnish these statistics the Friendly Societies Acts have since 1829 required registered societies to make, every five years, a return in prescribed form of their sickness and mortality experience for the previous five years; and other materials of the same nature have from time to time been collected and published.

An important provision in the Friendly Societies Act, 1875, is that which requires every registered society to make a return of its receipts and expenditure, funds and effects, in a prescribed form, to the registrar of friendly societies every year. Particulars of the returns received will be found in the chief registrar's reports.

A still more important provision in the same Act is one which requires societies to have a valuation made once at least every five years of their assets and liabilities, including the estimated risks and contributions, and to furnish particulars thereof to the registrar in a prescribed form. The object of such valuation is to ascertain as far as can be estimated the financial position of a society,—in other words, whether the future contributions receivable, plus the money or funds in hand, will according to the best estimate that can be formed, prove sufficient to enable the society to meet its engagements hereafter; and the valuation balance sheet, therefore, takes the following form:

Valuation Balance Sheet of Friendly Society, as at (say) 31st December, 1878.

Dr.	£	*Cr.*	£
To estimated present value of future benefits to existing members,	"	By estimated present value of future contributions of existing members, . . .	"
		" funds invested and in hand, . .	"
Balance (being surplus)	"	By balance (being deficiency), . . .	"
	"		"

It is confidently expected that this provision will, after it has been in operation some time, prove of enormous value, as it will in many cases have the effect of warning the members of societies, before it is too late, that certain steps are necessary to place the society in a sound financial condition, and in other cases to indicate unmistakably to the members that the society to which they belong cannot be trusted to meet its engagements in the future.

(E. W. B.)

FRIENDS, Society of. See Quakers.

FRIES, Elias Magnus (1794–1878), an eminent Swedish botanist, was born at Småland, August 15, 1794. As his father, the pastor of the church at Femsjö, was a zealous and accomplished botanist, Fries during his walks with him early acquired an extensive knowledge of flowering plants; and about the age of twelve he was led by the discovery of a remarkably brilliant *Hydnum* to commence the study of the Agarics and other fungi. After attending school at Wexio, he in 1811 entered the university of Lund, where in 1814 he was elected docent of botany, and in 1824 professor. In 1834 he became professor of practical economy at Upsala, and in 1844 and 1848 he represented the university of that city at the Rigsdag. In 1851 he succeeded Wahlenberg as emeritus professor of botany at Upsala, and there, on the 8th February, 1878, he died, having only by a few days outlived the centenary of his illustrious predecessor Linnæus. Fries was admitted a member of the Swedish Royal Academy in 1847, and a foreign member of the Royal Society of London in 1875.

As an author on the Cryptogamia Fries occupies the first rank. He wrote *Novitiæ Floræ Suecicæ* (1814 and 1823); *Observationes Mycologicæ* (1815); *Flora Hollandica* (1817–18); *Systema Mycologicum* (1821–29); *Systema Orbis Vegetabilis*, not completed (1825); *Elenchus Fungorum* (1828); *Lichenographia Europæa* (1831); *Epricisis Systematis Mycologici* (1838; 2d ed., or *Hymenomycetes Europæi*, 1874); *Summa Vegetabilium Scandinaviæ* (1846); *Sveriges ätliga och giftiga Svampar*, with colored plates (1860); *Monographia Hymenomycetum Suecicæ* (1863), with the *Icones Hymenomycetum*, vol. i. (1867), and pt. i. vol. ii. (1877).

FRIES, Jacob Friedrich (1773–1843), a distinguished post-Kantian writer on philosophy, was born at Barby, Saxony, August 23, 1773. He was educated in a community of the Moravian Brethren, and in their seminary was trained for theology. In 1795 he entered at the university of Leipsic, and for some years studied philosophy there and at Jena. In 1801, after having acted for a time as private tutor, he began to deliver courses of philosophical lectures at Jena. These he continued with an interval of two years spent in travels in Germany, France, and Italy, till 1806, when he was called to Heidelberg as professor of philosophy and elementary mathematics. His philosophical position with regard to his contemporaries he had already made clear in the critical work *Reinhold, Fichte, Schelling* (1803), and in the more systematic treatises *System der Philosophie als evidenter Wissenschaft* (1804), *Wissen, Glauben, Ahndung* (1805). Fries was an unusally prolific and somewhat hurried writer, and during the ten years he passed at Heidelberg, he poured forth a variety of volumes, differing widely in value, on philosophy and theoretical physics. The most important treatise, and that by which he will always be remembered in the history of philosophy, was the *Neue Kritik der Vernunft*, 3 vols., 1807, an attempt to give a new foundation to the critical theory of Kant. In 1811 appeared his *System der Logik*, a very instructive work, and in 1814 *Julius and Evagoras*, a philosophical romance. In 1816 he was invited to Jena to fill the chair of theoretical philosophy, under which appear to have been included mathematics and physics, along with philosophy proper. In 1824 Fries was accused of democratic tendencies, and formally deprived of the right to deliver lectures on philosophical subjects, although he still retained his chair. He seems, however, towards the end of his life, to have resumed his philosophical teaching. He died on 10th August, 1843. The most important of the many works written during his Jena professorate are the *Handbuch der praktischen Philosophie* (vol. i., 1818, and vol. ii., 1832), the *Handbuch der psychischen Anthropologie*, 2 vols., 1820; *Mathematische Naturphilosophie*, 1822; *System der Metaphysik*, 1824; *Geschichte der Philosophie*, 1837 and 1840. Fries's point of view in philosophy may be described as a modified Kantianism. With Kant he regarded *Kritik*, or the critical investigation of the faculty of knowledge, as the essential preliminary to philosophy. But he differed from Kant both as regards the foundation for this criticism and as regards the metaphysical results yielded by it. Kant's analysis of knowledge had disclosed the *a priori* element as the necessary complement of the isolated *a posteriori* facts of experience. But it did not seem to Fries that Kant had with sufficient accuracy examined the mode in which we arrive at knowledge of this *a priori* element. According to him we only know these *a priori* principles through inner or pyschical experience; they are not then to be regarded as transcendental factors of all experience, but as the necessary constant elements discovered by us in our inner experience. They are, in fact, to Fries, as to the Scotch school, the residuum which resists analysis. Accordingly Fries, like the Scotch school, places psychology or analysis of consciousness at the foundation of philosophy, and called his criticism of knowledge an anthropological critique. It requires very little consideration to see that Fries's proposed amendment of Kantianism rests upon an altogether mistaken view of the transcendental element in knowledge. It is absurd to make the demand that what is *a priori* in cognition should be known by an *a priori* method. There is no such method. A second point in which Fries differed from Kant is the view taken as to the relation between immediate and mediate cognitions. According to Fries, the understanding is purely the faculty of proof; it is in itself void; immediate certitude is the only source of knowledge. Reason contains principles which we cannot demonstrate, but which can be deduced, and are the proper objects of belief. In this view of reason Fries approximates to Jacobi rather than to Kant. The *Neue Kritik* and the *Psychische Anthropologie* contain much that is admirable in the way of psychological analysis, but it cannot be thought that Fries has effected any real advance on the Kantian position. See Henke, *J. F. Fries*, 1867.

FRIESLAND, or VRIESLAND, sometimes called West Friesland, to distinguish it from East Friesland in Hanover, is the most northerly province of the Netherlands. It is bounded on the S.W., W., and N. by the Zuyder Zee and the North Sea, on the E. by the provinces of Groningen and Drenthe, and on the S.E. by that of Overyssel. The area is 1281 English square miles; and the population in 1875 was calculated at 317,405, being an increase since 1853 of 57,897. The chief town is Leeuwarden, a place of 27,085 inhabitants in 1876, and the province is divided into the three districts of Leeuwarden, Heerenveen, and Sneek. Other towns of importance are Harlingen, a seaport with 11,043 inhabitants; Weststellingwerf, 13,969; Opsterland, 13,753; Schoterland, 12,893; Sneek, 9990; and Franeker, 6643. For history, etc., see FRISIANS.

FRIGATE-BIRD, the name commonly given by our sailors, on account of the swiftness of its flight, its habit of cruising about near other species and of daringly pursuing them, to a large Sea-bird[1]—the *Fregata aquila* of most ornithologists—the *Fregatte* of French and the *Rabihorcado* of Spanish mariners. It was placed by Linnæus in the genus *Pelecanus*, and until lately its assignment to the family *Pelecanidæ* has hardly ever been doubted. Professor Mivart has, however, now declared (*Trans. Zool. Soc.*, x. p. 364) that, as regards the postcranial part of its axial skeleton, he cannot detect sufficiently good characters to unite it with that family in the group named by Professor Brandt *Steganopodes*. There seems to be no ground for disputing this decision so far as separating the genus *Fregata* from the *Pelecanidæ* goes, but systematists will probably pause before they proceed to abolish the *Steganopodes*, and the result will most likely be that the Frigate-Birds will be considered to form a distinct family (*Fregatidæ*) in that group. In one very remarkable way the osteology of *Fregata* differs from that of all other birds known. The furcula coalesces firmly at its symphysis with the carina of the sternum, and also with the coracoids at the upper extremity of each of its rami, the anterior end of each coracoid coalescing also with the proximal end of the scapula. Thus the only articulations in the whole sternal apparatus are where the coracoids meet the sternum, and the consequence is a bony framework which would be perfectly rigid did not the flexibility of the rami of the furcula permit a limited amount of motion. That this mechanism is closely related to the faculty which the bird possesses of soaring for a considerable time in the air with scarcely a perceptible movement of the wings can hardly be doubted, but the particular way in which it works has yet to be explained.

Two species of *Fregata* are considered to exist, though they differ in little but size and geographical distribution. The larger, *F. aquila*, has a wide range all round the world within the tropics, and at times passes their limits. The smaller, *F. minor*, appears to be confined to the eastern seas, from Madagascar to the Moluccas, and southward to Australia, being particularly abundant in Torres Strait,—the other species, however, being found there as well. Having a spread of wing equal to a Swan's and a comparatively small body, the buoyancy of these birds is very great. It is a beautiful sight to watch one or more of them floating overhead against the deep blue sky, the long forked tail alternately opening and shutting like a pair of scissors, and the head, which is of course kept to windward, inclined from side to side, while the wings are to all appearance fixedly extended, though the breeze may be constantly varying in strength and direction. Equally fine is the contrast afforded by these birds when engaged in fishing, or, as seems more often to happen, in robbing other birds, especially Boobies, as they are fishing. Then the speed of their flight is indeed seen to advantage, as well as the marvellous suddenness with which they can change their rapid course as their victim tries to escape from their attack. Before gales Frigate-Birds are said often to fly low, and their appearance near or over land, except at their breeding-time, is supposed to portend a hurricane.[2] Generally seen singly or in pairs, except when the prospect of prey induces them to congregate, they breed in large companies, and Mr. Salvin has graphically described (*Ibis*, 1864, p. 375) one of their settlements off the coast of British Honduras, which he visited in May, 1862. Here they chose the highest mangrove-trees[3] on which to build their frail nests, and seemed to prefer the leeward side. The single egg laid in each nest has a white and chalky shell very like that of a Cormorant's. The nestlings are clothed in pure white down, and so thickly as to resemble puff-balls. When fledged, the beak, head, neck, and belly are white, the legs and feet bluish-white, but the body is dark above. The adult females retain the white beneath, but the adult males lose it, and in both sexes at maturity the upper plumage is of a very dark chocolate-brown, nearly black, with a bright metallic gloss, while the feet in the females are pink, and black in the males—the last also acquiring a bright scarlet pouch, capable of inflation, and being perceptible when on the wing. The habits of *F. minor* seem wholly to resemble those of *F. aquila*. According to Bechstein, an example of this last species was obtained at the mouth of the Weser in January, 1792, and it has hence been included by some ornithologists among European birds! (A. N.)

FRISCHLIN, NICODEMUS (1547–1590), scholar and poet, was born on the 22d of September, 1547, at Balingen, Würtemberg, where his father was parish minister. He was educated at Tübingen, and in 1568 was promoted to the chair of poetry and history. In 1575 for his comedy of *Rebecca*, which he read at Ratisbon before the emperor Maximilian II., he was rewarded with the laureateship and with the honor of knighthood. Some time afterwards he was made a comes palatinus. In 1582 his unguarded language and his reckless life had made it necessary that he should leave Tübingen; he accordingly accepted a quiet mastership at Laibach in Carniola, which he held for about two years. Shortly after his return to the university in 1584, he was threatened with a criminal prosecution on a charge of immoral conduct, to which, it was alleged, he had exposed himself some years previously, and the threat led to his withdrawal to Frankfort in 1587. Of the remaining four years of his life little is recorded. For eighteen months he taught in the Brunswick Gymnasium, and he appears also to have resided occasionally at Strasburg, Marburg, and Mainz. From the last-named city he wrote certain libellous letters, which led to his being arrested in March, 1590, at the instance of the authorities of Würtemberg. He was imprisoned in the fortress of Hohenurach, near Reutlingen, where, on the night of the 29th of November, 1590, he was killed by a fall in attempting to let himself down from the window of his cell. His prolific and versatile genius produced a great variety of works, which entitle him to some rank both among poets and among scholars. In his Latin verse he has often successfully imitated the classical models; his comedies are not without freshness and vivacity; and some of his versions and commentaries, particularly those on the *Georgics* and *Bucolics* of Virgil, though now well-nigh forgotten, were important contributions to the scholarship of his time.

---

[1] "Man-of-war-Bird" is also sometimes applied to it, and is perhaps the older name; but it is less distinctive, some of the larger Albatrosses being so called, and, in books at least, has generally passed out of use.

[2] Hence another of the names—"Hurricane-Bird"—by which the species is occasionally known.

[3] Capt. Taylor, however, found their nests as well on low bushes of the same tree in the Bay of Fonseca (*Ibis*, 1859, pp. 150–152).

No collected edition of his works has ever been published; to enumerate them exhaustively would be almost impossible. Among those most widely known may be mentioned the *Hebræis*, a Latin epic based on the Scripture history of the Jews; the *Elegiaca*, in twenty-two books; the *Opera Scenica*, consisting of six comedies and two tragedies; the *Grammatica Latina;* the versions of Callimachus and Aristophanes; and the commentaries on Persius and Virgil. See the monograph of Strauss (*Leben und Schriften des Dichters und Philologen Frischlen*, 1855).

FRISI, Paolo (1728–1784), a celebrated mathematician and astronomer, was born at Milan, April 13, 1728. At the age of fifteen he entered the monastery of the Barnabite friars, where, by self-instruction, he acquired a considerable knowledge of geometry. Under Professor Olivetano, at the university of Padua, he continued his mathematical studies. After a time he was sent to Lodi to give lectures on philosophy. When twenty-one years of age he composed a treatise on the figure of the earth, and the reputation which he soon acquired led to his appointment by the king of Sardinia to the professorship of philosophy in the college of Casale. His friendship with Radicati, a man of liberal opinions, occasioned Frisi's removal by his clerical superiors to Novara, where he was compelled to do duty as a preacher. In 1753 he was elected a corresponding member of the Paris Academy of Sciences, and shortly afterwards he became professor of philosophy in the Barnabite College of St. Alexander at Milan. An acrimonious attack by a young Jesuit, about this time, upon his dissertation on the figure of the earth laid the foundation of his animosity against the Jesuits, with whose enemies, including D'Alembert, Condorcet, and other Encyclopedists, he later closely associated himself. In 1756 he was appointed by Leopold, grand-duke of Tuscany, to the professorship of mathematics in the university of Padua, a post which he held for eight years. He was made in 1757 an associate of the Imperial Academy of St. Petersburg, and a foreign member of the Royal Society of London, and in 1758 a member of the Academy of Berlin, in 1766 of that of Stockholm, and in 1770 of the Academies of Copenhagen and of Bern. From several European crowned heads he received, at various times, marks of special distinction, and the empress Maria Theresa granted him a yearly pension of 100 sequins (£50). In 1764 he was created professor of mathematics in the Palatine Schools at Milan, and obtained from Pope Pius VI. release from ecclesiastical jurisdiction, and authority to become a secular priest. In 1766 he visited France and England, and in 1768 Vienna, and thus formed the acquaintance of the leading men of science of his day. Frisi was in 1777 made director of a school of architecture at Milan. His knowledge of hydraulics caused him to be frequently consulted with respect to the management of canals and other water-courses in various parts of Europe. It was through his means that lightning-conductors were first introduced into Italy for the protection of buildings. He was a man not only of extensive learning, but of wide views and fearless spirit, and by his lectures did much to dispel the popular superstitions of his fellow-countrymen concerning magic and witchcraft. He died November 22, 1784. He wrote—

Disquisitio mathematica in causam physicam figuræ et magnitudinis terræ, Milan, 1751; *Saggio della morale filosofia*, Lugano, 1753; *Nova electricitatis theoria*, Milan, 1755; *Dissertatio de motu diurno terræ*, Pisa, 1758; *Dissertationes variæ*, 2 vols. 4to, Lucca, 1759, 1761; *Del modo di regolare i fiumi e i torrenti*, Lucca, 1762; *Cosmographia physica et mathematica*, Milan, 1774, 1775, 2 vols. 4to, his chief work; *Dell architextura, statica e idraulica*, Milan, 1777; and other treatises.

See Verri, *Memorie . . . del signor dom Paolo Frisi*, Milan, 1787, 4to; Fabbroni, *Elogj d'illustri Italiani Atti di Milano*, vol. ii.

FRISIANS,—in classical Latin *Frisii*, in mediæval Latin *Frisones* or *Frisiones*, and on inscriptions of the later empire sometimes *Frisævones*,—a people of Teutonic stock, who at their first appearance in history, are found in possession of the same district of Europe which they still, at least partially, occupy. So far as can be judged they have never been of an aggressive disposition, and it is not improbable that at one time they may have possessed a much wider territory than history usually assigns them. The boundaries of Frisia proper are the Scheldt towards the west, and the Weser towards the east, and it never extended far inland from the coast of the German Ocean. But there is also a district of Schleswig in Denmark, extending along the west coast from the Eider northwards to Töndern, in which the common language still gives evidence of a Frisian population; the same may be said of the neighboring islands of För, Silt, Heligoland, etc.; and it is no improbable supposition that not only the Ditmarsch district to the south of the Eider, but also the whole maritime country westward to the Weser, was at an earlier period in the hands of distinctly Frisian tribes. If the presence of geographical names ending in *um*, the Frisian equivalent to the German *heim* and the Saxon *ham*, may be taken as sufficient evidence of Frisian occupation, Dr. Latham, in his notes to the *Germania* of Tacitus, has elaborately shown that there have been Frisian settlements as far north in Denmark as the Lijmfiord, and as far east as the islands of Funen and Zealand. By the older historians of Denmark and the countries of Lower Germany, the Frisian district in Denmark is frequently called *Frisia Minor* or Lesser Frisia, which, however, must not be confounded with the unexplained distinction which Tacitus makes between Frisii Majores and Frisii Minores.

The history of the Frisians, in spite of the labors of a few investigators like Wiarda and Richthofen, has hitherto been left in many respects in a very fragmentary and untrustworthy condition; and rash assertions of uncritical chroniclers have undisputed currency. For this neglect the principal reason is undoubtedly the fact that the people have, at least in modern times, displayed no strong political individuality, but have allowed themselves peacefully to be merged in more powerful nationalities. The reader who wishes may find the legendary history of the Frisian heroes traced from the 4th century B.C. in Furmius's *Annalium Phrisicorum Libri Tres*, Franeker, 1699, or in the quaintly-illustrated volumes of Westphal's *Scriptores rerum Danicarum*, which comprise Petrus Sax *De præcipuis rebus gestis Frisiorum septentrionalium breviter descriptis et iconice adumbratis libri sex;* Suffridus Petri *De antiq. et orig. Frisiorum;* Antonius Heimreich, *Supplementa ad Chronicon Frisiæ Septentr.*, etc.

The Frisians were so far rendered tributary by Drusus that they continued to pay to the Romans a tax of ox hides until the foolish exactions of Olennius, who demanded that all the hides should be of a certain superlative quality, drove them to revolt in 28 A.D. They defeated the Roman forces under Lucius Apronius, and though Corbulo obtained hostages for their future loyalty, and "gave them a senate, magistrates, and a constitution" (Tacitus, *Ann.* xi. 20), their subjugation was little more than nominal. About 57 A.D. a body of Frisians took possession of lands reserved for the Roman soldiers; and, instead of removing at the threat of the Roman governor, they sent their chiefs to Rome to obtain imperial sanction for their occupancy. In the 13th book of his *Annals*, Tacitus tells how the chiefs, Verritus and Malorix, as he calls them, excited the amusement and admiration of the people by taking, unasked, their seat among the senators in Pompey's theatre, when they heard that strangers from nations distinguished by their bravery and friendship to the Romans were advanced to that honorable position. Nero gave them both the Roman franchise, but refused to sanction the presumption of their tribe, who were afterwards expelled from the district which they had sought to colonize.

It is not till the new power of the Franks was beginning to lay the foundations of its empire that the Frisians again come prominently into notice; but it appears probable that in the mean time they had shared with their neighbors, the Angles and the Saxons, in the conquest of England and Scotland, though to what extent it is impossible to ascertain. The Frankish king Dagobert I. (622–638), sought to secure a footing among them by erecting a mission church at Utrecht on the Frisian frontiers, but the Frisians captured the place and destroyed the church. The preaching of Amandus and Eligius had little effect, and the honor of being the first successful missionary among the Frisians was left to Wilfrid of York, who in 677-678 was hospitably received by the king Aldegild (Adgillus or Aldgisl). Under Aldegild's successor Radbod a persecution of the new faith ensued, and though Radbod was driven from West Friesland by King Pippin, after the battle of Dorstadt in 689, he maintained his independence in Eastern Frisia, and Christianity was safe only as far as the wavering frontier of the Franks extended. On Pippin's death, Radbod not only recovered his western territory, but sailed up the Rhine as far as Cologne, and defeated Charles Martel. His successor, Aldegild II., was again driven eastward; the western districts fell finally into the power of the Franks; and Willibrord, the missionary, who had begun his labors in the country about 700, obtained a permanent see at Utrecht. The last independent prince of the Frisians, Poppo, was defeated by Charles Martel in 754, and Charlemagne still further extended the Frankish authority. At the same time he granted the Frisians important privileges, gave them the title of freemen, and allowed them to choose their own *podestat* (potestas), who should govern them under the protection of the empire. About this time the country of the Frisians was divided into three distinct districts:—Western Frisia, stretching from the Sincfal to the Fly or Flevum, that is, from the modern Zwin (a branch of the Scheldt northward of Bruges) to the Meuse; Middle Frisia, from the Fly to the Laubach, that is, from the Meuse to the Zuyder Zee: and Eastern Frisia, from the Zuyder Zee to the Weser. At the treaty of Verdun (843) Frisia went with Lotharingia; at the treaty of Mersen (870) the district between the Laubach and the Weser was assigned to the kingdom of the Eastern Franks, while the rest, with Lotharingia, passed to the kingdom of the Western Franks; in 880 the whole country was again united with Germany; and in 911, when Lotharingia recognized Charles, the king of the West, Frisia adhered to Conrad, the king of the East. The history of West Frisia gradually loses itself in that of the bishopric of Utrecht and the countship of Holland,—the first count of Holland, Thierry I., being the son of Gerulph, count of Frisia, and practically continuing the Frisian line. In 1248 William of Holland, having become emperor, restored to the Frisians in his country their ancient liberties in reward for the assistance they had rendered him in the siege of Aix-la-Chapelle; but in 1254 they revolted, and William lost his life in the contest which ensued. William IV. received a new donation of West Frisia in 1345. Meanwhile, the rest of the Frisians in the more eastern districts maintained their independence, and for a long time governed themselves after a very simple republican fashion. Each of the seven confederated Frisian maritime states—"Sieben Friesischen Seelande"—had its own administration, and consisted of a number of locally independent districts. For matters of general concern there was an annual assembly at the Upstalsbom, or "Tree of the Superior Court," near Aurich. According to Okko Leding, who in 1878 published at Emden an interesting study on *Die Freiheit der Friesen im Mittelalter, und ihr Bund mit den Versammlungen bei Upstalsbom*, it appears that these assemblies were allowed to fall into desuetude in the first half of the 13th century, were resumed from 1323 to 1327, anew discontinued, and again resumed in 1361. The counts disappear in East Frisia about the end of the 11th century, and in Middle Frisia after 1233. Though in religious matters nominally subject to the bishopric of Bremen, it was not till the crusade of 1234, and the famous defeat of the Stedingers (a people of the Weser marches) in the battle of Altenesch or Oldenesch, that the Frisians really recognized the authority of the Romish Church. In the course of the 14th century the whole country was in a state of anarchy; petty lordships sprang into existence, the interests of the common weal were forgotten or disregarded, and district carried on hostilities against district. Thus the Fetkoopers or Fatmongers, as they were called, of Ostergo, had endless feuds with the Schieringers or Eelfishers of Westergo.

This state of matters favored the attempts of the counts of Holland to push their conquests further, but the main body of the Frisians were still independent when the countship of Holland passed into the hands of Philip the Good of Burgundy. Philip laid claim to the whole country, but the people appealed to the protection of the empire, and Frederick III. in August, 1457, recognized their direct dependence on the empire, and called on Philip to bring forward formal proof of his rights. Philip's successor, Charles the Rash, summoned an assembly of notables at Enckhuysen in 1469, in order to secure their homage; but the conference was without result, and the duke's attention was soon absorbed by other and more important affairs. In 1498 Maximilian detached the country between the Laubach and the Fly from the empire, and gave it as a fief to Albert of Saxony, but it was the Schieringers alone (the name had by this time become the title of the popular faction) who submitted uncomplainingly to the arrangement, and the Fetkoopers, or faction of the nobility, had to be put down by force of arms. This the duke did with the utmost severity, and his successors carried out his despotic policy with only too faithful consistency.

In Eastern Frisia the anarchy was brought to a close by the formation of a confederation established in 1430, and the election of Edzard Cirksena to the office of president. Ulrich, the successor of Edzard, was made count of the country between the Ems and the Weser by the emperor Frederick III. in 1454. In the early part of the 16th century the Reformation was introduced by Edzard I., who patronized the preaching of Meister Jörgen von der Düre, or Magister Aportanus, as he was called in Latin. Under the Countess Anna, who ruled during the minority of her son Edzard II., the countship became, mainly through the agency of John a Lasco, the seat of a very flourishing Protestant church, and the refuge of the persecuted of many lands. Edzard II. proved an able ruler, published a body of laws for his people in 1515, introduced primogeniture into his family, extended his authority over Harlingerland and Jever, and was appointed by Charles V. governor of Groningen. His successor, Edzard III., was made a prince of the empire by Ferdinand III. in 1654. By the death of Charles Edzard, in 1744, the male line of the dynasty came to an end, and the king of Prussia took possession of the countship. After various vicissitudes, it was ceded to Hanover, in 1815.

The Frisian language is a member of the Low German branch of the Teutonic, and presents special interest to the English philologist as the nearest of all extant forms to the Saxon basis of his own tongue. It is still spoken in the country districts of the present province of West Friesland; in a much more Germanized condition it still exists in Saterland, in East Friesland; in strangely differentiated dialects it holds its own in many of the islands along the coast; and, in spite of the encroachments of Low German on the one hand, and Danish on the other, it survives in the country between Husum and Töndern. Among its peculiarities may be mentioned the dropping of the final *n*, which is such a favorite termination in German (thus even *ma* for *man*, as in Halbertsma, the proper name); the use of *sk* for the German *sch* and English *sh*, and of *t* for the German *k*; and, still more remarkable, the modification of *k* and *g* into *ts* when these letters precede *e* or *i*, as in tserke for kerke, *i.e.*, kirk, church. The explanation of this last peculiarity may perhaps be found in the contact of the Frisian with Slavonic languages, in which the modification is sufficiently common.

A brief sketch of Frisian grammar was published along with the poems of Gysbert Japicx; but the first separate treatment of the older forms of the language was by Rask, whose *Frisisk Sproglære* (Copenhagen, 1825; German translation by Buss, Freiburg, 1834) brought him into controversy with Grimm, who, in his *Deutschen Grammatik*, devoted some attention to the same subject. Moritz Heyne has also given a good treatment of Frisian in his *Kurze Laut- und Flexionslehre der Altgermanischen Sprachtstämme*, 1874. Richthofen's *Altfriesisches Wörterbuch*, Göttingen, 1840, practically supplanted the older work of Wiarda (Aurich, 1786), and its position has not been affected by the publication of Haan Hattema's *Idioticon Frisicum*, Leeuwarden, 1874. Outzen's *Glossarium der Friesischen Sprache* (unfortunately a posthumous publication from very illegible manuscripts), Copenhagen, 1837, deals mainly with North Frisian. For West Frisian we have the posthumous and incomplete *Lexicon Frisicum* (A–Feeor), by Justus Halbertsma, The Hague, 1874; and for East Frisian lexicography we have materials in Ehrentraut's *Friesisches Archiv*, Oldenburg, 1847–54, 2 vols., Posthumus and Halbertsma's *Onze reis naar Sageltesland*, Franeker, 1836, and J. Cadovius Müller's *Memoriale linguæ frisicæ*, written in the early part of the 18th century, and published by Dr. Kükelhan, 1875. J. ten Doornkaat Koolman began in 1877 a *Wörterbuch der Ostfriesischen Sprache*, which, along with much irrelevant matter, contains valuable contributions to the subject. The *Ostfriesisches Wörterbuch*, by Sturenburg (1857), is a dictionary, not of Frisian, but of the Low German spoken in East Friesland, which has incorporated comparatively few Frisian words. A list of Frisian personal names forms an appendix to Outzen's *Glossarium;* and Bernhard Brons, in his *Friesische namen und Mittheilungen Darüber*, Emden, 1877, furnishes lists of East, West, and North Frisian Christian names, and a collection of Frisian family names, with the dates at which they make their first appearance in church books or other historical documents.

For the older forms of the language the sources are unfortunately scanty: no great literary monument like that of the Heliand or the Nibelunglied has been preserved, and the investigator has mainly to depend on the various legal codes or collections which were formed in the course of the 14th and 15th centuries, and have have been published by Richthofen, *Friesische Rechtsquellen*, Berlin, 1840. The great *Lex Frisionum* is composed in Latin, and only contains a few Frisian terms, of comparatively small linguistic importance. The date of its recension is also a matter of conjecture, as there is no contemporary evidence either internal or external. By the older investigators it was assigned a high antiquity; but the more modern are for the most part of opinion that it is not earlier than the reign of Charlemagne. Haan Hettema in his *Oude Friesche Wetten* gives 802–804 as the probable date: while Richthofen thinks there are three portions, the first composed for use in Middle Frisia in the reign of Charles Martel or of Pippin, another for use in all Frisia, composed after Charlemagne's conquest in 785, and a third or supplementary and emendatory portion composed in 802. The first edition of the *Lex Frisionum* was published by B. J. Herold in his *Originum ac Germanicarum Antiquitatum libri*, Basel, 1557, but he gives no indication of the source of the manuscripts which he employed. Since his day there have been no fewer than 13 editions—Lindenbrog, *Codex legum Antiquarum*, Frankfort, 1613; Sibrand Siccama, *Lex Frisionum*, Franeker, 1617; Schotanus, *Beschryvinge van de Heerlyckheit van Frieslandt*, 1664; Gärtner, *Saxonum leges tres: accessit Lex Fris.*, Leipsic, 1730; Georgisch, *Corpus juris Germanici*, Halle, 1738; Schwartzenburg, *Groot Placaat en Charterboek van Vriesland*, Leeuwarden, 1768; Canciani, *Barbarorum leges antiquæ*, Venice, 1781; Walter, *Corpus juris German.*, Berlin, 1824; Gaupp, *Lex Fris.*, Breslau, 1732; Richthofen, *Friesische Rechtsquellen*, Berlin, 1840; De Wall, *Lex Fris.*, etc., Amsterdam, 1850; Hettema, *Oude Fr. Wetten*, Leeuwarden, 1851; and, finally, Richthofen in Pertz's *Mon. Germaniæ hist.*, vol. xv., Hanover, 1863. Though it has been supposed that Lindenbrog and Siccama may have had access to some manuscript authority in addition to Herold's recension, there is no proof that such was the case; and the text still remains to all intents in the same state as when Heröld left it. Some investigators have, owing to this absence of original evidence, even cast doubts on the authenticity of the code, but a comparison of the laws with undoubtedly genuine Frisian remains authorizes its acceptance. "I am convinced," says Richthofen, "that no man in the time of Herold, not to say in our own time, could have devised such a forgery as the Heroldian text." Among the minor collections of Frisian laws in Frisian, Low German, and Latin are the "seventeen general acts or *Küren*," dating from the close of the 12th century, according to Richthofen, but of much earlier origin according to Leding—the Upstalsbom laws of 1323, the local laws of Rüstring, and of the Brockmannen or inhabitants of Brockmerland, published by Wiarda; the "Emsiger Domen," or Emsig decisions, published by Hettema, Leeuwarden, 1830; the Fivelgo laws, published by Hettema, Dokkum, 1841; and the Hunsingo Küren in the 2d volume of the Groningen transactions of the society "pro excolendo jure patrio," 1778. The title chosen by Wiarda for the laws of Rüstring—the *Asegabuch*—though it has become perhaps the best known word of the whole Frisian vocabulary, is in reality not a genuine Frisian form, and never occurs in a Frisian document. The correct expression, according to Richthofen (*Altfries. Wörterbuch*, s.v. "Åsebok"), would have been *Asebok* or *Asékbok*, the former equivalent to the book out of which the "a" or law is to be *seen*, and the latter to the book in which the law is to be *sought*. In West Frisia the native language holds much the same relation to Dutch as the Scottish language holds to English in Scotland: it has no legal or educational position, but it preserves among the peasantry a considerable degree of vitality, and is even cultivated in a literary way by a small patriotic school. The chief place among West-Frisian authors is due to Gysbert or Gilbert Japicx, rector at Bolsward, whose *Friesche Rijmlerye* was first published at Bolsward in 1668, and has since been frequently reprinted—at Leeuwarden in 1681; at Franeker, 1684; with a glossary by Epkema, 2 vols., Leeuwarden. 1824; and under the editorship of Dykstra, 1853. The volume contains secular, and especially humorous, poems, fifty of the Psalms of David and other religious pieces, a number of letters, one or two prose essays, and fragments of the "Customs" of Leeuwarden. A popular comedy called *Waatze Gribbert's Brilloft*, or *Gribbert's Bridal*, dates from the beginning of the 18th century. The first edition appeared in 1812, at Leeuwarden, and the second in 1820, and there have been several since. Among the writers who have published in West Frisian during the 19th century, it is sufficient to mention Salverda Posthumus, J. H. Halbertsma, Deketh, Windsma, Van der Veen, and Dykstra. A society for the study of Frisian was founded in 1829 at Franeker—"Friesch genootschap voor geschied-oudheid-en taalkunde"—and since 1852 it has published a journal called *De Vrije Fries*. Other Frisian periodicals are *Forjit my net*, "Forget me not;" the *Swanne-blummen*, a Leeuwarden annual; and *De Byekoer*. In North Frisian the most valuable literary monument is *De gidt shals, i.e.*, the *Geizhals*, or *Curmudgeon*, a comedy, composed by J. P. Hunsen, in the Silt dialect. The minor remains have been collected by De Vries, in his *Nordfriesische Sprache nach der Moringer Mundart*, Leyden, 1860; and by Johansen in *Die Nordfriesische Sprache nach der Föhringer und Amrumer Mundart*, Kiel, 1862.

There is one book which, more than any other, has attracted the attention of other than Frisian scholars. If the *Oera Linda* book, as it is called, could be accepted as genuine, it would be, after Homer and Hesiod, the oldest document of European origin; but unfortunately it must be recognized as nothing more than a brilliant forgery. The first part of the manuscript, the book of the followers of Adela, professes to have been copied in 1256, from an ancient original, and gives an account of Neptune, Minerva, Minos, and other personages of classical antiquity, which would make them out to be of Frisian origin. According to J. Beckering Vinckers—who published *De Onechtheid van het Oera Linda bôk aangetoond uit de waartaal waarin het is geschreven*, in 1875, and *Wie heeft het Oera Linda Boek geschreven* in 1877—the real author is Cornelis Over de Linden, a ship-carpenter in the Royal docks at Den Helder, who was born in 1811, and died in 1873, and who appears to have forged the document for the purpose of giving importance to his invectives against the church, and of shedding dignity on his family, which is traced by the book back for about two thousand years.

Besides the works indicated above the following may be mentioned:—Ubbo Emmius, *Rerum Frisicarum historia*, Leyden, 1616; Pirius Winsemius, *Chronique . . . van Vriesland*, Franeker, 1622; Wiarda, *Ostfries Geschichte*, vols. 1–9, Aurich, 1791–1813, vol. 10, Bremen, 1817; Clement, *Lebens- u. Leidensgeschichte Frieslands der Friesen*, Kiel, 1845; Suur, *Geschichte der Häuptelinge Ostfrieslands*, Emden, 1846; Klopp, *Gesch. Ostfrieslands*, Weener, 1868–69; Friedländer, *Ostfries. Urkundenbuch*, Emden, 1874.

FRITH or FRYTH, JOHN (*cir.* 1503-1533), an eminent pioneer of the Reformation in England, was born about the beginning of the 16th century at Westerham, Kent, where his father kept an inn. He was educated at Eton, and afterwards at King's College, Cambridge, where Gardiner, who subsequently became bishop of Winchester, was his tutor. Immediately after taking his B.A. degree, he transferred his residence (December, 1525) to the newly founded college of St. Frideswide or Cardinal College (now Christ Church), Oxford, whither, along with other young men of distinguished talent, he had been invited by Wolsey. At Oxford the sympathetic interest which he showed in the Reformation movement in Germany soon caused him to be suspected as a heretic, and led to his imprisonment for some months. On being at the instance of Wolsey released from confinement, towards the close of 1526 or early in 1527, he fled to the Continent, where he appears to have resided chiefly at the newly founded Protestant university of Marburg, and to have been associated with Tyndal in many of the literary labors of the latter. At Marburg he became acquainted with several scholars and Reformers of note, and particularly with the famous Patrick Hamilton. Frith's first publication in fact was a translation of Hamilton's *Places*, made shortly after the martyrdom of their author; and soon afterwards the *Revelation of Antichrist*, a translation from the German, appeared, along with *A Pistle to the Christen Reader*, by "Richard Brightwall" (supposed to be Frith), and *An Antithesis wherein are compared togeder Christes Actes and our Holye Father the Popes*, dated "at Malborow in the lande of Hesse," 12th July, 1529. His *Disputacyon of Purgatorye*, a treatise in three books, against Rastell, Sir T. More, and Fisher (bishop of Rochester) respectively, was published at the same place in 1531. In 1532, probably in July or August, he ventured back to England, apparently on some business to which he and Tyndal attached importance in connection with the prior of Reading. Warrants for his arrest were almost immediately issued at the instance of Sir T. More, then lord chancellor. For some weeks Frith successfully evaded pursuit, but ultimately, in December, he fell into the hands of the authorities at Milton Shore in Essex, as he was on the point of making his escape to Flanders. The rigor of his imprisonment in the Tower was somewhat abated when

Sir T. Audley succeeded to the chancellorship, and it was understood that both Cromwell and Cranmer were disposed to show great leniency. But the treacherous circulation of a manuscript "lytle treatise" on the sacraments, which Frith had written for the information of a friend, and without any view to publication, served further to excite the hostility of his enemies, and in a Lent sermon preached against the "sacramentaries" before the king, special reference was made to some at that time in the Tower, "so bold as to write in defence of that heresy," and who seemed to be put there "rather for safeguard than for punishment." On this instigation, Henry ordered that Frith should be examined; the result of a regular trial which followed was that he was found guilty of having denied, with regard to the doctrines of purgatory and of transubstantiation, that they were necessary articles of faith. On the 23d of June, 1533, he was handed over to the secular arm, and at Smithfield on the 4th of July following he was burnt at the stake. During his captivity he had been more than usually busy with his pen, and his writings belonging to this period include, besides several letters of interest, a controversial work on the eucharist in reply to what Sir T. More had written against Frith's "lytle treatise;" also two tracts entitled respectively *A Mirror or Glass to know thyself*, and *A Mirror or Looking-glass wherein you may behold the Sacrament of Baptism*. Apart from his ability, which seems to have been regarded by all his contemporaries as extraordinary, his acquirements, his piety, his early and tragic death, Frith is an interesting and so far important figure in English ecclesiastical history as having been the first to maintain and defend that doctrine regarding the sacrament of Christ's body and blood which ultimately came to be incorporated in the English communion office. Twenty-three years after Frith's death as a martyr to the doctrine of that office, that "Christ's natural body and blood are in Heaven, not here," Cranmer, who had been one of his judges, went to the stake for the same belief. Within three years more, it had become the publicly professed faith of the entire English nation.

FRITZLAR, a town formerly of Electoral Hesse and now of Prussia, at the head of a circle in the district of Cassel, about 16 miles S.S.W. of Cassel, on the left bank of the Eder, a left-hand sub-tributary of the Weser. It is an old-fashioned place still surrounded with watchtowers, and it possesses a large number of churches, an Ursuline nunnery, and an old Franciscan monastery, now partly used as a Protestant church and partly as a poorhouse. Its inhabitants, who according to the census of 1875 numbered 2965, are mainly engaged in agriculture, but also manufacture considerable quantities of earthenware. As early as 732 Boniface, the apostle of Germany, established the church of St. Peter's and a small Benedictine monastery at Frideslar, "the quiet home" or "abode of peace." Before long the school connected with the monastery became famous, and among its earlier scholars it numbered Sturm, abbot of Fulda, and Megingoz, bishop of Würzburg. When Boniface found himself unable to continue the supervision of the society himself, he entrusted the office to Wigbert of Glastonbury, who thus became the first abbot of Fritzlar. In 774 the little settlement was taken and burnt by the Saxons; but it evidently soon recovered from the blow. For a short time after 786 it was the seat of the bishopric of Buraburg, or Bürberge, which had been founded by Boniface in 741. At the diet of Fritzlar in 919 Henry I. was elected by the Franks and Saxons. In the beginning of the 13th century the village received municipal rights; in 1232 it was captured and burned by the landgrave, Conrad of Thuringia, and his allies; in 1631 it was taken by storm by William of Hesse; in 1760 it was successfully defended by General Luckner against the French; and in 1761 it was occupied by the French and unsuccessfully bombarded by the allies. As a principality Fritzlar continued subject to the archbishopric of Mainz till 1802, when it was incorporated with Hesse. From 1807 to 1814 it belonged to the kingdom of Westphalia; and in 1866 it passed with Hesse to Prussia.

FRIULI (in Italian, *Friuli;* in French, *Frioul;* in German, *Friaul;* and in the local dialect, *Furlanei*), a district at the head of the Adriatic, at present divided between Italy and Austria, the Italian portion being included in the province of Udine, and the Austrian comprising the countship of Görtz and Gradiska and the so-called Idrian district. In the north and east it is occupied by portions of the Julian and Carnian Alps, while the south is an alluvial plain richly watered by the Isonzo, the Tagliamento, and many lesser streams which, although of small volume during the dry season, come down in enormous floods after rain or thaw. The inhabitants known as Furlanians are probably in the main Latinized Celts, largely mingled with Italians on the one hand and Slovenians on the other. They speak a language much more akin to Latin than even Italian; details about which will be found in Pirona's *Attenenze della lingua friulana date per chiosa ad una iscrizione del 1103*, Udine, 1859, and *Vocabulario friulino*, Venice, 1869.

Friuli derives its name from the Roman town of Forum Julii, or Forojulium, which is said by Paulus Diaconus to have been founded by Julius Cæsar. In the 2d century B.C. the district was subjugated by the Romans, and became part of Gallia Transpadana. During the Roman period, besides Forum Julii, its principal towns were Concordia, Aquileia, Vedinium, and Næria. On the conquest of the country by the Lombards it was made one of their thirty-six duchies, the capital being Forum Julii or, as they called it, Civitas Austriæ. It is needless to repeat the list of dukes of the Lombard line, from Gisulf to Rodgaud, who fell a victim to his opposition to Charlemagne; their names and exploits may be read in Paulus Diaconus. The discovery, however, of Gisulf's grave at Cividale, in 1874, is interesting as proof of the historian's authenticity. Charlemagne naturally filled Rodgaud's place with one of his own followers, and the frontier position of Friuli gave the new line of counts, dukes, or margraves (for they are variously designated) the opportunity of acquiring importance by exploits against the Bulgarians, Slovenians, and other hostile peoples to the east. In the 11th century the ducal rights over the greater part of Friuli were bestowed by the emperor on the archbishop of Aquileia; but towards the close of the 14th century the nobles called in the assistance of Venice, which, after defeating the archbishop, afforded a new illustration of Æsop's well-known fable, by securing possession of the country for itself. The eastern part of Friuli was held by the counts of Görtz till 1500, when on the failure of their line it was appropriated by Maximilian I. By the peace of Campo Formio (1797) the Venetian district also came to Austria, and on the formation of the Napoleonic kingdom of Italy in 1805, the department of Passariano was made to include the whole of Venetian and part of Austrian Friuli, and a few years later the rest was added to the Illyrian provinces. The title of duke of Friuli was borne by Marshal Duroc. In 1814 the whole country was recovered by the emperor of Austria, who himself assumed the ducal title and coat of arms; and it was not till 1866 that the Venetian portion was again ceded to Italy by the peace of Nikolsburg.

FROBEN, Joannes (Latinized name *Frobenius*), a German printer and scholar, was born at Hammelburg in Franconia about 1460. After completing his university career with great distinction at Basel, he established a printing office in that city about the year 1491, and was the first German who brought the art to anything like perfection. He was on intimate terms of friendship with Erasmus, who not only had his own works printed by him, but superintended Frobenius's editions of St. Jerome, St. Cyprian, Tertullian, Hilary of Poitiers, and St. Ambrose. It was part of Frobenius's plan to have printed also editions of the Greek Fathers. He did not live to carry out this project, but it was very creditably executed by his son Jerome and his son-in-law Bisschop or Episcopius. Frobenius died in 1527, in consequence of an accident which had befallen him some years before. An extant letter of Erasmus, written in the year of Frobenius's death, gives an epitome of his life and an estimate of his character; and in it Erasmus mentions that his grief for the death of his friend was far more poignant than that which he had felt for the loss of his own brother. The epistle concludes with an epitaph in Greek and Latin.

FROBISHER, Sir Martin (*c.* 1535–1594), English navigator and explorer, was the fourth child of Bernard Frobisher, and was born, it is usually stated, at Doncaster, but more probably at Altofts in the parish of Normanton, Yorkshire, some time between 1530 and 1540. The family came originally from North Wales. Martin was sent to London to his mother's brother, Sir John York, and in 1554 went with a small fleet of merchant ships to Guinea under Admiral John Lock. We next hear of him in 1565 as Captain Martin Frobisher, and again in 1571 as superintending at Plymouth the building of a ship to be employed against the Irish. As early as 1560 or 1561 Frobisher had conceived the idea of discovering a north-west passage to Cathay, a short route to which was the motive of most of the Arctic voyages undertaken at that period and for long after. For years he schemed and plotted, and solicited in all quarters, from the court downwards, to obtain means to carry his favorite project into execution; and it was only in 1576 that, mainly by help of the earl of Warwick, he was put in command of two tiny barks, the "Gabriel" and "Michael," mere cockle shells of about 20 tons each, and a pinnace of 10 tons, with an aggregate crew of 35. On June 7 Frobisher left Blackwall, and having received a good word from Queen Elizabeth at Greenwich, the expedition, if we may apply to it so considerable a term, sailed northwards to the Shetland Islands. Stormy weather had been met with, in which the pinnace was lost, and some time after the "Michael" deserted. After passing Greenland and being nearly wrecked, the "Gabriel" reached the coast of Labrador on July 28. Some days later Hall's Island, at the mouth of Frobisher Bay, was reached, and a landing effected. Among the things hastily brought away by the men was some "black earth," which played an important part in connection with Frobisher's further career. Sailing up Frobisher Bay, then thought to be a strait, they reached Butcher's Island on August 18. Here some natives were met with, and intercourse carried on with them for some days, the result being that five of Frobisher's men were decoyed and captured, and never more seen. After vainly trying to get back his men, Frobisher turned homewards, and reached London on October 9. It seemed as if nothing more was to come of this expedition, when it was noised abroad that the apparently valueless "black earth" was really a lump of gold ore. It is difficult to say how this rumor arose, and whether there was any truth in it, or whether Frobisher was a party to a deception, in order to obtain means to carry out the great idea of his life. The story, at any rate, was so far successful; the greatest enthusiasm was manifested by the court and the commercial and speculating world of the time; and next year a much more important expedition than the former was fitted out, the queen lending Frobisher from the royal navy a ship of 200 tons. A Cathay company was established, with a charter from the crown, giving the company the sole right of sailing in every direction but the east; Frobisher was appointed high admiral of all lands and waters that might be discovered by him. The queen herself subscribed £1000, and the rest required was soon forthcoming. On May 26, 1577, the expedition, which, besides the royal ship, the "Aid" of 200 tons, consisted of the "Gabriel" and "Michael" of the previous year, with boats and pinnaces and an aggregate complement of 120 men, including miners, refiners, etc., left Blackwall, and sailing by the north of Scotland, arrived at Greenland early in July. Hall's Island was reached on the 18th, and though no more "black earth" was found there, abundance of it was found on other islands, and the ships well loaded with it. The country around under the name of *Meta Incognita*, was solemnly taken possession of in the queen's name. Several weeks were spent in Frobisher Bay collecting ore, but very little was done in the way of discovery. There was much parleying and some skirmishing with the natives, and earnest but futile attempts made on the part of Frobisher to recover the men captured the previous year. The return was begun on August 22, and the "Aid" reached Milford Haven on September 20; the "Gabriel" and "Michael," having separated, arrived later at Bristol and Yarmouth. Frobisher was received and thanked by the queen at Windsor. Great preparations were made and considerable expense incurred for the assaying of the great quantity of "ore" brought home, in the testing of which the queen manifested a strong personal interest. This took up much time, and led to considerable dispute among the various parties interested. Meantime the faith of the queen and others remained strong in the productiveness of Meta Incognita, and it was resolved to send out a larger expedition than ever, with all necessaries for the establishment of a colony of 100 men. The queen herself contributed two ships of 400 and 200 tons, manned with 150 men and carrying 120 pioneers. Besides these the fleet contained other 13 vessels of various sizes, carrying other 250 men, and the most elaborate and minute instructions were drawn up for the conduct of the expedition. Frobisher was again received by the queen at Greenwich, and her Majesty threw a fine chain of gold around his neck. On May 31, the expedition left Harwich, and sailing by the English Channel, reached Greenland on June 19. This time Frobisher and some of his men managed to land, "being the first known Christians that we have true notice of that ever set foot upon that ground." In the first days of July, Frobisher Bay was reached, but stormy weather and dangerous ice drove the fleet southwards, and unwittingly Frobisher entered what was afterwards known as Hudson Strait, up which he sailed about 60 miles. When he found that he was sailing away from his destination, he, with apparent reluctance, turned back, and after many buffetings part of the fleet managed to come to anchor in Frobisher Bay. Some attempt was made at founding a settlement, and immense quantities of ore were shipped. But, as might be expected, there was much dissension and not a little discontent among so heterogeneous a company, and on the last day of August the fleet set out on its return to England, which was reached in the beginning of October. Thus ended what was little better than a fiasco, though Frobisher himself cannot be held to blame for the result; the scheme was altogether chimerical, and the "ore" seems to have been not worth smelting. Between 1578 and 1585 we hear little of Frobisher, though he seems to have been doing service at various places, and steadily advancing in the good opinion of those in power. In 1580 he obtained the reversion of the clerkship of the royal navy, of no immediate value. In 1585 he commanded in the "Primrose" in Sir F. Drake's expedition to the West Indies, in the large booty brought home from which he no doubt had a good share. For the next year or two he was employed in various responsible services against the designs of Spain, and in 1588 he did such excellent work in the "Triumph" against the Spanish Armada that he was rewarded with the honor of knighthood. He continued to cruise about in the Channel until 1589, when he was sent in command of a small fleet to the coast of Spain. In 1591 he visited his native Altofts, and there married a daughter of Lord Wentworth. He had prospered during recent years and was able to become a landed proprietor in Yorkshire and Notts. But he found little leisure for a country life, and was soon on the seas again watching and cutting off the richly laden ships of Spain. In November, 1594, he took part in the siege of Crozan, near Brest, and received a wound from which he died at Plymouth on November 22. His body was taken to London and buried at St. Giles's, Cripplegate. Frobisher was brave ard skilful as a naval leader, and had the enthusiasm of the true explorer, but was characterized by much of the coarseness, and probably some of the unscrupulousness, of his time, and appears to have been somewhat rough in his bearing, and too strict a disciplinarian to be much loved. He justly takes rank among England's great naval heroes.

FROEBEL, Friedrich Wilhelm August (1782–1852), philosopher, philanthropist, and educational reformer, was born at Oberweissbach, a village of the Thuringian Forest, the 21st April, 1782. He completed his seventieth year, on and died at Marienthal, near Bad-Liebenstein, on the 21st

June, 1852. Like Comenius, with whom he had much in common, he was neglected in his youth, and the remembrance of his own early sufferings made him in after life the more eager in promoting the happiness of children. His mother he lost in his infancy, and his father, the pastor of Oberweissbach and the surrounding district, attended to his parish but not to his family. Friedrich soon had a stepmother, and neglect was succeeded by stepmotherly attention; but a maternal uncle took pity on him, and gave him a home for some years at Stadt-Ilm. Here he went to the village school, but like many thoughtful boys he passed for a dunce. Throughout life he was always seeking for hidden connections and an underlying unity in all things. Nothing of the kind was to be perceived in the piecemeal studies of the school, and Froebel's mind, busy as it was for itself, would not work for the masters. His half-brother was therefore thought more worthy of a university education, and Friedrich was apprenticed for two years to a forester (1797–1799). Left to himself in the Thuringian Forest, Froebel now began to study nature, and without scientific instruction he obtained a profound insight into the uniformity and essential unity of nature's laws. Years afterwards the celebrated Jahn (the "Father Jahn" of the German gymnasts) told a Berlin student of a queer fellow he had met, who made out all sorts of wonderful things from stones and cobwebs. This queer fellow was Froebel; and the habit of making out general truths from the observation of nature, especially from plants and trees, dated from the solitary rambles in the Forest. No training could have been better suited to strengthen his inborn tendency to mysticism; and when he left the Forest at the early age of seventeen, he seems to have been possessed by the main ideas which influenced him all his life. The conception which in him dominated all others was the unity of nature; and he longed to study natural sciences that he might find in them various applications of nature's universal laws. With great difficulty he got leave to join his elder brother at the university of Jena, and there for a year he went from lecture-room to lecture-room hoping to grasp that connection of the sciences which had for him far more attraction than any particular science in itself. But Froebel's allowance of money was very small, and his skill in the management of money was never great, so his university career ended in an imprisonment of nine weeks for a debt of thirty shillings. He then returned home with very poor prospects, but much more intent on what he calls the course of "self-completion" (*Vervollkommung meines selbst*) than on "getting on" in a worldly point of view. He was soon sent to learn farming, but was recalled in consequence of the failing health of his father. In 1802 the father died, and Froebel, now twenty years old, had to shift for himself. It was some time before he found his true vocation, and for the next three and a half years we find him at work now in one part of Germany, now in another,—sometimes land-surveying, sometimes acting as accountant, sometimes as private secretary; but in all this his "outer life was far removed from his inner life," and in spite of his outward circumstancss he became more and more conscious that a great task lay before him for the good of humanity. The nature of the task, however, was not clear to him, and it seemed determined by accident. While studying architecture in Frankfort-on-the-Main, he became acquainted with the director of a model school who had caught some of the enthusiasm of Pestalozzi. This friend saw that Froebel's true field was education, and he persuaded him to give up architecture and take a post in the model school. In this school Froebel worked for two years with remarkable success, but he then retired and undertook the education of three lads of one family. In this he could not satisfy himself, and he obtained the parents' consent to his taking the boys to Yverdon, near Neuchatel, and there forming with them a part of the celebrated institution of Pestalozzi. Thus from 1807 till 1809 Froebel was drinking in Pestalozzianism at the fountain head, and qualifying himself to carry on the work which Pestalozzi had begun For the science of education had to deduce from Pestalozzi's experience principles which Pestalozzi himself could not deduce. And "Froebel, the pupil of Pestalozzi, and a genius like his master, completed the reformer's system; taking the results at which Pestalozzi had arrived through the necessities of his position, Froebel developed the ideas involved in them, not by further experience but by deduction from the nature of man, and thus he attained to the conception of true human development and to the requirements of true education" (Schmidt's *Geschichte der Pädagogik*).

Holding that man and nature, inasmuch as they proceed from the same source, must be governed by the same laws, Froebel longed for more knowledge of natural science. Even Pestalozzi seemed to him not to "honor science in her divinity." He therefore determined to continue the university course which had been so rudely interrupted eleven years before, and in 1811 he began studying at Göttingen, whence he proceeded to Berlin. But again his studies were interrupted, this time by the king of Prussia's celebrated call "to my people." Though not a Prussian, Froebel was heart and soul a German. He therefore responded to the call, enlisted in Lützow's corps, and went through the campaign of 1813. But his military ardor did not take his mind off education. "Everywhere," he writes, "as far as the fatigues I underwent allowed, I carried in my thoughts my future calling as educator; yes, even in the few engagements in which I had to take part. Even in these I could gather experience for the task I proposed to myself." Froebel's soldiering showed him the value of discipline and united action, how the individual belongs not to himself but to the whole body, and how the whole body supports the individual.

Froebel was rewarded for his patriotism by the friendship of two men whose names will always be associated with his, Langethal and Middendorf. These young men, ten years younger than Froebel, became attached to him in the field, and were ever afterwards his devoted followers, sacrificing all their prospects in life for the sake of carrying out his ideas.

At the peace of Fontainebleau (signed in May, 1814) Froebel returned to Berlin, and became curator of the museum of mineralogy under Professor Weiss. In accepting this appointment from the Government he seemed to turn aside from his work as educator; but if not teaching he was learning. More and more the thought possessed him that the one thing needful for man was unity of development, perfect evolution in accordance with the laws of his being, such evolution as science discovers in the other organisms of nature. He at first intended to become a teacher of natural science, but before long wider views dawned upon him. Langethal and Middendorf were in Berlin, engaged in tuition. Froebel gave them regular instruction in his theory, and at length, counting on their support, he resolved to set about realizing his own idea of "the new education." This was in 1816. Three years before one of his brothers, a clergyman, had died of fever caught from the French prisoners. His widow was still living in the parsonage at Griesheim, a village on the Ilm. Froebel gave up his post, and set out for Griesheim on foot, spending his very last groschen on the way for bread. Here he undertook the education of his orphan niece and nephews, and also of two more nephews sent him by another brother. With these he opened a school and wrote to Middendorf and Langethal to come and help in the experiment. Middendorf came at once, Langethal a year or two later, when the school had been moved to Keilhau, another of the Thuringian villages, which became the Mecca of the new faith. In Keilhau Froebel, Langethal, Middendorf, and Barop, a relation of Middendorf's, all married and formed an educational community. Such zeal could not be fruitless, and the school gradually increased, though for many years its teachers, with Froebel at their head, were in the greatest straits for money, and at times even for food. After 14 years' experience he determined to start other institutions to work in connection with the parent institution at Keilhau, and being offered by a private friend the use of a castle on the Wartensee, in the canton of Lucerne, he left Keilhau under the direction of Barop, and with Langethal he opened the Swiss institution. The ground, however, was very ill chosen. The Catholic clergy resisted what they considered as a Protestant invasion, and the experiment on the Wartensee and at Willisau in the same canton, to which the institution was moved in 1833, never had a fair chance. It was in vain that Middendorf at Froebel's call left his wife and family at Keilhau, and labored for four years in Switzerland without once seeing them. The Swiss institution never flourished. But the Swiss Government wished to turn to account the presence of the great educator; so young teachers were sent to Froebel for instruction, and finally Froebel moved to Burgdorf (a Bernese town of some importance, and famous from Pestalozzi's labors there thirty years earlier) to undertake the establishment of a public orphanage, and also to superintend a course of teaching for schoolmasters. The elementary teachers of the canton were to spend three months every alternate year at Burgdorf, and there compare experiences, and learn of distinguished men such as Froebel and Bitzius. In his conferences with these teachers Froebel found that the schools suffered from the state of the raw material brought into them. Till the school age was reached the children were entirely neglected. Froebel's conception of harmonious development naturally led him to attach much importance to the earliest years, and his great work on *The Education of Man*, published as early as 1826, deals chiefly with the child up to the age of seven. At Burgdorf his thoughts were much occupied with the proper treatment of young children, and in scheming for them a graduated course of exercises, modelled on the games in which he observed them to be most interested. In his eagerness to carry out his new plans he grew impatient of official restraints; so he returned to Keilhau, and soon afterwards opened the first *Kindergarten* or "Garden of Children," in the neighboring village of Blankenburg (1837). Firmly convinced of the importance of the Kindergarten for the whole human race, Froebel described his system in a weekly paper (his *Sonntagsblatt*) which appeared from the middle of 1837 till 1840. He also lectured in great towns; and he gave a regular course of instruction to young teachers at Blankenburg. But although the principles of the Kindergarten were gradually making their way, the first Kindergarten was failing for want of funds. It had to be given up, and Froebel, now a widower (he had lost his wife in 1839), carried on his course for teachers first at Keilhau, and from 1848, for the last four years of his life, at or near Liebenstein, in the Thuringian Forest, and in the duchy of Meiningen. It is in these last years that the man Froebel will be best known to posterity, for in 1849 he attracted within the circle of his influence a woman of great intellectual power, the Baroness von Marenholtz-Bülow, who has given us in her *Recollections of Friedrich Froebel* the only lifelike portrait we possess.

These seemed likely to be Froebel's most peaceful days. He married again, and having now devoted himself to the training of women as educators, he spent his time in instructing his class of young female teachers. But trouble came upon him from a quarter whence he least expected it. In the great year of revolutions, 1848, Froebel had hoped to turn to account the general eagerness for improvement, and Middendorf had presented an address on Kindergartens to the German Parliament. Besides this a nephew of Froebel's published books which were supposed to teach socialism. True, the uncle and nephew differed so widely that the "new Froebelians" were the enemies of "the old." The distinction was overlooked, and Friedrich and Karl Froebel were regarded as the united advocates of some new thing. In the reaction which soon set in Froebel found himself suspected of socialism and irreligion, and in 1851 the "cultus-minister" Raumer issued an edict forbidding the establishment of schools "after Friedrich and Karl Froebel's principles" in Prussia. This was a heavy blow to the old man, who looked to the Government of the "*Cultus-staat*" Prussia for support, and was met with denunciation. Of the justice of the charge the minister brought against Froebel the reader may judge from the account of his principles given below.

Whether from the worry of this new controversy, or from whatever cause, Froebel did not long survive the decree. His seventieth birthday was celebrated with great rejoicings in May, 1852, but he died in the following month, and lies buried at Schweina, a village near his last abode, Marienthal.

"All education not founded on religion is unproductive." This conviction of Froebel's followed naturally from his conception of the unity of all things, a unity due to the original Unity from whom all proceed and in whom all "live, move, and have their being." "In Allem wirkt und Schafft *Ein* Leben, Weil das Leben all' ein ein'ger Gott gegeben." "All has come forth from the divine, from God, and is through God alone conditioned. To this it is that all things owe their existence, to the divine working in them. The divine element that works in each thing is the true idea (*das Wesen*) of the thing." "The destiny and calling of all things is to develop their true idea, and in so doing to reveal God in outward and through passing forms."

As man and nature have one origin they must be subject to the same laws. Hence Froebel did what Comenius had done two centuries before him, he looked to the course of nature for the principles of human education. This he declares to be his fundamental belief: "In the creation, in nature and the order of the material world, and in the progress of mankind, God has given us the true type (*Urbild*) of education."

As the cultivator creates nothing in the trees and plants, so the educator creates nothing in the children,—he merely superintends the development of inborn faculties. So far Froebel agrees with Pestalozzi; but in one respect he went beyond him, and has thus become, according to Michelet, the greatest of educational reformers. Pestalozzi said that the faculties were developed by exercise. Froebel added that the function of education was to develop the faculties by arousing *voluntary activity*. Action proceeding from inner impulse (*Selbstthätigkeit*) was the one thing needful. And here Froebel as usual refers to God. "God's every thought is a work, a deed." As God is the Creator, so must man be a creator also. "He who will early learn to recognize the Creator must early exercise his own power of action with the consciousness that he is bringing about what is good, for the doing good is the link between the creature and the Creator, and the conscious doing of it is the conscious connection, the true living union of the man with God, of the individual man as of the human race, and is therefore at once the starting point and the eternal aim of all education." Again he says: "The starting point of all that appears, of all that exists, and therefore of all intellectual conception, is act, action. From the act, from action, must therefore start true human education, the developing education of the man; in action, in acting, it must be rooted and must spring up. . . . Living, acting, conceiving,—these must form a triple chord within every child of man, though the sound now of this string, now of that, may preponderate, and then again of two together."

The prominence which Froebel gave to action, his doctrine that man is primarily a doer and even a creator, and that he learns only through "self-activity," may produce great changes in educational methods generally, and not simply in the treatment of children too young for schooling. But it was to the first stage of life that Froebel paid the greatest attention, and it is over this stage that his influence is gradually extending. Froebel held with Rousseau that each age has a completeness of its own, and that the perfection of the later stage can be attained only through the perfection of the earlier. If the infant is what he should be as an infant, and the child as a child, he will become what he should be as a boy, just as naturally as new shoots spring from the healthy plant. Every stage, then, must be cared for and tended in such a way that it may attain its own perfection. Impressed with the immense importance of the first stage, Froebel like Pestalozzi devoted himself to the instruction of mothers. But he would not, like Pestalozzi, leave the children entirely in the mother's hands. Pestalozzi held that the child belonged to the family; Fichte, on the other hand, claimed it for society and the state. Froebel, whose mind like that of Frederick Maurice delighted in harmonizing apparent contradictions, and who taught that "all progress lay through opposites to their reconciliation," maintained that the child belonged both to the family and to society, and he would therefore have children spend some hours of the day in a common life and in well-organized common employments. These assemblies of children he would not call schools, for the children in them ought not to be old enough for schooling. So he invented the name *Kindergarten*, garden of children, and called the superintendents "children's gardeners." He laid great stress on every child cultivating its own plot of ground, but this was not his reason for the choice of the name. It was rather that he thought of these institutions as enclosures in which young human plants are nurtured. In the Kindergarten the children's employment should be *play*. But any occupation in which children delight is play to them; and Froebel invented a series of employments, which, while they are in this sense play to the children, have nevertheless, as seen from the adult point of view, a distinct educational object. This object, as Froebel himself describes it, is "to give the children employment in agreement with their whole nature, to strengthen their bodies, to exercise their senses, to engage their awakening mind, and through their senses to bring them acquainted with nature and their fellow creatures; it is especially to guide aright the heart and the affections, and to lead them to the original ground of all life, to unity with themselves."

At the end of the first quarter of a century since Froebel's death, the spread of his ideas, or at least of his methods, seems rapidly extending. Prophets are slowly recognized in their own country, and although he is so thoroughly German in his mode of thought and exposition that, as Deinhardt says, no other nation could have produced such a man, the Germans as yet are not so ready to learn from Froebel as from the Swiss Pestalozzi. In Austria the Kindergarten has made more way than in Prussia, and it seems to prosper in America. But Froebel's influence is not limited to the Kindergarten. His conception of education cannot but affect the thoughts and ultimately the practice of all teachers who will be at the pains to understand it.

Froebel's own works are—1. *Menschenerziehung* (there is a French translation by the Baronne de Crombrugghe); 2. *Pädagogik d. Kindergartens;* 3. *Kleinere Schriften,* herausgegeben von Wichard Lange; and 4. *Mutter- und Koselieder.* We have a lengthy but unsatisfactory life in A. B. Hanschmann's *Friedrich Fröbel.* An unpretentious but useful little book is *F. Froebel, a Biographical Sketch,* by Matilda H. Kriege, New York (Steiger). A very good account of Froebel's life and thoughts is given in Karl Schmidt's *Geschichte d. Pädagogik,* vol. iv.; also in Adalbert Weber's *Geschichte d. Volksschulpäd. u. d. Kleinkindererziehung* (Weber carefully gives authorities). For a less favorable account see K. Strack's *Geschichte d. deutsch. Volksschulwesens.* The article "Fröbel" in K. A. Schmid's *Encyklopädie* is by Deinhardt. Frau von Marenholtz-Bülow has published her *Erinnerungen an F. Fröbel* (a book which has been translated by Mrs. Horace Mann). This lady, who has been the chief interpreter of Froebel, has expounded his principles in *Das Kind u. sein Wesen,* and *Die Arbeit u. die neue Erziehung.* In England Miss E. Shirreff has published *Principles of Froebel's System,* and a short sketch of Froebel's life. The late Joseph Payne advocated Froebelism in a pamphlet, *Froebel and the Kindergarten System;* also in the book published since his death, *A Visit to German Schools.* In the United States, Miss E. E. Peabody, who has taken an active part in the spread of Froebelism, has written *Moral Culture of Infancy* (New York). W. N. Hailman treats of Froebel in his *Lectures* and his *Kindergarten Culture* (Cincinnati). A. Köhler's *Praxis* is the best known German work on the Kindergarten (it is translated as *Kindergarten Education,* New York); and T. F. Jacobs's *Manuel* is the best in French. (R. H. Q.)

FROG, the common name of an extensive group of Batrachians forming, along with the toads, the amphibian order *Anoura.* They are divided into 9 families, containing 92 genera and 440 species, and are found in all quarters of the globe, being most abundant in the tropical and subtropical regions, but also occurring within the Arctic circle. Most of the families have a very limited distribution, and only two of them, the true frogs (*Ranidæ*), of which there are 150 species, and the *Polypedatidæ,* a family of tree-frogs containing 124 species, can be regarded as almost cosmopolitan. The neotropical or South American region is richest in peculiar forms, while it possesses some only found beyond it in the widely remote Australian region; thus the *Pelodryadæ,* a family of tree-frogs, is peculiar to the two; the genus *Litoria* is confined to Australia, with the exception of a single species occurring in Paraguay; while the only frog known in New Zealand has its nearest allies in South America. Those regions bear also a negative resemblance in the total absence from both of the genus *Rana,* the 60 species of which are distributed throughout the other quarters of the globe. These facts, among others, have been adduced in support of the theory that at one time the continents of South America and Australia had a land connection. Frogs are almost totally absent from oceanic islands, a single species (*Liopelma Hochstetteri*) occurring in New Zealand, and one or two others in the Pacific islands, as far east as the Fijis, beyond which they are unknown. On the assumption that those islands obtained their present fauna from the nearest continental land, the absence of frogs can be readily explained by the fact that salt water is alike fatal to the adult frog and to its spawn, and thus formed an insuperable barrier to their migration.

Frogs, as is shown by their wide distribution, are capable of enduring a considerable degree of both heat and cold; they are, however, altogether intolerant of long-continued drought, a desert forming as certain a barrier to their migration as an ocean. Both during their larval stage and afterwards, for the purpose of cutaneous respiration, abundant moisture is a necessity of their existence; consequently, whether they live on the ground or on trees, they are never found far from rivers, marshes, or lakes. In winter the frogs of northern climates hibernate, burying themselves in the mud at the bottom of pools, and lying clustered together in a state of complete torpidity. In hot climates they are said to go into a similar condition, known as "æstivation," during periods of exceptional heat and drought, in order to retard the dissipation of the moisture in their bodies. On reappearing from their long winter sleep the work of reproduction is at once entered upon, the males making their presence known to the females by the vigorous exercise of their vocal organs. The croaking of the common frog can only be regarded as pleasant from its association with the welcome advent of spring; still more unpleasant, however, is the much louder croak of the edible frog of the Continent, the species to which Horace probably refers in the lines

> . . . "ranæque palustres
> Avertunt somnos."

The eggs of the frog, consisting of little black specks surrounded by an albuminous envelope, are fertilized during their extrusion from the body of the female, and are generally deposited at the bottom of the water, ascending, however, soon after to the surface, owing to the swelling and partial decomposition of the glairy substance surrounding the ova. There are several species known in which the eggs are deposited in an exceptional manner. Those of a small frog (*Alytes obstetricans*) found in France and Germany form a long chain, which the male twines round his thighs, retiring with them into seclusion until the young are ready to leave, when he enters the water, and the tadpoles immediately make their escape. The female of an American tree-frog (*Nototrema marsupiatum*) has a pouch along the whole extent of its back for the reception of its eggs; and Professor Peters of Berlin has recently drawn attention to a tree-frog of the genus *Polypedates* found in tropical West Africa, in which the female, after depositing her eggs in the usual mass of albuminous jelly, attaches them to the leaves of trees overhanging a dry water-hole or pool. The albumen speedily dries and forms a horny coating on the leaf, under which lie the unimpregnated eggs. On the advent of the rainy season the albumen becomes softened, and the eggs are washed into the pool below, now filled with water, where they are fecundated by the male.

The development of the egg after impregnation proceeds more or less rapidly according to the temperature, the young of the common frog being hatched, according to Rusconi, in 4 days, in a temperature varying from 70° to 80° Fahr., while in the climate of England this does not take place in less than a month. The creature which emerges from the egg is altogether unlike a frog, consisting mainly of a bulky head and tail, and wholly destitute of limbs. This is the tadpole or larval stage in the development of the frog, when it is essentially a fish, capable only of existing in water, breathing by gills, and having like a fish a two-chambered heart. At first the gills or branchiæ are external, but they are soon withdrawn within the branchial cavity, and concealed by an opercular membrane. As the process of development proceeds, the limbs begin to bud forth, the posterior pair appearing first; and with their growth the tail begins to dwindle, not falling off, but being gradually absorbed. At the same time vast changes are taking place in the blood-vascular system, the gills gradually disappearing, two lungs being developed, and the heart becoming three-chambered as in reptiles. The young frog must now come to the surface to breathe, and soon leaves the water altogether. On emerging from the egg, the tadpole at first feeds upon the gelatinous mass which before had formed a protective covering. It is unprovided with teeth, but has two minute horny jaws, which enable it to feed on decaying animal and vegetable matter. According to Bell (*British Reptiles*), tadpoles sometimes kill and feed upon each other. "I observed," he says, "that almost as soon as one had acquired its limbs it was found dead at the bottom of the water, and the remaining tadpoles feeding upon it. This took place with all of them successively, excepting the last, which lived on to complete its change." After leaving the water they feed almost entirely on insects and slugs.

The form of the frog is too well known to require description, but there are many almost unique features in its organization that may be noticed. Respiration in the adult frog is partly pulmonary; but as it is destitute of ribs, this operation in the frog cannot be performed by the alternate expansion and contraction of the chest, as in other air-breathing animals. The air has to be swallowed in order to be conveyed to the lungs, and the mechanism by which this operation is performed necessitates the closing of its mouth and the admission of air by the nostrils, so that a frog can be most readily suffocated by having its mouth gagged open. Respiration is also partly cutaneous, experiment having shown that the skin gives off carbonic acid gas in sufficient quantity to enable the creature to live for a very considerable time after pulmonary respiration has been stopped. Moisture is as necessary to the skin in the performance of this function as it is to the gills of a fish; and in order to preserve to the utmost its humidity, frogs avoid as much as possible the hot sunlight, sheltering themselves beneath stones or under loose turf, and reappearing on the advent of rain, sometimes in such numbers in a single locality as to have given rise to stories of frog showers. The skin of the frog, however, readily absorbs water; and this it stores up in an internal reservoir, from which it can in seasons of drought moisten the surface of its skin. When a frog is suddenly caught it frequently ejects a quantity of water, and thus suddenly diminishes its volume. The water voided is not urine, nor is the receptacle containing it the urinary bladder, as was at one time supposed. The skin of frogs is perfectly smooth, having neither plates nor scales, except in the American genus *Ceratophrys* (fig. 1), in certain species of which a few bony plates are enclosed in the skin of the back. The tongue in frogs is probably employed more for the capture of its insect prey, than as the organ of taste. It is fixed in front of the mouth, and free behind, and in seizing its prey, the free end, which possesses a viscid secretion, is darted suddenly forward, the captured insect being as suddenly transported to the back part of the mouth. Nothing can exceed the rapidity with which this motion is performed. Minute teeth are present in the upper jaw, and on the palate, in the true frogs. The vocal organs by which the characteristic croaking is produced differ somewhat in different species, a similar variety appearing in the quantity and quality of their song. The male of the edible frog is provided with bladder-like cheek pouches—the so-called vocal sacs—which it distends with air when in the act of croaking, an operation which it performs to such purpose as to have received the name of "Dutch nightingale" on the Continent, and "Cambridgeshire nightingale" in England. The bull-frog (*Rana mugiens*) has a laryngeal mechanism which Cuvier compared to a kettledrum, by which it produces a sound not unlike the bellowing of a bull. The sound produced by the tree-frogs is both loud and shrill, but in certain circumstances it seems to be somewhat pleasing. Thus Darwin says, "Near Rio de Janeiro I used often to sit in the evening to listen to a number of little *Hylæ*, which, perched on blades of grass close to the water, sent forth sweet chirping notes in harmony." The voice of another tree-frog (*Hyla crepitans*) has been compared to the sound produced "by the cracking of a large piece of wood;" while another, belonging to Surinam, has an extremely disagreeable voice, and unfortunately so much of it that, when a number of them combine, they at times drown the orchestra of the Paramaribo theatre. No frog, so far as yet known, possesses any poison organs. A species found in France (*Pelobates fuscus*), when disturbed, emits a strong odor, somewhat resembling garlic, and of sufficient pungency to make the eyes water; another (*Hyla micans*) exudes from the surface of its body a slimy substance having luminous properties, which probably acts as a defence by frightening its enemies. Many of the tree-frogs are of a green color, while others are brown, "and these," says Mr. Wallace (*Tropical Nature*, 1878), "usually feed at night, sitting quietly during the day so as to be almost invisible, owing to their color and their moist shining skins so closely resembling vegetable substances." The majority of tree-frogs have their color thus adapted to their surroundings, and are thus enabled the more readily to elude their enemies; for, so far as yet known, all the species protectively colored are edible, forming the chief food of many mammals, birds, and reptiles. A few, however, are brilliantly and conspicuously colored, as if courting observation; and such species, there is reason to believe (the reader will find evidence of this in Belt's *Naturalist in Nicaragua*), are rejected by frog-eating animals on account of their nauseous secretions, or some other unknown property which renders them unpalatable. The bright colors thus become directly useful to the species by making them readily recognizable as uneatable.

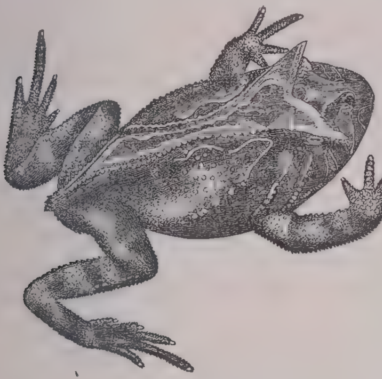

Fig. 1.—*Ceratophrys granosa.*

The Common Frog (*Rana temporaria*) is the most widely distributed species of the group, occurring throughout the temperate regions of both hemispheres, including North Africa, and Asia as far east as Japan. It does not occur in Iceland. Both in England and in Scotland it is abundant, nor is it uncommon in Ireland, although popularly supposed to be absent from that island. It varies very considerably in color, being either a reddish, yellowish, or greenish-brown above, with irregular spots and fasciæ, and of a lighter color beneath, but having almost invariably an oblong patch of brown behind the eyes, by which it may be readily distinguished from other European species. Although not an article of human food, the common frog in its various stages of growth forms the staple diet of many other animals. The tadpoles are eaten by newts and the smaller fishes, and frogs of all ages by weasels, waterfowl, pike, and snakes. By those agencies their numbers, which otherwise would be enormous, are greatly reduced. This species is said to take five years in attaining its full growth, and to live for about fifteen years. Like the toad it can be rendered tame and domesticated, having been known to take up its abode in a moist corner of a kitchen, and to come forth regularly at meal time to be fed. The Edible Frog (*Rana esculenta*) is very widely distributed throughout the temperate regions of the earth, but is not found in America, where, however, a closely allied species occurs (fig. 2). It is found in England, where it was first observed in a Cambridgeshire fen in 1843, to which probably it had been introduced from the Continent. It has since been introduced into various parts of the south of England, but apparently without much success, the summer heat there being, it is said, insufficient to enable the tadpole to attain its full development before the advent of autumnal cold. It may be readily distinguished from the common species by the yellowish mesial line which runs down the whole

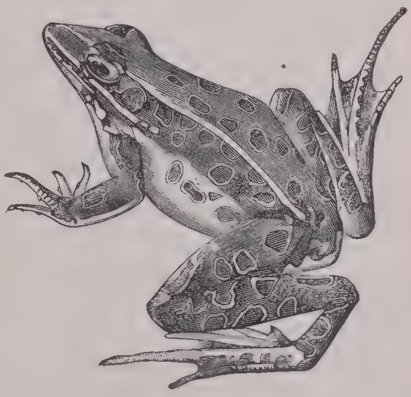

Fig. 2.—*Rana palustris.*

length of its back, by the absence of the characteristic brown spot behind the eyes, and by the presence in the males of "vocal sacs." It is also more aquatic than the common frog, seldom leaving the banks of its native pond or stream, into which it is always ready to dip on the slightest appearance of danger. It is very abundant throughout central and southern Europe, and forms, especially in France, a valued article of food, the hind legs when cooked being regarded as a luxury. Regarding a dish of these, Mr. F. Buckland says, "Most excellent eating they were, tasting more like the delicate flesh of the rabbit than anything else I can think of." The edible frog has been lately introduced into Ireland. The Bull-frog (*Rana mugiens*) is one of the largest species, measuring sometimes 8 inches in length, exclusive of the hind legs, and having a gape sufficiently wide to swallow ducklings whole. It inhabits North America, where it is said to haunt the pools formed at the origin of springs, the waters of which it was supposed to keep pure—a belief which long afforded it considerable protection; lately, however, the Americans have taken to frog-eating, and the bull-frog, in the absence of *R. esculenta,* has been selected among others for this purpose.

The Tree-frogs (fig. 3) are readily distinguished from all others by having the ends of their toes dilated into knobs or discs, generally provided with a sticky secretion, by means of which they can cling to the leaves and branches of trees. They are small, elegant, and exceedingly active creatures, the males possessing loud voices, of which they make copious use during the breeding season and on the approach of rain. Frogs have from remote times been regarded as weather prophets, and at the present day, in some parts of Germany, the European Tree-frog (*Hyla aborea*) is used as a barometer. A few of them are placed in a tall bottle provided with miniature ladders, the steps of which they ascend during fine weather, seeking the bottom again on the approach of rain. All frogs, whether arboreal or not, have their hind feet webbed, and in at least one tree-frog (*Rhacophorus*) the webs on all the feet are so largely developed as to render it probable that by their means the frog is able to execute flying leaps. This "flying frog" was brought to Mr. Wallace, while travelling in Borneo, by a Chinaman, who assured him "that he had seen it come down in a slanting direction as if it flew." Its body was about 4 inches in length, and the expanded webs of each hind foot covered a space of 4 square inches, while its forelegs were bordered by a membrane—features highly suggestive of aërial locomotion.

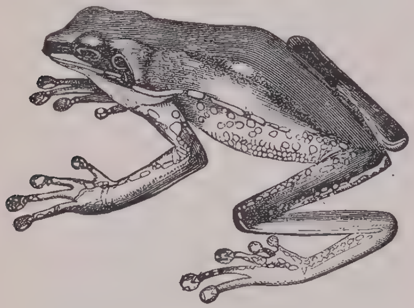

Fig. 3.—Tree-frog (*Hyla bicolor*).

Fossil remains of the frog do not occur in strata older than the Tertiary, being found in greatest abundance in the Miocene deposits. See Amphibia. (J. GI.)

FRÖHLICH, Abraham Emanuel (1796–1865), a German-Swiss poet, was born February 1, 1796, at Brugg, in the canton of Aargau, where his father was a teacher. At the age of fifteen he was sent to study theology in the academy of Zürich. In 1817 he was ordained, and returned as teacher to his native town, where he lived for ten years. He was then appointed professor of German language and literature in the canton-school at Aarau, which post he lost, however, in the political quarrels of 1830. He afterwards obtained the post of teacher and rector of the Bezirksschule, and was also appointed Hülfsprediger. He died December 1, 1865. His works are—170 *Fabeln* (1825); *Schweizerlieder* (1827); *Das Evangelium St. Johannis, in Liedern* (1830); *Elegien an Wieg' und Sarg* (1835); *Die Epopöen: Ulrich Zwingli* (1840); *Ulrich von Hutten* (1845); *Auserlesene Psalmen und Geistliche Lieder für die Evangelisch-reformirte Kirche des Cantons Aargau* (1844); *Ueber den Kirchengesang der Protestanten* (1846); *Trostlieder* (1852); *Der Junge Deutsch-Michel* (1846); *Reimsprüche aus Staat, Schule, und Kirche* (1820). An edition of his collected works, in 5 vols., was published in 1853. Fröhlich is best known for his two heroic poems, *Ulrich Zwingli* and *Ulrich von Hutten,* and especially for his fables, which have been ranked with those of Hagedorn, Lessing, and Gellert.

FROISSART, Jean (1337–1410?). The personal history of Froissart, the circumstances of his birth and education, the incidents of his life, must all be sought in his own verses and chronicles. He possessed in his own lifetime no such fame as that which attended the steps of Petrarch; when he died it did not occur to his successors that a chapter might well be added to his *Chronicle* setting forth what manner of man he was who wrote it. The village of Lestines, where he was curé, has long forgotten that a great writer ever lived there. They cannot point to any house in Valenciennes as the lodging in which he put together his notes and made history out of personal reminiscences. It is not certain when or where he died, or where he was buried. One church, it is true, doubtfully claims the honor of holding his bones. It is that of St. Monegunda of Chimay.

Gallorum sublimis honos et fama tuorum,
Hic Froissarde, jaces, *si modo forte jaces.*

It is fortunate, therefore, that the scattered statements in his writings may be so pieced together as to afford a tolerably connected history of his life year after year. The personality of the man, independently of his adventures, may be arrived at by the same process. It will be found that Froissart, without meaning it, has portrayed himself in clear and well-defined outline. His forefathers were *jurés* of the little town of Beaumont, lying near the river Sambre, to the west of the forest of Ardennes. Early in the 14th century the castle and seigneurie of Beaumont fell into the hands of Jean, younger son of the count of Hainault. With this Jean, sire de Beaumont, lived a certain canon of Liége called Jean le Bel, who, fortunately, was not content simply to enjoy life. Instigated by his seigneur he set himself to write contemporary history, to tell "la pure veriteit de tout li fait entièrement al manire de chroniques." With this view, he compiled two books of chronicles. And the chronicles of Jean le Bel were not the only literary monuments belonging to the castle of Beaumont. A hundred years before him Baldwin d'Avernes, the then seigneur, had caused to be written a book of chronicles or rather genealogies. It must therefore be remembered that when Froissart undertook his own chronicles, he was not conceiving a new idea, but only following along familiar lines.

Some 20 miles from Beaumont stood the prosperous city of Valenciennes, possessed in the 14th century of important privileges and a flourishing trade, second only to places like Bruges or Ghent, in influence, population, and wealth. Beaumont, once her rival, now regarded Valenciennes as a place where the ambitious might seek for wealth or advancement, and among those who migrated thither was the father of Froissart. He appears from a single passage in his son's verses to have been a painter of armorial bearings. There was, it may be noted, already what may be called a school of painters at Valenciennes. Among them were Jean and Colin de Valenciennes and André Beau-Neveu, of whom Froissart says that he had not his equal in any country.

The date generally adopted for his birth is 1337. In after years Froissart pleased himself by recalling in verse the scenes and pursuits of his childhood. These are presented in vague generalities. There is nothing to show that he was unlike any other boys, and unfortunately it did not occur to him that a photograph of a schoolboy's life amid bourgeois surroundings would be to posterity quite as interesting as that faithful portraiture of courts and knights which he has drawn up in his *Chronicle.* As it is, we learn that he loved games of dexterity and skill rather than the sedentary amusements of chess and draughts, that he was beaten when he did not know his lessons, that with his companions he played at tournaments, and that he was always conscious—a statement which must be accepted with suspicion—that he was born

"Loer Dieu et servir le monde."

In any case he was born in a place, as well as at a time, singularly adapted to fill the brain of an imaginative boy. Valenciennes, at the present day a dull town, was then a city extremely rich in romantic associations. Not far from its walls was the western fringe of the great forest of Ardennes, sacred to the memory of Pepin, Charlemagne, Roland, and Ogier. Along the banks of the Scheldt stood, one after the other, not then in ruins, but bright with banners, the gleam of armor, and the liveries of the men at arms, castles whose seigneurs, now forgotten, were famous in their day for many a gallant feat of arms. The castle of Valenciennes itself was illustrious in the romance of *Perceforest:* there was born that most glorious and most luckless hero, Baldwin, first emperor of Constantinople. All the splendor of mediæval life was to be seen in Froissart's native city: on the walls of the Salle le Comte glittered—perhaps painted by his father—the arms and scutcheons beneath the banners and helmets of Luxembourg, Hainault, and Avesnes; the streets were crowded with knights and soldiers, priests, artisans, and merchants; the churches were rich with stained glass, delicate tracery, and precious carving; there were libraries full of richly illuminated manuscripts on which the boy could gaze with delight; every year there was the *fête* of the *puy d'Amour de Valenciennes,* at which he would hear the verses of the competing poets; there were festivals, masques, mummeries, and moralities. And, whatever there might be elsewhere, in this happy city there was only the pomp, and not the misery, of war; the fields without were tilled, and the harvests reaped, in security; the workman within plied his craft unmolested for good wage. But the eyes of the boy were turned upon the castle and not upon the town; it was the splendor of the knights which dazzled him, insomuch that he regarded and continued ever afterwards to regard a prince gallant in the field, glittering of apparel, lavish of largesse, as almost a god.

The moon, he says, rules the first four years of life; Mercury the next ten; Venus follows. He was fourteen when the last goddess appeared to him in person, as he tells us, after the manner of his time, and informed him that he was to love a lady, "belle, jone, et gente." Awaiting this happy event, he began to consider how best to earn his livelihood. They first placed him in some commercial position—impossible now to say of what kind—which he simply calls "la marchandise." This undoubtedly means some kind of buying and selling, not a handicraft at all. He very soon abandoned merchandise—"car vaut mieux science qu' argens" —and resolved on becoming a learned clerk. He then naturally began to make verses, like every other learned clerk. Quite as naturally, and still in the character of a learned clerk, he fulfilled the prophecy of Venus, and fell in love. He found one day a demoiselle reading a book of romances. He did not know who she was, but stealing gently towards her, he asked her what book she was reading. It was the romance of *Cleomades.* He remarks the singular beauty of her blue eyes and fair hair, while she reads a page or two, and then—one would almost suspect a reminiscence of Dante—

"Adont laissames nous le lire."

He was thus provided with that essential for soldier, knight, or poet, a mistress,—one for whom he could write verses. She was rich and he was poor; she was nobly born and he obscure; it was long before she would accept the devotion, even of the conventional kind, which Froissart offered her, and which would in no way interfere with the practical business of her life. And in this hopeless way, the passion of the young poet remaining the same, and the coldness of the lady being unaltered, the course of this passion ran on for some time. Nor was it until the day of Froissart's departure from his native town that she gave him an interview and spoke kindly to him, even promising, with tears in her eyes, that "Doulce Pensée" would assure him that she would have no joyous day until she should see him again.

He was eighteen years of age; he had learned all that he wanted to learn; he possessed the mechanical art of verse; he had read the slender stock of classical literature accessible; he longed to see the world. He must already have acquired some distinction, because, on setting out for the court of England, he was able to take with him letters of recommendation from the king of Bohemia and the count of Hainault to Queen Philippa, niece of the latter. He was well received by the queen, always ready to welcome her own countrymen; he wrote ballades and virelays for her and her ladies. But after a year he began to pine for another sight of "la très douce, simple, et quoie," whom he loved loyally. Good Queen Philippa, perceiving his altered looks and guessing the cause, made him confess that he was in love and longed to see his mistress. She gave him his *congé* on the condition that he was to return. It is clear that the young clerk had already learned to ingratiate himself with princes.

The conclusion of his single love adventure is simply and unaffectedly told in his *Trettie de l'Espinette Amoureuse.* It was a passion conducted on the well-known lines of conventional love; the pair exchanged violets and roses, the lady accepted ballads; Froissart became either openly or in secret her recognized lover, a mere title of honor, which conferred distinction on her who bestowed it, as well as upon him who received it. But the progress of the amour was rudely interrupted by the arts of "Malebouche" or Calumny. The story, whatever it was, that Malebouche whispered in the ear of the lady, led to a complete rupture. The *damoiselle* not only scornfully refused to speak to her lover or acknowledge him, but even seized him by the hair and pulled out a handful. Nor would she ever be reconciled to him again. Years afterwards, when Froissart writes the story of his one love passage, he shows that he still takes delight in the remembrance of her, loves to draw her portrait, and lingers with fondness over the thought of what she once was to him.

Perhaps to get healed of his sorrow, Froissart began those wanderings in which the best part of his life was to be consumed. He first visited Avignon, perhaps to ask for a benefice, perhaps as the bearer of a message from the bishop of Cambray to pope or cardinal. It was in the year 1360, and in the pontificate of Innocent VI. From the papal city he seems to have gone to Paris, perhaps charged with a diplomatic mission. In 1361 he returned to England after an absence of five years. He certainly interpreted his leave of absence in a liberal spirit, and it may have been with a view of averting the displeasure of his kind-hearted protector that he brought with him as a present a book of rhymed chronicles written by himself. He says that notwithstanding his youth, he took upon himself the task "à rimer et à dicter"—which can only mean to "turn into verse"—an account of the wars of his own time, which he carried over to England in a book "tout compilé,"—complete to date,—and presented to his noble mistress Philippa of Hainault, who joyfully and gently received it of him. Such a rhymed chronicle was no new thing. One Colin had already turned the battle of Crécy into verse. The queen made young Froissart one of her secretaries, and he began to serve her with "beaux dittiés et traités amoureux."

Froissart would probably have been content to go on living at ease in this congenial atmosphere of flattery, praise, and caresses, pouring out his virelays and chansons according to demand with facile monotony, but for the instigation of Queen Philippa, who seems to have suggested to him the propriety of travelling in order to get information for more rhymed chronicles. It was at her charges that Froissart made his first serious journey. He seems to have travelled a great part of the way alone, or accompanied only by his servants, for he was fain to beguile the journey by composing an imaginary conversation in verse between his horse and his hound. This may be found among his published poems, but it does not repay perusal. In Scotland he met with a favorable reception, not only from King David but from William of Douglas, and from the earls of Fife, Mar, March, and others. The souvenirs of this journey are found scattered about in the chronicles. He was evidently much impressed with the Scotch; he speaks of the valor of the Douglas, the Campbell, the Ramsay, and the Graham; he describes the hospitality and rude life of the Highlanders; he admires the great castles of Stirling and Roxburgh, and the famous abbey of Melrose. His travels in Scotland lasted for six months. Returning southwards he rode along the whole course of the Roman wall, a thing alone sufficient to show that he possessed the true spirit of an archæologist; he thought that Carlisle was Carlyon, and congratulated himself on having found King Arthur's capital; he calls Westmoreland, where the common people still spoke the ancient British tongue, North Wales; he rode down the banks of the Severn, and returned to London by way of Oxford—"l'escole d'Asque-Suffort."

In London Froissart entered into the service of King John of France as secretary, and grew daily more courtly, more in favor with princes and great ladies. He probably acquired at this period that art, in which he has probably never been surpassed, of making people tell him all they knew. No newspaper correspondent, no American interviewer, has ever equalled this mediæval collector of intelligence. From Queen Philippa, who confided to him the tender story of her youthful and lasting love for her great husband, down to the simplest knight—Froissart conversed with none beneath the rank of gentlemen—all united in telling this man what he wanted to know. He wanted to know everything: he liked the story of a battle from both sides and from many points of view; he wanted the details of every little cavalry skirmish, every capture of a castle, every gallant action and brave deed. And what was more remarkable, he forgot nothing. "I had," he says, "thanks to God, sense, memory, good remembrance of everything, and an intellect clear and keen to seize upon the acts which I could learn." But as yet he had not begun to write in prose.

At the age of twenty-nine, in 1366, Froissart once more left England. This time he repaired first to Brussels, whither were gathered together a great concourse of minstrels from all parts, from the courts of the kings of Denmark, Navarre, and Aragon, from those of the dukes of Lancaster, Bavaria, and Brunswick. Hither came all who could "rimer et dicter." What distinction Froissart gained is not stated; but he received a gift of money as appears from the accounts, "uni Fritsardo, dictori, qui est cum regina Angliæ, dicto die, VI. mottones."

After this congress of versifiers, he made his way to Brittany, where he heard from eye-witnesses and knights who had actually fought there details of the battles of Cocherel and Auray, the Great Day of the Thirty and the heroism of Jeanne de Montfort. Windsor Herald told him something about Auray, and a French knight, one Antoine de Beaujeu, gave him the details of Cocherel. From Brittany he went southwards to Nantes, La Rochelle, and Bordeaux, where he arrived a few days before the visit of Richard, afterwards second of that name. He accompanied the Black Prince to Dax, and hoped to go on with him into Spain, but was despatched to England on a mission. He next formed part of the expedition which escorted Lionel duke of Clarence to Milan, to marry the daughter of Galeazzo Visconti. Chaucer was also one of the prince's suite. At the wedding banquet Petrarch was a guest sitting among the princes.

From Milan Froissart, accepting gratefully a *cotte hardie* with 20 florins of gold, set out upon his travels in Italy. At Bologna, then in decadence, he met Peter, king of Cyprus, from whose follower and minister, Eustache de Conflans, he learned many interesting particulars of the king's exploits. He accompanied Peter as far as Venice, where he left him after receiving a gift of 40 ducats. With them and his *cotte hardie*, still lined we may hope with the 20 florins, Froissart betook himself to Rome. The city was then at its lowest point: the churches were roofless; there was no pope; there were no pilgrims; there was no splendor; and yet, says Froissart sadly,

"Ce furent jadis en Rome,
Li plus preu et li plus sage homme
Car par sens tons les arts passèrent."

It was at Rome that he learned the death of his friend King Peter of Cyprus, and worse still, an irreparable loss to him, that of the good Queen Philippa, of whom he writes, in grateful remembrance—

"Propices li soit Diex à l'âme!
J'en suis bien tenus de pryer,
Et ses larghesces escuyer,
Car elle me fist et créa."

Philippa dead, Froissart looked around for a new patron. Then he hastened back to his own country and presented himself, with a new book in French, to the duchess of Brabant, from whom he received the sum of 16 francs, given in the accounts as paid *uni Frissardo dictatori*. The use of the word *uni* does not imply any meanness of position, but is simply an equivalent to the modern French *sieur*. Froissart may also have found a patron in Yolande de Bar, grandmother of King René of Anjou. In any case he received a substantial gift from some one in the shape of the benefice of Lestines, a village some three or four miles from the town of Binche. Also, in addition to his cure, he got placed upon the duke of Brabant's pension list, and was entitled to a yearly grant of grain and wine, with some small sum in money.

It is clear, from Froissart's own account of himself, that he was by no means a man who would at the age of four or five and thirty be contented to sit down at ease to discharge the duties of parish priest, to say mass, to bury the dead, to marry the villagers, and to baptize the young. In those days, and in that country, it does not seem that other duties were expected. Preaching was not required, godliness of life, piety, good works, and the graces of a modern ecclesiastic were not looked for. Therefore, when Froissart complains to himself that the taverns of Lestines got 500 francs of his money, we need not at once set him down as either a bad priest, or exceptionally given to drink. The people of the place were greatly addicted to wine; the *taverniers de Lestines* proverbially sold good wine; the Flemings were proverbially of a joyous disposition—

"Ceux de Hainaut chantent à pleines gorges."

Froissart, the parish priest of courtly manners, no doubt drank with the rest, and listened if they sang his own, not the coarse country songs. Mostly he preferred the society of Gerard d'Obies, provost of Binche, and the little circle of knights within that town. Or, for it was not incumbent on him to be always in residence, he repaired to the court of Coudenberg, and became "moult frère et accointé" with the duke of Brabant. And then came Gui de Blois, one of King John's hostages in London in the old days. He had been fighting in Prussia with the Teutonic knights, and now, a little tired of war, proposed to settle down for a time in his castle of Beaumont. This prince was a member of the great house of Chatillon. He was count of Blois, of Soissons, and of Chimay. He had now, about the year 1374, an excellent reputation as a good captain. In him Froissart, who hastened to resume acquaintance, found a new patron. More than that, it was this Sire de Beaumont, in emulation of his grandfather, the patron of Jean le Bel, who advised Froissart seriously to take in hand the history of his own time. Froissart was then in his thirty-sixth year. For twenty years he had been rhyming, for eighteen he had been making verses for queens and ladies. Yet during all this time he had been accumulating in his retentive brain the materials for his future work.

He began by editing, so to speak, that is, by rewriting with additions the work of Jean le Bel; Gui de Blois, among others, supplied him with additional information. His own notes, taken from information obtained in his travels, gave him more details, and when in 1374 Gui married Marie de Namur, Froissart found in the bride's father, Robert de Namur, one who had himself largely shared in the events which he had to relate. He, for instance, is the authority for the story of the siege of Calais and the six burgesses. Provided with these materials, Froissart remained at Lestines, or at Beaumont, arranging and writing his chronicles. During this period, too, he composed his *Espinette Amoureux*, and the *Joli Buisson de jonesce*, and his romance of *Méliador*. He also became chaplain to the count of Blois, and obtained a canonry of Chimay. After this appointment we hear nothing more of Lestines, which he probably resigned.

In these quiet pursuits he passed twelve years, years of which we hear nothing, probably because there was nothing to tell. In 1386 his travels began again, when he accompanied Gui to his castle at Blois, in order to celebrate the marriage of his son Louis de Dunois with Marie de Berry. He wrote a *pastourelle* in honor of the event. Then he attached himself for a few days to the duke of Berry, from whom he learned certain particulars of current events, and then becoming aware of what promised to be the most mighty feat of arms of his time, he hastened to Sluys in order to be on the spot. At this port the French were collecting an enormous fleet, and making preparations of the greatest magnitude in order to repeat the invasion of William the Conqueror. They were tired of being invaded by the English, and wished to turn the tables. The talk was all of conquering the country and dividing it among the knights, as had been done by the Normans. It is not clear whether Froissart intended to go over with the invaders; but as his sympathies are ever with the side where he happens to be, he exhausts himself in admiration of this grand gathering of ships and men. "Any one," he says, "who had a fever would have been cured of his malady merely by going to look at the fleet." But the delays of the duke of Berry, and the arrival of bad weather, spoiled everything. There was no invasion of England. In Flanders Froissart met many knights who had fought at Rosebeque, and could tell him of the troubles which in a few years desolated that country, once so prosperous. He set himself to ascertain the history with as much accuracy as the comparison of various accounts by eye-witnesses and actors would allow. He stayed at Ghent, among those ruined merchants and mechanics, for whom, as one of the same class, he felt a sympathy never extended to English or French, perhaps quite as unfortunate; and he devotes no fewer than 300 chapters to the Flemish troubles, an amount out of all proportion to the comparative importance of the events. This portion of the chronicle was written at Valenciennes. During this residence in his birthplace his verses were crowned at the "puys d'amour" of Valenciennes and Tournay.

This part of his work finished, he considered what to do next. There was small chance of anything important happening in Picardy or Hainault, and he determined on making a journey to the south of France in order to learn something new. He was then fifty-one years of age, and being still, as he tells us, in his prime, "of an age, strength, and limbs able to bear fatigue," he set out as eager to see new places as when, 33 years before, he rode through Scotland and marvelled at the bravery of the Douglas. What he had, in addition to strength, good memory, and good spirits, was a manner singularly pleasing, and great personal force of character. This he does not tell us, but it comes out abundantly in his writings; and, which he does tell us, he took a singular delight in his book. "The more I work at it," he says, "the better am I pleased with it."

On this occasion he rode first to Blois; on the way he fell in with two knights who told him of the disasters of the English army in Spain; one of them also informed him of the splendid hospitalities and generosity of Gaston Phœbus, count of Foix, on hearing of which Froissart resolved to seek him out. He avoided the English provinces of Poitou and Guienne, and rode southwards through Berry, Auvergne, and Languedoc. Arrived at Foix he discovered that the count was at Orthez, whither he proceeded in company with a knight named Espaing de Lyon, who, Froissart found, had not only fought but could describe.

The account of those few days' ride with Espaing de Lyon is the most charming, the most graphic, and the most vivid chapter in the whole of Froissart. Every turn of the road brings with it the sight of a ruined castle, about which this knight of many memories has a tale or a reminiscence. The whole country teems with fighting stories. Froissart never tires of listening nor the good knight of telling. "Sainte Marie!" cries Froissart in mere rapture. "How pleasant are your tales, and how much do they profit me while you relate them! And you shall not lose your trouble, for they shall all be set down in memory and remembrance in the history which I am writing." Arrived at length at Orthez, Froissart lost no time in presenting his credentials to the count of Foix. Gaston Phœbus was at this time fifty-nine years of age. His wife, from whom he was separated, was that princess, sister of Charles of Navarre, with whom Guillaume de Machault carried on his innocent and poetical amour. The story of the miserable death of his son is well known, and may be read in Froissart. But that was already a tale of the past, and the state which the count kept up was that of a monarch. To such a prince such a visitor as Froissart would be in every way welcome. Mindful, no doubt, of those paid clerks who were always writing verses, Froissart introduced himself as a chronicler. He could, of course, rhyme, and in proof he brought with him his romance of *Méliador;* but he did not present himself as a wandering poet. The count received him graciously, speedily discovered the good qualities of his guest, and often invited him to read his *Méliador* aloud in the evening, during which time, says Froissart, "nobody dared to say a word, because he wished me to be heard, such great delight did he take in listening." Very soon Froissart, from reader of a romance, became *raconteur* of the things he had seen and heard; the next step was that the count himself began to talk of affairs, so that the note-book was again in requisition. There was a good deal, too, to be learned of people about the court. One knight recently returned from the East told about the Genoese occupation of Famagosta; two more had been in the fray of Otterbourne; others had been in the Spanish wars.

Leaving Gaston at length, Froissart assisted at the wedding of the old duke of Berry with the youthful Jeanne de Bourbon, and was present at the grand reception given to Isabeau of Bavaria by the Parisians. He then returned to Valenciennes, and sat down to write his fourth book. A journey undertaken at this time is characteristic of the thorough and conscientious spirit in which he composed his work; it illustrates also his restless and curious spirit. While engaged in the events of the year 1385 he became aware that his notes taken at Orthez and elsewhere on the affairs of Castile and Portugal were wanting in completeness. He left Valenciennes and hastened to Bruges, where, he felt certain, he should find some one who would help him. There was, in fact, at this great commercial centre, a colony of Portuguese. From them he learned that a certain Portuguese knight, Dom Juan Fernand Pacheco, was at the moment in Middelburg on the point of starting for Prussia. He instantly embarked at Sluys, reached Middelburg in time to catch this knight, introduced himself, and conversed with him uninterruptedly for the space of six days, getting his information on the promise of due acknowledgment. During the next two years we learn little of his movements. He seems, however, to have had trouble with his seigneur Gui de Blois, and even to have resigned his chaplaincy. Froissart is tender with Gui's reputation, mindful of past favors, and remembering how great a lord he is. Yet the truth is clear that in his declining years the once gallant Gui de Blois became a glutton and a drunkard, and allowed his affairs to fall into the greatest disorder. So much was he crippled with debt that he was obliged to sell his castle and county of Blois to the king of France. Froissart lays all the blame on evil counsellors. "He was my lord and master," he says simply, "an honorable lord and of great reputation; but he trusted too easily in those who looked for neither his welfare nor his honor." Although canon of Chimay and perhaps curé of Lestines as well, it would seem as if Froissart was not able to live without a patron. He next calls Robert de Namur his seigneur, and dedicates to him, in a general introduction, the whole of his chronicles. We then find him at Abbeville, trying to learn all about the negotiations pending between Charles VI. and the English. He was unsuccessful, either because he could not get at those who knew what was going on, or because the secret was too well kept. He next made his last visit to England, where, after forty years' absence, he naturally found no one who remembered him. Here he gave King Richard a copy of his "traités amoureux," and got favor at court. He stayed in England some months, seeking information on all points from his friends Henry Chrystead and Richard Stury, from the dukes of York and Gloucester, and from Robert the Hermit.

On his return to France, he found preparations going on for that unlucky crusade, the end of which he describes in his *Chronicle.* It was headed by the count of Nevers. After him floated many a banner of knights, descendants of the crusaders, who bore the proud titles of duke of Athens, duke of Thebes, sire de Sidon, sire de Jericho. They were going to invade the sultan's empire by way of Hungary; they were going to march south; they would reconquer the holy places. And presently we read how it all came to nothing, and how the slaughtered knights lay dead outside the city of Nikopoli. In almost the concluding words of the *Chronicle* the murder of Richard II. of England is described. His death ends the long and crowded *Chronicle,* though the pen of the writer struggles through a few more unfinished sentences.

The rest is vague tradition. He is said to have died at Chimay; it is further said that he died in poverty so great that his relations could not even afford to carve his name upon the headstone of his tomb; not one of his friends, not even Eustache Deschamps, writes a line of regret in remembrance; the greatest historian of his age had a reputation so limited that his death was no more regarded than that of any common monk or obscure priest. We would willingly place the date of his death where his *Chronicle* stops, in the year 1400; but tradition assigns the date of 1410.

What date more fitting than the close of the century for one who has made that century illustrious for ever?

Among his friends were Guillaume de Machault, Eustache Deschamps, the most vigorous poet of this age of decadence, and Cuvelier, a follower of Bertrand du Guesclin. These alliances are certain. It is probable that he knew Chaucer, with whom Deschamps maintained a poetical correspondence; there is nothing to show that he ever made the acquaintance of Christine de Pisan. Froissart was more proud of his poetry than his prose. Posterity has reversed this opinion, and though a selection of his verse has been published, it would be difficult to find an admirer, or even a reader, of his poems. The selection published by Buchon in 1829 consists of the *Dit dou Florin*, half of which is a description of the power of money; the *Débat dou Cheval et dou Levrier*, written during his journey in Scotland; the *Dittie de la Flour de la Margherite; a Dittie d'Amour* called *L'Orloge Amoureus*, in which he compares himself, the imaginary lover, with a clock; the *Espinette Amoureuse*, which contains a sketch of his early life, freely and pleasantly drawn, accompanied by rondeaux and virelays; the *Buisson de Jonesce*, in which he returns to the recollections of his own youth; and various smaller pieces. The verses are monotonous; the thoughts are not without poetical grace, but they are expressed at tedious length. It would be, however, absurd to expect in Froissart the vigor and verve possessed by none of his predecessors. The time was gone when Marie de France, Rutebœuf, and Thibaut de Champagne made the 13th century language a medium for verse of which any literature might be proud. Briefly, Froissart's poetry, unless the unpublished portion be better than that before us, is monotonous and mechanical. The chief merit it possesses is in simplicity of diction. This not infrequently produces a pleasing effect.

As for the character of his *Chronicle*, little need be said. There has never been any difference of opinion on the distinctive merits of this great work. It presents a vivid and faithful drawing of the things done in the 14th century. No more graphic account exists of any age. No historian has drawn so many and such faithful portraits. They are, it is true, portraits of men as they seemed to the writer, not of men as they were. Froissart was uncritical; he accepted princes by their appearance. Who, for instance, would recognize in his portrait of Gaston Phœbus de Foix the cruel voluptuary, stained with the blood of his own son, which we know him to have been? Froissart, again, had no sense of historical responsibility; he was no judge to inquire into motives and condemn actions; he was simply a chronicler. He has been accused by French authors of lacking patriotism. Yet it must be remembered that he was neither a Frenchman nor an Englishman, but a Fleming. He has been accused of insensibility to suffering. Indignation against oppression was not, however, common in the 14th century; why demand of Froissart a quality which is rare enough even in our own time? Yet there are moments when, as in describing the massacre of Limoges, he speaks with tears in his voice.

Let him be judged by his own aims. "Before I commence this book," he says, "I pray the Saviour of all the world, who created everything out of nothing, that He will also create and put in me sense and understanding of so much worth, that this book, which I have begun, I may continue and persevere in, so that all those who shall read, see, and hear it may find in it delight and pleasure." To give delight and pleasure, then, was his sole design.

As regards his personal character, Froissart depicts it himself for us. Such as he was in youth, he tells us, so he remained in more advanced life; rejoicing mightily in dances and carols, in hearing minstrels and poems; inclined to love all those who love dogs and hawks; pricking up his ears at the uncorking of bottles,—"Car au voire prens grand plaisir;" pleased with good cheer, gorgeous apparel, and joyous society, but no commonplace reveller or greedy voluptuary,—everything in Froissart was ruled by the good manners which he set before all else; and always eager to listen to tales of war and battle. As we have said above, he shows, not only by his success at courts, but also by the whole tone of his writings, that he possessed a singularly winning manner and strong personal character. He lived wholly in the present, and had no thought of the coming changes. Born when chivalrous ideas were most widely spread, but the spirit of chivalry itself, as inculcated by the best writers, in its decadence, he is penetrated with the sense of knightly honor, and ascribes to all his heroes alike those qualities which only the ideal knight possessed.

The first edition of Froissart was published in Paris. It bears no date; the next editions are those of the years 1505, 1514, 1518, and 1520. The best and most complete edition is that of Buchon, 1824, which is a continuation of one commenced by Dacier. An abridgment was made in Latin, by Belleforest, and published in 1672. An English translation was made by Bourchier, Lord Berners, and published in London, 1525. The translation now in use is that made by Thomas Johnes, and originally published in 1802–1805. (W. BE.)

FROME, a parliamentary borough and market town of Somersetshire, is situated on the small river Frome, an affluent of the Avon, 11 miles S. of Bath. It was formerly called Frome Selwood, from its situation on the borders of the extensive forest of Selwood. The river is crossed at Frome by a stone bridge of five arches. The town is irregularly built on an acclivity, and the older streets, with the exception of the principal one, are somewhat narrow and irregular. The parish church is an elegant edifice in the later Gothic style, with a tower and a fine octagonal spire 120 feet in height, and the church of St. Mary's, a fine structure in the First Pointed style, was erected in 1864. The other public buildings of importance are the market-house, and the museum. Among the educational and charitable institutions are the free grammar school, founded in the time of Edward VI., the national school, the asylum for the education and maintenance of 25 poor girls, the blue-coat school, and the almshouses for old men and women. Frome also possesses a literary institute, a mechanics' institute, and a school of art. The inhabitants are chiefly employed in the manufacture of broadcloth and other fine woollens, but there are also foundries, wire-card manufactories, and edge-tool works, and the town has been long noted for its ale. The vicinity is fertile and picturesque, and is ornamented with numerous fine mansions. Frome returns a member to parliament. The population in 1871 was 9753.

FROMENTIN, EUGÈNE (1820–1876), French painter, was born at La Rochelle in December, 1820. After leaving school he studied for some years under Louis Cabat, the landscape painter. Fromentin was one of the earliest pictorial interpreters of Algeria, having been able, while quite young, to visit the land and people that suggested the subjects of most of his works, and to store his memory as well as his portfolio with the picturesque and characteristic details of North African life. In 1849 he obtained a medal of the second class. In 1852 he paid a second visit to Algeria, accompanying an archæological mission, and then completed that minute study of the scenery of the country and of the habits of its people which enabled him to give to his after work the realistic accuracy that comes from intimate knowledge. In a certain sense his works are not more artistic results than contributions to ethnological science. His first great success was produced at the Salon of 1847, by the Gorges de la Chiffa. Among his more important works are—La Place de la Brèche à Constantine, 1849; Enterrement Maure, 1853; Bateleurs Nègres and Audience chez un Chalife, 1859; Berger Kabyle and Courriers Arabes, 1861; Bivouac Arabe, Chasse au Faucon, Fauconnier Arabe (now at the Luxembourg), 1863; Chasse au Heron, 1865; Voleurs de Nuit, 1867; Centaurs and Arabes attaqués par une Lionne, 1868; Halte de Muletiers, 1869; Le Nil and Un Souvenir d'Esneh, 1875. Fromentin was much influenced in style by Eugène Delacroix. His works are distinguished by striking composition, great dexterity of handling, and brilliancy of color. In them is given with great truth and refinement the unconscious grandeur of barbarian and animal attitudes and gestures. His later works, however, show signs of an exhausted vein, and of an exhausted spirit, accompanied or caused by physical enfeeblement. But it must be observed that Fromentin's paintings show only one side of a genius that was perhaps even more felicitously expressed in literature, though of course with less profusion. "Dominique," first published in the *Revue des Deux Mondes* in 1862, and dedicated to George Sand, is remarkable among the fictions of the century for delicate and imaginative observation and for emotional earnestness. Fromentin's other literary works are—*Visites Artistiques*, 1852; *Simples Pèlerinages*, 1856; *Un Été dans le Sahara*, 1857; *Une Année dans le Sahel*, 1858; and *Les Maîtres d'autrefois*, 1876. In 1876 he was an unsuccessful candidate for the Academy. He died suddenly at La Rochelle on the 27th August, 1876.

FRONDE, War of the (1648–1652). See France (p. 504) and Condé.

FRONTINUS, Sextus Julius, a Roman soldier, and the author of some interesting works, was born of a patrician family at Rome about 40 A.D. Nothing is known of his early life or history, till we find him acting as *prætor urbanus* under Vespasian, in 70, an office from which he soon retired to make way for Domitian. Five years later he was sent into Britain to succeed Petilius Cerealis as governor of that island. He subdued the Silures, and held the other native tribes in check till 78, when he was superseded by Agricola. In 97 he was appointed *curator aquarum* at Rome, an office which was never conferred except upon persons of very high standing. He was also a member of the college of augurs, retaining the dignity till his death, which appears to have happened about 103. The later years of his life were spent in studious retirement on the shores of Campania. Many works have been attributed to Frontinus, of which only two that are undoubtedly his are now extant. The first of these is a treatise on tactics entitled *Strategematicon Libri IV.*, and the second is entitled *De Aquis Urbis Romæ Libri II.* The latter conveys in a clear and terse style much valuable information on the manner in which ancient Rome was supplied with water, and on other matters of importance in the history of architecture. A large number of interpolations have been inserted into the *Strategematicon* by various writers. The two works have been translated into most of the languages of Europe.

The best editions of the *Strategematicon* are those of Oudendorp, Leyden, 1731, and Schwebel, Leipsic, 1772. The best editions of the *De Aquis* are those of Polenus, Pavia, 1722, and G. C. Adler, Altona, 1792.

FRONTO, Marcus Cornelius, a Roman grammarian, rhetorician, and advoçate, was born of an Italian family at Cirta in Numidia, a Libyan of the Libyans, as he calls himself, *Λίβυς τῶν Λιβύων*. The date of his birth is unknown, but as he was quæstor in 138, it must have been before 113, and not improbably between 100 and 110. He came to Rome in the reign of Hadrian, and soon gained such renown as an advocate and orator as to be reckoned inferior only to Cicero. Antoninus Pius, hearing of his fame, appointed him tutor to his adopted sons Marcus Aurelius and Lucius Verus; and Fronto, as appears from his surviving letters, completely gained the confidence and affection of both these pupils. He was proconsul of Asia for a few months in 143, and five years later he was offered the same post, but declined acceptance on the plea of bad health. He preferred to remain at Rome, where, by the practice of his profession, he amassed a very large fortune, which enabled him to purchase the famous gardens of Mæcenas, besides sumptuous villas in various parts of Italy. In his old age, when confined to his house by the gout, he used to receive the leading literary men, who flocked to hear his unrivalled conversation. This exhibited the same qualities as his more formal orations, which were so much admired that a school of rhetoricians called itself after his name, having for its object the restoration to the Latin language of its ancient purity and simplicity. Fronto died at an advanced age, but the exact date of his death is not known, and it is even uncertain whether he survived or predeceased the emperor Marcus Aurelius. Till 1815 the only work of Fronto's believed to exist was some disjointed fragments of his essay *De Differentia Vocabulorum*, and even this is more probably the production of a later grammarian who made use of Fronto's works. In that year, however, Angelo Mai discovered in the Ambrosian library at Milan a palimpsest manuscript, on which had been originally written some of Fronto's letters to his royal pupils. These he deciphered and published with notes, Milan, 1815. On his removal to Rome he discovered in the Vatican some additional sheets of the same palimpsest, which, like the first, contained letters of Fronto to Aurelius and Verus, with their replies. These palimpsests had originally belonged to the famous convent of St. Columba at Bobbio, and had been written over by the monks with the acts of the first council of Chalcedon. All these letters were published by Mai, at Rome, in 1823, under the title of *M. Cornelii Frontonis et M. Aurelii imperatoris epistolæ; L. Veri et Antonini Pii et Appiani epistolarum reliquiæ; Fragmenta Frontonis et scripta grammatica.* The discovery excited intense interest among the scholars of Europe, but a certain amount of disappointment was felt when the contents of the letters were examined. The characters of the two emperors, indeed, are displayed in a very favorable light, especially in the affection which they both seemed to have retained for their old master; but the subject-matter of most of the letters is of such ephemeral interest as to throw little additional light on Roman antiquity. Not only have 146 of the leaves of the manuscript been lost, but hardly half of the 194 still extant have been deciphered so as to furnish an intelligible context. A more careful examination of the palimpsest might possibly show good results.

A critical edition was published by Niebuhr, Buttmann, and Heindorf, Berlin, 1826; a French translation of Mai's edition of 1823, by Armand Cassan, Paris, 2 vols. 8vo, 1830; and an edition based on a new examination of the MSS. by Du Rieu, by Naber, Leipsic, 1867. Orelli published a selection of the letters or *Chrestomathia Frontoniana*, as an appendix to his edition of the *Dialogus de Oratoribus* of Tacitus. Critical observations on the remains have been published by L. Schopen (Bonn, 1830, 1841); Alan (Dublin, 1841); A. Philibert Soupé, *De Frontonis reliquiis*, Amiens, 1853; J. Mahly, in *Philologus*, xvii. and xix.; M. Haupt, *De emendatione librorum Frontonis*, Berlin, 1867; R. Ellis, in *Journal of Philology*, 1868; Eussner, in *Rheinisches Museum*, xxv.; Mommsen, in *Hermes*, 1874; Klussmann, *Emendationes Frontonianæ*, Göttingen, 1871; enlarged, Berlin, 1874.

FROSINONE, town of Italy, in the province of Rome, on the railway between Rome and Naples, about 62 miles from the former and 104 from the latter. It is situated in a rich vine-growing district, at the foot of a hill near the left bank of the Cosa, an affluent of the Sacco or *Trerus*. Though a place of considerable size and great antiquity, it contains very little of interest either for the classical or mediæval archæologist. Its principal buildings are the eight churches and a number of old convents. In the plain below there are some remains of an amphitheatre. Frosinone is easily identified with the ancient Frusino or Frusinum, a city of the Volscians which ultimately became a Roman municipium and received a colony of veterans. Previous to 1870 it was the head of a delegation of the papal states, and as such a place of some importance. The population in 1871 was 10,161.

FROST, William Edward (1810–1877), a painter of mythological and fanciful subjects, was born at Wandsworth, near London, in September, 1810. He showed at an early age considerable talent for drawing, and his father placed him under as good instruction as was available in the neighborhood. About 1825 he was introduced to Etty, who advised that he should attend a celebrated drawing school in Bloomsbury Street. After several years' study there, and in the sculpture rooms at the British Museum, Frost was in 1829 admitted as a student in the schools of the Royal Academy, where he was noted for steady and careful application, and for success in competition. He won medals in all the schools, except the antique, in which he was beaten by Maclise. During those years, and indeed until the time when more imaginative work had brought, with fame, other means of subsistence, he maintained himself by portrait painting. He is said to have painted, about this time, over 300 portraits; but not one of them is now remembered as a work of any artistic value. In 1839 he obtained the gold medal of the Royal Academy for his picture of Prometheus bound by Force and Strength. At the cartoon exhibition at Westminster Hall in 1843 he was awarded a third-class prize of 100 pounds, for his cartoon of Una alarmed by Fauns and Satyrs. He exhibited at the Academy Christ crowned with Thorns (1843), Nymphs dancing (1844), Sabrina (1845), Diana and Actæon (1846). In 1846 he was elected Associate of the Royal Academy. His Nymph disarming Cupid was exhibited in 1847; Una and the Wood-Nymphs of the same year was bought by the Queen. This was the time of Frost's highest popularity. Influences affecting the art of the country at the time led to the decline of his reputation after 1850; and opinion on his work so changed in later years that it was perhaps by courtesy only that he obtained the dignity of full membership of the Royal Academy. His later pictures are simply repetitions of earlier motives. Among them may be named Euphrosyne (1848), Wood-Nymphs (1851), Chastity (1854), Il Penseroso (1855), The Graces (1856), Narcissus (1857), Zephyr with Aurora playing (1858), The Graces and Loves (1863), Hylas and the Nymphs (1867). After being for some years at the head of the list of associates, Frost was elected to full membership of the Royal Academy in December, 1871. This dignity, however, he soon resigned, and his name appears in the lists issued during the last years of his life among those of honorary retired Academicians. There is something very flimsy about the productions of this painter. In work after work is continued the same unvarying series of maidens and nymphs, having the same smiles, gestures, graces. There is in these paintings no spontaneity and little truth of feeling of any kind. Frost had no high power of design, though some of his smaller and apparently less important works are not without grace and charm. Technically, his paintings are, in a sense, very highly finished, but they are entirely without mastery. The writings of Ruskin and the rise of the pre-Raphaelites changed the regard in which such productions as those of Frost were held; and his career was practically at an end some years before his death. As a man he was highly esteemed by his friends for the gentleness and modesty of his disposition. He died on the 4th of June, 1877.

FROSTBITE. See MORTIFICATION.

FRUGONI, CARLO INNOCENZO (1692–1768), an Italian poet, was born at Genoa 21st November, 1692. In accordance with the custom of the family to which he belonged, being destined, as the youngest son, for the ecclesiastical profession, he was, at the age of fifteen, in opposition to his strong wishes, shut up in a convent; and although in the following year he was induced to pronounce monastic vows, his sentiments continued to remain completely at variance with the profession he had adopted. He, however, made so rapid progress in his studies that he soon acquired considerable reputation as an elegant writer both of Latin and Italian prose and verse; and from 1716 to 1724 he filled the chairs of rhetoric at Brescia, Rome, Genoa, Bologna, and Modena successively, attracting by his brilliant fluency a large number of students at each university. Through Cardinal Bentivoglio he was recommended to Antonio Farnese, duke of Parma, who appointed him his poet laureate; and he remained at the court of Parma until the death of Antonio, after which he returned to Genoa. Shortly afterwards, through the intercession of Bentivoglio, he obtained from the pope the remission of his monastic vows, and by eloquent representations he ultimately succeeded in recovering a portion of his paternal inheritance. After the peace of Aix-la-Chapelle, he returned to the court of Parma, and there devoted the later years of his life chiefly to poetical composition. He died 20th December, 1768. Frugoni holds a place in the first rank of the lyrical poets of his time, and his other compositions, which embrace almost every form of poetry, have in most cases considerable merit, and are generally characterized by harmony of versification, elegance of language, and appositeness and great variety of imagery.

His collected works were published at Parma in 10 vols. in 1799, and a more complete edition appeared at Lucca in the same year in 15 vols. A selection from his works was published at Brescia in 1782, in 4 vols.

FRUMENTIUS, an early Christian missionary and bishop who is recognized by the Abyssinian church as its apostle and founder, and usually bears in Abyssinian literature the title of Abba Salama or Father of Salvation. According to Rufinus, an ecclesiastical historian of the latter part of the 4th century, who gives Ædesius himself as his authority, a certain Tyrian philosopher, accompanied by his kinsmen Frumentius and Ædesius, set out on an expedition to "India," but was murdered by the natives of a coast town which he visited by the way. The two young men, on the contrary, were taken under royal protection, and ultimately became tutors of the heir apparent to the throne. On the succession of their pupil they returned home. Ædesius was made presbyter of Tyre, and Frumentius was consecrated bishop by Athanasius of Alexandria, and went back to propagate Christianity among the "Indians." This story is substantiated by the letters of Athanasius, who distinctly mentions the consecration of Frumentius, in 326, as bishop of Axum in Abyssinia, and gives some details of the history of his mission. The opinion of Thomas Wright (*Early Christianity in Arabia*, 1855), that the scene of the labors of Frumentius was not Abyssinia but southern Arabia, appears quite irreconcilable with the direct testimony of Athanasius, whatever support it may find in the vaguer notices of ecclesiastical historians.

See Nicephorus, ix. 18; Rufinus, x. 9; Theodoret, i. 23; Athanasius, *Epistola ad Constantinum*.

FRUYTIERS, PHILIP, a pupil of the Jesuits' college at Antwerp in 1627, entered the Antwerp guild of painters without a fee in 1631. He is described in the register of that institution as "illuminator, painter, and engraver." The current account of his life is "that he worked exclusively in water colors, yet was so remarkable in this branch of his art for arrangement, drawing, and especially for force and clearness of color, as to excite the admiration of Rubens, whom he portrayed with all his family." The truth is that he was an artist of the most versatile talents, as may be judged from the fact that in 1646 he executed an Assumption with figures of life size, and four smaller pictures in oil, for the church of St. Jacques at Antwerp, for which he received the considerable sum of 1150 florins. Unhappily, no undoubted production of his hand has been preserved, and hence we are at a loss surely to gauge his acquirements. All that we can point to with certainty is a series of etched plates, chiefly portraits, which are acknowledged to have been powerfully and skilfully handled. If, however, we search the portfolios of art collections on the Continent, we sometimes stumble upon miniatures on vellum, drawn with great talent, and colored with extraordinary brilliancy. In form they quite recall the works of Rubens, and these, it may be, are the work of Philip Fruytiers, who died in 1666, and was buried on the 21st of June in the church of the Récollets at Antwerp.

FRY, or GURNEY, ELIZABETH (1780–1845), an eminent philanthropist and, after Howard, the chief promoter of prison reform in Europe, was born in Norwich on the 21st of May, 1780. Her father, John Gurney, afterwards of Earlham Hall, a wealthy merchant and banker, represented an old family which for some generations had belonged to the Society of Friends; and her mother, Catharine Bell, was a great-granddaughter of Robert Barclay, the friend and companion of George Fox. Elizabeth was the third daughter in a large family, which included Joseph John Gurney, whose name is intimately associated with those of Buxton, Wilberforce, and other promoters of the anti-slavery cause. While still a girl she gave many indications of the benevolence of disposition, clearness and independence of judgment, and strength of purpose, for which she was afterwards so distinguished; but it was not until after she had entered her eighteenth year that her religion assumed a decided character, and that she was induced, under the preaching of the American Quaker, William Savery, to become an earnest and enthusiastic though never fanatical "Friend." In August, 1800, she became the wife of Joseph Fry, a London merchant, and had her home for some years in St. Mildred's Court, City, and afterwards at Plashet House, Essex. Amid increasing family cares she was unwearied in her attention to the poor and the neglected of her neighborhood; and in 1811 she was acknowledged by her co-religionists as a "minister," an honor and responsibility for which she was undoubtedly qualified, not only by vigor of intelligence and warmth of heart, but also by an altogether unusual faculty of clear, fluent, and persuasive speech. Although she had made several visits to Newgate prison as early as February, 1813, it was not until nearly four years afterwards, that the great public work of her life may be said to have begun. The "Association for the Improvement of the Female Prisoners in Newgate," was formed in April, 1817. Its aim was the much-needed establishment of some of what are now regarded as the first principles of prison-discipline, such as entire separation of the sexes, classification of criminals, female supervision for the women, and adequate provision for their religious and secular instruction, as also for their useful employment. The ameliorations effected by this association, and largely by the personal exertions of Mrs. Fry, soon became obvious, and led to a rapid extension of similar methods to other places. In 1818 she, along with her brother, visited the prisons of Scotland and the north of England; and the publication (1819) of the notes of this tour, as also the cordial recognition of the value of her work by the House of Commons' committee on the prisons of the metropolis, led to a great increase of her correspondence, which now extended to Italy, Denmark, and Russia, as well as to all parts of the United Kingdom. Through a visit to Ireland, which she made in 1827, she was led to direct her attention to other houses of detention besides prisons; and her observations resulted in many important improvements in the British hospital system, and in the treatment of the insane. In 1838 she visited France, and besides conferring with many of the leading prison officials, she personally visited most of the houses of detention in Paris, as well as in Rouen, Caen, and some other places. In the following year she obtained an official permission to visit all the prisons in that country; and her tour, which extended from Boulogne and Abbeville to Toulouse and Marseilles, resulted in a report which was presented to the minister of the interior and the prefect of police. Before returning to England she had included Geneva, Zurich, Stuttgart, and Frankfort in her inspection. The summer of 1840 found her travelling through Belgium, Holland, and Prussia on the same mission; and in 1841 she also visited Copenhagen. In 1842, through failing health, Mrs. Fry was compelled to forego her plans for a still more widely extended activity, but had the satisfaction of hearing from almost every quarter of Europe that the authorities were giving increased practical effect to her suggestions. In 1844 she was seized with a lingering illness of which she died on the 12th of October, 1845. She was survived by a numerous family, the youngest of whom was born in 1822. Two interesting volumes of *Memoirs, with Extracts from her Journals and Letters*, edited by two of her daughters, were published in 1847.

FUAD PASHA, Mehmed (1814–1869), a Turkish statesman and author, was born at Constantinople in 1814. His father, Izzet-Effendi Kitchegizadey, better known as Izzet-Mollah, was a man of wealth and position, and had a high reputation as a poet; but he fell into disgrace with the Turkish Government, and his estates were confiscated. Fuad being therefore compelled to adopt a profession chose that of medicine; and after studying from 1828 to 1832 at Galata-Serai, he was appointed in 1834 physician to the admiralty, and accompanied the expedition against Tripoli. On his return to Constantinople he quitted the medical service and entered the interpreters' office, with the view of qualifying himself for a diplomatic post. In 1840 he accompanied the Turkish embassy to London as first secretary, and in 1843 he was appointed to the office of second interpreter to the Turkish Government, and subsequently to that of director of the translation office. Shortly after he was sent to congratulate Isabella II. on her accession to the throne of Spain. In 1845 he was appointed chief interpreter to the Porte; and in 1848, as grand-referendary of the imperial divan, he was named Ottoman commissioner, to settle the revolutionary disputes in the principalities of Moldavia and Wallachia. On his return from a special mission to Russia he was named minister of the interior, and shortly afterwards minister of foreign affairs. In 1853 he published a pamphlet on the question of the holy sepulchres, which greatly irritated the czar of Russia, and led Prince Menschikoff to act in such a manner that Fuad Pasha felt compelled, from self respect, to tender his resignation to the Turkish Government. Shortly afterwards war was declared between Russia and Turkey, and he was appointed commissioner at the headquarters of Omar Pasha. In 1855 he resumed his duties of foreign minister, and he continued in that office till the close of the war. In 1857 he became president of the council of tanzimat, in 1860 was appointed commissioner to Syria to settle the disputes between the Druses and the Maronites; shortly after his return he was named grand vizier; and in 1863 he became war minister, and a little later returned to his old post of foreign minister. In 1867 he accompanied the sultan to England and France. He died at Nice, whither he had gone for the benefit of his health, February 12, 1869. Fuad Pasha was one of the first members of the Turkish Imperial Academy of Sciences and Belles-Lettres, founded in 1851. He is the author of a poem entitled *Alhambra*, written after his sojourn in Spain, and of a Turkish grammar. The suave and genial manners of Fuad Pasha, and his diplomatic talents, stood Turkey in good stead in connection with the Crimean war and the various negotiations in reference to Turkey's relation to her Christian subjects, and helped to inspire a faith in her capacity for reforms, which later events have shown to have been largely misplaced. He endeavored to secure to his country the material advantages to be derived from the adoption of European improvements, but his measures effected no lasting reform in her administration; and by the adoption of a heedless system of credit, he largely increased her financial difficulties.

FUCHS, Johann Joseph. See Fux.

FUCHS, Johann Nepomuk von (1774–1856), an eminent chemist and mineralogist, was born at Mattenzell near Bremberg, in the neighborhood of the Baierischer Wald, May 15, 1774. Having acquired a knowledge of medicine at Vienna and Heidelberg, he in 1801 turned his attention to chemistry and mineralogy, which he studied at Freiberg, Berlin, and Paris. In 1807 he became professor of those sciences at the university of Landshut, and in 1823 conservator of the mineralogical collections at Munich, where, on the occasion of the removal thither of the university of Landshut, in 1826 he was appointed professor of mineralogy. In 1852 he retired from public life, and in 1854 he was raised to the nobility by the king of Bavaria. He died at Munich, March 5, 1856. Mineralogy and inorganic chemistry are indebted to Fuchs for numerous researches. He is more especially known for his discovery, in 1823, of a process for making a soluble glass, used for fixing fresco-colors, according to the method termed stereochromy. Among his works are—

Ueber den gegenseitigen Einfluss der Chemie und Mineralogie, Munich, 1824; *Die Naturgeschichte des Mineralreichs*, Kempten, 1842; *Ueber die Theorien der Erde*, Munich, 1844; *Bereitung, Eigenschaften, und Nutzanwendung des Wasserglasses*, Munich, 1857, of which French translations appeared in 1861 and 1864. His collective works were published at Munich in 1856.

FUCHS, Leonhard (1501–1566), a celebrated German physician, and one of the fathers of scientific botany, was born at Wembdingen in Bavaria, January 17, 1501. At the age of five years he lost his father, but under the care of his mother he early made great progress in learning. In his tenth year he was sent to school at Heilbronn, whence, a twelvemonth later, he was removed to Erfurt. After a year and a half he was admitted a student of the university of that town, which in 1521 conferred on him the degree of "baccalaureus." During the next 18 months he gave lessons in Latin and literature in his native town. He then repaired to the university of Anspach, where in 1521 he was created a master of arts. About the same time he espoused the doctrines of the Reformation. Having in 1524 received his diploma as doctor of medicine, he practised for two years in Munich. He became in 1526 professor of medicine at Ingolstadt, and in 1528 physician to the margrave of Anspach. In Anspach he was the means of saving the lives of many during the epidemic locally known as the "English sweating-sickness." By the duke of Würtemberg Fuchs was, in 1535, appointed to the professorship of medicine at the university of Tübingen, a post held by him till his death, which took place May 10, 1566. Among his numerous writings are the following:—

Errata recentiorum medicorum LX numero, adjectis eorum confutationibus, Haguenau, 1530, 4to; *Cornarius Furens* (an answer to a pamphlet by his medical opponent Cornarius, entitled *Vulpecula Excoriata*), Basel, 1533, 8vo, Vienna, 1545; *Paradoxorum medicinæ libri tres*, Basel, 1535, fol., etc.; *Tabulæ aliquot universæ medicinæ*, Basel, 1538, 4to; *De curandi ratione* (Tübingen, 1539)? 16mo, Leyd., 1548, 8vo, etc.; *Medendi Methodus*, Basel, 1541, fol., Lyons, 1541, and Paris, 1550, 8vo; *De historia stirpium commentarii insignes*, Basel, 1542, fol., a work illustrated with more than 500 excellent outline illustrations, including figures of the common foxglove, and of another species of the genus *Digitalis*, so named by him: it was several times re-edited, and was translated into most European languages; *De Sanandis totius humani corporis . . . malis*, Basel, 1542, 8vo, Paris, 1543, and Lyons, 1547, 16mo; *Nicolai Myrepsi Medicamentorum Opus, . . . e græco in latinum conversum*, 1549, fol.; *Institutiones Medicinæ*, Leyd. (2d ed.), 1560, 8vo; *De componendorum miscendorumque medicamentorum ratione*, Leyd., 1561, fol.; *De compositione medicamentorum*, Lyons, 1563, 12mo; *Opera didactica*, a revised collection of various of his already published works, Frankf., 1566 and 1604, fol.: the latter edition has prefixed to it a life of the author by Hitzler. Fuchs was an advocate of the Galenic school of medicine, and published several Latin translations of treatises by its founder and by Hippocrates, besides controversial tracts against the opinions of H. Thriverius, G. Ryffius, C. Egenolphus, G. Rufinus, G. Puteanus, and S. Montius.

FUCHSIA, so named by Plumier in honor of the botanist Leonhard Fuchs (*v. supra*), a genus of plants of the natural order *Onagraceæ*, characterized by entire, usually opposite leaves; pendent flowers; a funnel-shaped, brightly colored, quadripartite, deciduous calyx; 4 petals, alternating with the calycine segments; 8, rarely 10, exserted stamens, a long and filiform style, and inferior ovary; and fleshy, ovoid, many-seeded berries or fruit. All the members of the genus, with the exception of the New Zealand species, *F. excorticata*, *F. Kirkei* and *F. procumbens*, are natives of Central and South America,—occurring in the interior of forests, or in damp and shady mountainous situations. The various species differ not a little in size as well as in other characters; some, as *F. verrucosa*, being dwarf shrubs; others, as *F. arborescens* and *F. apetala*, attaining a height of 12 to 16 feet, and having stems several inches in diameter. Plumier, in his *Nova Plantarum Americanarum Genera*, p. 14, tab. 14, Paris, 1703, 4to, gave a description of a species of fuchsia, the first known, under the name of *Fuchsia triphylla, flore coccineo*, and a somewhat conventional outline figure of the same plant was published at Amsterdam, in 1757, by Burmann.[1] In the *Histoire des Plantes Médecinales* of the South American traveller Feuillée (p. 64, pl. XLVII.), written in 1709-11, and published by him with his *Journal*, Paris, 1725, the name *Thilco* is applied to a species of fuchsia from Chili, which is described, though not evidently so figured, as having a pentamerous calyx. The *F. coccinea* of Aiton (see Dr. J. D. Hooker, *J. Proc. Linnean Soc.*, Botany. vol. x. p. 458, 1867), the first species of fuchsia cultivated in England, where it was long confined to the greenhouse, was brought from South America by Captain Firth in 1788, and placed in Kew Gardens. Of this species Mr. Lee, a nurseryman at Hammersmith, soon afterwards obtained an example, and procured from it by means of cuttings several hundred plants, which he sold at a guinea each. In 1823, *F. macrostemon* and *F. gracilis*, and during the next two or three years several other species, were introduced into England; but it was not until about 1837, or soon after florists had acquired *F. fulgens*, that varieties of interest began to make their appearance. The numerous hybrid forms now existing are the result chiefly of the intercrossing of that or other long-flowered with globose-flowered plants. *F. Venus victrix*, raised by Mr. Gulliver, gardener to the Rev. S. Marriott of Horsemonden, Kent, and sold in 1822, to Messrs Cripps, was the earliest white-sepalled fuchsia, and is one of the best of its kind for hybridization. The first fuchsia with a white corolla was produced about 1853, by Mr. Storey. In some varieties the blossoms are variegated, and in others they are double. There appears to be very little limit to the number of forms to be obtained by careful cultivation and selection. To hybridize, the flower as soon as it opens is emasculated, and it is then fertilized with pollen from some different flower. As seed in the high-bred varieties of fuchsia is produced in but small quantity, it is worth, if it will germinate, at least 50 guineas an ounce (see H. Cannel, *Gardener's Mag.*, 1875, p. 251). To procure the seed, which when good is firm and plump, the ripe pods are sun-dried for a few days, and then crushed between the finger and thumb; the seed is next cleansed in water from the surrounding pulp, dried in saucers, and wrapped in paper for use. It is sown about February or March, in light, rich, well-drained mould, and is thinly covered with sandy soil, and watered. A temperature of 70°–75° Fahr. has been found suitable for raising. The seedlings are pricked off into shallow pots or pans, and when 3 inches in height are transferred to 3-inch pots, and are then treated the same as plants from cuttings (*v. inf.*). Fuchsias may be grafted as readily as camellias, preferably by the splice or whip method, the apex of a young shoot being employed as a scion; but the easiest and most usual method of propagation is by cuttings. As one of the most expeditious ways of procuring these, Loudon recommends to put plants in heat in January, and to take their shoots when three inches in length. For summer flowering in England they are best made about the end of August, and should be selected from the shortest-jointed young wood. Coarse brown sand intermixed with a little leaf-mould, with a surface-layer of silver-sand, affords them a good soil for striking. In from two to three weeks they may be put into 3-inch pots containing a compost of equal parts of rich loam, silver-sand, and leaf-mould. They are subsequently moved from the frame or bed, first to a warm and shady, and then to a more airy part of the greenhouse. In January a little artificial heat may be given, to be gradually increased as the days lengthen. The side-shoots are generally pruned when they have made three or four joints, and for bushy plants the leader is stopped soon after the first potting. Care is taken to keep the plants as near the glass as possible, and shaded from bright sunshine, also to provide them plentifully with water, except at the time of shifting, when the roots should be tolerably dry. For the second potting a suitable soil is a mixture of well-rotted cow-dung or old hotbed mould with leaf mould and sandy peat, and to promote drainage a little peat-moss may be placed immediately over the crocks in the lower part of the pot. Weak liquid manure greatly promotes the advance of the plants, and should be regularly supplied twice or thrice a week during the flowering season. After this, water is gradually withheld from them, and they may be placed in the open air to ripen their wood. The common garden fuchsia, *F. fulgens*, stands the winter in England if cut down and covered with 4–6 inches of dry ashes (Smee), and many other species may be grown in the open air if afforded a little protection from frosts. *F. discolor*, a native of the Falkland Islands, is a particularly hardy species (see *Trans. Hort. Soc. Lond.*, 2d ser., ii. p. 284). The nectar of fuchsia flowers has been shown by Mr. A. S. Wilson (*Rep. Brit. Assoc.*, 1878) to contain nearly 78 per cent. of cane sugar, the remainder being fruit sugar. The berries of some fuchsias are subacid or sweet, and edible. From certain species a dye is obtainable. The so-called "native fuchsias" of Southern and Eastern Australia are plants of the genus *Correa*, and natural order *Rutaceæ*.

(F. H. B.)

FUEL. This term includes all substances that may be usefully employed for the production of heat by combustion with atmospheric air or oxygen. Any element or combination of elements susceptible of oxidation, *i. e.*, any substance electro-positive to oxygen, may under particular conditions be made to burn; but only those that ignite by a moderate preliminary heating, and burn with comparative rapidity, and, what is practically of equal importance, are obtainable in quantity and at a moderate price, come fairly within the category of fuels. Among elementary substances only hydrogen, sulphur, carbon, silicon, and phosphorus can be so classed, and of these the last two are only of special application. More important than the elements are, however, the carbohydrates, or compounds of carbon, hydrogen, and oxygen, which form the bulk of the natural fuels, wood, peat, and coal, as well as of their liquid and gaseous derivatives, coal gas, coal tar, pitch, oil, etc., which are possessed of great fuel value. Carbon in the elementary form has its nearest representatives in charcoal and coke.

In the determination of the value of fuel two principal factors are involved, namely, the calorific power, or the total amount of heat obtainable from the perfect combustion of its constituents, and the calorific intensity, or pyrometric effect which is the temperature attained by the gaseous products of the combustion. The first of these is constant for any particular composition, and does not vary with the method of combustion, the quantity of heat developed by the combustion of a unit of carbon or hydrogen being the same whether it be burnt with oxygen, air, or a metallic oxide. The calorific intensity, on the other hand, being inversely proportional to the volume of gases produced, it is obvious that if the combustion is effected with pure oxygen the resulting carbonic acid (in the case of carbon) may be very much hotter than when air is used, as the duty of heating up an additional quantity of nitrogen rather more than three times the weight of the oxygen is in the latter case imposed upon a similar weight of carbon.

Theoretically 1 unit of carbon combines with 2·67 units of oxygen to form 3·67 units of carbonic acid, whose specific heat is 0·216. The resulting maximum temperature of the gases produced therefore cannot exceed

$$\frac{8080}{3{\cdot}67\times0{\cdot}216}=10187°\text{ C.};$$

but when a similar weight of carbon is burnt with air, the gases are diluted with 8·88 units of nitrogen, whose specific heat is 0·244. The highest temperature possible in the products of combustion in this case does not exceed

---

[1] *Plantarum Americanarum Fasciculus Sextus, Continens Plantas, quas olim Carolus Plumierius, Botanicorum Princeps, Detexit, Eruitque. J. Burmannus atque in Insulis Antillis ipse depinxit*, pp. 124, 125, tab. cxxxiii.

$$\frac{8080}{3{\cdot}67\times0{\cdot}216+8{\cdot}88\times0{\cdot}24}=2731^\circ\ \text{C.}$$

The calorific value of a fuel may be determined by direct experiment, either by complete combustion on the small scale in a calorimeter, or by practical experiment on a working scale, by ascertaining the effect of a weighed quantity in performing a particular kind of work, such as evaporating water in a steam boiler, the result being expressed in the number of pounds of water converted into steam per pound of fuel burnt. It may also be computed from an ultimate chemical analysis,—the carbon and so much of the hydrogen as remains disposable for burning, after deducting sufficient to form water with the oxygen present, being credited with the full heating power derivable from their complete oxidation, according to the results found for these elements by the calorimeter.

The pyrometric effect, on the other hand, cannot be either computed or determined experimentally with complete accuracy, partly because the total combustion of a quantity of fuel in a given time at one operation is practically impossible, but more particularly from the fact that dissociation of the gaseous compounds produced in burning takes place to a greater or less extent at temperatures far below those indicated as possible by calculation based upon comparisons of the weight of the products of combustion and their specific heat with the calorific value of the substance as found by experiment. According to Bunsen, Deville, Dewar, and others who have specially considered this subject, a temperature of about 3000° C. will be the maximum attainable from any fuel by any ordinary process of combustion. The calorific powers of the principal elementary substances susceptible of use as fuels are given in the following table; they are expressed in *calories* or heat units, signifying the weight of water raised, in temperature 1° C., by the combustion of one unit of the different substances, and the corresponding weight of water converted into steam from a temperature of 100° C.

		Heat Units.	Water evaporated.
Hydrogen....	Burnt to Water, H_2O..............	34,462	62·66
Carbon........	" Carbonic acid, CO_2.....	8,080	14·69
"	" Carbonic oxide, CO....	2,474	4·50
Silicon........	" Silicic acid, SiO_2........	7,830	14·24
Phosphorus..	" Phosphoric acid, P_2O_5.	5,747	10·45
Sulphur	" Sulphurous acid, SO_2.	2,140	4·09

The corresponding values for the principal carbon compounds are—

		Heat units.	Units of water evaporated.
Marsh gas, C_2H_4...	Burnt to carbonic acid, CO_2, and water, H_2O.	14,675	26·68
Olefiant gas, C_4H_4.		11,849	21·55
Crude petroleum..		10,190	18·53
Oil of Turpentine.		10,852	19·73
Wax		10,496	19·04
Ether		9,027	16·41
Tallow		9,000	16·37
Alcohol................		7,183	13·06
Methyl alcohol (wood spirit).....		5,307	9·65
Bisulphide of carbon, CS_2...........	Burnt to CO_2 and SO_2.........	3,400	6·18
Carbonic oxide.....	Burnt to CO_2.......................	2,403	4·37

The fuels of the highest calorific value are, therefore, those containing the largest amount of disposable hydrogen. Such substances are, however, only of special application as being either gases, volatile liquids, or easily fusible solids; they require special contrivances for their combustion in order to avoid an undue production of smoke, or the formation of vapors liable to become explosive when mixed with air. The ordinary solid vegetable and mineral fuels,—wood, peat, coal, etc.,—are, therefore, of more general interest economically considered.

Wood may be considered as having the following average composition when in the air-dried state:—carbon, 39·6; hydrogen, 4·8; oxygen, 34·8; ash, 1·0; water, 20 per cent. When it is freshly felled, the water may be from 18 to 50 per cent. Air-dried or even green wood ignites readily when a considerable surface is exposed to the kindling flame, but in large masses with regular or smooth surfaces it is often difficult to get it to burn. When previously torrefied or scorched by heating to about 200°, at which part incipient charring is set up, it is exceedingly inflammable. The ends of imperfectly charred boughs from the charcoal heaps in this condition are used in Paris and other large towns in France for kindling purposes, under the name of *fumerons*. The inflammability, however, varies with the density,—the so-called hard woods, oak, beech, and maple taking fire less readily than the softer, and more especially the coniferous varieties rich in resin. The calorific power of absolutely dry woods may as an average be taken at about 4000 units, and when air-dried, *i.e.*, containing 25 per cent. of water, at 2800 to 3000 units, and their evaporative value as 3·68 and 4·44 times their own weight respectively.

Wood being essentially a flaming fuel is admirably adapted for use with heat-receiving surfaces of large extent, such as locomotive and marine boilers, and is also very cleanly in use. The absence of all cohesion in the cinders or unburnt carbonized residua causes a large amount of ignited particles to be projected from the chimney, when a rapid draught is used, unless special spark-catchers of wire gauze or some analogous contrivance are used. When burnt in open fire places the volatile products given off in the apartment on the first heating have an acrid penetrating odor, which is, however, very generally considered to be agreeable. Owing to the large amount of water present, no very high temperatures can be obtained by the direct combustion of wood, and to produce these for metallurgical purposes it is necessary to convert it previously either into charcoal, or into inflammable gas in a so-called gazogene or gas-producer. See CHARCOAL and CARBON.

Peat includes a great number of substances of very unequal fuel value, the most recently formed spongy light brown kind approximating in composition to wood, while the dense pitchy brown compact substance, obtained from the bottom of bogs of ancient formation, may be compared with lignite, or even in some instances with coal. Unlike wood, however, it contains incombustible matter in variable but large quantity, from 5 to 15 per cent., or even more. Much of this, when the amount is large, is often due to sand mechanically intermixed; when air-dried, the proportion of water is from 8 to 20 per cent. When these constituents are deducted, the average composition may be stated to be —carbon, 52 to 66; hydrogen, 4·7 to 7·4; oxygen, 28 to 39; and nitrogen, 1·5 to 3 per cent. Average air-dried peat may be taken as having a calorific value of 3000–3500 units, and when freed from water by a heat of 100 degrees, and with a minimum of ash (4 to 5 per cent.), at about 5200 units, or from a quarter to one third more than that of an equal weight of wood. The lighter and more spongy varieties of peat when air-dried are exceedingly inflammable, firing at a temperature of 200° C.; the denser pulpy kinds ignite less readily when in the natural state, and often require a still higher temperature when prepared by pulping and compression or partial carbonization. Most kinds burn with a red smoky flame, developing a very strong odor, which, however, has its admirers in the same way that wood smoke has. This arises from the destructive distillation of imperfectly carbonized organic matter. The ash, like that of wood, is light and powdery, except when much sand is present, when it is of a denser character.

Peat is principally found in high latitudes, on exposed high table-lands and treeless areas in more temperate climates, and in the valleys of slow-flowing rivers,—as in Ireland, the west of Scotland, the table-land of Bavaria, the North-German plain, and parts of the valleys of the Somme, Oise, and a few other rivers in northern France. In the last-named country it is dredged from the bottom of ponds, and in the summer time moulded into bricks, which are dried by exposure to the sun. A principal objection to its use is its extreme bulk, which for equal evaporative effect is from 8 to 18 times that of coal. On the railways in Bavaria and Oldenburg, where peat is burned, the tenders, in order to have the necessary fuel capacity, are made of equal dimensions with the largest goods waggons, and the water reservoir is placed below the axles, nearly down to the level of the rails. Various methods have been proposed, and adopted more or less successfully, for the purpose of increasing the density of raw peat by compression, either with or without pulping; the latter process gives the heaviest products, but the improvement is scarcely sufficient to compensate for the cost.

Lignite or brown coal is of intermediate character between peat and coal proper. The best kinds are undistinguishable in quality from free-burning coals, and the lowest earthy kinds are not equal to average peat. When freshly raised, the proportion of water may be from 45 to 50 per cent. and even more, which is reduced from 28 to 20 per cent. by exposure to dry air. Most varieties, however, when fully dried, break up into powder, which considerably diminishes their utility as fuel, as they cannot be consolidated by coking. Lignite dust may, however, be compacted into serviceable blocks for burning, by pressure in machines similar to those used for brick-making, either in the wet state as raised from the mines, or when kiln-dried at 200° C. This method, adopted to a very large extent in Prussian Saxony, is noticed in Ure's *Dictionary*, vol. iv. p. 530, and described in detail in *Zeitschr. für Berg-, Hütten-, u. Salinen-wesen*, xxiv. p. 234. The calorific value, as far as it can be expressed by averages, varies between 3500 and 5000 units, and the evaporative factor from 2·16 when freshly raised to 5·84 for the best kinds of lignite when perfectly dried.

The manner of estimating the heating power of coal has already been considered (vol. vi., pp. 74, 75).

The heating effect of fuels obtained in practice is always considerably less than that indicated by theory, as the latter supposes complete combustion, a result which cannot be attained in the ordinary system of burning upon a grate of bars with spaces between them for the admission of air, as a certain portion of unconsumed particles when sufficiently reduced in size to pass through the grate bars fall through with the ashes, forming cinders which represent so much of the useful fuel lost, at any rate for the time. This proportion varies very considerably with the state of the fuel and its proportion of ash. A summary of the different observations upon this point made by Hartig, Playfair, Johnson, and Brix gives the total loss in ash and cinders observed in the coal trials of various countries as follows:—

American coals	5·0 to 18·5 per cent.
English "	2·9 " 27·7 "
Prussian "	1·5 " 11·6 "
Saxon "	7·4 " 63·4 "

In one of the latest researches upon the heating power and other properties of coal for naval use, carried out by the German Admiralty, the following results were obtained with coals from different localities:—

	Slag left in grate per cent.	Ashes in ash-pit per cent.	Soot in flues per cent.	Water evaporated by 1 ℔ of coal.
Westphalian gas coals	0·33–6·42	2·83– 6·53	0·32–0·46	6·60–7·45 ℔
Do. bituminous coals	0·98–9·10	1·97– 9·63	0·24–0·88	7·30–8·66
Do. dry coals	1·93–5·70	4·37–10·63	0·24–0·48	7·03–8·51
Silesian coals	0·92–1·30	3·15– 3·50	0·24–0·30	6·73–7·10
Welsh steam coals	1·20–4·07	4·07	0·32	8·41
Newcastle coals	1·92	2·57	0·35	7·28

The evaporative power in these experiments is referred to water at the freezing point, while in the results given in article COAL, vol. vi. p. 75, it is computed from the boiling point. The latter quantities therefore require to be reduced by about one-seventh to bring them into comparison.

In many cases, however, the evaporative factor found by practical experiment in a steam boiler is from a third to nearly a half less than that indicated by theory, the differences covering waste by imperfection of combustion and losses by radiation, etc., in the furnace and flues.

Of the other natural fuels the most important is so-called vegetable refuse, such as cotton stalks, brushwood, straw, and the woody residue of sugar cane after the extraction of the saccharine juice known as megasse or cane trash. These are extensively used in countries where wood and coal are scarce, usually for providing steam in the manufactures where they arise, *e. g.*, straw for threshing, cotton stalks for ploughing, irrigating, or working presses, and cane trash for boiling down sugar or driving the cane mill. According to Mr. J. Head (*Proc. Inst. of Civil Engineers*, vol. xlviii. p. 75), the evaporative values of 1 ℔ of these different articles when burnt in a tubular boiler are—coal, 8 ℔; dry peat, 4 ℔; dry wood, 3·58–3·52 ℔; cotton stalks or megasse, 3·2–2·7 ℔; straw, 2·46–2·30 ℔. In burning straw it is found most convenient to use a pair of toothed rollers, which pass it continuously into the fire box in a thin layer. Owing to the siliceous nature of the ash, it is also desirable to have a means of clearing the grate bars from slags and clinkers at short intervals, and to use a steam jet to clear the tubes from similar deposits.

The common fuel of India and Egypt is derived from the dung of camels and oxen, moulded into thin cakes, and dried in the sun. As might be imagined it has a very low heating power, and in burning gives off acrid ammoniacal smoke and vapor.

Somewhat similar to these are the tan cakes made from spent tanners' bark, which are used to some extent in eastern France and in Germany. They are made by moulding the spent bark into circular cakes, which are then slowly dried by exposure to the air. Their effect is about equivalent to 80 and 30 per. cent. of equal weights of wood and coal respectively. The same class of fuel made from exhausted dye-wood is considered to be equal to two-thirds of its weight of coal.

Liquid fuel in the form of natural petroleum, and the heavy or so-called dead or creosote oil obtained in coal-tar distilleries, have recently been used to some extent both for heating steam boilers and welding iron. In England the former cannot be used from its high price, apart from the danger caused by the irregular volatility of its constituents; the latter, however, is perfectly manageable when blown into a heated combustion chamber as a fine spray by means of steam jets, where it is immediately volatilized and takes fire. The heating power is very great, one ton of creosote oil being equal to 2 or 2½ tons of coal in raising steam.

Natural gases, consisting principally of light hydrocarbons, have at different times been used as fuel, but the examples of their application are necessarily rare. The most conspicuous example at the present time is afforded by the Iron City and Siberia Iron Works, near Pittsburg, in Pennsylvania, where puddling and welding furnaces, as well as steam boilers, are entirely fired by the gas from a well bored for oil, 1200 feet deep, which is brought to the works through a pipe several miles in length, and arrives with a pressure of two atmospheres. Ordinary coal gas, such as is used for illuminating, can also be applied for heating purposes, but it is, in spite of its very high calorific power, too expensive for general use. A cheaper material obtained by the distillation of lignite at a high temperature has been tried to some extent in Berlin. The average composition of this is—hydrogen 42·36; carbonic oxide, 40; marsh gas, 11·37; nitrogen, 3·17; carbonic acid, 2·01; and condensable hydrocarbons, 1·09 per cent. According to Ziurek, a thousand cubic feet of such gas corresponds in heating power to 30 or 33 ℔ of coal.

Sulphur, phosphorus, and silicon, the other principal combustible elements, are only of limited application as fuels. The first is used in the liquation of sulphur-bearing rocks. The ore is piled into large heaps, which are ignited at the bottom, a certain proportion, from one-fourth to one-third of the sulphur contents, being sacrificed, in order to raise the mass to a sufficient temperature to allow the remainder to melt, and run down to the collecting basin. Phosphorus, which is of value from its low igniting point, receives its only application in the manufacture of lucifer matches,—the heat generated by friction against a roughened surface being sufficient to start the flame, which is ultimately communicated to the dry wood, by means of a somewhat less inflammable substance, such as sulphur or paraffin. The high temperature produced by burning phosphorus is due to the product of combustion (phosphoric acid) being solid, and therefore there is less heat absorbed than would be the case with a gaseous product. The same effect is observed in a still more striking manner with silicon, which in the only special case of its application to the production of heat, namely, in the Bessemer process of steel-making, gives rise to an enormous increase of temperature in the metal, sufficient indeed to keep the softest iron melted. The absolute calorific value of silicon is rather less than that of carbon, but the product of combustion (silicic acid) being fixed at all furnace temperatures, the whole of the heat developed is available for heating the molten iron, instead of a considerable part being consumed in the work of volatilization, as is the case with carbonic acid. (H. B.)

FUENTE DE CANTOS, a town of Spain in the province of Badajoz, and midway between the cities of Badajoz and Seville. It has some trade in the produce of the surrounding district, which is fertile; and there are important copper mines in the vicinity. Almost its only manufacture is a coarse sort of frieze. Francisco Zurbaran, the painter, was born there in 1598. Population upwards of 6000.

FUENTE DEL MAESTRE, a town of Spain in the province of Badajoz, about 25 miles S.S.W. of Merida. Its manufactures are insignificant, but it has some trade in corn, wine, oil, garbanzos, and other produce of the broad and fertile plain on which it is situated. Population, 5869.

FUENTERRABIA, an ancient town and frontier fortress of Spain, in the province of Guipúzcoa and bishopric of Pamplona, 11 miles E.N.E. of San Sebastian, and 2 miles from Irun. It stands on the slope of a hill on the west bank of the Bidassoa, and near the point where its estuary begins. At one time it possessed considerable strategic importance, and it has frequently been taken and retaken in wars between France and Spain. The "dolorous rout" of Charlemagne, however, which has been associated by Milton with Fontarabia, is generally understood to have taken place not here but at Roncesvalles, which is nearly 40 miles distant. Unsuccessful attempts to seize Fuenterrabia were made by the French troops in 1476, and again in 1503. In a subsequent campaign (1521) these were more successful, but it was retaken in 1524. The prince of Condé sustained a severe repulse under its walls in 1638, and it was on this occasion that the town received from Philip IV. the rank of city (muy noble, muy leal, y muy valorosa ciudad). After a severe siege it surrendered to the duke of Berwick in the English war of 1719 (18th June); and in 1794 it again fell into the hands of the French, who so dismantled it that it has never since been reckoned by the Spaniards among their fortified places. It was by the ford opposite Fuenterrabia that the duke of Wellington, on the 8th of October, 1813, by "one of the most daring exploits of military genius," successfully forced a passage into France in the face of an opposing army commanded by Soult. Severe fighting also took place here during the Carlist war in 1837. The town is now considerably dilapidated and decayed. Its inhabitants are employed chiefly in salmon and other fisheries. Population, 772. See Palafox, *Sitio y Socorro de Fuente-rabia*, Madrid, 1639.

FUERO. The Castilian use of this Latin word (forum) in the sense of a right, privilege, or charter is most probably to be traced to the Roman conventus juridici, otherwise known as jurisdictiones, or fora, which in Pliny's time were already numerous in the Iberian peninsula. In each of these provincial fora the Roman magistrate, as is well known, was accustomed to pay all possible deference to the previously established common law of the district; and it was the privilege of every free subject to demand that he should be judged in accordance with the customs and usages of his proper forum. This was especially true in the case of the inhabitants of those towns which were in possession of the jus italicum. It is not, indeed, demonstrable, but there are many presumptions, besides some fragments of direct evidence, which make it more than probable, that the old administrative arrangements both of the provinces and of the towns, but especially of the latter, remained practically undisturbed at the period of the Gothic occupation of Spain.[1] The Theodosian Codex and the Breviarium Alaricianum alike seem to imply a continuance of the municipal system which had been established by the Romans; nor does the later Lex Visigothorum, though avowedly designed in some points to supersede the Roman law, appear to have contemplated any marked interference with the former fora, which were still to a large extent left to be regulated in the administration of justice by unwritten, immemorial, local custom. Little is known of the condition of the subject populations of the Peninsula during the Arab occupation; but we are informed that the Christians were, sometimes at least, judged according to their own laws in separate tribunals presided over by Christian judges;[2] and the mere fact of the preservation of the name alcalde, an official whose functions corresponded so closely to those of the judex or defensor civitatis, is fitted to suggest that the old municipal fora, if much impaired, were not even then in all cases wholly destroyed. At all events when the word forum[3] begins to appear for the first time in documents of the 10th century in the sense of a liberty or privilege, it is generally implied that the thing so named is nothing new. The earliest extant written fuero is probably that which was granted to the province and town of Leon by Alphonso V. in 1020. It emanated from the king in a general council of the kingdom of Leon and Castile, and consisted of two separate parts; in the first 19 chapters were contained a series of statutes which were to be valid for the kingdom at large, while the rest of the document was simply a municipal charter.[4] But in neither portion does it in any sense mark a new legislative departure, unless in so far as it marks the beginning of the era of written charters for towns. The "fuero general" does not profess to supersede the consuetudines antiquorum jurium or Chindaswint's codification of these in the Lex Visigothorum; the "fuero municipal" is really for the most part but a resuscitation of usages formerly established, a recognition and definition of liberties and privileges that had long before been conceded or taken for granted. The right of the burgesses to self-government and self-taxation is acknowledged and confirmed, they, on the other hand, being held bound to a constitutional obedience and subjection to the sovereign, particularly to the payment of definite imperial taxes, and the rendering of a certain amount of military service (as the ancient municipia had been). Almost contemporaneous with this fuero of Leon was that granted to Najera (Naxera) by Saucho el Mayor of Navarre (*ob.* 1035), and confirmed, in 1076, by Alphonso VI.[5] Traces of others of perhaps even an earlier date are occasionally to be met mith. In the fuero of Cardeña, for example, granted by Ferdinand I. in 1039, reference is made to a previous forum Burgense (Burgos), which, however, has not been preserved, if, indeed, it ever had been reduced to writing at all. The phraseology of that of Sepulveda (1076) in like manner points back to an indefinitely remote antiquity.[6] Among the later fueros of the 11th century, the most important are those of Jaca (1064) and of Logroño (1095). The former of these, which was distinguished by the unusual largeness of its concessions, and by the careful minuteness of its details, rapidly extended to many places in the neighborhood, while the latter charter was given also to Miranda by Alphonso VI., and was further extended in 1181 by Sancho el Sabio of Navarre to Vitoria, thus constituting one of the earliest written fora of the "Provincias Vascongadas." In the course of the 12th and 13th centuries the number of such documents increased very rapidly; that of Toledo especially, granted to the Mozarabic population in 1101, but greatly enlarged and extended by Alphonso VII. (1118) and succeeding sovereigns, was used as a basis for many other Castilian fueros. Latterly the word fuero came to be used in Castile in a wider sense than before, as meaning a general code of laws; thus about the time of Saint Ferdinand the old Lex Visigothorum, then translated for the first time into the vernacular, was called the Fuero Juzgo, a name which was soon retranslated into the barbarous Latin of the period as Forum Judicum;[7] and among the compilations of Alphonso the Learned in like manner were an *Espejo de Fueros* and also the *Fuero de las leyes*, better known perhaps as the *Fuero Real*. The famous code known as the *Ordenamiento Real de Alcalá*, or *Fuero Viego de Castilla*, dates from a still later period. As the power of the Spanish crown was gradually concentrated and consolidated, royal pragmaticas began to take the place of constitutional laws; the local fueros of the various districts slowly yielded before the superior force of imperialism; and only those of Navarre and the Basque provinces have had sufficient vitality to enable them to survive to comparatively modern times. While actually owning the lordship of the Castilian crown since about the middle of the 14th century, these provinces, until quite recently, rigidly insisted upon compliance with their consuetudinary law, and especially with that which provided that the señor, before assuming the government, should personally appear before the assembly and swear to maintain the ancient constitutions. Each of the provinces mentioned had distinct sets of fueros, codified at different periods, and varying considerably as to details; the main features, however, were the same in all. In the province of Biscay, the most democratic of the group, the management of public affairs was vested in the junta or assembly of popular representatives, chosen by household suffrage. Its functions included the collection of taxes, the protection and defence of the territory, and the nomination of all the officers of government except the corregidor. The inhabitants of the province were exempt from all imposts except the self-imposed ones of their own locality, and from all duties on imported merchandise. They claimed the privileges of Spanish nobility on merely proving their descent from pure Biscayan blood. They were not obliged to appear before any tribunal beyond the bounds of their own lordship, or to tolerate any royal intendant or comptroller within the province, or to allow any royal monopoly as in the rest of Spain, or have any royal establishment except the post-office, or admit royal troops within the territory, or furnish recruits for the royal army. They were privileged to defend their territory with their own means and their own blood, and, moreover, to visit with summary punishment every attempt to interfere with these their constitutional rights. These rights, after having been recognized by successive Spanish sovereigns from Ferdinand the Catholic to Ferdinand VII., were, at the death of the latter in 1833, set aside by the Government of Castaños. The result was a civil war, which terminated in a renewed acknowledgment of the fueros by Isabel II. (1839). The provisional Government of 1868 also promised to respect them, and similar pledges were given by the Governments which succeeded. In consequence, however, of the Carlist rising of 1873-76, the Basque fueros were finally extinguished in 1876. The history of the *Foraes* of the Portuguese towns, and of the *Fors du Béarn*, is precisely analogous to that of the Fueros of Castile.

---

[1] The nature of the evidence may be gathered from Savigny, *Gesch. d. Röm. Rechts.* See especially i. pp. 154, 259 *seq.*

[2] Compare Lembke u. Schäfer, *Geschichte Spaniens*, i. 314; ii. 117.

[3] Or rather forus. See Ducange, *s. v.*

[4] Cap. xx. begins:—Constituimus etiam ut Legionensis civitas, quæ depopulata fuit a Sarracenis in diebus patris mei Veremundi regis, repopulatur *per hos foros subscriptos.*

[5] Mando et concedo et confirmo ut ista civitas cum sua plebe et cum omnibus suis pertinentiis sub tali lege et sub tali foro maneat per sæcula cuncta. Amen. Isti sunt fueros quæ habuerunt in Naxera in diebus Sanctii regis et Gartiani regis.

[6] Ego Aldefonsus rex et uxor mea Agnes confirmamus ad Septempublica suo foro quod habuit in tempore antiquo de avolo meo et in tempore comitum Ferrando Gonzalez et comite Garcia Ferdinandez et comite Domno Santio.

[7] This Latin is later even than that of Ferdinand, whose words are: "Statuo et mando quod Liber Judicum, quo ego misi Cordubam, translatetur in vulgarem et vocetur forum de Corduba . . . et quod per sæcula cuncta sit pro foro et nullus sit ausus istud forum aliter appellare nisi forum de Corduba, et jubeo et mando quod omnis morator et populator . . . veniet ad judicium et ad forum de Corduba."

Among the numerous works that more or less expressly deal with this subject, that of Marina (*Ensayo Historico-critico sobre la antigua Legislacion y principales Cuerpos Legales de los Reynos de Leon y Castilla*) still continues to hold a high place. Reference may also be made to Colmeiro's *Curso de Derecho Politico segun la historia de Leon y de Castilla* (Madrid, 1873); to Schäfer's *Geschichte von Spanien*, ii. 418-428, iii. 293 *seq.*; and to Hallam's *Middle Ages*, c. iv.

FUGGER, the name of a Swabian family which, by remarkable energy in industry and commerce, acquired enormous wealth, and rose to high rank in the state. The founder of the family was John Fugger, a respectable master-weaver at Graben, near Augsburg. His eldest son, John, associated trade in linen with weaving in Augsburg, of which he became a citizen by marriage in 1370. Here he rose to an honorable position, being one of the twelve councillors of the guild of weavers, and an assessor of the Fehmgericht, the much dreaded secret tribunal of Westphalia. He died in 1409, leaving a fortune of 3000 florins. His eldest son, by a second marriage, Andrew, was known as "the rich Fugger," and became the founder of a noble line, Fugger vom Reh, which died out in 1583. Jacob Fugger, the second son of John, was the first of the family who possessed a house in Augsburg, where he greatly extended the business he inherited, and was made head of the guild of weavers. After his death in 1469, his three sons, Ulrich, George, and Jacob, who were men of unusual resource and industry, added immensely to the riches he had left them. Ulrich devoted himself to trade, and his operations were so varied that even the works of Albert Dürer reached Italy by his means. Jacob worked the mines of Tyrol, and his profits were vast enough to enable him, without difficulty, to lend the archduke of Austria 150,000 florins, and to build (in Tyrol) the splendid castle of Fuggerau. The three brothers married ladies of noble families, and were themselves raised to noble rank by the emperor Maximilian, who, being always in need of money, was delighted to honor subjects whose power of aiding him was so extensive. In return for 70,000 gulden he mortgaged to them the county of Kirchberg and the lordship of Weissenhorn; and afterwards, in carrying on war with Venice, he received from them, at the request of Pope Julius II., a subsidy of 170,000 ducats. An evidence of the generous use to which they put their wealth still survives in the Fuggerei at Augsburg,—a collection of more than 100 small houses built by the brothers and let by them at low rents to poor tenants. Jacob and the two sons of Ulrich died without heirs, so that the possessions of the family descended to the sons of George. Of these the eldest, Marcus, became a priest, and died in 1511. His two brothers, Raimund and Antonius, then represented the house, and their names were soon well-known far beyond the limits of Germany, for they had commercial relations with nearly every part of the civilized world. They were vehement opponents of the Reformation, and freely spent money in support of the church. During the famous diet of Augsburg in 1530, Charles V. enjoyed the splendid hospitality of Antonius in his house in the Weinmarkt; and there is a story that the merchant astonished the emperor by lighting a fire of cinnamon with an imperial bond for money due to him. According to another anecdote, Charles remarked at a later time, when the treasury of the king of France was being shown to him, "There is a linen-weaver in Augsburg who could pay all that out of his own purse." Whether these things are true or not, the emperor was certainly impressed by the extraordinary resources of the two citizens. He not only made over to them the mortgaged properties of Kirchberg and Weissenhorn, but created them counts and invested them with princely privileges. In return for the help they gave him in his expedition against the pirates of Algiers in 1535, he conferred on them the right of issuing a gold and silver coinage of their own; and the right was repeatedly exercised. Their princely rank did not prevent them from continuing their mercantile career, and when Antonius died in 1560 he left six million gold crowns, besides a vast amount of property of various kinds in Europe, Asia, and America. He and his brother Raimund (who died in 1535) were the founders of two great lines which are still continued. The privileges conferred on the family by Charles V. were confirmed and increased by Ferdinand II.; and since that time, although no member either of the Raimund or the Antonius line has risen to the highest distinction in any department, many of them have done honorable service to the state, and have been famous for their liberality. The fortunes of the family are often cited in evidence of the prosperity of Germany before the country was nearly ruined by the Thirty Years' War. In 1593 a collection of portraits of the chief representatives of the Fugger race, engraved by D. Custos of Antwerp, was issued at Augsburg. Editions with 127 portraits appeared at Augsburg in 1618 and 1620, the former accompanied by a genealogy in Latin, the latter by one in German. An edition which was published at Ulm in 1754 includes 139 portraits.

FUH-CHOW, more usually Foo-Chow, and in German Fu-Tschau, a city of China, capital of the province of Fuhkeen, and one of the principal ports open to foreign commerce. In the local dialect it is called Hokchin. It is situated on the river Min, about 35 miles from the sea, in 26° 5′ N. lat. and 119° 20′ E. long., 140 miles N. of Amoy, and 280 S. of Hang-Chow. The city proper, lying nearly three miles from the north bank of the river, is surrounded by a wall about 30 feet high and 12 feet thick, which makes a circuit of upwards of five miles and is pierced by seven gateways surrounded by tall fantastic watch-towers. The whole district between the city and the river, the island of Nantai, and the southern banks of the Min are occupied by extensive suburbs; and the river itself bears a large floating population. Communication from bank to bank is afforded by a long stone bridge supported by forty solid stone piers in its northern section and by nine in its southern. The most remarkable establishment of Fuh-Chow is the arsenal, situated about three miles down the stream at Pagoda Island, where the sea-going vessels usually anchor. It was founded in 1867, and is conducted under the direction of French engineers according to European methods. In 1870 it employed about 1000 workmen besides fifty European superintendents. The port was opened to European commerce in 1842; and in 1853 the firm of Russell and Co. shipped the first cargoes of tea from Fuh-Chow to Europe and America. The European firms now number thirteen; and the tea trade is second in importance only to that of Shanghai. In 1867, 550,239 piculs of tea were exported; in 1869, 581,003 piculs; in 1872, 642,841 piculs; in 1875, 723,732 piculs; and in 1876, 617,579. The total trade in foreign vessels in 1876 was imports to the value of £1,531,617 and exports to the value of £3,330,489. The number of vessels that entered in the same year was 275, and of these 211 were British, 27 German, 11 Danish, and 9 American. A large trade is carried on by the native merchants in timber, paper, woollen and cotton goods, oranges, and olives; but the foreign houses mainly confine themselves to opium and tea. Commercial intercourse with Australia and New Zealand is on the increase. The principal imports, besides opium, are shirtings, T cloths, lead and tin, medicines, rice, tobacco, and beans and pease. Two steamboat lines afford regular communication with Hong-Kong twice a month. The town is the seat of several important missions, of which the first was founded in 1846. That supported by the American Board had already in 1876 issued 1,300,000 copies of Chinese books and tracts. The population of Fuh-Chow is stated by the *Boston Missionary Herald*, Feb., 1872, at about 1,000,000; but A. E. Hippeslay in *Handelsstatistik der Vertagshäfen von China*, Vienna, 1874, the *Overland China Mail*, June, 1872, and the *Church Missionary Record*, Sept., 1872, are all quoted by Behm and Wagner, *Bevölkerung der Erde*, 1875, as giving the number 600,000.

FÜHRICH, Joseph von (1800–1876), a painter and contemporary of Cornelius and Overbeck, was born at Kratzau in Bohemia in 1800. Deeply impressed as a boy by rude pictures adorning the wayside chapels of his native country, his first attempt at composition was a sketch of the Nativity for the festival of Christmas in his father's house. He lived to see the day when, becoming celebrated as a composer of scriptural episodes, his sacred subjects were transferred in numberless repetitions to the roadside churches of the Austrian state, where humble peasants thus learnt to admire modern art reviving the models of earlier ages. Führich has been fairly described as a "Nazarene," a romantic religious artist whose pencil did more than any other to restore the old spirit of Dürer and give new shape to countless incidents of the gospel and scriptural legends. Without the power of Cornelius or the grace of Overbeck, he composed with great skill, especially in outline. His mastery of distribution, form, movement, and expression was considerable. In its peculiar way his drapery was perfectly cast. Essentially creative as a landscape draughtsman, he had still no feeling for color; and when he produced monumental pictures he was not nearly so successful as when designing subjects for woodcuts. That such a man as Führich should have lived and prospered in the same city as Rahl and Makart proves that Vienna had room for every form of artistic development. But Führich's fame extended far beyond the walls of the Austrian capital; and there are few in Germany who are not acquainted with his illustrations to Tieck's *Genofeva*, the Lord's Prayer, the Triumph of Christ, the Road to Bethlehem, the Succession of Christ according to Thomas à Kempis, the Prodigal Son, and the verses of the Psalter. His Prodigal Son, especially, is remarkable for the fancy with which the spirit of evil is embodied in a figure constantly recurring, and like that of Mephistopheles exhibiting temptation in a human yet demoniacal shape. Führich became a pupil of Bengler in the Academy of Prague in 1816. His first inspiration was derived from the prints of Dürer and the Faust of Cornelius, and the first fruit of this turn of study was the Genofeva series. In 1826 he went to Rome, where he added three frescoes to those executed by Cornelius and Overbeck in the Palazzo Massimi. His subjects were taken from the life of Tasso, and are almost solitary examples of his talent in this class of composition. In 1831 he finished the Triumph of Christ now in the Raczynski Palace at Berlin. In 1834 he was made custos and in 1841 professor of composition in the Academy of Vienna. After this he completed the monumental pictures of the church of St. Nepomuk, and in 1854–61 the vast series of wall paintings which cover the inside of the Lerchenfeld church at Vienna. In 1872 he was pensioned and made a knight of the order of Franz Joseph; 1875 is the date of his illustrations to the Psalms. He died on the 13th of March, 1876.

FULDA. The monastery of Fulda occupies the place in the ecclesiastical history of mid Germany which Monte Cassino holds in Italy, St. Galle in south Germany, Corvey in north Germany, Tours in France, and Iona in Scotland. It was the centre of a missionary work, both of conversion and reformation, organized on monastic principles. The monastery of Fulda, was only one of several founded by Boniface, the so-called "apostle of Germany," but it was specially favored by its founder, who selected it for his burying place, and it was by far the most important. The first abbot was Sturmius, the son of noble Christian parents in Noricum, who along with several other youths left their homes to follow Boniface, and were trained by him for missionary work. Boniface, notwithstanding his intense hatred of the Celtic missionaries, the true apostles of Germany, was content to imitate their mode of evangelical work; and the monastery of Fulda, though under Benedictine rule, in almost all respects resembled the great missionary institutions of Tours and Iona. Sturmius was sent by his master to seek for a convenient place for the monastery, and after two unsuccessful efforts he at length found a spot on the banks of the Fulda which Boniface approved of. A grant of the site, with four miles of surrounding demesne, was obtained from Carloman. Boniface himself superintended the clearing of the forest and the erection of the building. He sent Sturmius for a year to Italy to visit monasteries, and especially to study the mode of life in the great Benedictine convent of Monte Cassino. The Benedictine rule was adopted, and Sturmius with seven companions began their work of preaching, education, and civilization. They taught the rude tribes agriculture, masonry, and the other arts of peace. Soon a school was formed, and the educational organization seems to have resembled in the closest way that of the great Celtic monasteries. The school at Fulda speedily became the most famous portion of the monastery, and was the centre of the earlier mediæval theological learning. Rabanus Maurus, the first of the schoolmen, was a teacher in the convent school, and many of the most famous princes of the times were educated in the lay-school. When Alcuin laid the basis of the university system of mediæval Europe, it was to Fulda as well as to Durham and Scotland that he looked for help in carrying out his designs. Fulda became the parent of many other missionary monasteries, the most famous of these being Hirsgau in Swabia. In 968 the abbot of Fulda was recognized as primate of the other abbeys of Germany; but wealth and power brought corruption. In the beginning of the 11th century the monastery had to be reformed, and this was done by turning out the old monks, bringing a number of new ones from Scotland, and re-establishing in all its strictness the old Benedictine rule. The later history of Fulda has merely an antiquarian and local interest. Its practical work was done when the evangelization of Germany was complete; for Fulda, like the Celtic monasteries, was fitted for missionary work and little else. Investigations have shown curious sympathies with the Reformation of the 16th century among the abbots and monks of Fulda.

See the Life of Sturmius in Pertz's *Monumenta Germ.*, ii.; Rettberg's *Kirchen-Gesch. Deutschlands*; Milman's *Latin Christianity*, bk. iii. 5; and for the reformed tendencies of Fulda an interesting article in Niedner's *Zeitsch. für Hist. Theologie*, 1846.

FULHAM, a suburb of London, in the county of Middlesex, is situated on the Thames, 5½ miles S. W. of St. Paul's, and opposite Putney, with which it is connected by a curious old wooden bridge erected in 1729. In 1642 a bridge of boats was constructed across the river at this point by the earl of Essex, in order to convey his army into Surrey. Fulham has been connected with the see of London from a period long anterior to the conquest. The village is irregularly built, and has a somewhat old-fashioned and antique appearance. It contains an orphanage, a reformatory, and other charitable institutions. In the neighborhood there are a number of gentlemen's seats, and of old mansions which have been occupied by persons of celebrity. There are extensive nurseries and market gardens in the parish, and in the village there is a large pottery. The parish church, in the Decorated English style, possesses a picturesque tower 95 feet in height. In the church and churchyard there are a number of fine monuments of distinguished persons, including those of the bishops of London. The palace has been the summer residence of the bishops of London since the time of Henry VII., with the exception of the period of the Commonwealth when it was sold to Colonel Edmund Harvey. It is a large brick structure of various dates and of small architectural merit.

The grounds, which are surrounded by a moat, are 40 acres in extent. They are remarkable for the beauty of their arrangements, and contain many rare plants and shrubs. Fulham is included in the parliamentary borough of Chelsea. The population of the parish in 1871 was 23,350.

FULLER, ANDREW (1754–1815), a distinguished preacher and theological writer of the Baptist denomination, was born on the 6th of February, 1754, at Wicken, in Cambridgeshire, where his father was a small farmer, and received the rudiments of his education at the free school of Soham, to which place his parents had removed about 1760. Early in life he began to assist in the work of the farm, and he continued to do so till he was twenty years of age. In his seventeenth year he became a member of the Baptist church at Soham, and soon afterwards began to exercise his gifts as an exhorter with so great approval that, in the spring of 1775, he was called and ordained as pastor of that congregation. In 1782 he removed to Kettering in Northamptonshire, where, besides other advantages, he enjoyed that of frequent intercourse with some of the most eminent ministers of the denomination, such as Ryland, Sutcliff, and the Halls. About that time the Calvinism prevalent among the Baptists of England had come to be mingled and overlaid with many crudities which the Genevan Reformer would have disowned as foreign to his system; and for many years Fuller's intellectual and spiritual development had been much impeded, not only by the narrowness of his outward circumstances, and by the defects of his early education, but also by the contracted religious views of those to whom he had been accustomed to look for guidance. Even before leaving Soham, however, he had written the substance of a treatise, in which he had sought to counteract that hyper-Calvinism which, "admitting nothing spiritually good to be the duty of the unregenerate, and nothing to be addressed to them in a way of exhortation excepting what related to external obedience," had so long perplexed his own mind. This work he published, under the title *The Gospel worthy of all Acceptation*, soon after his settlement in Kettering; and although it immediately involved him in a somewhat bitter controversy which lasted for nearly 20 years, it was ultimately successful, as from its ability and force it deserved to be, in considerably modifying the views prevalent among English Dissenters with regard to the matters of which it treats. In 1793 he published a treatise in which the Calvinistic and Socinian systems were examined and compared as to their moral tendency. This work, which, along with another against Deism, entitled *The Gospel its own Witness*, is regarded as the production on which his reputation as a theologian mainly rests, was attacked by Toulmin and Kentish, to whom he replied in a supplementary pamphlet in which the weak side of Socinianism was still further exposed. Fuller also published an admirable *Memoir of the Rev. Samuel Pearce*, of Birmingham, and a volume of *Expository Lectures in Genesis*, besides a considerable number of smaller pieces, chiefly sermons and pamphlets, which have been issued in a collected form since his death, and like everything he did gave evidence of great intellectual vigor and acuteness as well as of deep religious convictions. Perhaps the most important services of his life, however, were those rendered in connection with the Baptist Missionary Society, which was formed at Kettering in 1792, and of which he was secretary until his death on the 7th of May, 1815. The correspondence he maintained, the journeys he undertook, the pamphlets he wrote in defence of the society, and the discourses he preached on its behalf, imply an amount of work which few men could possibly have overtaken, and which ultimately proved too heavy even for his naturally powerful constitution. Several editions of his collected works have appeared, and a *Memoir*, principally compiled from his own papers, was published about a year after his decease by Dr. Ryland, his most intimate friend and coadjutor in the affairs of the Baptist mission. There are also biographies by his son, the Rev. A. G. Fuller, and by the Rev. J. W. Morris.

FULLER, SARAH MARGARET. See OSSOLI.

FULLER, THOMAS (1608–1661), the witty divine and historian, eldest son of a father of the same name who was rector of Aldwincle St. Peter's, Northamptonshire, was born at the rectory house of that country parish in the year 1608, and was baptized on 19th June in that year. Dr. Robert Townson and Dr. John Davenant, bishops of Salisbury, were his uncles and godfathers. The boy's training was influenced by the position of these prelates and of other friends of his father, who was B.D., and had held the position of lector primarius in Trinity College, Cambridge. The youth studied under the care of the Rev. Arthur Smith, and of his cousin Dr. Edward Davenant, the mathematician. According to Aubrey, Fuller was "a boy of pregnant wit." At an early age he was admitted of Queen's College, Cambridge, then presided over by Dr. John Davenant. He was apt and quick in study; and in Lent, 1624–5, he became B.A., and in July, 1628, M.A. Being overlooked in an election of fellows of his college, he was removed by Bishop Davenant to Sidney Sussex College, November, 1628. In 1630 he received from Corpus Christi College, in the same university, the curacy of St. Benet's, which he held for a short time, and where he had for a parishioner the celebrated carrier Hobson. Fuller's quaint and humorous oratory, as displayed in his sermons on Ruth, soon attracted attention. He also attained a certain fame in the university as a writer of verses, and as the author of a poem, 1631, on the subject of David and Bathsheba. In June of the same year his uncle gave him a prebend in Salisbury, where his father, who died in the following year, held a canonry. The rectory of Broadwindsor, Dorsetshire, then in the diocese of Bristol, was his next preferment (1634); and 11th June, 1635, he proceeded B.D. For about six years he devoted himself to his rustic flock, and meanwhile compiled *The Holy War*, being a history of the crusades (published in 1640), and *The Holy and Prophane States*, being a book of character biography (1642), both which deservedly popular works went through several editions. At this time Fuller was well known as a man of engaging manners, of good connections, and of literary tastes. Being, moreover, a cordial lover of the Church of England, and of its discipline as fixed by the canons of 1603, he was in 1640 elected proctor for Bristol in the memorable convocation of Canterbury, which assembled with the Short Parliament. On the sudden dissolution of the latter, he united himself to those who urged that convocation should likewise dissolve as usual. That opinion was overruled; and the assembly continued to sit by virtue of a royal writ, and to frame, amongst its canons, the much-ridiculed Etcetera Oath. Fuller has left a valuable account of the proceedings of this synod, for sitting in which he was fined £200, but was never pressed to pay it. Meanwhile he preached in some of the "voiced pulpits" of London, and was followed for his excellent gifts. His first published volume of sermons appeared in 1640 under the title of *Joseph's parti-colored Coat*, 4to, which contains many of his quaint utterances and odd conceits. His grosser mannerisms of style, derived from the divines of the former generation, disappeared for the most part in his subsequent discourses. About 1640 he married Eleanor, daughter of Hugh Grove of Chisenbury, co. Wilts. Their eldest child, John, baptized at Broadwindsor by his father, 6th June, 1641, was afterwards of Sidney Sussex College, edited the *Worthies of England*, 1662, and became rector of Great Wakering, Essex, where he died in 1687. At Broadwindsor, early in the year 1641, Thomas Fuller, his curate Henry Sanders, the church wardens, and others, nine persons altogether, certified that their parish, represented by 242 grown-up male persons, had taken the Protestation ordered by the Speaker of the Long Parliament. Again Fuller is met with in London, interested in the coming strife. He is said to have foreseen whither the commotions were tending; and he directed his efforts, as events developed, in advocacy of peace and in preservation of the interests of his order. For a short time he preached with success at the Inns of Court, and thence removed, at the invitation of the master of the Savoy (Dr. Balcanqual) and the brotherhood of that foundation, to be lecturer at their chapel of St. Mary Savoy. Certain of the parishioners would have elected one Thomas Gibbs, whose claims were put forward in the House of Commons by Sir Robert Harley; but the greater number earnestly desired Fuller, whose better title was upheld in the House by Sir John Northcote, M.P. for Ashburton. Some of the best discourses of the witty preacher were delivered at the Savoy to audiences which extended into the chapel-yard. In one, he set forth with searching and truthful minuteness the hindrances to peace, and urged the signing of petitions to the king at Oxford, and to the parliament, to continue their care in advancing an accommodation. In his intercourse with persons of influence who attended upon his ministry, or who resided in the neighborhood of his cure, Fuller, with all the earnestness of Lord Falkland in that direction, labored to promote the same peaceful views. With these honorable efforts an historic circumstance of some significance connects itself. With Sir Edward Wardour, clerk of the pells, Dr. Dukeson, and four or five others, Fuller was deputed to take an influential peace petition to the king, emanating from the city of Westminster and the parishes contiguous to the Savoy. To carry it with fitting circumstance, a pass was granted by the House of Lords, 2d January, 1643, for an equipage of two coaches, four or six horses, and eight or ten attendants. On the arrival of the deputation at Uxbridge, 4th January, officers of the Parliamentary army stopped the coaches and searched the gentlemen; and they found upon the latter "two scandalous books arraigning the proceedings of the House," and letters with ciphers to Lord Viscount Falkland and the Lord Spencer. A message was then sent to acquaint the House of Commons with the matter, and it was complained that the Lords had given the pass. Ultimately a joint order of both Houses remanded the party; and Fuller and his friends suffered a brief imprisonment. The Westminster Petition, notwithstanding, reached the king's hands; and it was published with the royal reply. When it was expected, three months later, that a favorable result would attend the negotiations at Oxford, Fuller preached a remarkable sermon in the old abbey of Westminster, 27th March, 1643, on the text 2 Sam. xix. 30, the occasion being the anniversary of Charles I.'s accession and the subject, his return to "our English Zion." This loyal discourse, in accord with the loyal text, brought the preacher into disfavor in the city. Domestic trouble likewise overtook him in the death of his wife. On 19th April the Lords gave him a pass to and from Salisbury to carry her remains thither, to be buried, as it seems, amongst her own kin. He returned to London, and on Wednesday, 26th July, he preached on church reformation, satirizing the religious reformers, and maintaining that only the Supreme Power could initiate reforms. The storm which this sermon aroused in the metropolis, then well-nigh abandoned by the active royalists, brought about Fuller's secret flight to Oxford, and the loss of all his preferments and property. He lived in a hired chamber at Lincoln College for 17 weeks. Thence he put forth a witty and effective reply to John Saltmarsh, who had attacked his views on ecclesiastical reform. Fuller subsequently published by royal request a fast sermon preached 10th May, 1644, at St. Mary's, Oxford, before the king and Prince Charles, called *Jacob's Vow*. In this discourse which, it is supposed, had relation to the king's proposed restoration of the church lands, the preacher referred to some religious exercise then being observed every Tuesday by Charles I., all record of which has been omitted in the pages of history. The spirit of Fuller's preaching, always characterized by calmness and moderation, gave offence to the high royalists, who charged him with lukewarmness in their cause. To silence unjust censures, he became chaplain to the regiment of the excellent Lord Hopton. For the first five years of the war, as he said, when excusing the non-appearance of his *Church-History*, "I had little list or leisure to write, fearing to be made a history, and shifting daily for my safety. All that time I could not live to study, who did only study to live." After the defeat of Hopton at Cheriton Down, Fuller retreated to Basing House. He took an active part in its defence, and was once incited by the noise of the enemy's artillery, which disturbed him at his books, to head a sally upon the trenches. His life with the troops caused him to be afterwards regarded as one of "the great cavalier parsons." In his marches with his regiment round about Oxford and in the west, he devoted much time to the collection of details, from churches, old buildings, and the conversation of ancient gossips, for his *Church-History* and *Worthies of England*. His patriotism in the national crisis was evidenced in many ways. For the soldiers and the more religious of the royalist party he compiled, 1645, a small volume of prayers and meditations,—the *Good Thoughts in Bad Times*,—which, set up and printed in the besieged city of Exeter, whither he had retired, was called by himself "the first fruits of Exeter press." It was inscribed to Lady Dalkeith, governess to the infant princess, Henrietta Anne, who was born at Exeter, 16th June, 1644. Fuller was by the king placed in the household of the princess through the influence of Lady Dalkeith. In this city, as elsewhere, he attracted to himself a circle of friends. The corporation gave him the Bodleian lectureship, 21st March, 1645-46, and he held it until 17th June following, soon after the surrender of the city to the Parliament. *The Fear of losing the Old Light*, 4to, 1646, was his farewell discourse to his Exeter friends. Under the Articles of Surrender Fuller made his composition with the Government at London, his "delinquency" being that he had been present in the king's garrisons. In a characteristic petition to compound, dated 1st June, 1646, he acquainted the committee that he was then lodging at "the Crown" in St. Paul's Church-yard (the sign of his bookseller, Williams); and the word *Crown* is written in large letters and designedly falls in the centre of the document, in which, moreover, there are traces of the disagreeable position in which he was placed. In a life of Andronicus, 1646, partly authentic and partly fictitious, he satirized the leaders of the Revolution; and more than one edition of this little book was called for. For the comfort of sufferers by the war he issued, 1647, a second devotional manual, entitled *Good Thoughts in Worse Times*, abounding, like its predecessor and its successor, in fervent aspirations, and drawing moral lessons in beautiful language out of the events of his life or the circumstances of the time. In grief over his losses which included his library and manuscripts (his "upper and nether millstone,") and over the calamities of the country, he wrote his work on the *Wounded Conscience*, 1647. It was prepared at Boughton House in his native county, where, in a penniless, feeble, and exiled position, he and his little son were entertained by Edward Lord Mountagu, his patron, and where, as he says, he was restored to his former self. For the next few years of his life, Fuller was mainly dependent upon his dealings with booksellers, of whom he asserted that none had ever lost by him. Amongst other minor productions of his pen at this time he seems to have made considerable progress in an English translation of the *Annales* of his friend Archbishop Ussher from the MS. of that great work. Amongst his benefactors it is curious to find Sir John Danvers of Chelsea, afterwards the regicide. Under the countenance of citizens whose names are perpetuated in the dedications in his books, Fuller in 1647 began to preach at St. Clement's, East Cheap, and elsewhere, in the capacity of lecturer. While at St. Clement's he was suspended; but speedily recovering his freedom, he preached wherever he was invited. His connection with the church named has recently been recognized by the erection of a fine memorial window in which, clad in a doctor's gown, he stands holding in his hand his best gift to the universal church. At Chelsea, where also he occasionally officiated, he covertly preached a sermon on the death of Charles I.,—an event which he deeply deplored. Amongst Fuller's noble patrons was the earl of Carlisle, who made him his chaplain, and presented him to the curacy of Waltham Abbey. To this kind patron he dedicated his history of that foundation; and on the title-page placed the words—

"Patria est ubicunque est bene;
Bene vixit qui bene latuit."

His possession of the living was in jeopardy on the appointment of Cromwell's "Tryers;" but he evaded the inquisitorial questions of that dreaded body by his ready wit. He had, however, the good sense to fortify himself under this ordeal with the counsel of the catholic-minded John Howe, to whom he went, saying, "Sir, you may observe that I am a pretty corpulent man, and I am to go through a passage that is very straight; I beg you would be so good as to give me a shove and help me through." Nor was Fuller disturbed at Waltham in the "dangerous year" 1655, when the Protector's edict prohibited the adherents of the late king from preaching. Moreover, Lionel, third earl of Middlesex, who lived in the parish, gave him what remained of the books of the lord treasurer his father; and through the good offices of the marchioness of Hertford, part of his own pillaged library was restored to him. Under such circumstances Fuller actively prosecuted his literary labors, producing successively, at great cost, his survey of the Holy Land, called *A Pisgah-Sight of Palestine*, 1650; and his *Church-History of Britain*, 1655, from the birth of Jesus Christ until the year 1648. These works were furthered in no slight degree by his connection with Sion College, London, where he had a chamber, as well for the convenience of the press as of his city lectureships. The *Church-History* was angrily attacked by Dr. P. Heylin, who, in the spirit of High-Churchmanship, wished, as he said, to vindicate the truth, the church, and the injured clergy. About 1652 Fuller married into the noble and loyal family of Roper. By his wife (Mary, youngest sister of Thomas, Viscount Baltinglass) he had several children. At the Oxford Act of 1657, the celebrated Robert South, who was *Terræ filius*, lampooned Fuller for his frequent puns and other peculiarities. He described him in this *Oratio* as living in London, ever scribbling, and each year bringing forth new *folia* like a tree. At length, continues South, the *Church-History* came forth with its 166 dedications to wealthy and noble friends; and with this huge volume under one arm, and his wife (said to be little of stature) on the other, he ran up and down the streets of London, seeking at the houses of his patrons invitations to dinner, to be repaid by his dull jests at table. This speech, although exaggerated, throws light upon the social qualities of Fuller, who had many kind friends amongst the nobility. His last and best patron was the Hon. George Berkeley of Cranford House, Middlesex, whose chaplain he was, and who gave him Cranford rectory, 1658. To this nobleman Fuller's reply to Heylin, called *The Appeal of Injured Innocence*, 1659, was inscribed. This remarkable and instructive book embraces, as its editor, Mr. James Nichols, has remarked, "almost every topic within the range of human disquisition, from the most sublime mysteries of the Christian religion, and the great antiquity of the Hebrew and Welsh languages, down to the *The Tale of a Tub*, and criticisms on Shakespeare's perversion of the character of Sir John Falstaff." At the end of the *Appeal* is an elegant epistle "to my loving friend Dr. Peter Heylin," conceived in the admirable Christian spirit which characterized all Fuller's dealings with controversialists. "Why should *Peter*," he asked, "fall out with *Thomas*, both being disciples to the same Lord and Master? I assure you, sir, whatever you conceive to the contrary, I am cordial to the cause of the English Church, and my hoary hairs will go down to the grave in sorrow for her sufferings." The only other important works issued by Fuller in his lifetime were connected with the Restoration. The revived Long Parliament, December, 1659, proposed an oath of fealty to the Commonwealth, and the abjuration of Charles II. and his family. The matter was much debated; and in an able letter published in February, 1660, which went into a third edition, called *An Alarum to the Counties of England and Wales*, Fuller discussed the proposal. His arguments tended to swell the cry for a free and full parliament,—free from force, as he expressed it, as well as from abjurations or previous engagements. In anticipation of the meeting of the new parliament, 25th April, and as if foreseeing the unwise attitude of those in power in relation to the reaction, Fuller put forth his *Mixt Contemplations in Better Times*, 1660, dedicated to Lady Monk. It tendered advice in the spirit of its motto, "Let your moderation be known to all men: the Lord is at hand." There is good reason to suppose that Fuller was at the Hague immediately before the Restoration, in the retinue of Lord Berkeley, one of the commissioners of the House of Lords, whose last service to his friend was to interest himself in obtaining him a bishopric. A *Panegyrick to His Majesty on his Happy Return* was the last of Fuller's verse-efforts. On 2d August, by royal letters, he was admitted D.D. at Cambridge, as a scholar of integrity and good learning, who had been hindered in the due way of proceeding to his degree. His former preferments were restored to him. At the Savoy Pepys heard him preach; but he preferred his conversation or his books to his sermons. Fuller's last promotion was that of chaplain in extraordinary to Charles II. In the summer of 1661 he visited the west in connection with the business of his prebend, and upon his return he was seized with a kind of typhus-fever called the "new disease." On Sunday, 12th August, while preaching a marriage sermon at the Savoy, he was disabled from proceeding; and at the close of the service he was carried home in a sedan to his new lodgings in Covent-Garden, where he expired, Thursday, 16th August, aged 54. On the following day 200 of his brethren attended his corpse to its resting place in the chancel of Cranford Church, where Dr. Hardy preached a funeral sermon. A mural tablet was afterwards set up on the north side of the chancel with an epitaph, which, though perhaps longer than Fuller's essay on tombs might allow him to approve, contains a conceit worthy of his own pen, to the effect that while he was endeavoring (viz., in *The Worthies*) to give immortality to others, he himself attained it. It is said that the thought of that unfinished work troubled him upon his deathbed, and that he often incoherently called out to his attendants for pen and ink, as if to complete it.

Dr. Fuller was in stature somewhat tall, "with a proportionable bigness to become it," and his gait was graceful. He was of a sanguine temperament, and had a ruddy countenance and light curled hair. Some of these features are pleasingly depicted in his portrait at Cranford House. His personal character was admirable. The charm of his manners was felt by all, his deportment being "according to the old English guise." His disposition was genial, leading him to embrace goodness wherever he found it. To these fine qualities of mind he added prudence. "By his particular temper and management," said the historian Echard, "he weathered the late great storm with more success than many other great men." He had many of the peculiarities of scholars. He was known as "a perfect walking library." The strength of his memory was proverbial, and some amusing anecdotes are connected with it.

His writings were the product of a highly original mind, and their moral tone was excellent. He had a fertile imagination and a happy faculty of illustration. His diction in the main was elegant, and more idiomatic than that of Taylor or Browne. Antithetic and axiomatic sentences abound in his pages, embodying literally the wisdom of the many in the wit of one. He was "quaint," and something more. "Wit," said Coleridge, in a well-known eulogy, "wit was the stuff and substance of Fuller's intellect. It was the element, the earthen base, the material which he worked in; and this very circumstance has defrauded him of his due praise for the practical wisdom of the thoughts, for the beauty and variety of the truths, into which he shaped the stuff. Fuller was incomparably the most sensible, the least prejudiced, great man of an age that boasted a galaxy of great men." This opinion was formed after the perusal of the *Church-History*. That work and *The Worthies of England* are unquestionably Fuller's greatest efforts. They embody the collections of an entire life; and since his day they have been the delight and the solace of their readers, and the incentive which has directed or allured many English scholars into historical and topographical studies. The *Holy State* has taken rank amongst the best books of characters. Fuller's works, according to Charles Lamb, were, in the early portion of this century, scarcely perused except by antiquaries; but since that time, mainly through the appreciative criticisms of Coleridge, Southey, Crossley, and others, they have received more general attention; and nearly the whole of his extant writings have been reprinted of late years. (J. E. B.)

FULLER'S EARTH (Germ. *Walkererde*, Fr. *Terre à foulon*, *Argile smectique*), so named from its use by fullers as an absorbent of the grease and oil of cloth, is an earthy hydrated silicate of aluminium, containing, according to one analysis, silica 53·0, alumina 10, ferric oxide 9·75, magnesia 1·25, lime ·5, sodium chloride ·1, water 24 per cent., and a trace of potash. It has a specific gravity of 1·7–2·4 and a shining streak; is unctuous to the touch; is commonly greenish-brown or greenish-gray, sometimes bluish-gray, whitish, or red-brown in color; adheres but slightly to the tongue; becomes translucent in water, and falls to powder; and before the blowpipe gives a porous slag, melting eventually to a white glass. Among the localities where fuller's earth is found are Nutfield near Reigate in Surrey, Renton in Yorkshire, Quarry Wood in Morayshire, Rosswein in Saxony, and Zwikowetz in Bohemia. Fuller's or "Walker's" earth is found between the Aymestry limestone and the underlying lower Ludlow beds, rendering the former particularly liable to slides or subsidences (see Murchison, *Siluria*). From the presence in it of beds of the mineral, a thick deposit of blue and yellow clays with bands of rubbly limestone in the Oolitic or Jurassic series of rocks in England has received the name of Fuller's Earth (see GEOLOGY). The consumption of fuller's earth has fallen off considerably, owing to the employment of other substances for the cleansing of cloth. It was in past times largely mined in the Downs, south of Bath, for use in the cloth-mills of Bradford-on-Avon, Frome, and Gloucestershire.

FULMAR, from the Gaelic *Fulmaire*, the *Fulmaris glacialis* of modern ornithologists, one of the largest of the Petrels (*Procellariidæ*) of the northern hemisphere, being about the size of the Common Gull (*Larus canus*) and not unlike it in general coloration, except that its primaries are gray instead of black. This bird, which ranges over the North Atlantic, is seldom seen on the European side below lat. 53° N., but on the American side comes habitually to lat. 45°, or even lower. It has been commonly believed to have two breeding-places in the British Islands, namely, St. Kilda and South Barra; but, according to Mr. Robert Gray (*Birds of the West of Scotland*, p. 499), it has abandoned the latter since 1844, while he is assured of its now breeding in Skye. Northward it established itself about 1838 on Myggenæs Holm, one of the Faroes, while it has several stations off the coast of Iceland and Spitzbergen, as well as at Bear Island. Its range towards the pole seems to be only bounded by open water, and it is the constant attendant upon all who are employed in the whale and seal fisheries, showing the greatest boldness in approaching boats and ships, and feeding on the offal obtained from them. By our seamen it is commonly called the "Molly Mawk"[1] (corrupted from the Dutch *Mallemuck*), and is extremely well known to them, its flight, as it skims over the waves, first with a few beats of the wings and then gliding for a long way, being very peculiar. It only visits the land to deposit its single white egg, which is laid on a rocky ledge, where a shallow nest is made in the turf and lined with a little dried grass. Many of its breeding-places are a most valuable property to those who live near them and take the eggs and young, which, from the nature of the locality, are only to be had at a hazardous risk of life. In St. Kilda it is said that from 18,000 to 20,000 young are killed in one week of August, the only time when, by the custom of the community, they are allowed to be taken. These, after the oil is extracted from them, serve the islanders with food for the winter. This oil, says Mr. Gray, having been chemically examined by Mr. E. C. C. Stanford, was found to be a fish-oil, and to possess nearly all the qualities of that obtained from the liver of the cod, with a lighter specific gravity. It, however, has an extremely strong scent, which is said by those who have visited St. Kilda to pervade every thing and person on the island, and is certainly retained by an egg or skin of the bird for many years. Whenever a live example is seized in the hand it ejects a considerable quantity of this oil from its mouth. The Fulmar is said by Mr. Darwin (*Origin of Species*, ed. 4, p. 78) to be the most numerous bird in the world; but on whose authority the statement is made does not appear, and to render it probable we should have to unite specifically with the Atlantic bird, not only its Pacific representative, *F. pacificus*, which some ornithologists deem distinct, but also that which replaces it in the Antarctic seas and is considered by most authorities to be a perfectly good species, *F. glacialioides*. The differences between them are, however, exceedingly slight, and for Mr. Darwin's purpose on this particular occasion it matters little how they are regarded. It is a more interesting question whether the statement is anyhow true, but one that can hardly be decided as yet. (A. N.)

FULTON, ROBERT (1765–1815), an American engineer and mechanician, was born in 1765 at Little Britain in Pennsylvania. At the age of seventeen he adopted the profession of a portrait and landscape painter, but he also even then devoted a considerable portion of his time to mechanical pursuits. In his twenty-second year he visited England, with the view of improving himself in art by the instructions of his countryman West. There he made the acquaintance of the duke of Bridgewater, Earl Stanhope, and Watt; and partly by their influence he was led to devote his attention more exclusively to mechanical engineering. In 1793 he had conceived the design of propelling vessels by steam, but did not at that time find a suitable opportunity for putting his views into practice. His time was also much engrossed in devising a method of superseding the locks on canals by a plane of double incline for which he obtained a patent from the British Government in 1794. In the same year he obtained patents for flax-spinning and rope-twisting machines, and various other mechanical inventions, bearing chiefly upon the construction of canals, on which latter subject he published a treatise. In 1797 he removed to Paris, and remained for seven years in the house of Joel Barlow, the American minister at the court of France, prosecuting his scientific studies. During that period he projected the first panorama ever exhibited in Paris, and made important experiments on submarine explosives. These experiments were further continued in America, but although Congress voted him 5000 dollars for prosecuting them, his plans were finally declared impracticable. It was also at Paris that he first succeeded, after repeated trials, in propelling a boat through the water by the aid of steam. In 1806 he returned to America and repeated the experiment on a larger scale and with more decided success. In 1809 he took out his first patent, but his rights were disputed, and after protracted legislation a compromise was effected. In 1814 Fulton constructed the first United States' war steamer, and he was engaged upon an improvement of his submarine torpedo when he died, February 24, 1815.

See *Life of Robert Fulton*, by C. D. Colden, 1817, and the biography by James Renwick in Sparks's *American Biography*.

FUMITORY, or *Fumaria*, Linn. (Germ. *Erdrauch*, Fr. *Fumeterre*), a genus of annual, rarely perennial, herbs of the natural order *Fumariaceæ*, with stems usually branched and straggling, often climbing by means of their petioles; leaves alternate and decompound, with narrow segments; flowers in racemes, small, tubular, and purple or whitish, with purple tips; sepals 2, and deciduous; petals 4, and connivent, the upper one saccate or spurred at the base, the two inner cohering at the apex; stamens 6, and in two bundles opposite the outer petals; style deciduous; and capsule one-seeded and indehiscent. There are several British species of the genus. The Common Fumitory, *F. officinalis* (Germ. *Taubenkropf*), called by Shakespeare the "rank fumitory" or "fumiter" (*Henry V.*, v. 2; *Lear*, iv. 4), is a plant indigenous to Europe, North Africa, and Asia, and is found as an introduced species in the United States. It has glaucous leaves and pale or dark rose-purple flowers, which bloom throughout the summer, and grows to a height of one or two feet. It is a common weed in corn fields, and like other members of the genus flourishes best in rich cultivated ground. In past times it was in esteem for its reputed cholagogue and other medicinal properties, and in England, boiled in water, milk, or whey, it was used as a cosmetic. The herbage of *F. officinalis* and *F. racemosa* is used in China under the name of *Tsze-hwa-ti-ting* as an application for glandular swellings, carbuncles, and abscesses, and was formerly valued in jaundice, and in cases of accidental swallowing of the beard of grain (see F. Porter Smith, *Contrib. towards the Mat. Medica . . . of China*, p. 99, 1871). The name fumitory, Latin *fumus terræ*, has been supposed to be derived from the fact that its juice irritates the eyes like smoke (see Fuchs, *De Historia Stirpium*, p. 338, 1542); but *The Grete Herball*, cap. clxix., 1529, fol., following the *De Simplici Medecina* of Platearius, fo. xciii. (see in *Nicolai Præpositi Dispensatorium ad Aromatarios*, 1536), says: "It is called Fumus terre, fume or smoke of the erthe bycause it is engendred of a cours fumosyte rysynge frome the erthe in grete quantyte lyke smoke: this grosse or cours fumosyte of the erthe wyndeth and wryeth out: and by workynge of the ayre and sonne it turneth into this herbe."

For figures of various species of fumitory, see J. T. Boswell Syme, *English Botany*, vol. i., 1863.

FUNCHAL. See MADEIRA.

FUNCTION. Functionality, in Analysis, is dependence on a variable or variables; in the case of a single variable u, it is the same thing to say that v depends upon u, or to say that v is a function of u, only in the latter form of expression the mode of dependence is embodied in the term "function." We have given or known functions such as u^2 or $\sin u$, and the general notation of the form ϕu, where the letter ϕ is used as a functional symbol to denote a function of u, known or unknown as the case may be: in each case u is the independent variable or argument of the function, but it is to be observed that if v be a function of u, then v like u is a variable, the values of v regarded as known serve to determine those of u; that is, we may conversely regard u as a function of v. In the case of two or more independent variables, say when w depends on or is a function of u, v, etc., or $w=\phi(u, v, \ldots)$, then $u, v, \ldots$ are the independent variables or arguments of the function; frequently when one of these variables, say u, is principally or alone attended to, it is regarded as the independent variable or argument of the function, and the other variables v, etc., are regarded as parameters, the values of which serve to complete the definition of the function. We may have a set of quantities $w, t, \ldots$ each of them a function of the same variables $u, v, \ldots$; and this relation may be expressed by means of a single functional symbol ϕ, $(w, t, \ldots) = \phi(u, v \ldots)$; but, as to this, more hereafter.

---

[1] A name misapplied in the southern hemisphere to *Diomedea melanophrys*, one of the Albatrosses.

The notion of a function is applicable in geometry and mechanics as well as in analysis; for instance, a point Q, the position of which depends upon that of a variable point P, may be regarded as a function of the point P; but here, substituting for the points themselves the co-ordinates (of any kind whatever) which determine their positions, we may say that the co-ordinates of Q are each of them a function of the co-ordinates of P, and we thus return to the analytical notion of a function. And in what follows a function is regarded exclusively in this point of view, viz., the variables are regarded as numbers; and we attend to the case of a function of one variable $v = fu$. But it has been remarked (see Equation) that it is not allowable to confine the attention to *real* numbers; a number u must in general be taken to be a complex number $u = x + iy$, x and y being real numbers, each susceptible of continuous variation between the limits $-\infty$, $+\infty$, and i denoting $\sqrt{-1}$. In regard to any particular function, fu, although it may for some purposes be sufficient to know the value of the function for any real value whatever of u, yet to attend only to the real values of u is an essentially incomplete view of the question; to properly know the function it is necessary to consider u under the aforesaid imaginary or complex form $u = x + iy$.

To a given value $x + iy$ of u there corresponds in general for v a value or values of the like form $v = x' + iy'$, and we obtain a geometrical notion of the meaning of the functional relation $v = fu$ by regarding x, y as rectangular co-ordinates of a point P in a plane Π, and x', y' as rectangular co-ordinates of a point P′ in a plane (for greater convenience a different plane) Π'; P, P′ are thus the geometrical representations, or representative points, of the variables $u = x + iy$ and $u' = x' + iy'$ respectively; and, according to a locution above referred to, the point P′ might be regarded as a function of the point P; a given value of $u = x + iy$ is thus represented by a point P in the plane Π, and corresponding hereto we have a point or points P′ in the plane Π', representing (if more than one, each of them) a value of the variable $v = x' + iy'$. And, if we attend only to the values of u as corresponding to a series of positions of the representative point P, we have the notion of the "path" of a complex variable $u = x + iy$.

Known Functions.

1. The most simple kind of function is the rational and integral function. We have the series of powers u^2, u^3, . . each calculable not only for a real but also for a complex value of u, $(x + iy)^2 = x^2 + i^2y^2 + 2ixy$, $(x + iy)^3 = x^3 + i(3x^2 + 3ixy^2 + i^2y^3)$, etc., and thence, if $a, b, \ldots$ be real or complex numbers, the general form $a + bu + cu^2 \ldots + ku^m$, of a rational and integral function of the order m. And taking two such functions, say of the orders m and n respectively, the quotient of one of these by the other represents the general form of a rational function of u.

The function which next presents itself is the algebraical function, and in particular the algebraical function expressible by radicals. To take the most simple case, suppose (m being a positive integer) that $v^m = u$; v is here the irrational function $= u^{\frac{1}{m}}$. Obviously, if u is real and positive, there is always a real and positive value of v, calculable to any extent of approximation from the equation $v^m = u$, which serves as the definition of $u^{\frac{1}{m}}$; but it is known (see Equation) that as well in this case as in the general case where u is a complex number there are in fact m values of the function $u^{\frac{1}{m}}$; and that for their determination we require the theory of the so-called circular functions sine and cosine; and these depend on the exponential function exp u, or, as it is commonly written, e^u, which has for its inverse the logarithmic function log u; these are all of them transcendental functions.

2. In a rational and integral function $a + bu + cu^2 \ldots + ku^m$, the number of terms is finite, and the coefficients $a, b, \ldots k$ may have any values whatever, but if we imagine a like series $a + bu + cu^2 + \ldots$ extending to infinity, *non constat* that such an expression has any calculable value—that is, any meaning at all; the coefficients $a, b, c \ldots$ must be such as, either for every value whatever of u (that is, for every finite value) or for values included within certain limits, to make the series *convergent*. It is easy to see that the values of $a, b, c \ldots$ may be such as to make the series always convergent; for instance, this is the case for the exponental function,

$$\exp u = 1 + \frac{u}{1} + \frac{u^2}{1.2} + \frac{u^3}{1.2.3} +, \text{ etc.};$$

taking for the moment u to be real and positive, then it is evident that however large u may be, the successive terms will become ultimately smaller and smaller, and the series will have a determinate calculable value. A function thus expressed by means of a convergent infinite series is not in general algebraical, and when it is not so, it is said to be transcendental (but observe that it is in nowise true that we have thus the most general form of a transcendental function); in particular, the exponential function above written down is not an algebraical function.

By forming the expression of exp v, and multiplying together the two series, we derive the fundamental property

$$\exp u \exp v = \exp (u + v);$$

whence also

$$\exp x \exp iy = \exp (x + iy),$$

so that exp $(x + iy)$ is given as the product of the two series exp x and exp iy. As regards this last, if in place of u we actually write the value iy, we find

$$\exp iy = \left(1 - \frac{y^2}{1.2} + \frac{y^4}{1.2.3.4} - \ldots\right) + i\left(y - \frac{y^3}{1.2.3} + \ldots\right),$$

where obviously each series is convergent and actually calculable for any real value whatever of y, calling the two series cosine y and sine y respectively, or in the ordinary abbreviated notation cos y and sin y, the equation is

$$\exp iy = \cos y + i \sin y;$$

and if we herein for y write z, and multiply the two expressions together, observing that the product will be $= \exp i\,(y + z)$, we obtain the fundamental equations

$$\cos (y + z) = \cos y \cos z - \sin y \sin z;$$
$$\sin (y + z) = \sin y \cos z + \sin z \cos y,$$

for the functions sine and cosine.

Taking y as an angle, and defining as usual the sine and cosine as the ratios of the perpendicular and base respectively to the radius, the sine and cosine will be functions of y; and we obtain geometrically the foregoing fundamental equations for the sine and cosine; but in order to the truth of the foregoing equation $\exp iy = \cos y + i \sin y$, it is further necessary that the angle should be measured in circular measure, that is by the ratio of the arc to the radius; so that π denoting as usual the number 3·14159 . . , the measure of a right angle is $= \frac{1}{2}\pi$. And this being so, the functions sine and cosine, obtained as above by consideration of the exponential function, have their ordinary geometrical significations.

3. The foregoing investigation was given in detail in order to the completion of the theory of the irrational function $u^{\frac{1}{m}}$. We henceforth take the theory of the circular functions as known, and speak of tan x, etc., as the occasion may arise.

We have

$$x + iy = r(\cos \theta + i \sin \theta),$$

where, writing $\sqrt{x^2 + y^2}$ to denote the positive value of the square root, we have

$$r = \sqrt{x^2 + y^2}, \quad \cos \theta = \frac{x}{\sqrt{x^2 + y^2}}, \quad \sin \theta = \frac{y}{\sqrt{x^2 + y^2}},$$

and therefore also

$$\tan \theta = \frac{y}{x}.$$

Treating x, y as the rectangular co-ordinates of a point P, r is the distance (regarded as positive) of this point from the origin, and θ is the inclination of r to the positive part of the axis of x; to fix the ideas θ may be regarded as lying within the limits $0, \pi$, or $0, -\pi$, according as y is positive or negative; θ is thus completely determinate, except in the case, x negative $= 0$, for which θ is $= \pi$ or $-\pi$ indifferently.

And if $u = x + iy$, we hence have

$$u^{\frac{1}{m}} = (x + iy)^{\frac{1}{m}} = r^{\frac{1}{m}}\left(\cos \frac{\theta + 2s\pi}{m} + i \sin \frac{\theta + 2s\pi}{m}\right),$$

where $r^{\frac{1}{m}}$ is real and positive and s has any positive or negative integer value whatever, but we thus obtain for $u^{\frac{1}{m}}$ only the m values corresponding to the values $0, 1, 2 \ldots m - 1$ of s. More generally we may, instead of the index $\frac{1}{m}$, take the index to be any rational fraction $\frac{n}{m}$. Supposing this to be in its least terms, and m to be positive, the number of distinct values is always $= m$. If instead of $\frac{n}{m}$ we take the index to be the general real or complex quantity m, we have u^m, no longer an algebraical function of u, and having in general an infinity of values.

4. The foregoing equation $\exp(x+y) = \exp x . \exp y$ is in fact the equation of indices, $a^{x+y} = a^x . a^y$; $\exp x$ is thus the same thing as e^x, where e denotes a properly determined number, and putting e^x equal to the series, and then writing $x = 1$, we have $e = 1 + \frac{1}{1} + \frac{1}{1.2} + \frac{1}{1.2.3} + \text{etc.}$, that is, $e = 2{\cdot}7128 \ldots$ But as well theoretically as for convenience of printing, there is considerable advantage in the use of the notation $\exp u$.

From the equation, $\exp iy = \cos y + i \sin y$, we deduce $\exp(-iy) = \cos y - i \sin y$, and thence

$$\cos y = \frac{1}{2}\left\{\exp(iy) + \exp(-iy)\right\},$$

$$\sin y = \frac{1}{2i}\left\{\exp(iy) - \exp(-iy)\right\};$$

if we write herein ix instead of y we have

$$\cos ix = \frac{1}{2}\left\{\exp x + \exp(-x)\right\},$$

$$\sin ix = \frac{i}{2}\left\{\exp x - \exp(-x)\right\},$$

viz., these values are

$$\cos ix = 1 + \frac{x^2}{1.2} + \frac{x^4}{1.2.3.4} + \,.\,.$$

$$\frac{1}{i}\sin ix = x + \frac{x^3}{1.2.3} + \,.\,.$$

each of them real when x is real; the functions in question $1 + \frac{x^3}{1.2} + \frac{x^4}{1.2.3.4} + \,.\,.$ and $x + \frac{x^3}{1.2.3} + \ldots$, regarded as functions of x, are termed the hyperbolic cosine and sine, and are represented by the notations $\cosh x$ and $\sinh x$ respectively; and similarly we have the hyperbolic tangent $\tanh x$, etc.: although it is easy to remember that $\cos ix \frac{1}{i} \sin ix$, are in fact real functions of x, and to understand accordingly the formulæ wherein they occur, yet the use of these notations of the hyperbolic functions is often convenient.

5. Writing $u = \exp v$ then v is conversely a function of u which is called the logarithm (hyperbolic logarithm, to distinguish it from the tabular or Briggian logarithm), and we write $v = \log u$, or what is the same thing, we have $u = \exp(\log u)$ (and it is clear that if u be real and positive there is always a real and positive value of $\log u$, in particular the real logarithm of e is $= 1$); it is however to be observed that the logarithm is not a one-valued function, but has an infinity of values corresponding to the different integer values of a constant s; in fact, if $\log u$ be any one of its values, then $\log u + 2s\pi i$ is also a value, for we have $\exp(\log u + 2s\pi i) = \exp \log u \exp 2s\pi i$, or since $\exp 2s\pi i$ is $= 1$, this is $= u$; that is, $\log u + 2s\pi i$ is a value of the logarithm of u.

We have

$$uv = \exp(\log uv) = \exp \log u \,.\, \exp \log v,$$

and hence the equation which is commonly written

$$\log uv = \log u + \log v,$$

but which requires the addition on one side of a term $2s\pi i$. And reverting to the equation $x + iy = r(\cos\theta + i \sin\theta)$, or as it is convenient to write it, $x + iy = r \exp i\theta$, we hence have

$$\log(x + iy) = \log r + i(\theta + 2s\pi),$$

where $\log r$ may be taken to denote the real logarithm of the real positive quantity r, and θ the completely determinate angle defined as already mentioned.

Reverting to the function u^m, we have $u = \exp \log u$, and thence $u^m = \exp(m \log u)$, which, on account of the infinity of values of $\log u$, has in general (as before remarked) an infinity of values; if $u = e$, then $e^m, = \exp(m \log e)$, has in general in like manner an infinity of values, but in regarding e^m as identical with the one-valued function $\exp m$, we take $\log e$ to be $=$ its real value, 1.

The inverse functions $\cos^{-1} x$, $\sin^{-1} x$, $\tan^{-1} x$, are in fact logarithmic functions; thus in the equation $\exp ix = \cos x + i \sin x$ writing first $\cos x = u$, the equation becomes $\exp i \cos^{-1} u = u + i\sqrt{1-u^2}$, or we have $\cos^{-1} u = \frac{1}{i} \log(u + i\sqrt{1-u^2})$, and from the same equation, writing secondly $\sin x = u$, we have $\sin^{-1} u = \frac{1}{i} \log(\sqrt{1-u^2} + iu)$. But the formula for $\tan^{-1} u$ is a more elegant one, as not involving the radical $\sqrt{1-u^2}$; we have

$$i \tan x = \frac{\exp ix - \exp(-ix)}{\exp ix + \exp(-ix)}, = \frac{\exp 2ix - 1}{\exp 2ix + 1},$$

and thence

$$\exp 2ix = \frac{1 + i \tan x}{1 - i \tan x},$$

that is,

$$x = \frac{1}{2i} \log \frac{1 + i \tan x}{1 - i \tan x},$$

or if $\tan x = u$, then

$$\tan^{-1} u = \frac{1}{2i} \log \frac{1 + iu}{1 - iu}.$$

The logarithm (or inverse exponential function) and the inverse circular functions present themselves as the integrals of algebraic functions

$$\int \frac{dx}{x} = \log x,$$

whence also

$$\int \frac{dx}{1 + x^2} = \frac{1}{2i} \log \frac{1 + ix}{1 - ix} = \tan^{-1} x,$$

and

$$\int \frac{dx}{\sqrt{1 - x^2}} = \sin^{-1} x.$$

6. Each of the functions $\exp u$, $\sin u$, $\cos u$, $\tan u$, etc., as a one-valued function of u, is in this respect analogous to a rational function of u; and there are further analogies of $\exp u$, $\sin u$, $\cos u$, to a rational and integral function; and of $\tan u$, $\sec u$, etc., to a rational non-integral function.

A rational and integral function has a certain number of roots, or zeros, each of a given multiplicity, and is completely determined (except as to a constant factor) when the several roots and the multiplicity of each of them is given; *i.e.*, if $a, b, c \ldots$ be the roots, $p, q, r \ldots$ their multiplicities, then the form is $A\left(1 - \frac{u}{a}\right)^p \left(1 - \frac{u}{b}\right)^q \ldots$; a rational (non-integral) function has a certain number of infinities, or poles, each of them of a given multiplicity, viz., the infinities are the roots or zeros of the rational and integral function which is its denominator.

The function $\exp u$ has no finite roots, but an infinity of roots each $= -\infty$; this appears from the equation $\exp u = \left(1 + \frac{u}{n}\right)^n$, where n is indefinitely large and positive. The function $\sin u$ has the roots $s\pi$ where s is any positive or negative integer zero included; or what is the same thing, its roots are 0 and $\pm s\pi$, s now denoting any positive integer from 1 to ∞; each of these is a simple root, and we in fact have $\sin u = u\,\Pi\left(1 - \frac{u^2}{s^2\pi^2}\right)$. Similarly the roots of $\cos u$ are $(s + \frac{1}{2})\pi$, s denoting any positive or negative integer, zero included, or what is the same thing, they are $\pm(s + \frac{1}{2})\pi$, s now denoting any positive integer from 0 to ∞; each root is simple, and we have $\cos u = \Pi\left(1 - \frac{u^2}{(s + \frac{1}{2})^2\pi^2}\right)$. Obviously $\tan u$, as the quotient $\sin u \div \cos u$, has both roots and infinities, its roots being the roots of $\sin u$, its infinities the roots of $\cos u$; $\sec u$ as the reciprocal of $\cos u$ has infinities only, these being the roots of $\cos u$, etc.

In the foregoing expression $\sin u = u\,\Pi\left(1 - \frac{u^2}{s^2\pi^2}\right)$ the product must be understood to mean the limit of $\Pi_1^n\left(1 - \frac{u^2}{s^2\pi^2}\right)$ for an indefinitely large positive integer value of n, viz., the product is first to be formed for the values $s = 1, 2, 3 \ldots$ up to a determinate number n, and then n is to be taken indefinitely large. If, separating the positive and the negative values of s, we consider the product $u\,\Pi_1^n\left(1 + \frac{u}{s\pi}\right)\Pi_1^m\left(1 - \frac{u}{s\pi}\right)$, (where in the first product s has all the positive integer values from 1 to m, and in the second product s has all the positive integer values from 1 to n), then by making m and n each of them indefinitely large, the function does *not* approximate to $\sin u$, unless $m : n$ be a ratio of equality.[1] And similarly as regards $\cos u$, the product $\Pi_0^n\left(1 + \frac{u}{(s + \frac{1}{2})\pi}\right)\Pi\left(\frac{u}{(s + \frac{1}{2})\pi}\right)$, m and n indefinitely large, does not approximate to $\cos u$, unless $m : n$ be a ratio of equality.

7. The functions $\sin u$, $\cos u$, are *periodic*, having the period 2π, $\begin{smallmatrix}\sin\\ \cos\end{smallmatrix}(u + 2\pi) = \begin{smallmatrix}\sin\\ \cos\end{smallmatrix}(u)$; and the half-period π, $\begin{smallmatrix}\sin\\ \cos\end{smallmatrix}(u + \pi) = -\begin{smallmatrix}\sin\\ \cos\end{smallmatrix}u$; the periodicity may be verified by means of the foregoing fractional forms, but some attention is required; thus

---

[1] The value of the function in question $u\,\Pi_1^n\left(1 + \frac{u}{s\pi}\right)\Pi_1^m\left(1 + \frac{u}{s\pi}\right)$, when m, n are each indefinitely large, but $\frac{m}{n}$ not $= 1$, is $= \left(\frac{n}{m}\right)^{\frac{u}{\pi}} \sin u$.

writing, as we may do, $\sin u = \dfrac{\Pi(u+s\pi)}{\Pi s\pi}$, where s extends from $-n$ to n, n ultimately infinite, if for u we write $u+\pi$, each factor of the numerator is changed into the following one, and the numerator is unaltered, save only that there is an introduced factor $u+(n+1)\pi$ at the superior limit, and an omitted factor $u-n\pi$ at the inferior limit; the ratio of these $(u+\overline{n+1}\pi) \div (u-n\pi)$, for n infinite is $=-1$, and we thus have, as we should have, $\sin(u+\pi) = -\sin u$.

The most general periodic function having no infinities, and each root a simple root, and having a given period a, has the form $A\sin\dfrac{2\pi u}{a} + B\cos\dfrac{2\pi u}{a}$, or, what is the same thing, $L\,{}^{\sin}_{\cos}\left(\dfrac{2\pi u}{a}+\lambda\right)$.

8. We come now to the Elliptic Functions; these arose from the consideration of the integral $\displaystyle\int\frac{R\,dx}{\sqrt{X}}$, where R is a rational function of x, and X is the general rational and integral quartic function $\alpha x^4+\beta x^3+\gamma x^2+\delta x+\epsilon$; a form arrived at was

$$\int\frac{dx}{\sqrt{1-x^2.1-k^2x^2}}, = \int\frac{d\phi}{\sqrt{1-k^2\sin^2\phi}},$$

on putting therein $x=\sin\phi$, and this last integral was represented by $F\phi$, and called the elliptic integral of the first kind. In the particular case $k=0$, the integral is $\displaystyle\int\frac{dx}{\sqrt{1-x^2}} = \sin^{-1}x$, and it thus appears that $F\phi$ is of the nature of an inverse function; for passing to the direct functions we write $F\phi=u$, and consider ϕ as hereby determined as a function of u, ϕ = amplitude of u, or for shortness am u. And the functions $\sin\phi$, $\cos\phi$, and $\sqrt{1-k^2\sin^2\phi}$ were then considered as functions of the amplitude, and written sin am u, cos am u, Δ am u; these were afterwards written sn u, cn u, dn u, which may be regarded either as mere abbreviations of the former functional symbols, or (in a different point of view) as functions, no longer of am u, but of u itself as the argument of the functions; sn is thus a function in some respects analogous to a sine, and cn and dn functions analogous to a cosine; they have the corresponding property that the three functions of $u+v$ are expressible in terms of the functions of u and of v. The following formulæ may be mentioned:

$$\mathrm{cn}^2 u = 1-\mathrm{sn}^2 u,\ \mathrm{dn}^2 u = 1-k^2\,\mathrm{sn}^2 u.$$
$$\mathrm{sn}' u = \mathrm{cn}\,u\,\mathrm{dn}\,u,\ \mathrm{cn}' u = -\mathrm{sn}\,u\,\mathrm{dn}\,u,\ \mathrm{dn}' u = -k^2\,\mathrm{sn}\,u\,\mathrm{cn}\,u$$

(where the accent denotes differentiation in regard to u); and the addition-formulæ:

$$\begin{aligned}\mathrm{sn}(u+v) &= \mathrm{sn}\,u\,\mathrm{cn}\,u\,\mathrm{dn}\,v+\mathrm{sn}\,v\,\mathrm{cn}\,u\,\mathrm{dn}\,u, && (\div)\\ \mathrm{cn}(u+v) &= \mathrm{cn}\,u\,\mathrm{cn}\,v-\mathrm{sn}\,u\,\mathrm{dn}\,u\,\mathrm{sn}\,v\,\mathrm{dn}\,v, && (\div)\\ \mathrm{dn}(u+v) &= \mathrm{dn}\,u\,\mathrm{dn}\,v-k^2\,\mathrm{sn}\,u\,\mathrm{cn}\,u\,\mathrm{sn}\,v\,\mathrm{cn}\,v, && (\div)\end{aligned}$$

each of the expressions on the right-hand side being the numerator of a fraction of which

$$\text{Denom.} = 1-k^2\,\mathrm{sn}^2 u\,\mathrm{sn}^2 v.$$

It may be remarked that any one of the fractional expressions, differentiated in regard to u and to v respectively, gives the same result; such expression is therefore a function of $u+v$, and the addition-formulæ can be thus directly verified.

9. The existence of a denominator in the addition-formulæ suggests that sn, cn, dn are not, like the sine and cosine, functions having zeros only, without infinities; they are in fact functions, having each its own zeros, but having a common set of infinities; moreover, the zeros and the infinities are simple zeros and infinities respectively. And this further suggests, what in fact is the case, that the three functions are quotients having each its own numerator but a common denominator, say they are the quotients of four θ-functions, each of them having zeros only (and these simple zeros) but no infinities.

The functions sn, cn, dn, but not the θ-functions, are moreover *doubly periodic*; that is, there exist values 2ω, $2v$ ($=4K$ and $4(K+iK')$ in the ordinary notation), such that the sn, cn, or dn of $u+2\omega$, and the sn, cn, and dn of $u+2v$ are equal to the sn, cn, and dn respectively of u; or say that $\phi(u+2\omega) = \phi(u+2v) = \phi u$, where ϕ is any one of the three functions.

As regards this double periodicity, it is to be observed that the equations $\phi(u+2\omega)=\phi u$, $\phi(u+2v)=\phi u$, imply $\phi(u+2m\omega+2nv)=\phi u$, and hence it easily follows that if ω, v were commensurable, say if they were multiples of some quantity α, we should have $\phi(u+2\alpha)=\phi u$, an equation which would replace the original two equations $\phi(u+2\omega)=\phi u$, $\phi(u+2v)=\phi u$, or there would in this case be only the single period α; ω and v must therefore be incommensurable. And this being so, they cannot have a real ratio, for if they had, the integer values m, n could be taken such as to make $2m\omega+2nv=k$ times a given real or imaginary value, k *as small as we please*; the ratio $\omega : v$ must be therefore imaginary (as is in fact the case when the values are $4K$ and $4(K+iK')$).

10. The function sn u has the zero 0 and the zeros $m\omega+nv$, m and n any positive or negative integers whatever, and this suggests that the numerator of sn u is equal to a doubly infinite product (Cayley, "On the Inverse Elliptic Functions," *Camb. Math. Jour.*, t. iv., 1845; and "Mémoire sur les fonctions doublement périodiques," *Liouville*, t. x., 1845). The numerator is equal to

$$u\Pi\Pi\left(1+\frac{u}{m\omega+nv}\right),$$

m and n having any positive or negative integer values whatever, including zero, except that m, n must not be simultaneously $=0$, these values being taken account of in the factor u outside the product. But until further defined, such a product has no definite value, nor consequently any meaning whatever. Imagine m, n to be co-ordinates, and suppose that we have surrounding the origin a closed curve having the origin for its centre (*i. e.*, the curve is such that if α, β be the co-ordinates of a point thereof, then $-\alpha$, $-\beta$ are also the co-ordinates of a point thereof); suppose further that the form of the curve is given, but that its magnitude depends upon a parameter h, and that the curve is such that, when h is indefinitely large, each point of the curve is at an indefinitely large distance from the origin; for instance, the curve might be a circle or ellipse, or a parallelogram, the origin being in each case the centre. Then if in the double product, taking the value of h as given, we first give to m, n all the positive or negative integer values (the simultaneous values 0, 0 excluded) which correspond to points within the curve, and then make h indefinitely large, the product will thus have a definite value; *but this value will still be dependent on the form of the curve.* Moreover, varying in any manner the form of the curve, the ratio of the two values of the double product will be = exp βu^2, where β is a determinate value depending only on the forms of the two curves; or what is the same thing, if we first give to the curve a certain form, say we take it to be a circle, and then give it any other form, the product in the latter case is equal to its former value into exp βu^2, where β depends only upon the form of the curve in the latter case.

Considering the form of the bounding curve as given, and writing the double product in the form

$$\Pi\Pi\left(\frac{u+m\omega+nv}{m\omega+nv}\right),$$

the simultaneous values $m=0$, $n=0$ being now admitted in the numerator, although still excluded from the denominator, then if we write for instance $u+2\omega$ instead of u, each factor in the numerator is changed into a contiguous factor, and the numerator remains unaltered, except that we introduce certain factors which lie outside the bounding curve, and omit certain factors which lie inside the bounding curve; we in fact affect the result by a singly infinite series of factors belonging to points adjacent to the bounding curve; and it appears on investigation that we thus introduce a constant factor exp $\gamma(u+\omega)$. The final result thus is that the product

$$u\Pi\Pi\left(1+\frac{u}{m\omega+nv}\right)$$

does not remain unaltered when u is changed into $u+2\omega$, but that it becomes therefore affected with a constant factor, exp $\gamma(u+\omega)$. And similarly the function does not remain unaltered when u is changed into $u+2v$, but it becomes affected with a factor, exp $\delta(u+v)$. The bounding curve may however be taken such that the function is unaltered when u is changed into $u+2\omega$, this will be the case if the curve is a rectangle such that the length in the direction of the axis of m is infinitely great in comparison of that in the direction of the axis of n; or it may be taken such that the function is unaltered when u is changed into $u+2v$, this will be so if the curve be a rectangle such that the length in the direction of the axis of n is indefinitely great in comparison with that in the direction of the axis of m; but the two conditions cannot be satisfied simultaneously.

11. We have three other like functions, viz., writing for shortness $\overline{m}$, $\overline{n}$ to denote $m+\frac{1}{2}$, $n+\frac{1}{2}$ respectively, and (m, n) to denote $m\omega+nv$, then the four functions are

$$u\Pi\Pi\left(1+\frac{u}{(m,n)}\right), \Pi\Pi\left(1+\frac{u}{(\overline{m},n)}\right), \Pi\Pi\left(1+\frac{u}{(m,\overline{n})}\right), \Pi\Pi\left(1+\frac{u}{(\overline{m},\overline{n})}\right),$$

the bounding curve being in each case the same; and, dividing the first three of these each by the last, we have (except as to constant factors) the three functions sn u, cn u, dn u; writing in each of the four functions $u+2\omega$ or $u+2v$ in place of u, the functions acquire each of them the *same* exponential factor exp $\gamma(u+\omega)$, or exp $\delta(u+v)$, and the quotient of any two of them, and therefore each of the functions sn u, cn u, dn u, remains unaltered.

It is easily seen that, disregarding constant factors, the four θ-functions are in fact one and the same function, with different arguments, or they may be written θu, $\theta(u+\frac{1}{2}\omega)$, $\theta(u+\frac{1}{2}v)$,

$\theta\,(u + \frac{1}{2}\omega + \frac{1}{2}v)$; by what precedes the functions may be so determined that they shall remain unaltered when u is changed into $u + 2\omega$ (that is, be singly periodic), but that the change u into $u + 2v$ shall affect them each with the same exponential factor $\exp\delta\,(u + v)$.

12. Taking the last-mentioned property as a definition of the function θ, it appears that θu may be expressed as a sum of exponentials

$$\theta u = \mathrm{A}\Sigma \exp \frac{\pi i}{\omega}(vm^2 + um),$$

where the summation extends to all positive and negative integer values of m, including zero. In fact, if we first write herein $u + 2\omega$ instead of u, then in each term the index of the exponential is altered by $\frac{\pi i}{\omega} 2\omega m, = 2m\pi i$, and the term itself thus remains unaltered; that is, $\theta\,(u + 2\omega) = \theta u$. But writing $u + 2v$ in place of u, each term is changed into the succeeding term, into the factor $\exp \frac{\pi i}{\omega}(u + v)$; in fact, making the change in question u into $u + 2v$, and writing also $m - 1$ in place of m, $vm^2 + um$ becomes $v\,(m-1)^2 + (u + 2v)\,(m - 1), = vm^2 + um - u - v$, and we thus have $\theta(u + 2v) = \exp \left\} -\frac{\pi i}{\omega}(u + v) \right\} . \theta u$. In order to the convergency of the series it is necessary that $\exp \frac{\pi i v m^2}{\omega}$ should vanish for indefinitely large values of m, and this will be so if $\frac{iv}{\omega}$ be a complex quantity of the form $\alpha + \beta i$, α *negative*; for instance, this will be the case if ω be real and positive and v be $= i$ into a real and positive quantity. The original definition of θ as a double product seems to put more clearly in evidence the real nature of this function, but the new definition has the advantage that it admits of extension to the θ-functions of two or more variables.

The elliptic functions sn u, cn u, dn u, have thus been expressed each of them as the quotient of two θ-functions, but the question arises to express conversely a θ-function by means of the elliptic functions; the form is found to be $\theta u = \mathrm{C} \exp\left(\mathrm{A}u^2 + \mathrm{B}\int_0\int_0 \mathrm{sn}^2\,u\,du^2\right)$, viz., θu is expressible as an exponential, the index of which depends on the double integral $\int_0\int_0 \mathrm{sn}^2\,u\,du^2$.

The object has been to explain the general nature of the elliptic functions sn u, cn u, dn u, and of the θ-functions with which they are thus intimately connected; it would be out of place to go into the theories of the multiplication, division, and transformation of the elliptic functions, or into the theory of the elliptic integrals, and of the application of the θ-functions to the representation of the elliptic integrals of the second and third kinds.

13. The reasoning which shows that for a doubly periodic function the ratio of the two periods 2ω, $2v$ is imaginary shows that we cannot have a function *of a single variable,* which shall be *triply* periodic, or of any higher order of periodicity. For if the periods of a triply periodic function $\phi\,(u)$ were $2\omega, 2v, 2\chi$, then m, n, p being any positive or negative integer values, we should have $\phi\,(u + 2m\omega + 2nv + 2p\chi) = \phi u$; ω, v, χ must be incommensurable, for if not, the three periods would really reduce themselves to two periods, or a single period; and being incommensurable, it would be possible to determine the integers m, n, p in such manner that the real part and also the coefficient of i of the expression $m\omega + nv + p\chi$ shall be each of them as small as we please, say $\phi\,(u + \epsilon) = \phi u$, and thence $\phi\,(u + k\epsilon) = \phi u$ (k an integer), and $k\epsilon$ as near as we please to any given real or imaginary value whatever. We have thus the nugatory result $\phi u =$ a constant, or at least the function if not a constant is a function of an infinitely and perpetually discontinuous kind, a conception of which can hardly be formed. But a function of two variables may be triply or quadruply periodic—viz., we may have a function $\phi\,(u, v)$ having for u, v the simultaneous periods $2\omega, 2\omega'$; $2v, 2v'$; $2\chi, 2\chi'$; $2\psi, 2\psi'$; or what is the same thing, such that m, n, p, q being any integers whatever, we have $\phi\,(u + 2m\omega + 2nv + 2p\chi + 2q\psi,\ v + 2m\omega' + 2nv' + 2p\chi' + 2q\psi') = \phi\,(u, v)$; and similarly a function of $2n$ variables may be $2n$-tuply periodic.

It is in fact in this manner that we pass from the elliptic functions and the single θ-functions to the hyperelliptic or Abelian functions and the multiple θ-functions; the case next succeeding the elliptic functions is when we have X, Y the same rational and integral sextic functions of x, y respectively, and then writing

$$\frac{dx}{\sqrt{\mathrm{X}}} + \frac{dx}{\sqrt{\mathrm{Y}}} = du,\ \frac{xdx}{\sqrt{\mathrm{X}}} + \frac{ydy}{\sqrt{\mathrm{Y}}} = dv,$$

we regard certain symmetrical functions of x, y, in fact the ratios of ($2^4 =$) 16 such symmetrical functions as functions of (u, v); say we thus have 15 hyperelliptic functions $f(u, v)$ analogous to the 3 elliptic functions sn u, cn u, dn u, and being quadruply periodic. And these are the quotients of 16 double θ-functions $\theta\,(u, v)$, the general form being

$$\theta\,(u, v) = \mathrm{A}\Sigma\Sigma \exp \{\tfrac{1}{2}(a, h, b,)\,(m, n)^2 + mu + nv\},$$

where the summations extend to all positive and negative integer values of (m, n); and we thus see the form of the θ-function for any number of variables whatever. The epithet "hyperelliptic" is used in the case where the differentials are of the form just mentioned $\frac{dx}{\sqrt{\mathrm{X}}}$, where X is a rational and integral function of x; the epithet "Abelian" extends to the more general case where the differential involves the irrational function of x, determined by any rational and integral equation $\phi\,(x, y) = 0$ whatever.

As regards the literature of the subject, it may be noticed that the various memoirs by Riemann, 1851–1866, are republished in the collected edition of his works, Leipsic, 1876; and shortly after his death we have the *Theorie der Abelschen Functionen*, by Clebsch and Gordan, Leipsic, 1866. Preceding this we have by MM. Briot and Bouquet, the *Théorie des Fonctions doublement périodiques et en particulier des Fonctions Elliptiques*, Paris, 1859, the results of which are reproduced and developed in their larger work, *Théorie des Fonctions Elliptiques*, 2 ed., Paris, 1875.

14. It is proper to mention the gamma (Γ) or Π function, $\Gamma(n + 1) = \Pi n, = 1.2.3. \ldots n$, when n is a positive integer. In the case just referred to, n a positive integer, this presents itself almost everywhere in analysis,—for instance, the binomial coefficients, and the coefficients of the exponential series are expressible by means of such functions of a number n. The definition for any real positive value of n was taken to be $\Gamma n = \int_0^\infty x^{n-1} e^{-x} dx$; it is then shown that, n being real and positive, $\Gamma\,(n + 1) = n\Gamma n$, and by assuming that this equation holds good for positive or negative real values of n, the definition is extended to real negative values; the equation gives $\Gamma 1 = 0\Gamma 0$, that is $\Gamma 0 = \infty$, and similarly $\Gamma(-n) = \infty$, where $-n$ is any negative integer. The definition by the definite integral has been or may be extended to imaginary values of n, but the theory is not an established one. A definition extending to all values of n is that of Gauss $\Pi n =$ limit. $\frac{1\ .\ 2\ .\ 3\ \ldots\ k}{n+1 . n+2 . n+3 \ldots n+k} k^n$, the ultimate value of k being $= \infty$; but the function is chiefly considered for real values of the variable.

A formula for the calculation when x has a large real and positive value, is $\Pi x = \sqrt{2\pi}\, x^{x+\frac{1}{2}} \exp\,(-x + \frac{1}{12x} + \ldots)$, or as this may also be written (neglecting the negative powers of x) $\Pi x = \sqrt{2\pi} \exp\{(x + \frac{1}{2}) \log x - x\}$.

Another formula is $\Gamma x \Gamma(1 - x) = \frac{\pi}{\sin \pi x}$, or as this may also be written, $\Pi(x - 1)\Pi(-x) = \frac{\pi}{\sin \pi x}$.

It is to be observed that the function Π serves to express the product of a set of factors in arithmetical progression, we have $(x + a)(x + 2a) \ldots (x + ma) = a^m\left(\frac{x}{a} + 1\right)\left(\frac{x}{a} + 2\right) \ldots \left(\frac{x}{a} + m\right) = a^m\Pi\left(\frac{x}{a} + m\right) \div \Pi\frac{x}{a}$. We can consequently express by means of it the product of any number of the factors which present themselves in the factorial expression of sin u. Starting from the form $u\Pi_1^m\left(1 + \frac{u}{s\pi}\right)\Pi_1^n\left(1 - \frac{u}{s\pi}\right)$, where Π is here as before the sign of a product of factors corresponding to the different integer values of s, this is thus converted into

$$n\Pi\left(\frac{u}{\pi} + m\right)\Pi\left(-\frac{u}{\pi} + n\right) \div \Pi\left(\frac{u}{\pi}\right)\Pi\left(-\frac{u}{\pi}\right)\Pi m \Pi n,$$

or as this may also be written—

$$\pi\Pi\left(\frac{u}{\pi} + m\right)\Pi\left(-\frac{u}{\pi} + n\right) \div \Pi\left(\frac{u}{\pi} - 1\right)\Pi\left(-\frac{u}{\pi}\right)\Pi m \Pi n,$$

which in virtue of

$$\Pi\left(\frac{u}{\pi} - 1\right)\Pi\left(-\frac{u}{\pi}\right) = \frac{\pi}{\sin u},$$

becomes

$$= \sin u\Pi\left(\frac{u}{\pi} + m\right)\Pi\left(-\frac{u}{\pi} + n\right) \div \Pi m \Pi n.$$

m and n are here large and positive, and calculating the second factor by means of the formula for Πx, in this case we have the before-mentioned formula

$$u\Pi_1^m\left(1 + \frac{u}{s\pi}\right)\Pi_1^n\left(1 - \frac{u}{s\pi}\right) = \left(\frac{n}{m}\right)^{\frac{u}{\pi}} \sin u.$$

The gamma or Π function is the so-called second Eulerian integral; the first Eulerian integral $\int_0^1 x^{p-1}(1-x)^{q-1}dx, = \Gamma p \Gamma q \div \Gamma(p+q)$, is at once expressible in terms of Γ, and is therefore not a new function to be considered.

15. We have the function defined by its expression as a hypergeometric series $\Gamma.(\alpha, \beta, \gamma, u) = 1 + \frac{\alpha.\beta}{1.\gamma} u + \frac{\alpha.\alpha+1.\beta.\beta+1}{1.2.\gamma+1.\gamma+2} u^2 + \text{etc.}$, *i. e.*, this expression of the function serves as a definition, if the series be finite, or if being infinite it is convergent. The function may also be defined as a definite integral; in other words, if in the integral

$$\int_0^1 x^{\alpha'-1}(1-x)^{\beta'-1}(1-ux)^{-\gamma'}dx$$

we expand the factor $(1-ux)^{-\gamma'}$ in powers of ux, and then integrate each term separately by the formula for the second Eulerian integral, the result is

$$= \frac{\Gamma\alpha'.\Gamma\beta'}{\Gamma(\alpha'+\beta')} + \frac{\Gamma(\alpha'+1).\Gamma\beta'}{\Gamma(\alpha'+\beta'+1)} \cdot \frac{\gamma'}{1} u + \text{etc.},$$

which is

$$= \frac{\Gamma\alpha'.\Gamma\beta'}{\Gamma(\alpha'+\beta')} \left\{ 1 + \frac{\alpha'.\gamma'}{\alpha'+\beta'.1} u + \frac{\alpha'.\alpha'+1.\gamma'.\gamma'+1}{\alpha'+\beta'.\alpha'+\beta'+1.1.2} u^2 + \ldots \right\},$$

or writing $\alpha', \beta', \gamma' = \alpha, \gamma-\alpha, \beta$ respectively, this is $= \frac{\Gamma\alpha\Gamma(\gamma-\alpha)}{\Gamma\gamma}\Gamma(\alpha, \beta, \gamma, u)$, so that the new definition is $\Gamma(\alpha, \beta, \gamma, u) = \frac{\Gamma\alpha\Gamma(\gamma-\alpha)}{\Gamma\gamma}\int_0^1 x^{\alpha-1}(1-x)^{\beta'-1}(1-ux)^{-\beta}dx$; but this is in like manner only a definition under the proper limitations as to the values of α, β, γ, u. It is not here considered how the definition is to be extended so as to give a meaning to the function $\Gamma(\alpha, \beta, \gamma, u)$ for all values, say of the parameters α, β, γ, and of the variable u. There are included a large number of special forms which are either algebraic or circular or exponential, for instance $\Gamma(\alpha, \beta, \beta, u) = (1-u)^{-\alpha}$, etc., or which are special transcendents which have been separately studied, for instance Bessel's functions, the Legendrian functions X_n presently referred to, series occurring in the development of the reciprocal of the distance between two planets, etc.

16. There is a class of functions depending upon a variable or variables x, y . . and a parameter n, say the function for the parameter n is X_n such that the product of two functions having the same variables, multiplied it may be by a given function of the variables, and integrated between given limits, gives a result $= 0$ or not $= 0$, according as the parameters are unequal or equal; $\int UX_m X_n \, dxdy \ldots = 0$, but $\int UX_n{}^2 dx$ not $= 0$; the admissible values of the parameters being either any integer values, or it may be the roots of a determinate algebraic or transcendental equation; and the functions X_n may be either algebraical or transcendental. For instance, such a function is $\cos nx$; m and n being integers, we have $\int_0^\pi \cos mx . \cos nx \, dx = 0$, but $\int_0^\pi \cos^2 nx \, dx = \frac{1}{2}\pi$. Assuming the existence of the expansion of a function fx, in a series of multiple cosines, we thus obtain at once the well-known Fourier series, wherein the coefficient of $\cos mx$ is $= \frac{1}{2}\pi \int_0^\pi \cos mx . fx \, dx$. The question whether the process is applicable is elaborately discussed in Riemann's memoir (1854), *Ueber die Darstellbarkeit einer Function durch eine trigonometrische Reihe*, No. xii. in the collected works. And again we have the Legendrian functions, which present themselves as the coefficients of the successive powers of α in the development of $(1-ax+\alpha^2)^{-\frac{1}{2}}$, $X_0 = 1$, $X_1 = x$, $X_2 = \frac{3}{2}(x^2 - \frac{1}{3})$, etc.: here m, n being any positive integers $\int_{-1}^1 X_m X_n dx = 0$, but $\int_{-1}^1 X_n^2 dx = \frac{2}{2n+1}$. And we have also Laplace's functions, etc.

Functions in General.

17. In what precedes a review has been given, not by any means an exhaustive one, but embracing the most important kinds of known functions; but there are questions to be considered in regard to functions in general.

A function of $x+iy$ has been built up by means of analytical operations performed upon $x+iy$, $(x+iy)^2 = x^2+y^2+i.2xy$, etc., and the question next referred to has not arisen. But observe that, knowing $x+iy$, we know x and y, and therefore any two given functions $\phi(x, y)$, $\psi(x, y)$ of x and y: we therefore also know $\phi(x, y) + i\psi(x, y)$, and the question is, whether such a function of x, y (being known when $x+iy$ is known) is to be regarded as a function of $x+iy$; and if not, what is the condition to be satisfied in order that $\phi(x, y) + i\psi(x, y)$ may be a function of $x+iy$. Cauchy at one time considered that the general form was to be regarded as a function of $x+iy$, and he introduced the expression "fonction monogène," monogenous function, to denote the more restricted form which is the proper function of $x+iy$.

Consider for a moment the above general form, say $x'+iy' = \phi(x, y) + i\psi(x, y)$, where ϕ, ψ are any real functions of the real variables (x, y); or what is the same thing, assume $x' = \phi(x, y)$, $y' = \psi(x, y)$; if these functions have each or either of them more than one value, we attend only to one value of each of them. We may then as before take x, y to be the co-ordinates of a point P in a plane Π, and x', y' to be the co-ordinates of a point P′ in a plane Π′. If for any given values of x, y the increments of $\phi(x, y)$, $\psi(x, y)$ corresponding to the indefinitely small real increments h, k of x, y be $Ah+Bk$, $Ch+Dk$, A, B, C, D being functions of x, y, then if the new co-ordinates of P are $x+h, y+k$, the new co-ordinates of P′ will be $x'+Ah+Bk$, $y'+Ch+Dk$; or P, P′ will respectively describe the indefinitely small straight paths at the inclinations $\tan^{-1}\frac{k}{h}$, $\tan^{-1}\frac{Ch+Dk}{Ah+Bk}$ to the axes of x, x' respectively; calling these angles θ, θ', we have therefore $\tan\theta' = \frac{C+D\tan\theta}{A+B\tan\theta}$. Now in order that $x'+iy'$ may be $= \phi(x+iy)$, a function of $x+iy$, the condition to be satisfied is that the increment of $x'+iy'$ shall be proportional to the increment $h+ik$ of $x+iy$, or say that it shall be $= (\lambda+i\mu)(h+ik)$, λ, μ being functions of x, y, but independent of h, k; we must therefore have $Ah+Bk$, $Ch+Dk = \lambda h - \mu k$, $\mu h + \lambda k$ respectively, that is A, B, C, D $= \lambda, -\mu, \mu, \lambda$ respectively, and the equation for $\tan\theta'$ thus becomes $\tan\theta' = \frac{\mu+\lambda\tan\theta}{\lambda-\mu\tan\theta}$; hence writing $\frac{\mu}{\lambda} = \tan\alpha$, where α is a function of x, y, but independent of h, k, we have $\tan\theta' = \frac{\tan\alpha+\tan\theta}{1-\tan\alpha\tan\theta}$, that is $\theta' = \alpha+\theta$; or for the given points (x, y), (x', y'), the path of P being at any inclination whatever θ to the axis of x, the path of P′ is at the inclination θ + constant angle α to the axis of x'; also $(\lambda h-\mu k)^2 + (\mu h+\lambda k)^2 = (\lambda^2+\mu^2)(h^2+k^2)$, *i. e.*, the lengths of the paths are in a constant ratio.

The condition may be written $\delta(x'+iy') = (\lambda+i\mu)(\delta x+i\delta y)$; or what is the same thing $\left(\frac{dx'}{dx}+i\frac{dy'}{dx}\right)\delta x + \left(\frac{dx'}{dy}+i\frac{dy'}{dy}\right)\delta y = (\lambda+i\mu)(\delta x+i\delta y)$, that is, $\frac{dx'}{dx}+i\frac{dy'}{dx} = (\lambda+i\mu)$, $\left(\frac{dx'}{dy}+i\frac{dy'}{dy}\right) = i(\lambda+i\mu)$; consequently $\frac{dx'}{dx}+i\frac{dy'}{dy} = i\left(\frac{dx'}{dx}+i\frac{dy'}{dx}\right)$; that is, $\frac{dx'}{dy} = -\frac{dy'}{dx}, \frac{dy'}{dy} = \frac{dx'}{dx}$, as the analytical conditions in order that $x'+iy'$ may be a function of $x+iy$: they obviously imply $\frac{d^2x'}{dx^2}+\frac{d^2x'}{dy^2} = 0$, $\frac{d^2y'}{dx^2}+\frac{d^2y'}{dx^2} = 0$; and if x' be a function of x, y, satisfying the first of these conditions, then $-\frac{dx'}{dy}dx + \frac{dx'}{dx}dy$ is a complete differential, and $y' = \int\left(-\frac{dx'}{dx}dx + \frac{dx'}{dx}dy\right)$.

18. We have in what just precedes the ordinary behavior of a function $\phi(x+iy)$ in the neighborhood of the value $x+iy$ of the argument or point $x+iy$; or say the behavior in regard to a point $x+iy$ such that the function is in the neighborhood of this point a *continuous* function of $x+iy$ (or that the point is not a point of *discontinuity*): the correlative definition of continuity will be that the function $\phi(x+iy)$, assumed to have at the given point $x+iy$ a single finite value, is continuous in the neighborhood of this point, when the point $x+iy$ describing continuously a straight infinitesimal element $h+ik$, the point $\phi(x+iy)$ describes continuously a straight infinitesimal element $(\lambda+i\mu)(h+ik)$; or what is really the same thing, when the function $(x+iy)$ has at the point $x+iy$ a differential coefficient.

19. It would doubtless be possible to give for the continuity of a function $\phi(x+iy)$ a less stringent definition not implying the existence of a differential coefficient; but we have this theory only in regard to the functions ϕx of a real variable in memoirs by Riemann, Hankel, Dubois Reymond, Schwarz, Gilbert, Klein, and Darboux. The last-mentioned geometer, in his "Mémoire sur les fonctions discontinues," *Jour. de l'École Normale*, t. iv. (1875) pp. 57–112, gives (after Bonnet) the following definition of a continuous function (observe that we are now dealing with real quantities only):—the function $f(x)$ is continuous for the value $x = x_0$ when h and ϵ being positive quantities as small as we please, and θ any positive quantity at pleasure between 0 and 1, we have for all the values of θ $f(x_0 \pm \theta h) - f(x)$ less in absolute magnitude than ϵ; and moreover $f(x)$ is continuous through the interval x_0, x_1

($x_1 > x_0$, that is, nearer $+\infty$) when $f(x)$ is continuous for every value of x between x_0 and x_1, and, h tending to zero through positive values, $f(x_0+h)$ and (x_0-h) tend to the limits $f(x_0)$, $f(x_1)$ respectively. It is possible, consistently with this definition, to form continuous functions not having in any proper sense a differential coefficient, and having other anomalous properties; thus if $a_1, a_2, a_3 \ldots$ be an infinite series of real positive or negative quantities, such that the series Σa_n is absolutely convergent (*i. e.*, the sum $\Sigma \pm a_n$, each term being made positive, is convergent), then the function $\Sigma a_n (\sin n\pi x)^{\frac{2}{3}}$ is a continuous function actually calculable for any assumed value of x; but it is shown in the memoir that, taking $x =$ any commensurable value $\frac{p}{q}$ whatever, and then writing $x = \frac{p}{q} + h$, h indefinitely small, the increment of the function is of the form $(k+\epsilon)h^{\frac{2}{3}}$, k finite, ϵ an indefinitely small quantity vanishing with h; there is thus no term varying with h, nor consequently any differential co-efficient. See also Riemann's Memoir *Ueber die Darstellbarkeit*, etc. (No. xii. in the collected works), already referred to.

20. It was necessary to allude to the foregoing theory of (as they may be termed) infinitely discontinuous functions; but the ordinary and most important functions of analysis are those which are continuous, except for a finite number (or it may be an infinite number) of points of discontinuity. It is to be observed that a point at which the function becomes infinite is *ipso facto* a point of discontinuity; a value of the variable for which the function becomes infinite is, as already mentioned, said to be an "infinity" (or a "pole") of the function; thus in the case of a rational function expressed as a fraction in its least terms, if the denominator contains a factor $(x-a)^m$, a a real or imaginary value, m a positive integer, then a is said to be an infinity of the m-th order (and in the particular case $m = 1$, it is said to be a simple infinity). The circular functions $\tan x$, $\sec x$ are instances of a function having an infinite number of simple infinities.

A rational function is a one-valued function, and in regard to a rational function the infinities are the only points of discontinuity; but a one-valued function may have points of discontinuity of a character quite distinct from an infinity: for instance, in the exponential function $\exp\left(\frac{1}{u-a}\right)$ where a is real or imaginary, the value $u\,(=x+iy) = a$, is a point of discontinuity but not an infinity; taking $u = a + \rho e^{\alpha i}$, where ρ is an indefinitely small real positive quantity, the value of the function is $\exp\left(\frac{1}{\rho} e^{-\alpha i}\right)$, $= \exp \frac{1}{\rho}(\cos\alpha - i \sin\alpha)$, which is indefinitely large or indefinitely small according as $\cos\alpha$ is positive or negative, and in the separating case $\cos\alpha = 0$, and therefore $\sin\alpha = \pm 1$, it is $= \cos\frac{1}{\rho} \pm i \sin\frac{1}{\rho}$ which is indeterminate. If instead of $\exp\frac{1}{u-a}$ we consider a linear function $\left\{A + B \exp\frac{1}{u-a}\right\} \div \left\{C + D \exp\frac{1}{u-a}\right\}$, then writing as before $u = a + \rho e^{\alpha i}$, the value is $= A \div C$, or $= B \div D$, according as $\cos\alpha$ is negative or positive. As regards the theory of one-valued functions in general, the memoir by Weierstrass, "Zur Theorie der eindeutigen analytischen Functionen," *Berl. Abh.* 1876, pp. 11–60, may be referred to.

21. A one-valued function *ex vi termini* cannot have a point of discontinuity of the kind next referred to; if the representative point P, moving in any manner whatever, returns to its original position, the corresponding point P′ cannot but return to its original position. But consider a many-valued function, say an n-valued function $x' + iy'$, of $x + iy$; to each position of P′ there correspond n positions, in general all of them different, of P′. But the point P may be such that (to take the most simple case) two of the corresponding points P′ coincide with each other, say such a position of P is at V, then (using for greater distinctness a different letter W′ instead of V′) corresponding thereto we have two coincident points (W′), and $n-2$ other points W′; V is then a branch-point (Verzweigungspunkt). Taking for P any point which is not a branch-point, then in the neighborhood of this value each of the n functions $x' + iy'$ is a continuous function of $x + iy$, and by what precedes, if P describing an infinitely small closed curve (or oval) return to its original position, then each of the corresponding points P′ describing a corresponding indefinitely small oval will return to its original position. But imagine the oval described by P to be gradually enlarged, so that it comes to pass through a branch-point V; the ovals described by two of the corresponding points P′ will gradually approach each other, and will come to unite at the point (W′), each oval then sharpening itself out so that the two form together a figure of eight. And if we imagine the oval described by P to be still further enlarged so as to include within it the point V, then the figure of eight, losing the crossing, will be at first an hour-glass form, or twice-indented oval, and ultimately in form an ordinary oval, but having the character of a twofold oval; *i. e.*, to the oval described by P (and which surrounds the branch-point V) there will correspond this twofold oval, and $n-2$ onefold ovals, in such wise that to a given position of P on its oval there correspond two points, say P_1', P_2', on the twofold oval, and $n-2$ points $P_3', \ldots P_n'$, each on its own onefold oval. And then as P describing its oval returns to its original position, the point P_1' describing a portion only of the twofold oval, will pass to the original position of P_2', while the point P_2' describing the remaining portion of the twofold oval will pass to the original position of P_1'; the other points $P_3', \ldots P_2'$, describing each of them its own onefold oval, will return each of them to its original position. And it is easy to understand how, when the oval described by P surrounds two or more of the branch-points V, the corresponding curves for P′ may be a system of manifold ovals, such that the sum of the manifoldness is always $= n$, and to conceive in a general way the behavior of the corresponding points P and P′.

Writing for a moment $x + iy = u$, $x' + iy' = v$, the branch-points are the points of contact of parallel tangents to the curve $\phi(u, v) = 0$, a line through a cusp (but not a line through a node), being reckoned as a tangent; that is, if this be a curve of the order n and class m, with δ nodes and κ cusps, the number of branch-points is $= m + \kappa$, that is, it is $= n^2 - n - 2\delta - 2\kappa$, or if $p, = \frac{1}{2}(n-1)(n-2) - \delta - \kappa$, be the *deficiency*, then the number is $= 2n - 2 + 2p$.

To illustrate the theory of the n-valued algebraical function $x' + iy'$ of the complex variable $x + iy$, Riemann introduces the notion of a surface composed of n coincident planes or sheets, such that the transition from one sheet to another is made at the branch-points, and that the n sheets form together a multiply-connected surface, which can be by cross cuts (Querschnitte), converted into a simply-connected surface; the n-valued function $x' + iy'$ becomes thus a one-valued function of $x + iy$, considered as belonging to a point on some determinate sheet of the surface: and upon such considerations he founds the whole theory of the functions which arise from the *integration* of the differential expressions depending on the n-valued algebraical function (that is, any irrational algebraical function whatever) of the independent variable, establishing as part of the investigation the theory of the multiple θ-functions. But it would be difficult to give a further account of these investigations.

The Calculus of Functions.

22. The so-called Calculus of Functions, as considered chiefly by Herschel and Babbage and De Morgan, is not so much a theory of functions as a theory of the solution of functional equations; or, as perhaps should rather be said, the solution of functional equations by means of known functions, or symbols,—the epithet known being here used in reference to the actual state of analysis. Thus for a functional equation $\phi x + \phi y = \phi(xy)$, taking the logarithm as a known function the solution is $\phi x = c \log x$; or if the logarithm is not taken to be a known function, then a solution may be obtained by means of the sign of integration $\phi x = c\int\frac{dx}{x}$; but the establishment of the properties of the function logarithm (assumed to be previously unknown) would not be considered as coming within the theory. A class of equations specially considered is where $\alpha x, \beta x, \ldots$ being given functions of x, the unknown function ϕ is to be determined by means of a given relation between $x, \phi x, \phi\alpha x, \phi\beta x, \ldots$; in particular the given relation may be between $x, \phi x, \phi\alpha x$; this can be at once reduced to equations of finite differences; for writing $x = u_n$, $\alpha x = u_{n+1}$, we have $u_{n+1} = \alpha u_n$, giving u_n, and therefore also x, each of them as a function of n; and then writing $\phi x = v_n$, $\phi\alpha x$ will be the same function of $n + 1$, $= v_{n+1}$, and the given relation is again an equation of finite differences in v_{n+1}, v_n, and n; we have thus $v_n, = \phi x$, as a function of n, that is of x. As regards the equation $u_{n+1} = \alpha u_n$, considered in itself apart from what precedes, observe that this is satisfied by writing $u_n = \alpha^n(x)$, or the question of solving this equation of finite differences is in fact identical with that of finding the n-th function $\alpha^n(x)$, where $\alpha(x)$ is a given function of x. It of course depends on the form of $\alpha(x)$ whether this question admits of solution in any proper sense; thus, for a function such as $\log x$, the n-th logarithm is expressible in its original function $\log^n x\,(= \log\log \ldots x)$, and not in any other form. But there are forms, for instance $\alpha x = \frac{a + bx}{c + dx}$, where the n-th function $\alpha^n x$ is a function of the like form $\alpha^n x = \frac{A + Bx}{C + Dx}$, in which the actual value can be expressed as a function of n; if α be such a form, then $\phi\alpha\phi^{-1}$, whatever ϕ may be, is a like form, for we obviously have $(\phi\alpha\phi^{-1})^n = \phi\alpha^n\phi^{-1}$. The determi-

nation of the n-th function is in fact a leading question in the calculus of functions.

It is to be observed that considering the case of two variables, if for instance $\alpha(x, y)$ denote a given function of x, y, the notation $\alpha^2(x, y)$ is altogether meaningless; in order to generalize the question we require an extended notation wherein a single functional symbol is used to denote two functions of the two variables, thus $\phi(x, y) = \alpha(x, y), \beta(x, y)$, α and β given functions; writing from shortness $x_1 = \alpha(x, y)$, $y_1 = \beta(x, y)$, then $\phi^2(x, y)$ will denote $\phi(x_1, y_1)$, that is, two functions $\alpha(x_1, y_1)$, $\beta(x_1, y_1)$, say these are x_2, y_2; $\phi^3(x, y)$ will denote $\phi(x_2, y_2)$, and so on, so that $\phi^n(x, y)$ will have a determinate meaning. And the like is obviously the case in regard to any number of variables, the single functional symbol denoting in each case a set of functions equal in number to the variables. (A. CA.)

FUNERAL RITES, ceremonies attending the burial, burning, or disposal otherwise of the dead.

The prevalent modes of disposal are very various. The rudest is that of certain nomadic tribes, who, from the exigence of their wandering life, simply expose their dead, unless the custom of some tribes in modern Guinea be still ruder, who, like the ancient Ichthyophagi, throw their dead into the sea, and think they have thus got rid of corpse and ghost together. In exposing the dead, various rules prevail: some leave them where they die and move their own camp on to other hunting grounds; others, like the Wanyamwesi, carry them a little distance into the forest and leave them to be devoured by beasts of prey; while others still, like the Kamtchadales, refine upon this practice, and keep special dogs for the purpose of consuming the dead, reconciling themselves to this custom by the doctrine that they who are eaten by dogs here will drive fine dogs in the other world. Probably the straits of war explain the practice of the Latookas of Zanzibar, who bury their dead, but make it a rule to leave those slain in battle to be devoured by wild beasts where they lie. The custom of exposure has survived among cultured nations in the case of the Parsees, who bring their dead to certain round towers, called towers of silence, to be eaten by vultures which make these towers their dwelling-places. There is evidence that a more startling mode of disposal still is sometimes practised. Certain tribes of the ancient Scythians are said to have eaten their dead, and Burton says that at Dahomey the body of a person killed by lightning is not buried like others, but is hacked in pieces and eaten by the priests. Skertchley says they do not actually eat it, but only make believe to do so; but the make-believe is probably a survival of what was once the reality.

Next to exposure, burial is the simplest method of disposal, and it is the most widespread, being common alike to the lowest and the highest forms of culture. Burial likewise has its varying customs, from laying the body in natural holes or caves to erecting over it majestic temples. A common practice is simply to lay the body out on the ground and pile stones, or, as among the Moors, prickly thorns, over it, to keep off beasts. The use of the coffin is no sure test of culture, for while some of the rudest peoples lay the dead in a hollowed trunk or a boat, the Mahometan nations use nothing of the kind. Nor is the possession of fixed burying places a better index to the stage of development, for while many primitive tribes have stated burial places, the more advanced Mexicans had none. Some American tribes bury their children in a separate graveyard from adults, and others bury them by the wayside that their souls may enter into persons passing by.

Refinements upon ordinary burial are the practices of first burning the dead, or embalming them, or drying them on trees or artificial scaffolds, before burying them. That plain burial is the earlier custom, and that these other more elaborate and costly fashions are later engraftments upon it, seems to be proved by the fact that many nations adopt more than one custom, and that, while they only bury their women, they first burn or dry their men. The ancient Colchians suspended the corpses of men in trees, but their women they buried. The Gonds and Bhils of India, who have adopted under Hindu influences the practice of burning, still bury their women, while the Todas burn all now except children the victims of infanticide, whom they bury. The Muddikers, who bury, burn lepers, probably from sanitary reasons; and certain tribes who burn bury the lightning-struck on the spot where they fall. The Kalmucks follow all modes: their usual custom is exposure; but they also burn, or bury, or throw the corpse into the water, or under a heap of stones, or build a hut over it, according to what the priest declares to be most suitable to the condition of the deceased.

Another point of interest in burying is the position of the body in the grave. Some bury their dead lying, others sitting, and there is a remarkable consensus of custom for the practice of laying the body east and west, sometimes with the head to the east and sometimes to the west. This custom is evidently due originally to solar symbolism, and the head is turned to the east or to the west, according as the dead are thought of in connection with the sunrise, the reputed home of deity, or with the sunset, the reputed region of the dead. This practice, however, though nearly universal, is not absolutely so, for some tribes lay their dead north and south; and others, like the Bongos, bury men with the face to the north and women with the face to the south; while if one of the Wanyamwesi in Africa happens to die abroad, he is buried facing his native village.

The necessary act of disposing of the corpse has always been accompanied by ceremonies expressive (1) of affection for the deceased or grief for his loss; (2) of present interest in and solicitude for his welfare; (3) of a certain mysterious fear of him in his present state; and (4) of affectionate remembrance of him. These ceremonies vary much under different changes of culture, yet have all the same central elements.

Among primitive nations the most common ceremonial expressions of grief are simple exaggerations of the natural expressions of the emotions,—a carelessness as to usual comforts, and a positive distracting agony. Fasting, neglecting the hair, wearing rags or sackcloth, sitting in ashes, daubing one's self with mud or pigment, are almost universal examples of the one; while wringing the hands, tearing the hair, shaving the head, beating the breast, are common examples of the other. The New Zealanders daub themselves with red pigment and gash their bodies with broken shells. The Hawaians gash themselves, knock out front teeth, cut off a finger joint or an ear, and on the death of a king the nation feigns universal madness, and murders, robs, and commits all manner of crimes, as a ceremonial expression of a sorrow which has driven them frantic. Singing laments, playing plaintive music, dancing funeral dances, are not unusual expressions of grief, though it is probable that the music continuously kept up at the wakes of the Celts and other nations was meant to ward off evil spirits.

The most interesting funeral rites, however, are those which express men's ideas of the present state, and their solicitude for the present welfare, of the deceased. There is no nation which does not believe that the soul continues to exist after its separation from the body, in another world like the present, but invisible. Many of the funeral rites of the nations are determined by the belief that death is a journey of the soul from this world to that other, and are meant to provide necessary entertainment for the dead on the way, or even after arrival. Meat, drink, weapons, light, musical instruments, horses, money, servants, wives, are among the most usual things buried with the body. The Gonds even leave toothpicks with it. The Aztecs laid a waterbottle beside the dead to be used on the way to Mictlan, the land of the dead. The North American Indian buries with the dead a kettle and provisions, bow and arrows, a pair of moccasins, with a spare piece of deerskin to patch them if they wear out, and sinews of deer to sew the patches on with. The Laplanders lay beside the corpse flint, steel, and tinder to supply light for the dark journey. The Chippewas light fires on the grave for four nights after the funeral, for guidance on the journey, which they think lasts four days. The Karens give the deceased at the grave explicit instructions as to the relations of things in space being reversed in the next world. Taking a stick, they throw it to the north and say that it is the south, and taking another, they throw it to the south and say that is the north. The Mexicans gave several slips of paper to the deceased, to serve as passports, taking him in succession past a precipice, a serpent, and a crocodile. The obolus which the Greeks put in the dead man's mouth to pay Charon, and the coin the Irish place in his hand, are well known. It is a fine touch of the Greenlanders to bury with a child a dog to guide him, for they say a dog will find his way anywhere. The North American Indian buries his "medicine" with him to take him to the happy hunting-grounds. The Norse warrior had his horse and armor laid in the grave with him that he might ride to Valhalla in full panoply.

Graver sacrifices, of animals, wives, and slaves, for the permanent use of the deceased in the next world, have prevailed at one period or another among most nations of Asia, Africa, and America. They are conspicuously absent from the Semitic peoples, though even among them a trace is found in the Arab custom of leaving the dead man's camel to die on his grave. Of human funeral sacrifices, Hindu suttee is the best known instance. The Fijians strangle wives, slaves, and friends to attend the deceased. The Dyaks of Borneo make head-hunting a main business of this life, under the impression that every person whose head they secure will serve them in the next. A kind of suttee by symbol still survives in certain nations when the sacrifice itself is abolished. The Chinese make paper images of sedan bearers and the like, and fly them in the wind over the grave, thus despatching them after the dead man to serve him; and the Japanese, with whom at one time it was the custom for 20 or 30 slaves to kill themselves by "hari-kari" with the dead, substitute images in modern times; and the Quakeolths of North America rested the widow's head on the burning corpse, and then dragged her out half dead. Treasure buried with the dead was meant also for their use. In Madagascar as much as 11,000 dollars were laid in the tomb of a prince. The principle that lies at the root of those sacrifices is the prevalent belief in object souls as well as animal souls. The soul of the warrior rode upon the soul of his horse, and wielded the soul of his weapon.

Many of the primitive funeral rites seem dictated by a certain awe or fear of the ghost, and a wish to get it well away. Lane mentions a practice among modern Egyptians of turning the corpse round and round so as to make it giddy, that it might not know where it was going. For the same end, apparently, the Santals carry the body three times round the pile. The Karens walk round the bier in opposite directions three times, each time exchanging candles they have in their hands, and then bid the ghost depart in peace, and to make more sure of his departure, destroy the village where the death occurred. From a similar desire to confuse the ghost, the Greenlanders take the body out by a window instead of the door, and the Siamese break out a new opening in the wall to take it through, and then carry it three times round the garden. The Siberians fling a red-hot stone after the corpse, and the Brandenburg peasants pour out a pail of water after it, to prevent it returning. The Pomeranians leave some straw behind in the graveyard that the soul may rest contented there; while the Bongos on leaving the burial place shoot arrows at a votive stake they erect on the grave, and leave the arrows sticking in the wood. The Australians take off the nails of the corpse and tie its hands, lest it scrape its way out again.

The affectionate commemoration of the deceased takes many forms, from simply mourning for a definite period up to periodical funeral feasts, the erection of memorial images, the preservation of the relics as instruments of superhuman power, and the worship of the Manes. The natives of Dahomey keep up intercourse with the departed by killing a slave from time to time, whose soul is supposed to go to the dead with the news of the living. The Guinea negroes used to keep the bones of their friends in chests and go occasionally and hold conversation with them. The Mandan women in North America take food year by year to their dead kinsfolk, whose skulls have been preserved in circles of 100 on the prairie. Funeral feasts prevail extensively in America, Africa, and Asia, and arise partly, like our own anniversary dinners, from a simple desire to do honor to the dead, but partly also from the belief that the dead participate in the good cheer. They are not merely commemorative but communion meals. Funeral games were probably, like the elaborate dressing of the dead in Brazil and other places in the robes of their patron saints or deities, merely designed to show respect.

To come now to the more cultured peoples, the Greeks either buried or burnt their dead. The body was anointed, crowned with flowers, dressed handsomely and usually in white, laid out in a bed of state with an obolus in its mouth for Charon and a honeycake for Cerberus. These offices were performed by the female relations. The kinsfolk gathered round the bed, and lamented and tore their clothes and hair. On the third day after death the body was carried out by the friends in a coffin, usually of earthen ware, before sunrise,—men walking before it, women, attended by the hired mourners, behind,—and was buried outside the town. A monument with inscription was raised over the grave. All who took part in the funeral needed to be purified before they could again enter the temple of the gods. Funeral sacrifices were offered on the third, ninth, and thirtieth days after. On the last of these days stated mourning ended, and the relatives might appear in public again. It was customary afterwards to visit the tomb and leave garlands, and burn meals as offerings to the dead.

The Roman ceremonies were analogous. Burial was the earlier custom. Burning was not general till the republic, but was universal under the empire; the preparation of the body for burial or cremation was performed by a hired body called *pollinctores.* The corpse was dressed in its best,—if a magistrate, in official robes; and if he had while alive been crowned, then wearing the crown. In early times the burial took place at night, but in later times this was the practice only of the poor who could not afford a funeral display. On the eighth day the body was carried to the grave in a stone coffin on a wooden—or in some cases a golden—bier, amid music and lamentation, and sometimes mimic representations of the life and merits of the deceased by professional players. The sons of the deceased went veiled, and the women beat their breasts. When the body was burned, oil, perfumes, ornaments, and everything supposed to be agreeable to the deceased, were thrown into the fire. On returning from the funeral friends were purified by sprinkling themselves with water or stepping over a fire. Mourning lasted nine days, and on the ninth a funeral sacrificial feast was celebrated, sometimes with games and gladiatorial combats.

The funeral rites of ancient Egypt were too elaborate to be described here. Their chief peculiarities were the embalming of the body and the judgment of the dead before burial. It is an error to suppose the embalming took place in order to preserve the body for a future state, for there is no evidence that the Egyptians believed in the resurrection of the body, and embalming could not have reference to that belief if they did, for the whole body was not preserved, but some of the most important internal parts were taken out first; besides, they embalmed not only men, but the lower animals also. The mummy was often kept in the house a whole year before being buried, and during that interval feasts were held in honor of the dead, and the tomb was being prepared. Then the case was taken out, set on a hearse, taken by a sledge to the sacred lake of the nome, across which it was carried in a boat by a boatman called Charon, and then deposited in the tomb on the other side. Before being allowed to cross, however, the judgment of the dead took place before forty-two judges summoned for the purpose; any one was allowed to bring forward any accusation against the deceased, and if he had led an evil life burial was refused. If there was no accusation, then the relatives ceased lamenting and pronounced encomiums, enlarging not on his descent, as among the Greeks, but on his personal merits. The denial of burial was not perpetual, however, its duration being measured by the extent of the crimes of the deceased. A gold or silver plate was put into the mouth of the mummy, not as a fee to the ferryman, but as a passport or certificate of good character.

The Russians have a similar custom of putting a passport (in their case a paper one) into the hand of the deceased as a testimonial of his virtue, to be shown to Peter at the gate of heaven. More curious still are the custom of the Badages of the Nilgherry Hills, who let loose a scape calf at the grave to take away the dead man's sins, and the practice mentioned by Brand as prevailing in Wales at one time, of employing sin-eaters, men who receive a loaf over the corpse, and eating it take upon them all the sins of the deceased.

The Mahometans bury their dead usually on the day of death. The prophet forbade wailing, but this prohibition is generally neglected. Even hired wailing women are employed by some, who wail during all the time the corpse is in the house and on the way to the grave; parts of the Koran are recited by religious officials in the house. In the funeral procession the male relatives go in front of the bier, and are preceded by four or six poor old men, mostly blind, who chant the profession of faith, and followed by four or six schoolboys who chant passages from a poem descriptive of the last judgment; while the female relatives come behind the bier, accompanied by the wailing women with their tambourines, and cry and shriek, and celebrate the praises of the deceased. If the dead man was rich, then several camels follow bearing bread and water to give the poor at the tomb, and last of all comes a buffalo to be slaughtered there for the same purpose. The bier is then brought to the mosque, laid in the usual place of prayer, with the right side towards Mecca; and the imam standing at its left side, with the people behind him, recites the funeral service, after which he calls upon those present to give their testimony respecting the dead, and they reply, "He was of the virtuous." The body is then laid in the tomb, and is there instructed in the answers to be given to questions, such as Who is God, and Who is his apostle? which the angels are expected to put.

Christian rites are marked by high reverence for the body, due to the belief in its future resurrection. Under Christian influence cremation gradually disappeared from Europe, northern and southern alike, and burial became universal, as being more expressive of the truth held so precious. Christians bury in separate places of their own, which, except among Presbyterians and other sections of Protestants, have been usually consecrated for the purpose by a special ceremony. Interment in churches of favorite martyrs and apostles was at one time much sought after, and had to be repeatedly forbidden by ecclesiastical councils. Bishops and distinguished churchmen or laymen were sometimes allowed to be buried in the church, only not near the altar. Among the early Christians the washing and anointing of the body for the burial were not done by hired persons, but were counted a work of love, done by friend for friend, and by the charitable for the poor and the stranger. The body was swathed in white, decked sometimes with the insignia of office or personal ornaments, placed in a coffin and laid out in the church or in the chamber of death for friends to come and take a last look at it. Three or four days usually elapsed between the death and burial, and vigils were held with prayers and hymn-singing. Hired mourners were forbidden. The funeral took place by day, for, Christian death being a victory, it was meant to give the procession the aspect of a triumph; for which reason those who took part in it carried branches, not of cypress, as among the Romans, but of palm and olive. Evergreen leaves were strewn on the coffin, but the practice of crowning the head with wreaths was forbidden, as savoring of idolatry. Lamps and torches, however, were sometimes carried. The body was borne on a bier and covered with a pall costly in proportion to the rank of the deceased. It was laid in the grave with face upward and feet to the east, in token of the resurrection at the coming again of the Sun of Righteousness. A service took place at the grave, and, as a rule, does so still among most Christians. In Scotland this was abolished at the Reformation, as being liable to be mingled with superstitious ideas, and a service and exhortation in the church were recommended instead, but this is seldom practised. Christian burial in consecrated ground, and with a religious service, was denied by canon law to all who were not Christians, to excommunicated persons, suicides, criminals, usurers, schismatics, heretics, and, among Roman Catholics, even unbaptized children of Christian parents. The eucharist was celebrated at the grave as early as the fourth century; and for some centuries, in spite of repeated prohibition by ecclesiastical councils, the practice prevailed in West Africa, Gaul, and the East, of placing the consecrated bread itself, steeped in wine, in the lips of the dead. Another practice, which has indeed the sanction of Basil, was not uncommon, that of burying the eucharistic bread with the dead. Special prayers were offered for the soul of the departed, and the priests, and afterwards other friends, gave the corpse the last kiss of peace. See CREMATION.

For descriptions of the funeral rites of different nations the reader may be referred to general works on ethnography, such as Dr. Robert Brown's *Races of Mankind;* Herbert Spencer's *Descriptive Sociology;* Prichard's *Researches into the Physical History of Man;* Fr. Müller's *Allgemeine Ethnographie;* Waitz's *Anthropologie der Natur-Völker;* Klemm's *Allgemeine Culturgeschichte der Menzchheit;* and more particularly to Porcacchi, *Funerali antichi di diversi populi e nationi*, Ven., 1754; Muret, *Cérémonies funèbres de toutes nations*, Paris, 1677 (English translation by Lorrain, 1683); Feydeau, *Hist. générale des usages funèbres et des sépultures des peuples anciens*, Paris, 1858, 3 vols.; De Gubernatis, *Storia popolare degli usi funebri Indo-Europei*, 1873; Tegg, *The Last Act*, London, 1876; and Sonntag, *Die Todtenbestattung*, Halle, 1878. For the funeral customs of the Bengal tribes reference may be made to Dalton's *Ethnology of Bengal;* for those of the American races, to Bancroft's *Native Races of the Pacific States of America;* and for interpretations of funeral rites, to Tylor's *Primitive Culture*, vol. ii., and Spencer's *Principles of Sociology*. Spencer not only treats of the origin and meaning of funeral rites, but strives to deduce all religious ideas and institutions out of those rites as their original source. For classical rites see Guichard, *Funérailles . . . des Romains, Grecs*, etc., Lyons, 1581; Meursius, *De Funere Grecorum et Romanorum.* Hague, 1604; Gutherius, *De Jure Manium*, Paris, 1613; Kirchmann, *De funeribus Romanorum*, Hamburg, 1605; Stackelberg, *Die Gräber der Hellenen*, Berlin, 1837; and Becker's *Charicles* and *Gallus;* and for early Christian rites, Gretser, *De Funere Christiano*, Ingoldst., 1611; Durand, *Rationale Divinorum Officium*, composed in the 13th century, and first published at Mainz, 1459; Bingham's *Antiquities of the Christian Church*, book xxiii.; and Augusti's *Christliche Archæologie*, Bd. ix. For English ceremonies see Agard, Dethick, Holland, etc., "On antiquity of ceremonies used at funerals," in Hearne's *Collection;* Brand's *Popular Antiquities;* Strutt's *Manners and Customs*. Weinhold has treated of early German customs in *Die heidnische Todtenbestattung in Deutschland*, Vienna, 1859. (J. R.)

FÜNFHAUS, Fünfhäusel, formerly Hangendenlissen, a flourishing and populous suburb to the south-west of Vienna, forming, along with Sechshaus proper and Rudolfsheim, the commissariat of Sechshaus, and trending in a westerly direction towards Schönbrunn. The principal manufactures are silk, satin, velvet, and cotton fabrics. Hangendenlissen was a village belonging to the Barnabite college of St. Michael at Vienna. The population, which in 1869 numbered 27,065, had increased in 1872 to 36,388.

FÜNFKIRCHEN, Hung. *Pécs*, a royal free city of Hungary, capital of the vármegye or county of Baranya, is situated on the declivity of Mount Mecsek, and on the railway to Mohács, 105 miles S.S.W. of Buda, 46° 6′ N. lat., 18° 13′ E. long. It is one of the oldest and finest towns in Hungary, and is the seat of a bishop and of the county administration. It consists principally of a public square, and a main street extending about five miles in length. Amongst the noteworthy buildings are the cathedral, said to have been founded by St. Stephen of Hungary in 1009, and reputed to be the oldest church in the kingdom, the bishop's palace, the county and town halls, several churches and monasteries, a public hospital, the theatre, an ecclesiastical seminary, a high-class gymnasium, and other educational establishments. Fünfkirchen has manufactories of woollen cloth, flannels, rosoglio, oil, leather, and paper, and also carries on a considerable trade in tobacco, gall-nuts, and wine. The population in 1870 amounted to 23,863, chiefly Catholics; by nationality the greater number are Magyars, the remainder Germans and Croatians. In former times Fünfkirchen was of much greater relative importance than at present. According to tradition it existed in the time of the Romans. In the Frankish-German period it was known under the name of Quinque Ecclesiæ; its bishopric was founded in 1009; in 1543 it was taken by the Turks, who retained possession of it till 1686. On the 18th June, 1849, it was occupied by the Austrians under General Nugent.

FUNGUS (Gr. μύκης, whence are derived *mycetes*, employed as a termination to the names of certain orders of fungi, and also the term *mycetology*, or more commonly *mycology*, the science of fungi) is the name applied to a distinct class of cellular cryptogams or *Thallophyta*. Though as plants the class is well marked by the invariable absence of chlorophyll, and consequently of the physiological phenomena attending its presence and action, it is not so at some points, where a dubious border exists between it and the lower members of the animal kingdom.

The vegetative body or thallus of fungi consists of filiform, cellular elements called *hyphæ*. In one group, the *Phycomycetes*, the hypha usually consists of a single densely branching cell; but in most cases it is composed of a series of cells placed end on end. These hyphæ ramify laterally much more frequently than dichotomously, and the usual mode of growth is by an apical cell which divides transversely; but in the bodies of the larger fungi intercalary growth also occurs (as in *Rhizomorpha subterranea*). A single hypha forms the complete thallus of the simpler fungi called *Hyphomycetes*, *Haplomycetes*, etc., but the bodies of the larger (compound) fungi are composed of a colony of hyphæ, usually densely interwoven, more rarely running in parallel lines, but always more or less firmly adhering together. In many fungi (as in the stalk of the *Phalloideæ*, the pileus of *Russula*, and *Lactarius*, in *Sclerotia*, and in the *peridia* of the *Lycoperdaceæ*) the fully developed tissue consists of polyhedral cells, closely packed, and bearing resemblance to *parenchyma*. This texture, however, consists of ordinary hyphæ, which, through pressure from adjacent parts, have been forced to assume this form. It bears the name of *pseudo-parenchyma*.

The *Myxomycetes* are the only large group of organisms usually classed with fungi which cannot be described as consisting of hyphæ. These differ in so many ways and so widely from any fungal or indeed vegetable structures that a separate consideration of their position is necessary (see Order V.). Other exceptions of a minor nature have been made of such organisms as *Hormiscium*, *Cryptococcus*, etc., but it is now the general belief that these are merely reproductive bodies of more perfect fungi. The cells of fungal hyphæ are of many shapes, but the usual one is long and cylindrical, and the other shapes are more or less modifications of this. The structure and growth of the fungal cell agree in general with those of the vegetable cell as it occurs elsewhere. At the same time no group in the vegetable kingdom exhibits so many minor divergent histological characters—a condition which serves to mark its boundaries as a class of vegetables with great distinctness.

The Cell-Membrane.—In the numerous fungi which develop rapidly and have a short existence in the adult state, the cell-wall is thin, tender, and structureless; but when a plant of this kind is accidentally checked in its expansion, the result is the production of thick homogeneous, unstratified membranes. On the other hand, the cell-wall of the more persistent species early acquires considerable thickness which, in the adult state, often so increases that the cell has the appearance of a solid cylinder. These thick membranes vary from a woody to a gelatinous consistency, and are composed sometimes of more than one layer. In the *Polyporei*, *Thelephora*, *Bovista*, *Geaster*, *Tulostoma*, etc., the cell-walls often exhibit (either after simple immersion in water or on the application of chemical reagents) at least two layers, the outer firmer and often colored, the inner softer and clearer. The cohesion of the filaments in these larger plants is brought about by their being densely interwoven, and also by the firm union and to a certain extent the amalgamation of the outer layers of the membranes. Spiral and ring-shaped thickenings are to be found in the capillitium cells of *Batarrea* and *Podaxon carcinomatis*, and pits are of constant occurrence in corresponding cells of the *Lycoperdaceæ*, and in the filaments which bear the fructification of *Dactylium*.

Chemical analyses of the cell-membrane show that it possesses the elementary constituents of cellulose; but since the uncolored and unthickened membrane does not commonly exhibit the characteristic reaction of cellulose towards iodine (neither simply nor after treatment with potash or Schultz's mixture), nor towards many of the reagents commonly employed in testing typical cellulose, it is necessary to apply to it the special term *fungal cellulose*. In several special cases, however, typical cellulose is known to exist. The membranes of old cells frequently undergo a kind of lignification, and in this condition offer extraordinary resistance to such treatment as that with concentrated sulphuric acid.

The Cell-Contents.—The protoplasm of fungal cells has no special quality of importance to distinguish it from that of other vegetable cells. Professor Sachs states (*Bot. Ztg.*, 1855) that under his observation the apices of growing hyphæ seemed to consist of one mass, in which the membrane could not be distinguished from the protoplasm; but Professor de Bary (*Morp. u. Physiol. der Pilze*, etc.), on the other hand, finds that the same conditions as exist in similar situations in other plants obtain here, viz., a dense mass of protoplasm enclosed by a tender membrane—an experience endorsed by most mycologists. The existence of a nucleus was long denied, and indeed its presence in the cells of the thallus has not yet been proved; but in the reproductive organs, where it had long been overlooked, its occurrence is not uncommon. Attempts to prove its existence in the cells of the thallus have not been wanting, but as yet with apparently no success: Schacht's observations on this head are notably untrustworthy, since there is no doubt that he confounded the true nucleus in other fungal cells with drops of oil and such bodies. The formation of vacuoles takes place as in other vegetable cells. Oleaginous matter is present, often abundantly, in nearly all fungi, in the form of drops of various sizes. Water (cell-sap) is necessarily present, though the quantity varies considerably without serious injury to the plant. A good proof of this variation is to be found in the expansion or contraction of the filaments of many *Hyphomycetes* according to the supply of water. In fungi with firmer cell-membranes, air-bubbles take the place of the water which has evaporated, and the contraction of the hyphæ is very inconsiderable.

The fungal cell is wholly destitute of chlorophyll, and it may be safely stated, of starch also. Schlossberger and Döpping record their detection of starch granules in the extracted sap of *Cantharellus cibarius;* but from their method of investigation it is highly probable that these were accidentally present.

The pigments of various colors to be found in many fungi are perhaps in most cases properties of the cell-membrane. Another class of them is peculiar to the cell-contents, and a third seems to pervade both membrane and contents. Those peculiar to the contents are mostly of an oleaginous or resinous nature, and their occurrence is in the form either of minute particles distributed throughout the protoplasm, or of larger drops or granules scattered irregularly among the contents. From the pigments peculiar to the fungal cell there are to be distinguished those absorbed in an unaltered state from the substratum. An instance of this is to be found in *Peziza æruginosa*, which owes it color to the abnormally greenish wood on which it grows. It was long thought that the *Peziza* was the cause of the green color, but a sufficient proof is contained in the facts that the wood is more frequently found green without any trace of the fungus than with it, and that the upper part of the fungus is sometimes uncolored when the lower portion has become green. Moulds, and other fungi usually colorless, are occasionally stained with the color of an unusual substratum. The subject of the pigments of fungi is one of which our knowledge is very incomplete.

Crystals of calcium oxalate are to be met with on the surfaces and in the intercellular spaces of many of the larger fungi; but in only two cases have they been found in the interior of the cell (*Phallus caninus* and *Russula adusta*). Cell-division takes place in the same way as in other plants.

The *mycelium* is the part of the thallus devoted to the functions of absorbing and storing nutriment. It consists of hyphæ developed directly from the germinating filaments, but often on further growth intricately bound up (frequently anastomosing) with each other, usually in amorphous masses, but sometimes in more or less definite bodies. In the larger fungi a number of hyphæ (in which case they run parallel to each other) are sometimes associated into bundles, like rootlets. The mycelium not unfrequently persists for several years. Mycelia in general bear so strong a resemblance to each other that it is usually impossible to determine the species to which they belong on their own characters.

A number of parasitic fungi possess peculiar organs called *haustoria*, which perform the function of extracting nourishment, and when necessary retaining the plant in its position. These are lateral branches of the mycelial hyphæ of various shapes and sizes. In *Erysiphe*, the mycelium of which creeps over the surface of its host plant, the haustoria are emitted abundantly from the side of the hyphæ next the epidermis, into which they penetrate and cause decay. They are in this case small and irregular in shape. On the *Peronosporeæ*, the mycelium of which inhabits usually the intercellular spaces of living plants, haustoria are frequently present. In some cases, as in *Cystopus candidus*, they have the form of minute stalked globules, but in most other *Peronosporeæ* they are irregular filamental protuberances, frequently branching to such an extent as almost to fill the affected cell.

Sclerotia are tuberous bodies composed of densely interwoven mycelial hyphæ enclosed by a layer of pseudo-parenchyma. They are specific in occurrence, like the bulbs and tubers of phanerogams, and are situated on or beneath the surface of the substrata—the ground or parts of plants. They were long regarded as independent forms of fungi, but it has been discovered that they are only resting states in which nourishment is stored up. They vary much in size.

The Receptacle.—On the mycelium there arises a body called the receptacle, the function of which is to bear the reproductive bodies, the spores. It varies much in size in different fungi; in most cases it forms the greater part of the whole thallus, and in others it consists of a simple or branched hypha. The same species of fungus may possess more than one kind of receptacle, either in different generations, or arising subsequently from the same mycelium. According to their structure receptacles may be divided into two groups, viz., those which consist of one hypha, and those which, composed of aggregated hyphæ, form a compound body. In certain cases the receptacle is entirely suppressed (as in the interstitial oogonia of the *Peronosporeæ*). When the receptacle consists of a simple or branched hypha, the spores are borne terminally. The sporophorous hyphæ are branches of the mycelium, rising usually vertically from it, and themselves frequently so characteristically branched as to afford means of generic and specific distinction. After bearing the first spore, the sporophore may again grow for a short space before bearing another. In compound receptacles the fructiferous hyphæ form together expansions called *hymenia*, from which the individual fertile branches arise. If the hymenium is formed upon the exterior surface of the receptacle it is termed *gymnocarpous*, and if within the receptacle *angiocarpous*. The hymenium never produces any but asexual spores.

Reproduction.—The reproduction of fungi is effected by both sexual and asexual means—the latter being far the more frequent of the two. No one species is known to possess more than one form of sexual reproduction, though it is frequently the case that more than one kind of asexual reproduction belongs to it. In many fungi no sexual reproduction is known to exist, but it is generally believed that in such cases the plants are merely members of a cycle of generations, the other stages in their life-history being unknown or unrecognized. The term *spore* is applied to all reproductive bodies, whether asexual or the product of the union of sexual cells. Discussion has frequently been engaged in as to the propriety of employing the same term to denote both kinds of bodies; but though in isolated cases the use of new terms has been advised, no satisfactory system of nomenclature has been established. There is, however, no doubt that some distinction ought to be made.

Sexual reproduction is effected by the union of two cells of different nature, which in themselves are incapable of further development. In the usual forms these cells are apparently of different nature, but in the phenomenon of conjugation the difference in the sexual elements is not determinable, though doubtless existing within the molecular sphere. The product of the union of sexual cells is developed into an organ of reproduction which, at the proper time, fulfils its office by giving rise either to a new mycelium directly or to a receptacle. These organs of reproduction bear names more or less expressive of their nature, such as *zygospore*, *oospore*, etc.

In those fungi of which the life-cycle is known, several different kinds of asexually produced spores have been observed. In only one group, the *Phycomycetes*, are motile spores (*zoospores*) known. In all other cases they are produced either at the apex of a *basidium* (*basidiospores*) or similar sporophore (*conidia*, etc.), by cell-division, or within an *ascus* by free cell-formation (*ascospores*). In *compound* or *septate* spores, which are multicellular, each separate secondary cell is termed a *merispore*. *Gemmæ* are produced by the breaking up (by cell-division) of hyphæ into series of cells capable of germinating. The germination of spores is dependent chiefly on moisture, but to their farther development specific conditions are necessary, a description of which is beyond the scope of this article. The dissemination of spores is effected chiefly by the agency of the atmosphere and of water, and it is probable that insects or other animals have very little to do with it.

In their *mode of life* fungi are controlled by the absence of chlorophyll. Without it they cannot assimilate, and are therefore driven to obtain their nourishment by taking up the carbon compounds assimilated by other organisms. Their modes of life are either parasitic or saprophytic. As parasites they inhabit the bodies of living plants and animals, and even of other fungi. In some cases they kill their hosts, and in others encourage growth, as in the case of the *Lichenes;* and between those two extremes various degrees of parasitism occur. As saprophytes they promote the decomposition of dead organic bodies, and thus aid in the production of carbonic acid, water, and ammonia, the elements of which return to the course of organic life. Jodin states that some fungi absorb as much as 6 per cent. of their nitrogenous contents in the form of nitrogen gas from the atmosphere. In the decomposition of fungi ammonia is formed from the nitrogenous compounds. As parasites and saprophytes their influence as regulators in the economy of nature may be compared with that of the lower animals living the same mode of life.

Though the ravages of parasitic fungi are mostly confined to the vegetable kingdom, it is well known that many animals suffer from their attack. The occurrence of parasitic fungi on insects and fish is common; more rarely do they attack the higher animals or man. It has been strongly contended that the minute fungi play very important parts in many diseases of man, but this has usually been much exaggerated. The occurrence of *Bacteria* on the mucous surfaces of living bodies and on wounds has given rise to much discussion; and there is no doubt that insufficient knowledge of these organisms has often led to error, the observers not unfrequently mistaking the products of the decomposition of organic bodies, crystalline precipitations, etc., for *Bacteria*. It may safely be maintained that these are oftener the concomitants than the causes of disease in man. A considerable number of fungi have also been described as playing active parts in various skin-diseases, but very little trustworthy information about their life-history has ever been gained.

The *economic properties* of fungi are of an unimportant character. A great number are poisonous, and many are edible; a few are used for medicinal purposes. Many of those described as edible, though they can be eaten without any serious consequence, are certainly not likely to become articles of food. At the same time it may be mentioned that much valuable food is annually lost through ignorance of the excellent esculent qualities of a few common fungi.

The *phosphorescence* or luminosity observed in several fungi has given rise to many absurd conjectures. This phenomenon depends on the respiration of oxygen, those fungi which exhibit luminosity ceasing to do so when the oxygen is extracted.

Geographical Distribution.—From the extreme poverty of our knowledge of the geographical distribution of fungi no general estimate can be even outlined. Of the fungi of by far the greater portion of the world we have no account, or at the best the meagre collections of passing explorers. Of even the European mycologic flora our knowledge is far from complete, Russia, Turkey, Spain, Portugal, and even Ireland, being only partially examined. Of countries in which the surveys have been more complete, only England, Scotland, Wales, Germany, France, and large districts of Austria, Italy, and Switzerland can be pointed to. Of the whole American continent the Carolinas alone are tolerably well known, and though collections have been made in Mexico, Texas, the island of Cuba, and a few tracts of South America, the examination of these countries has not been thorough. China, Japan, Siberia, and Further India are totally unexplored; but, on the other hand, Ceylon and the northern part of India are perhaps as well known as any other extra-European district save Carolina. From the Himalayas and northern India there are the collection and notes of Sir Joseph Hooker. In Africa, Algeria and the Cape have been examined, but from the tropical parts of that continent we have only the collection and notes of Dr. Welwitsch, which are, however, of great value so far as the district he explored extends.

Any attempted scheme of geographical distribution would, therefore, be not only incomplete but open to great error, from the very partial accounts from the most of those districts which have been examined. As in other vegetables, heat and moisture necessarily exert the greatest influence on growth, and therefore on distribution. The character of the trees composing the forests of different countries, and the amount of cultivated land, subordinately affect the nature, if not the numbers, of the fungi inhabiting them. One broad principle, however, seems apparent, viz., that the large *fleshy* fungi, like the *Agaricini*, affect temperate countries more than tropical, and that those of a woody texture, like the *Polyporei*, inhabit tropical in preference to temperate countries. In the Arctic regions fungi are represented almost solely by the *Lichenes*. Of the distribution of microscopic fungi nothing of any value is known.

Classification.—Fungi are divided into orders and suborders as follows:—

- I. *Phycomycetes.*
  - 1. Saprolegnieæ.
  - 2. Peronosporeæ.
  - 3. Mucorini.
- II. *Hypodermiæ.*
  - 1. Uredineæ.
  - 2. Ustilagineæ.
- III. *Basidiomycetes.*
  - 1. Tremellini.
  - 2. Hymenomycetes.
  - 3. Gasteromycetes.
- IV. *Ascomycetes.*
  - 1. Discomycetes.
  - 2. Erysipheæ.
  - 3. Tuberaceæ.
  - 4. Pyrenomycetes.
  - 5. Lichenes.
- V. *Myxomycetes.*
- VI. *Schizomycetes.*

The above classification is broadly the same as that proposed by Professor de Bary. The principal characters of these orders and suborders are described below.

Order I.—PHYCOMYCETES.—The *Phycomycetes* possess both sexual and asexual organs of reproduction. The sexually produced reproductive body gives rise to a generation bearing first asexual and then sexual organs, and the asexually produced reproductive body gives rise to a similar generation. The mycelium in this order consists of long densely-ramifying tubes or hyphæ, on which the reproductive organs are borne.

Suborder I.—Saprolegnieæ.—In this order the male organs are called *antheridia* and the female organs *oogonia*. In the monœcious forms these arise beside each other on the same plant. The oogonia are usually to be found at the end of short branches of the mycelium—very rarely sessile or intercalary. They are globular cells with one enclosing membrane containing dense protoplasm. In some cases (as in *Saprolegnia monoica*) the cell-wall soon becomes resorbed at various places, and the protoplasm divides into several globular bodies, which float in a watery fluid, the whole enclosed by the wall of the oogonium. In *Aphanomyces Pythium*, and several species of *Saprolegnia*, only one globe is formed in the oogonium. The fluid in which these globes float is part of the watery contents of the globes expelled when the contraction took place. While these alterations are proceeding in the oogonia, the antheridia grow out from the same or some adjoining branch of the mycelium. These are thin, crooked hyphæ, which frequently entwine the stalks of the oogonia in their growth; the tips of the tubes, however, on reaching the wall of the oogonium adhere, and the upper part becomes separated from the rest by a septum. This process is usually contemporary with the contraction or separation into globules of the contents of the oogonia. The antheridia then push through the walls one or more tubes, which discharge from the points minute motile spermatozoids (about $\frac{1}{500}$ millim. in size), and these fertilize the globules. The globules then assume a cellulose membrane and are called *oospores*.

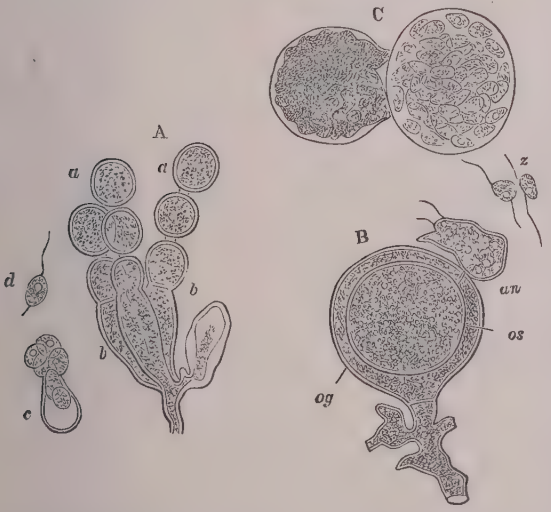

FIG. 1.—*Cystopus candidus*. A. *a*, conidia; *b*, conidiophores; *c*, conidium emitting zoospores; *d*, free zoospore. B. *og*, oogonium; *os*, oosphere; *an*, antheridium. C. Formation of zoospores by oospores. *z*, free zoospores. (After De Bary. ×400.)

The oogonia are formed in the diœcious as in the monœcious species, but the antheridia in a totally different way. They arise within bladder-like protuberances of the mycelium, which are divided by transverse septa into a series of cells, each of which is an antheridium. In *Saprolegnia dioica*, the antheridium breaks up into numerous spermatozoids; but in *Achlya dioica* a preliminary division of the antheridium into several portions precedes the formation of the spermatozoids. When free these spermatozoids move actively by means of one long cilium. Fertilization, and the consequent formation of oospores, are effected in a similar way to that described as occurring in the monœcious forms. Doubt has been expressed as to the described monœcious fertilization, but on the whole it may be regarded as generally true. The oospores of the *Saprolegnieæ* are double-coated. After a long period of rest they emit germ-tubes, but it has been recorded that they sometimes produce zoospores, when the resting state is shorter.

The zoosporangia or asexually-produced organs of reproduction are terminal cells (very rarely intercalary), sometimes irregularly cylindrical, sometimes ovoid, of a constant form in some genera (*Saprolegnia, Achlya*) but variable in others (*Pythium, Monoblepharis*).

The reproduction by means of the zoosporangia is much more extensive than that by means of the oospores. Each zoosporangium contains a great number of zoospores. The mycelium is composed of long ramifying tubes, of considerable diameter, and nearly always aseptate.

The *Saprolegnieæ* grow for the most part in water, chiefly on the dead bodies of insects. One species, *Saprolegnia ferax*, is notable on account of its extensive ravages on the bodies of fishes (especially salmon) and other water animals.

Suborder II.—Peronosporeæ.—The *Peronosporeæ* are very closely allied to the *Saprolegnieæ*—the modes of reproduction both sexual and asexual being similar to those of the monœcious forms of the latter suborder. The oogonia are terminal as a rule, and the protoplasmic contents contract always into one central globule. Two forms of germination have been observed in the oospores. In *Cystopus* they burst and produce zoopores, and in *Peronospora* the usual mode of germination is by the emission of a hypha. As regards the asexually-produced spores the same rule holds. In *Cystopus* and *Phytophthora* they are zoosporangia, producing in the former case each the same number of zoospores as the oospores; and in *Peronospora* they are usually *conidia*, emitting hyphæ on germination. Both zoospores and hyphæ produce mycelia directly.

The zoosporangia of *Cystopus* are borne in vertical series on short, club-shaped filaments; the conidia of *Peronospora* in most cases, and the zoosporangia of *Phytophthora*, on branching, tree-like sporophores. The mycelium, which is usually septate and ramifies densely, possesses frequently haustoria of various shapes.

The *Peronosporeæ* are parasitic on living phanerogams, the tissues of which they penetrate and destroy. The most notable example is the well-known potato-disease, *Phytophthora infestans*, the ravages of which are too well known to need description.

Suborder III.—Mucorini.—Sexual reproduction in this suborder is effected by means of the conjugation of two apparently similar sexual cells, which as a result of their union form a *zygospore*. It will be sufficient to describe one typical case, viz., that of *Rhizopus nigricans*. The conjugating cells of this fungus are elongated, stout tubes. Where two meet, each pushes against the other a protuberance, at first cylindrical and of equal thickness. They remain closely adhering, and soon grow considerably, chiefly in thickness. At the end of each a separate cell is formed by the growth of a partition. These two cells are usually of unequal size, one as long as it is broad, the other only half as long as its breadth. The membrane which originally separated them is now perforated in the middle, and soon vanishes altogether; the two conjugating cells thus unite and form the *zygospore*, which increases rapidly, usually attaining a diameter of over $\frac{1}{5}$ millim. It is, as a rule, drum-shaped, the ends smooth, and the free surface clothed with wart-like protuberances. The contents are coarsely granular protoplasm, in which float drops of oil. On germination the zygospore produces a hypha (as observed in *Syzygites*), which by repeated dichotomous branching soon forms a new mycelium.

Asexual reproduction is accomplished by *sporangia* similar in function, and in some degree in structure, to the corresponding organs of the two preceding suborders. They are borne terminally on special branches of the mycelial hyphæ, which, like the mycelium, are aseptate up to the time of fructification. The spores produced in the sporangia germinate by the emission of a filament, which, like that produced by the zygospore, forms by dichotomous branching a new mycelium. This was the only mode of reproduction known in the *Mucorini*, until the researches of Professor de Bary and others brought to light the sexual form, which, however, has not yet been observed in all the species.

The *Mucorini* are usually to be found growing on excrement and on decaying substances; none of the species are known to cause any important disease to plants or animals.

Order II.—Hypodermiæ.—No mode of sexual reproduction is known to belong to the plants of this order. They are (so far as is known) reproduced wholly by asexual spores arising by cell-division. All the species inhabit the parenchyma of living plants, through the epidermis of which the receptacles burst.

Suborder I.—Uredineæ.—The life-history of the *Uredineæ* consists of a cycle of three generations, the transition in each case being effected (so far as is at present known) by asexual spores. The cycle begins in spring with the germination of thick-walled spores, called *teleutospores*, borne usually in pairs at the end of sterigmata. Germination takes the form of the emission of a hypha, which rapidly (usually in two or three hours) forms a promycelium, bearing three or four sporidia. These sporidia become detached, and on finding a suitable host-plant penetrate the epidermis cells by means of a germinating filament, and form a new mycelium within the parenchyma. After a few days this mycelium begins to form receptacles under the epidermis of the host, on which are borne *æcidia* and *spermogonia*. The latter appear before the former. They are small, narrow-necked sacs, in which are found minute spore-like bodies, called *spermatia* by Tulasne, who believed them to be male organs, partly on comparative grounds and partly because he found them incapable of germinating. No female organs have been found; though it was suggested that the spermatia stood in sexual relations to the æcidia beside which they are constantly found. Professor de Bary, however, found that the spores of æcidia, on a plant on which no trace of spermogonia or spermatia could be found, germinated exactly as under other circumstances. The æcidia are at first round or oval but on bursting basin-shaped receptacles of pseudo-parenchyma, at the base of each of which a circular, flat hymenium is formed. From this hymenium there rise erect basidia bearing in vertical series a number of spores of a round polyhedral form, and filled with protoplasm colored red or yellow by oil. These spores on being liberated produce germ-tubes which penetrate the stomata of the next host plant (one of the same species as that on which the teleutospores were found), and soon form another mycelium in the intercellular spaces. Again, in a few days, this mycelium forms a new kind of receptacle, the *uredo*. This receptacle is flat and circular, and is situated immediately under the epidermis. On it basidia bearing round or oval uredospores arise and break through the epidermis. The uredospores constantly reproduce the uredo, which is the cause of the extensive ravages of this form of the disease; on the same mycelium which produces the uredo, teleutospores are ultimately formed. These hibernate, and when spring arrive again germinate, and start the same cycle of generations.

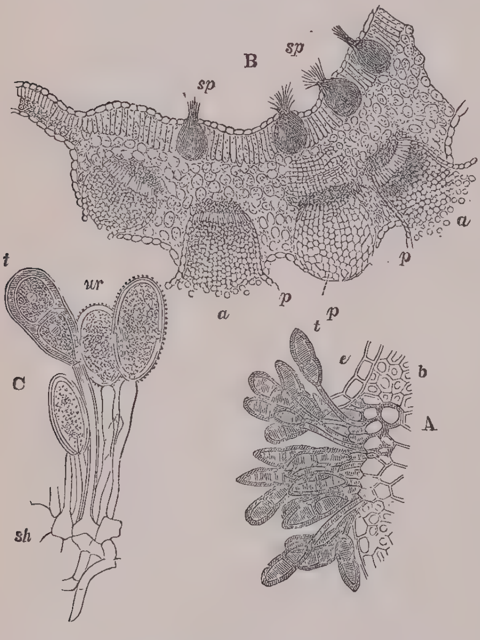

Fig. 2.—*Puccinia graminis*. A. Mass of teleutospores (*t*) on a leaf of couch-grass; *e*, epidermis ruptured; *b*, sub-epidermal fibres. (After De Bary.) B. Part of vertical section through leaf of *Berberis vulgaris*, with *a*, æcidium fruits, *p*, peridium, and *sp*, spermogonia. (After Sachs.) C. Mass of uredospores (*ur*), with one teleutospore (*t*); *sh*, sub-hymenial hyphæ. (After De Bary.)

Teleutospores
|
æcidium-spores (accompanied by spermatia)
|
uredospores, and later on the same mycelium teleutospores again.

This cycle of generations is carried out on two different host plants. The uredospores and teleutospores affect the *Gramineæ* chiefly, but the ravages of æcidia, though not so severe in their nature, extend over many species of *Compositæ*, *Ranunculaceæ*, *Leguminosæ*, and *Labiatæ*.

Suborder II.—Ustilagineæ.—The life-history of this suborder, so far as yet known, consists in the formation of asexual spores, either singly, in series, or in masses, on very slender sporophores; these germinate, and form a promycelium bearing sporidia (as in the case of the teleutospores of the *Uredineæ*), which in turn germinate and form a mycelium bearing the same kind of spores as those with which we started. This life history, it will be seen, is, so far as it goes, similar to that of the *Uredineæ*. The present order resembles the preceding one also in the habit of life. They are very injurious, especially to the *Gramineæ*. The power of producing many sporidia in successsion, possessed by the promycelium, tends to the plentiful distribution of the disease. These sporidia usually attack the axis of germinating plants, in which a mycelium is then developed and carried up with the growth of the plant, ultimately producing spores in the fruit and causing its destruction.

Order III.—Basidiomycetes.—The only form of reproduction known in this order is by asexual spores borne at the apex of erect basidia. These spores reproduce the plant directly without the intervention of another generation. The receptacle of the hymenium consists of interwoven hyphæ, and is gelatinous, fleshy, or woody in consistency; it sometimes attains great size. The mycelium is comparatively small and floccose.

Suborder I.—Tremellini.—The hymenium of this suborder bears two different kinds of basidia in different genera. In the genius *Tremella* the basidia are at first subglobose or quite spherical, and divided from top to bottom into four equal parts. These segments either remain united, or diverge, while they grow out to the margin of the fungus in the form of long hyphæ bearing kidney-shaped spores. In *Dacrymyces* and *Guepinia* the basidia are at first claviform then divergent into two arms, bearing one reniform spore each.

Spermatia are often met with abundantly in many of the *Tremellini*. They are produced in regular spermatophorous apparatus, and are very minute and spherical or ovoid. Like the spermatia of the *Uredineæ*, their function is unknown.

The consistence of these plants is gelatinous, with, in some cases, a denser nucleus. They are usually to be found growing on stumps of trees and on the ground. Their shape, when they have one, is usually more or less cup-like.

Suborder II.—Hymenomycetes.—The *Hymenomycetes* is the most widely-known group of fungi. It includes the common mushroom, to which all the species bear more or less resemblance. The familiar form is that of a pileus raised upon a stalk and bearing on its under surface the hymenium extended over gills or *lamellæ* (*Agaricini*), pores (*Polyporei*), or teeth (*Hydnacei*). From the hymenium rise the basidia, at the apex of which are usually four sterigmata bearing the spores. These spores are asexually produced, and on germinating, by emitting a hypha, give rise to a new mycelium on which the receptacle is again borne. The question of the existence of a form of sexual reproduction in the *Hymenomycetes* has been fought over many times, as yet with no certain result. Among the basidia are to be seen other cells of similar shape, but of greater dimensions, called *cystidia*;[1] it has been contended that these are male organs. The mycelium is nearly always underground.

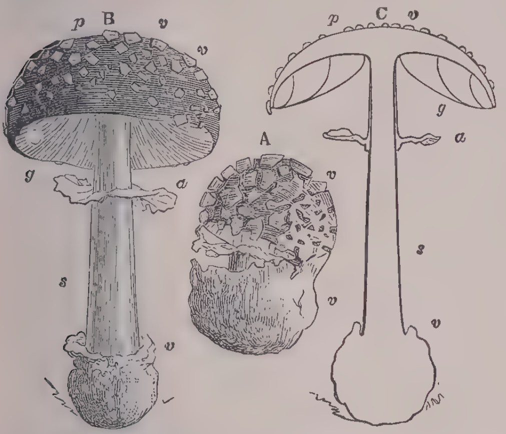

Fig. 3.—*Agaricus muscarius.* A, the young plant; B, the mature plant; C, longitudinal section of mature plant. *p*, the *pileus*; *g*, the gills; *a*, the *annulus*, or remnant of *velum partiale*; *v*, remains of *volva* or *velum universale*; *s*, the stalk.

The *Agaricini* possess an inferior hymenium spread over lamellæ or gills radiating from the stalk. These are sometimes simple and sometimes branched, and attached to or distinct from the stalk. The spores vary much in color, one color being constant to a genus or to a subgenus. On the stems of some genera an *annulus* or ring may be found, as a remnant of a veil (*velum partiale*) which united that part of the stem with the outer edge of the cap or pileus, but was ruptured on the expansion of the latter. In certain subgenera of *Agaricus* (*e.g.*, *Volaria, Amanita*) the whole plant is, when young, enclosed in a *volva* (*velum universale*), the remains of which may be seen in mature plants adhering to the base of the stem. In some genera, as in *Amanita*, both forms of veil are found together. When the stem is lateral, as in *Pleurotus*, it is usually very much suppressed. The species of *Agaricini* are usually terrestrial, many of them are edible, and a few are deadly poisons.

The *Polyporei* are distinguished by the hymenium (sometimes inferior, sometimes superior) extending over the surfaces of cavities or pores. In the genus *Boletus* the habit of an Agaric is assumed—the stem usually central, the texture almost always soft. In *Polyporus* the stem is usually lateral and the texture woody. The hymenophore is not easily separable. In some cases the habit of Polyporus is crust-like, the pores opening upwards, when it is called *resupinate.* Polypori grow usually on stumps of trees.

The *Hydnacei* possess an inferior or an amphigenous hymenium spread over teeth or spines. Some of the species have the form of a stalked pileus with the teeth inferior, while others resemble the resupinate *Polypori.* They are fleshy or corky in texture.

In the *Auricularini* the hymenium is confluent with the hymenophore. In form they resemble the *Polyporei.*

The *Clavarinei* are distinguished by an amphigenous hymenium, scarcely distinct from the hymenophore, and reaching to the apex of the plant, which is club-shaped, or in the form of upright spines. The species are gelatinous in consistence, but become horny when dry. The surface is usually smooth at first, but afterwards assumes an indented or wrinkled appearance.

Suborder III.—Gasteromycetes.—The receptacles of the *Gasteromycetes* are angiocarpous. They consist of an outer peridium enclosing masses of tissues which bear the hymenia. The basidia often bear as many as eight spores which are ultimately liberated by the bursting of the peridium, either simply or by the development of special masses of tissues. The peridium of *Phallus* resembles the *velum universale* of the *Agaricini* in its mode of enveloping the receptacle, and the appearance it presents after bursting. Within this volva is a gelatinous stratum, then an inner peridium, then the hymenium. The bursting of the peridium or volva is caused by the elongation of a stalk on which the hymenium is elevated in a kind of pileus—as in the *Agaricini.* In *Batarrea* there also occurs a universal volva, and the hymenium is similarly elevated, but the plant in this case is of a woody consistence, and spiral vessels are found in the stalk. In *Clathrus* the receptacle is in the form of a globular net.

In *Lycoperdon, Hymenogaster*, and *Nidularia* the hymenium remains unelevated, and the spores are liberated by the simple bursting of the peridium.

Order IV.—Ascomycetes.—The characteristic form of reproduction of the *Ascomycetes* is by *ascospores* formed within *asci* by free cell-formation. Other generations in the cycle of development form *stylospores* in special conceptacles called *pycnidia*, and *conidia* borne on *conidiophores.* The receptacles on which the ascospores are produced arise as the result of the union of sexual organs, which takes place on the mycelium. The receptacles vary very much in size and form throughout the order.

Suborder I.—Discomycetes.—The sexual organs of this suborder are formed on the mycelium and are called the *carpogonium* (female) and the *pollinodium* (male). As typical of the rest of the order the life-history of *Ascobolus furfuraceus*, as described by Janczewski, may be chosen. The *pollinodium* and *carpogonium* are both composed of a series of short crooked cells, in the former case much thinner than in the latter. The pollinodium embraces the more remote end of the carpogonium, which is at this stage sausage-shaped, and so fertilizes it. After fertilization one of the cells of the carpogonium (usually near the middle) increases and becomes globular. It is called the *ascogonium.* From it proceed ascogenous hyphæ on which the *asci* arise. The asci are flask-shaped, the base being the narrow portion, and within them the *ascospores*, 8 in number, are formed by free cell-formation. Between the asci, and borne on the ascogenous hyphæ, are more or less numerous *paraphyses* which are generally regarded as abortive asci, but may serve (as Boudier affirms they do) to assist in some way the dehiscence of the asci. The hyphæ of the mycelium on which the sexual organs are borne produce a dense mass of pseudo-

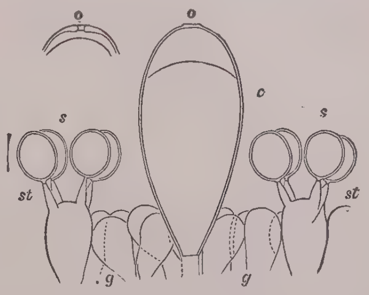

Fig. 4.—*Agaricus mucidus.* Portion of hymenium (×350). *s*, sporidia; *st*, sterigmata; *g*, sterile cells; *c*, cystidium, with operculum *o*.

---

[1] Mr. W. G. Smith, who has examined a large number of cystidia, especially among the *Agaricini*, states that they all normally open by an orifice capped by a minute operculum at the top. In *Coprinus* the cystidia are unusually large, with at first a rounded top, which at length is capped by a nipple-like protuberance. After the careful examination of a large number of specimens Mr. Smith has convinced himself that the apex of each cystidium is furnished with a minute operculum, which is burst off in the discharge of the liquid or granular contents of the cystidium. In *Lactarius* the operculum is tall and cap-like. The liquid secreted by the cystidia of the *Agaricini* is sometimes granular before liberation, but in other cases not until after. When this granular matter is ripe, the grains revolve and move freely about, and if the operculum do not readily open this motion is increased until an opening is forced. Mr. Smith looks on these granular bodies as analogues of antherozoids.

parenchyma, which surrounds the carpogonium and forms the sterile part of the fructification.

Sexuality was first discovered in the *Discomycetes* by Professor de Bary in the case of *Peziza confluens*, which though it differs in details from that described as occurring in *Ascobolus*, agrees in all essential details with it.

Certain species of *Pezizæ*, the mycelium of which is extensively reproduced by conidia, undergo a resting state in the form of a *sclerotium*. This was first observed in *Peziza Fückeliana* by Professor de Bary. In it conidia are produced by the mycelium before the sclerotia. The sclerotia, which are formed without the occurrence of any sexual process, so far as has been observed, consist of densely packed hyphæ enclosed by a pseudo-parenchymatous rind. Sometimes these germinate shortly after their formation, and produce a mycelium which bears conidia again; but if germination be delayed for a month or two, the characteristic basin-shaped hymenium of *Peziza*, with asci and ascospores, is formed.

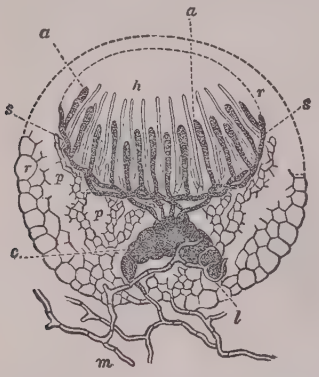

FIG. 5.—*Ascobolus furfuraceus.* Diagrammatic section of the fructification (after Janczewski). *m*, mycelium; *c*, carpogonium; *l*, pollinodium; *s*, ascogenous filaments; *a*, asci; *r*, *p*, the sterile tissue from which the paraphyses *h* spring.

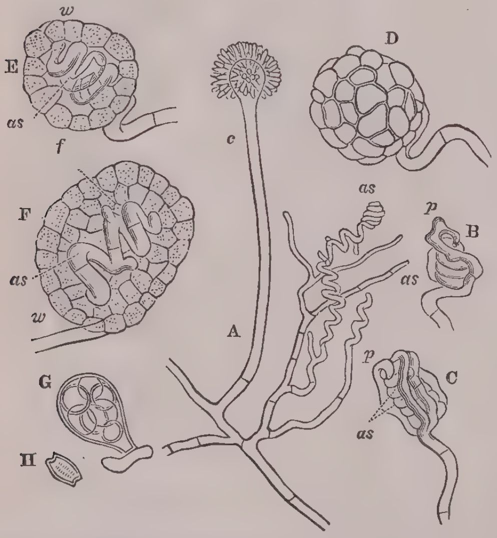

FIG. 6.—Development of *Eurotium repens* (after De Bary). A, small portion of mycelium with conidiophore *c*, and young ascogonium *as*. B, the spiral ascogonium (*as*), with the antheridium (*p*). D, the same, beginning to be surrounded by the hyphæ forming the perithecium wall. D, the perithecium. E, F, sections of young perithecia; *w*, parietal cells; *f*, pseudo parenchyma; *as*, ascogonium. G, an ascus. H, an ascospore.

Spermatia are found in this as in other orders. They are borne in *spermogonia*, similar to those of the *Uredineæ*, and were long believed to be incapable of germination. M. Cornu, however, has recently stated that he caused them to germinate under artificial conditions, and to produce a mycelium like the conidia.

In *Peziza* and the genera closely allied to it, the ascogenous receptacle is basin-shaped, with the hymenium on the inner surface of the basin; but in other genera it takes the form of clubs or stalks of considerable size with the hymenium on the outer surface (as in *Geoglossum*, *Spathularia*, *Helvella*, *Morchella*, etc.).

The species of *Morchella* and *Helvella* are, as a rule, esculent; but none of the other *Discomycetes* have ever obtained any reputation in this direction.

Suborder II.—Erysiphyeæ.—In this suborder the species follow two types in their mode of sexual reproduction, viz., *Erysiphe* and *Eurotium.*

The mycelium of *Erysiphe* creeps over the surface of its host plant, through the epidermis of which it sends down numerous haustoria. Both the conidia and the sexually produced fruits are borne on the same mycelium. The conidia occur in vertical order at the end of unbranched conidiophores. These conidia reproduce the mycelium directly. The mode of sexual reproduction resembles that of the *Discomycetes*. The carpogonium is more or less globular in shape, and is fertilized by a pollinodium of one or more branches. The carpogonium is at first represented by one cell, but after fertilization a transverse wall divides it into two cells, the inferior one of which must be regarded as an ascogenous hypha. The superior one becomes the ascus, which in most cases contains 8 spores. In a few other forms several asci are formed by the carpogonium.

The species of *Eurotium*—*e.g.*, *E. repens* and *E.* (*Aspergillus*) *glaucus*—agree in the more striking details of their life-history with those of *Erysiphe*. The mycelium may be found as a fine flocculent mass on the surfaces of most putrefying organic matter. The usual and most extensive mode of reproduction is by the conidia, which are formed in great abundance at the apex of the conidiophores. These germinate and grow under most varied conditions, which fact, coupled with their plentiful production, explains the general distribution of the fungus. Subsequently the sexual organs arise on the same mycelium. The carpogonium is the end of a mycelial hypha wound up in the form of a corkscrew, with a tranverse septum at each turn of the screw. From the lowest turn two tubes sprout and grow up on the outside of the carpogonium; one always grows more rapidly than the other, and reaches the top of the carpogonium, which it fertilizes. This is the pollinodium. Other cells then grow out from the bases of both organs and envelop them. After fertilization the carpogonium divides into several cells from which the ascogenous hyphæ arise. The asci contain ascospores which germinate as in the other *Erysipheæ*. The whole fructification is called the *perithecium*.

Suborder III.—Tuberaceæ.—The mycelium of the *Tuberaceæ* is in most cases small in comparison with the fructification. This fructification consists usually of a large subterranean tuberous body, possessing a thick wall of pseudoparenchyma, and enclosing a dense mass of hyphæ, among which the ascogenous filaments produce the asci embedded in sterile paraphyses. Conidia are known only in the case of *Penicillium glaucum*, a fungus which, from its common occurrence, and its being well known in all its stages, may be chosen as a type of the suborder. Its mycelium inhabits almost any organic substance, and produces on erect conidiophores long chains of conidia in very great abundance. It is only in darkness that (as in the other *Tuberaceæ*) the sexually produced form of fructification arises. The sexual organs resemble in a very high degree those of *Eurotium* (see preceding suborder), but the development of the fructification after the ascogonium has been fertilized is totally different from the corresponding process. After the ascogonium has begun to germinate, the growth of the enveloping hyphæ so hinders this process that it is forced to rest in a sclerotioid state. If germination, however, be encouraged by artificial means, the ascogenous hyphæ force their way out and form asci, in each of which there are 8 ascospores. These spores, on germinating, produce a mycelium which bears conidia. If the germination of the sclerotia be delayed so long that the ascogenous hyphæ lose the power of producing asci, the enveloping filaments give rise to the conidial form of fructification. The structure of these sclerotia is so similar to that of the well-known tuberous fructifications of the *Tuberaceæ*, that Brefeld, who discovered them, classes *Penicillium* with this suborder, in spite of the very strong resemblance of the sexual organs to those of *Eurotium*. In no other species of *Tuberaceæ* has this life-history been observed.

Suborder IV.—Pyrenomycetes.—The *Pyrenomycetes* produce their asci within round or flask-shaped *perithecia*, with walls of pseudo-parenchyma. The asci contain, as a rule, 8 spores. In some cases the perithecium is open at first, but in others the neck, closed during the earlier stage, forms subsequently a canal through which the spores escape. In the case of the *Sphæriæ simplices*, the perithecia arise on a very fine mycelium, and according to Woronin and others are the result of a sexual act. In *Xylaria* and allied genera, however, the perithecia are formed on sometimes very large club or basin shaped bodies, consisting of dense masses of tissue, which, according to some, are simply the receptacles, and according to others, bearers of sexual organs, the union of which gives rise to the perithecia. Analogy leads to regarding them as receptacles. Conidia are formed not only on the mycelium but also on the stroma, and even occasionally on the hyphæ composing the wall of the perithecium. *Spermogonia* and *pycnidia* are other conceptacles which give rise to asexual organs of reproduction, called respectively *spermatia* and *stylospores*. It was urged with much show of probability that these were parasitic bodies; but the recent researches of Dr. Bauke on the *pycnidia* and M. Cornu on the *spermatia* seem to disprove this view. M. Cornu states that he caused spermatia to germinate and reproduce the mycelium of the species to which they belonged. It will be seen, however, that in the next suborder (*Lichenes*) the analogous spermatia act as male organs,—a function which not only precludes the possibility of their parasitic nature, but does not agree well with M. Cornu's (so far as we know) unconfirmed views. In *Claviceps purpurea* (ergot), which attacks the young ovary of rye, the mycelium first bears conidia embedded in a mucous secretion; this is called the *sphacelia* stage. The mycelium, however, soon permeates the ovary and forms a hard sclerotium—the ergot stage. After undergoing a period of rest, usually from summer to spring, but varying in length, the sclerotium on falling on damp ground pushes out small stalks with a rounded head in which numerous flask-shaped, wall-less perithecia arise. These perithecia bear as usual asci containing ascospores. The ascospores, on germinating, and finding their usual host—the rye, or some nearly related grass—give rise again to the sphacelia, which closes the cycle.

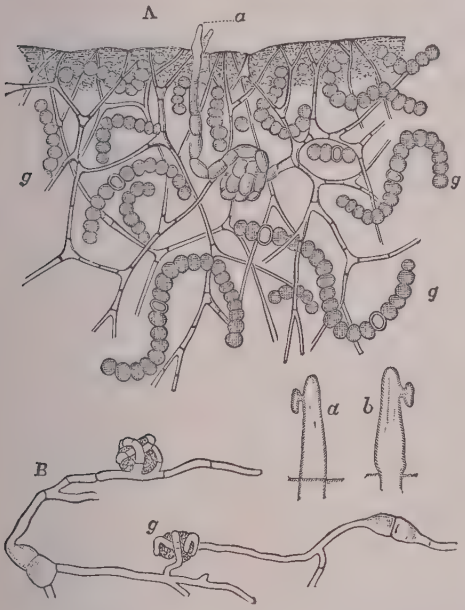

FIG. 7.—A, transverse section through the thallus of *Collema microphyllum*, with *g*, gonidia, and *a*, the point of trichogyne (×350); *a*, *b*, the point of trichogyne with spermatium attached (×750). B, spores of *Thelidium minutulum*, the germinating filaments of which enclose the (*g*) hymenial gonidia of *Endocarpon*. (After Stahl.)

This suborder, like the *Discomycetes*, contains a great number of forms, many of which are known in only one, viz., the perithecium-bearing stage,—the other phases probably being known by other names as distinct genera and species. The *Pyrenomycetes* grow either on dead organic matter or on the bodies of living plants.

Suborder V.—Lichenes.—Until recently, and before their true nature was understood, the *Lichenes* were treated as constituting a separate class of cellular cryptogams or Thallophyta. The researches of Schwendener, Stahl, De Bary, Bornet, and others have proved that these consist of a fungal *Ascomycetous* element parasitic on an algal element. The algal element belongs to the lower orders of *Algæ* and acts as the nourisher of the fungal element. The fungal element is reproduced by *Ascomycetous* reproductive organs, and the algal element, which in a free state is capable of independently subsisting, is reproduced in the manner characteristic of the order of *Algæ* to which it belongs. We have to do here with the life-history of the fungal portion only, but illustration will be given of its relations with its hosts.

Though sexuality is not known to exist generally in the *Lichenes*, it has been so satisfactorily proved in the case of the *Collemaceæ* by Dr. Stahl that it may be concluded that investigation only is necessary to bring fresh cases to light. In the *Collemaceæ* the male organs of reproduction (the *spermatia*) are formed within receptacles called *spermogonia* (similar organs have been described as occurring in the *Uredineæ*, etc.), and though not possessing the power of spontaneous motion, reach the female organ (*trichogyne*) by the agency of water or the atmosphere. The spermatia consist of one simple minute cell; the *trichogynes* are of a more complicated structure, and may be described as consisting of a unicellular organ of conception, a conductive canal, and an ascogonium, consisting of a coiled hypha of several cells. The point of the trichogyne emerges from the surface of the thallus, and the spermatia on coming in contact become united with it by a small tube through which the contents of the male organs fertilize the trichogyne. After fertilization the cells of the ascogonium increase in number and size, and the ascogenous hyphæ spring from the original coil and bear the characteristic asci in which the ascospores are formed.

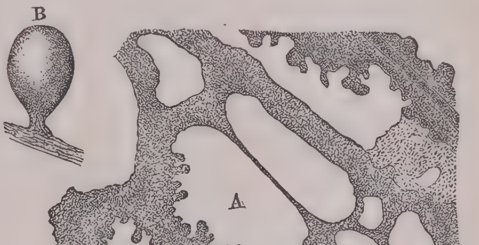

FIG. 8.—A, plasmodium of *Didymium leucopus*. (After Cienkowski ×350.) B, closed sporangium of *Arcyria incarnata*. (After De Bary, ×20.)

The relations between the fungal and the algal elements may be illustrated by the following instance from Dr. Stahl's *Beiträge zur Entwickelungsgeschichte der Flechten*. The Algæ were formerly considered organs of the fungal portion, and received the name of *gonidia*. A smaller form of *gonidia*, called the *hymenial-gonidia*, occurs in interstitial spaces of the apothecia of many Lichens; these *hymenial-gonidia* are the offspring of the ordinary gonidia (the *thallus-gonidia*), and have been carried up in the hymenium by the growth of its hyphæ. When the ascospores are emitted from the apothecia, the *hymenial-gonidia* are cast out also, and falling in the neighborhood of the ascospores are, many of them, enveloped by the germinating filaments proceeding from the spores, when the conditions are favorable for growth. Along with the growth of the hyphæ, these *hymenial-gonidia* increase in size, and ultimately act as the *thallus-gonidia* of the new Lichen. This process has been observed in *Dermatocarpon Schæreri* and *Polyblastia rugulosa*. When this discovery was made by Dr. Stahl, he found growing beside the *Dermatocarpon* a species of *Thelidium*, the *gonidia* of which appeared to belong to the same species of Alga as those of the *Dermatocarpon*. He isolated, under favorable conditions for growth, the spores of *Thelidium* and the *hymenial-gonidia* of *Dermatocarpon*, and soon obtained the thallus of *Thelidium* complete as regards gonidia and fructification. This experiment, by proving that the same species of Alga (in this case a species of *Pleurococcus*) served as the *gonidia* of two totally different fungi, also strongly supports the above views as to the dual nature of the elements composing the Lichen. These views, though supported by the most eminent botanists and backed by incontestable facts, are still occasionally the subject of attack by lichenologists.

The suborder *Lichenes* contains a greater number of species than any other suborder or order of fungi, but it is probable that excessive subdivision has given rise to many. Lichens grow chiefly in exposed situations, such as the bark of trees and rocks, and are very generally distributed throughout the globe. They vary much in size and form, but are generally of a foliaceous or encrusting habit. They form a large proportion of the vegetation of alpine and polar regions. Their economic and medicinal properties are in many cases of importance.

Order V.—MYXOMYCETES.—In the first stage of their life-history the *Myxomycetes* are mobile organisms, differing so strongly from any state of any other vegetable that it was proposed by Professor de Bary to place them among amœboid animal organisms. In this stage, where one would expect a thallus of hyphæ, a mobile plasmodium is found, which in habit of life greatly resembles animal organisms. In appearance it is slimy or creamy, and consists of numerous anastomosing net-like channels, through which there is conducted with more or less rapidity a current of protoplasmic matter containing many foreign bodies, such as particles of coloring matter of different natures, starch granules, diatoms, spores of fungi, etc. These channels are not bounded by any definite membrane, and the direction is frequently changed, probably for the purpose of gathering nourishment. Where one or more individuals are situated near each other these plasmodia occasionally unite (this has been observed between two different species). These mobile masses ultimately, usually after undergoing division, are transformed into motionless fruits, in some cases of regular form (*sporangia*), and in others of irregular (*plasmodiocarp*). Compound fruits called *æthalia*, of regular or irregular form, either naked or enclosed by a membrane (*cortex*), are produced externally on definite sporophores by cell-division, or within the fruit by free-cell formation. On germinating, the contents of the spores escape either in the form of a zoospore with a nucleus, vacuole, and long cilia, or of an amœboid, and these zoospores or amœboids soon aggregate and form mobile plasmodia.

Taking the two generations in their life-history, it will be found that the fructification has probably greater claims to a fungal nature than the plasmodium has to an animal. They have, therefore, been retained in the vegetable kingdom by the majority of botanists,—whether justly or not remains to be determined by future research.

Order VI.—SCHIZOMYCETES.—In the *Schizomycetes*, the usual and apparently most common form of reproduction is by simple segmentation. In several forms, however, reproduction of a higher type has been observed. An instance of this is to be found in *Bacillus anthracis*—the cause of splenic fever—the life-history of which, according to Ewart, Koch, and others, is as follows: At first the *Bacilli* consist of motionless hyaline rods capable of segmentation, which after a short time pass through a motile phase lasting usually several hours. After settling down these rods elongate considerably in a short time; if the temperature be favorable a rod may increase in five hours to from 80 or 100 times its original length. The filaments usually become interwoven like mycelial hyphæ, and are in most cases irregular in their course. Within them spores are soon formed by free self-formation, each spore being separated from its neighbor by a transverse septum. At this stage the filaments decay more or less rapidly and set free the oval spores, which are, from Cohn's measurement, not more than $\frac{15}{25000}$ to $\frac{22}{25000}$ inch in their greatest diameter. According to Koch these spores directly elongate into filaments, but Ewart has more recently observed that they divide into four sporules, each of which germinates by the production of a filament. These filaments become motionless rods such as those from which we started.

In the classification of this order much confusion exists from the meagreness of our knowledge of the life-history of its members. Organisms described as *Micrococcus*, *Bacterium*, and *Bacillus* are apparently in many cases different phases of the same life-history. Much attention has been paid to their influence on diseases of men and animals, from their frequent occurrence on mucous surfaces, on wounds, and elsewhere. An extensive literature has arisen on this subject, but its interest is far more medical than botanical. Whether these organisms are the concomitants or the causes of diseases in men and animals has not often been decided, and is still much debated,—a source of frequent error being the confusion of débris of various kinds with *Bacteria*, etc. "Spontaneous generation" has also been attributed to them, but there has certainly not been anything like proof to support this assertion.

The following are the most important works of reference on this subject:—

Morphology and Physiology.—A. de Bary, *Morphologie und Physiologie der Pilze, Flechten, und Myxomyceten*, Leipsic, 1866; Id., *Die Mycetozoen Schleimpilze*, Leipsic, 1864; Id., *Untersuchungen über die Brandpilze*, Berlin, 1853; Id., "Recherches sur les Champignons parasites," in *Ann. Sc. nat.*, tom. xx., 4e series; Id., *Die Fruchtentwickelung der Ascomyceten*, Leipsic, 1863; Id., *Zur Kenntniss der Mucorinen und Peronosporeen*, Frankfort, 1865; De Bary and Woronin, *Beiträge sur Morphologie und Physiologie der Pilze*, Frankfort, 1864; M. (G. MU.)

FUR. Certain animals, which inhabit the colder climates, have a covering upon the skin called fur, lying alongside of another and longer covering, called the overhair. The fur differs from the overhair in that it is soft, silky, curly, downy, and barbed lengthwise, while the overhair is straight, smooth, and comparatively rigid. These properties of fur constitute its essential value for felting purposes, and mark its difference from wool and silk; the first, after some slight preparation by the aid of hot water, readily unites its fibres into a strong and compact mass; the others can best be managed by spinning and weaving.

On the living animal the overhair keeps the fur filaments apart, prevents their tendency to felt, and protects them from injury—thus securing to the animal an immunity from cold and storm; while, as a matter of fact, this very overhair, though of an humbler name, is most generally the beauty and pride of the pelt, and marks its chief value with the furrier. We arrive thus at two distinct and opposite uses and values of fur. Regarded as useful for felt it is denominated staple fur, while with respect to its use with and on the pelt it is called fancy fur. For the one purpose the Russian hare skin is more valuable than the Russian sable, while for the other the sable may be valued at one thousand times the former.

History.—The manufacture of fur into a felt is of comparatively modern origin, while the use of fur pelts as a covering for the body, for the couch, or for the tent is coeval with the earliest history of all northern tribes and nations. They were not simply a barbarous expedient to defend man from the rigors of an arctic winter; woven wool alone cannot, in its most perfect form, accomplish this. The pelt or skin is requisite to keep out the piercing wind and driving storm, while the fur and overhair ward off the cold; and they are as much a necessity to-day among more northern peoples as they ever were in the days of barbarism. With them the providing of this necessary covering became the first purpose of their toil; subsequently the article grew into an object of barter and traffic, at first among themselves, and afterwards with their neighbors of more temperate climes; and with the latter it naturally became an article of fashion, of ornament, and of luxury. This, in brief, has been the history of its use in China, Tartary, Russia, Siberia, and North America, and at present the employment of fancy furs among the civilized nations of Europe and America has grown to be more extensive than at any former period. The supply of this demand in earlier times led to such severe competition as to terminate in tribal pillages and even national wars; and in modern times it has led to commercial ventures on the part of individuals and companies, the account of which, told in its plainest form, reads like the pages of a romance. Furs have constituted the price of redemption for royal captives, the gifts of emperors and kings, and the peculiar badge of state functionaries. At the present day they vie with precious gems and gold as ornaments and garniture for wealth and fashion; but by their abundance, and the cheapness of some varieties, they have recently come within the reach of men of moderate incomes. The history of furs can be read in Marco Polo, as he grows eloquent with the description of the rich skins of the khan of Tartary; in the early fathers of the church, who lament their introduction into Rome and Byzantium as an evidence of barbaric and debasing luxury; in the political history of Russia, stretching out a powerful arm over Siberia to secure her rich treasures; in the story of the French occupation of Canada, and the ascent of the St. Lawrence to its source in Lake Superior, and the subsequent contest to retain possession against England; in the early settlements of New England, New York, and Virginia; in Irving's *Astoria;* in the records of the Hudson's Bay Company; and in the annals of the fairs held at Nijni-Novgorod and Leipsic. Here it may suffice to give some account of the present condition of the trade in fancy furs. The collection of skins is now chiefly a matter of private enterprise. Few, if any, monopolies exist. The Alaska Commercial Company, now about ten years old, enjoys some special privilege for the taking of seal skins on the Pribiloff Islands, and some peculiar restrictions exist in Russia in relation to certain peltries, but beyond this, the trade in furs is a free one the world over. Individual enterprise, skill, forecast, and capital, have an open field. The Hudson's Bay Company, with its chief office in London, still maintains its organization, but conducts its affairs in North America under no special or royal grant, and competes in the open market with individual traders throughout Canada, Labrador, Manitoba, and Columbia. Its collection of peltries is offered to the highest bidder at public auction in London, in January, March, and September of each year.

Private collectors and dealers throughout Canada and the United States forward their furs to the seaboard, chiefly to New York, for sale there, or for consignment principally to London and to Leipsic. The latter town still maintains the custom of spring and autumn fairs, at which most kinds of wares are sold or exchanged with dealers from Turkey, Austria, and Russia. Nijni-Novgorod is the chief fair for European Russia, though very important fairs are also held in Kasan and in Irbit among the Ural Mountains. The most important fair for eastern Siberia is held at Kiachta, on the borders of China, where an extensive exchange of furs is carried on with the Celestials. Japan has added but little to the activity or extension of the fur trade, though her northern shores have furnished many a fine fur seal and sea otter to the hardy navigator. Staple furs, or those used chiefly in the manufacture of hats, are those of the hare and the rabbit, collected mainly in Russia, Germany, France, and England, dressed, carroted, and cut from the skin in western Germany, France, Belgium, and England, and thence distributed to the manufacturing centres of the world; and here it may be added that the clippings and cuttings of fancy furs from the workshops of furriers are all saved, and find their way to the machinery which utilizes the waste and transforms them into hatters' furs. But of all these fur marts that of London is the chief, for thither tend by the laws of trade, not only much of the produce of Asia and Europe, but also the fine peltries of Chili and Peru, the nutria from Buenos Ayres, the fur seal of Cape Horn and South Shetland, the hair seal from Newfoundland, as well as the inferior peltries of Africa. To prepare fur skins in a way to endure this long transportation is a simple and easy matter. When stripped from the animal the flesh and fat are carefully removed, and the pelts hung in a cool place to dry and harden; nothing is added to protect them. Care is taken that they do not heat after packing, and that they are occasionally beaten to destroy worms. A marked exception is the case of the fur seal, which is best preserved by liberal salting and packing in hogsheads. All other raw furs are marketed in bales.

Kinds and Quantities.—Few kinds of animals furnish a pelt of suitable weight and pliability, and all of them differ widely in elegance of texture, delicacy of shade, and fineness of overhair, and it is these differences which determine their place in the catalogue of merchandise. These few animals are not very prolific, and many of them attain their greatest beauty in wild and uncultivated regions. To this remark there are some notable exceptions. Being thus few in kind, and limited in quantity, one might fear the extinction of the several choice varieties through the persistent energy of the trapper. But here the fickleness of fashion steps in, and does for the fur trade what the law of supply and demand does for the more staple articles of commerce. Fashion, fastidious and fickle, neglects the use of certain kinds for a season; the market price of the pelt no longer repays the outfit of the trapper; the hunt is intermitted, and in two or three years the animal regains its numbers and strength. The annual collection of furs is thus a matter of ceaseless change; but the following may be relied on as an estimate correct enough for all practical purposes:—

Average Annual Collection.

Badger	America	5,000
“	Europe and Asia	50,000
Bear	America	15,000
“	Europe and Asia	4,000
Beaver	Asia	20,000
“	America	200,000
Buffalo	America	100,000
Chinchilla	Peru and Chili	100,000
Cat, Wild		10,000
“ House		1,000,000
Ermine	Asia and Europe	400,000
Fisher	America	12,000
Fitch	Europe	600,000
Fox, Silver	Asia and America	2,000
“ Cross	Asia and America	10,000
“ Blue	Europe and America	7,000
“ White	Arctic	75,000
“ Red	Asia and Europe	300,000
“ “	America	60,000
“ Gray	America	30,000
“ Kitt	America	40,000
Hamster	Europe	200,000
Hare	Asia and Europe	4,500,000
Kolinsky	Asia	80,000
Lamb	Persian	100,000
“	Astrakhan	600,000
“	European	2,000,000
Lion		500
Lyme		50,000
Marten	America	130,000
“ Stone	Europe	150,000
“ Baum	Europe	60,000
“ Russian Sable		100,000
Mink	America	250,000
“	Russia	50,000
Monkey	Africa	40,000
Musk Rat	America	3,000,000
“	Russia	100,000
Nutria	South America	3,000,000
Opossom	America	250,000

Otter, Land		40,000
" Sea	North Pacific	5,000
Rabbit	Europe	5,000,000
Raccoon	America	500,000
Seal, Hair	Atlantic	1,000,000
" Fur	Pacific	200,000
Skunk	America	350,000
Squirrel	Siberia	6,000,000
Tiger	Bengal and North China	500
Wolf		25,000
Wolverin		3,500

For the habits of these animals, and their modes of life, reference must be made to the separate articles, and to such works as those of Cuvier and Brehm. But a brief account may be given here of the different qualities of the pelts, with some general remarks as to their average value and their customary uses.

Badger.—Size, 2 by 3 feet; overhair coarse, 3 to 4 inches long, black with silver spots. The German are the best. Fur woolly. American have softer overhair. Used for robes, military trappings, and brushes. Value of prime, from 2s. to 6s. per skin.

Bear, Black.—Size, 3 by 6 feet; overhair 6 to 8 inches long, fine, flowing, and glossy; fur thin. Best are American. Used for robes, military caps, and mats. The finest are the cubs. Value of prime, from £1 to £4.

Bear, Brown.—Same size as the black, and very fine in overhair. Found only in the Hudson's Bay territory. Used for muffs and garniture. Value of best prime, £15. Quantity very small.

Bear, Grizzly.—Larger than the black; coarse hair; thick heavy pelt. Only found in western part of United States. Used as robes. Value, £1 to £2.

Bear, White.—Largest of the bear family; hair short and rigid; pelt thick. Found only in the Arctic regions. The best pure white are used for robes. Value from £10 to £20.

Beaver.—Size, 2 by 3 feet; overhair 3 inches long, coarse and brown in color; fur thick, fine, and dark gray. Best are from Labrador and Moon Fort. Used in every form and fashion in all northern countries; highly prized in Russia and China. Value from 4s. to 12s. per pound in the raw parchment state.

Buffalo.—Size, 8 to 12 feet long; hair coarse, color dun brown. Only found on the western and northern American prairies. Best are from the region of the Saskatchewan river. Prime are used as robes; coarse and unprime as leather for moccasins. Value 12s. to £2.

Chinchilla.—Two kinds, real and bastard. Size of real, 8 by 12 inches; overhair and fur of equal length—about 1½ inches long, very fine, and like wool may be spun and woven; color silver gray and dark. Best are from Peru. Used for muffs, boas, and borders on garments; value from 4s. to 12s. The bastard are from Chili (chinchilla means the Chilian skin), short in fur, small in size, weak in pelt, and are worth from 5d. to 10d.

Cat, Wild.—Overhair and fur thin and coarse; color gray; value and uses very limited. Civet cats are sometimes admired for their singular marks, but are in poor demand. House cats are too well known to require a description. Their colors are black, gray, red, and mottled. Best come from Holland; the poorest from Russia. Used very generally for fur work. Price of best black 4s. to 8s.; other sorts nominal.

Ermine.—Size, 4 by 10 inches; overhair and fur fine, soft, and close; pelt thin and tough; color pure white, the tip of the tail black. Best are from Barabinsk and Ischim, in Siberia. Used for muffs, garments, and linings. Value variable; the best have been as high as 6s., and as low as 7d.

Fisher.—Size, 15 by 30 inches; overhair very fine, glossy, dark, and durable, 2 inches long; fur close; tail 12 inches long, bushy, and dark. A right noble skin. Best from British America. Value from £2 to £4.

Fitch.—Size about that of the American mink; overhair fine, 1½ inches long, with dark points; fur a golden yellow. Best from Germany, Holland, and Denmark; smallest from Russia. Used for ladies' furs according to the prevalent fashion. Value from 2s. to 6s.

Fox, Silver.—Size, 2 by 4 feet; overhair thick and fine, 3 inches long, varied in color from pale silver to a brilliant blue black; fur fine and curly; its beauty places it at the head of all fancy furs; the tail is a royal brush. The choicest are from Labrador and Moon Fort; those of Russia are more woolly and less valuable. Used for muffs, boas, and linings of robes. Price from £10 to £40.

Fox, Cross.—Not quite so large as the silver, with fine overhair, but a shade of red at the points, and from the paleness of the fur making a distinct dark cross at the shoulders. Best are from the Hudson's Bay territory, and valued from £2 to £8.

Fox, Blue.—Size the same as the cross, with gray-blue overhair, and a woolly fur. The finest are from Archangel on the White Sea, and from Greenland. Value from £2 to £4.

Fox, White.—Size the same as the cross, with pure white overhair and fur. The best are from Labrador, the poorest from Asia. Value from 4s. to 12s.

Fox, Red.—Well known to all northern nations; abundant in Europe, but in size and beauty inferior to the American family. The former fetch 4s., while those from Labrador are valued at 16s.

Fox, Gray.—Only found in the United States. Overhair is gray, sprinkled with silver on the back, the sides are yellow, and the tail an ashen gray. Value from 4s. to 8s.

Fox, Kitt.—Found in north-west America and in Tartary. Overhair fine; the back is a pure gray, the sides yellow, and the belly white. In size it is the smallest of the foxes. Price from 1s. to 3s.

Hamster.—Size, 3 by 5 inches; hair short and close, back gray and the sides yellow. A great trouble to the farmers in Germany, who spare no pains to exterminate them. The pelt is made into linings for cloaks.

Hare.—Overhair fine; fur very long, fine, abundant, and strong: pelt weak; color gray and white. Best are from Russia. This skin is largely used by furriers, but its fur is among the best for hatters' purposes. Value from 5d. to 1s.

Kolinsky.—Found only in Asia, and attains the size of the American mink; overhair a golden red, 1½ inches long. The tails make excellent pencils for painters. Value from 2s. to 4s.

Lamb.—The finest, dark, close curled skins come from Persia; the next grade from the Crimea, and are gray in color; inferior skins from Astrakhan. All these are used by furriers for caps, borders, and garments. The finest Persian are worth 12s. to £1, the Crimean 6s., and the Astrakhan from 1s. to 2s. The lamb-skins of western Europe are used for lining gloves. Angora sheep are sometimes in demand, and are colored red, blue, gray, and orange to suit the fashion for fringes and borders. Their value is from 12s. to £2.

Lion.—The finest from Asia. Specimens are rare, and price variable.

Lyme.—Size, 2 by 3½ feet; overhair fine and flowing, of a clear silver blue shade, sprinkled with black; length of overhair 3 to 4 inches. Best are from Sweden and Labrador. Value from 8s. to £1.

Marten, American.—Size from 5 by 15 inches to 8 by 20 inches; overhair fine and flowing, 1 to 2 inches long; fur close and thick; color of best a dark coffee brown, of poorest a pale yellow. The finest are from the Great Whale River and Labrador. Always a choice and valued pelt. Price of best £5, of poorest 2s. The tips of the tails are highly prized for artists' brushes.

Marten, Stone.—Found in Europe; the best from Hungary and Turkey. Color a dull gray, overhair coarse, and fur woolly. Value of best prime, 8s. to 12s.

Marten, Baum.—Found in Europe and Asia, of fine overhair, but woolly fur, of a brownish color, approaching that of the American marten, and furnished with a long and bushy tail. Value from £1 to £2.

Marten, Russian Sable.—These skins are in the highest estimation with furriers. Size about the same as the American marten, but the overhair is much more fine and flowing, of a rich bluish dark shade, and from 1½ to 2½ inches long; the pelt is very soft, tough, and durable. The best are from Yakutsk in Siberia. The next from the Lena river, and the poorest from the lower Amoor. Very choice grades, but of a browner shade, are furnished by Kamschatka. Value of the poor Saghalien from 4s. to 8s.; while the darkest from Okhotsk will command £30.

Mink, American.—This valuable skin has nearly the size of the marten, with an overhair that is shorter and slightly more rigid, but vies with the marten in elegance of lustre, the choicest having a dark blue shade that is always admired in furs. The best are from Nova Scotia, the State of Maine, and the Labrador coast. It is most abundant in the middle and north-western States. Value of the best, from 12s. to £2.

Mink, Russian.—Of smaller size than the American, and inferior in all other respects, but still a valuable pelt. Price of prime, from 2s. to 6s.

Monkey.—From the west coast of Africa; has a long, thin, flowing hair; of various colors, chiefly black and dun gray. Has a limited use with furriers, fetching from 2s. to 6s.

Musk-Rat.—A well-known fur in North America. Size 8 by 12 inches; overhair coarse and light brown; fur fine, thick, and silky; in general favor with furriers, and available for a great variety of purposes. Best are from New England and New York; very prolific in cultivated regions. The price is very fluctuating, and as the annual collection varies from three to five millions of skins, it is difficult to forecast the market value. Price for prime, from 6d. to 3s. A variety of black colored musk-rat from Delaware and Maryland fetches double these prices.

Nutria.—From the La Plata, South America; in size and value between the beaver and the musk-rat; overhair coarse and rigid; fur short and fine; pelts too often unsound, and hence the value of the fur is chiefly for hats. Price of dry skins from 1s. to 2s. per pound.

Opossum.—Chiefly from the United States, but some also from Australia. Overhair long, coarse and whitish gray; fur woolly. Best from Ohio. Value from 5d. to 2s.

Otter.—Comes from all northern countries. Size of best, 2 by 5 feet; overhair thick and close; color brown black. Best are from Labrador and Canada. The skin is in high reputation and general use with furriers. Value of best, £1, 10s. to £3.

Otter, Sea.—Found only in the North Pacific Ocean, on the coasts of Alaska, Kámchatka, and Japan. Size, 2 by 6 feet; overhair exceedingly fine, and extending but little beyond the fur, which itself is very thick, close, fine, and silky; color dark brown, occasionally with silver points regularly interspersed; pelt pliable and firm. The poorest skins are not more valuable than those of the beaver; but the fine choice specimens command from £20 to £100. They are in high repute with the Russians and Chinese.

Rabbit.—Size, 10 by 16 inches: fur thick and fine; pelt weak; color all shades from black to white. Best are found in England, but the purest come from Poland. The best colored skins are used by furriers, but much the larger portion is cut for hatters' fur. The animal is largely bred in warrens, and its flesh used as food; the pelts thus become of secondary importance, and, being abundant, supply a cheap fur.

Raccoon.—One of the peculiar and valuable pelts of the United States, and flourishing best in cultivated regions. Size, 1 by 2 feet; overhair not fine, but bright in color, 3 inches long, thick, and flowing; fur resembling that of the beaver; color from silver blue to gray brown and coffee brown. Best are from Michigan and Ohio. Average value of prime, 4s. Some specimens vie with the fisher in its peculiar shade, and some even with the silver fox, and such rare skins bring from £1 to £4.

Seal, Hair.—Chiefly from the North Atlantic. Size from 3 to 10 feet; hair coarse and rigid; no fur; divided into white coats, blue backs, mottled, and ordinary. Used for saddlery and military purposes. Average price, 2s.

Seal, Fur.—Found only in the Pacific and in the South Atlantic. Size of the wigs, 4 by 8 feet; of the large, 3 by 6 feet; middling, 2½ by 5 feet; small, 2 by 4 feet; the pups vary in length from 2 to 4 feet. Overhair coarse and rigid; fur fine, thick, silky, and very uniformly distributed. Pelt thin, pliable, and of light weight. The largest number come from Alaska, whence 100,000 are allowed by law to be brought annually. The best of these are the prime middling pups. Value varies from £1 to £3 in the salted state. A few fine skins come from the coast of British Columbia, and being caught in winter are in prime condition. The choicest skins are taken on the South Shetland and South George Islands in the Antarctic Ocean. Fur fine beyond comparison; pelt very pliable, light, and thin and firm. Value salted, from £2 to £10.

Skunk.—Another peculiar production of North America. Size, 10 by 16 inches long; overhair fine, 3 inches long, dark blue and coffee brown, thick, glossy, and flowing. Many have two white stripes, more or less broad, extending from the head to the tail. It is now easy to deodorize the skin, and the fur is a popular one in all countries. The best are from New York and Ohio; value of best prime black, from 4s. to 10s.

Squirrel.—Only those of northern Europe and Asia have a value as merchandise. American are worthless. Size, 3 by 6 inches; overhair and fur equally fine; color from pale blue to clear dark blue; best are from eastern Siberia; palest and poorest from European Russia; bellies white; tails long and bushy. This fur is in universal demand among furriers for muffs and linings, as well as for large garments. Pelt pliable and tough; fur durable, close, and fine. The tails are made into boas and brushes.

Tiger.—Specimens are rare. Those from Bengal are large and short in hair, but well marked; while those from northern China have hair 2 to 3 inches long, and frequently measure 10 to 14 feet in length. Value of the latter, from £10 to £20.

Wolf.—The largest are from Labrador, measuring from 4 to 6 feet long, chiefly gray-brown in color, with long, flowing, coarse overhair. The finest are from Fort Churchill, and fetch a high price. The American prairie wolf is a variety inferior in every respect. Price of best, £2; of the inferior, 4s. The wolf is very destructive of the fur-bearing animals, and is an object of extermination with all trappers.

Wolverin.—From Russia, Norway, and Hudson's Bay. Color a clear dark brown, overhair coarse, 2½ inches long. Value from 12s. to 24s.

Of the fur-bearers, those that seek their food in water have their finest but shortest fur on the belly, and longer fur upon the back; while those that avoid the rivers have their longest and finest fur upon the back, and their bellies clothed with fine, long, flowing overhair.

Dressing.—Raw furs are made ready for use by softening the pelt with pure butter or sweet oil, trampling them in tubs filled with fine hardwood sawdust at about blood heat, drawing the pelt over a sharp knife to remove every particle of flesh, and finally trampling them again in clean sawdust. The pelt thus becomes soft and pliable like the fine kid used for gloves. They are then ready for the furrier, who assorts the skins as to color and overhair, and cuts them in various ways to bring them to the pattern of the article required. Having been sewed together with a close fine overseam, the article is damped, and stretched upon a smooth pine board after a pattern marked, then nailed along its edges and left to dry. After removal from the board the article is trimmed, and softened by rubbing, and is then ready for the liner. The skill of the furrier lies in the taste exhibited in the arrangement of the furs, and in the economy of use of material.

Dyeing.—Furs are dyed in a variety of ways to make them uniform in color, and adapt them to the fashion and taste of the time. Ordinarily this is a cheap and ready process, and only becomes an art when employed upon fine skins, from which the overhair has been first removed by plucking, leaving the fur alone to receive the dye-stuff. Among these are the skins of the musk-rat, beaver, otter, and especially the fur seal; the last has received very careful attention, as its entire value depends upon the perfection and success of the process. Unprime fur seals part with their overhair very reluctantly, while the seasoned skins are very readily unhaired, leaving the fur in all its smoothness; thus the best grades are likely to be very good, while the rest rank only from ordinary to very common. A subsequent process is the removal of all grease from the fur, which is effected by repeated washings in softened water; if this is imperfectly done, the color will be uneven and not permanent. The final work is to prepare a dye of suitable strength, and apply it in a suitable way to infuse the coloring matters into the fur, without suffering too much of it to reach the pelt, whereby its durability might be ruined. London claims to have accomplished this for the sealskin in a manner that distances all competition; and it certainly enjoys a wide popularity, as well as the substantial fruits of the sale of its production of colored seals. But America also has its successful dyers of seals, one of the most important of the results they have achieved being the giving to the fur seal a fine deep brown color, without injuring or burning the fur, while leaving the pelt soft, light, and durable.

Prices of Fancy Furs.—The market value of dressed and manufactured furs is at the mercy of fickle fashion and the weather. The production of any one variety is very limited, and consequently those that are in fashion during a cold winter command full and even extravagant prices, while others, of equal intrinsic merit, have a merely nominal value. The consumer is not more responsible for this than are the furrier and the fur merchant. It was the remark of an old and successful fur dealer that "furs when wanted are diamonds, when not wanted are charcoal." This fact renders the trade an extremely hazardous one, and tends to make the venture in it a matter of speculation rather than of provident enterprise; and while the consumer occasionally may have to pay a very extravagant price for some few varieties of furs for a short period, it happens far more frequently that the fur dealer is a severe sufferer by reason of sanguine anticipations of advance in values, which in nine cases out of ten are doomed to disappointment. FUREEDPORE. See FARIDPUR.

FURETIÈRE, ANTOINE, best known as the author of a *Dictionnaire Universel de la Langue Française*, was born at Paris in 1620, and died 14th May, 1688. He first studied law, and practised for a time as an advocate, but finally entered the church and became abbé of Chalivoy. In his leisure moments he devoted himself to letters, and in virtue of his satires—*Nouvelle Allégorique ou Histoire des derniers troubles arrivés au royaume d'éloquence*, 1658; *Voyage de Mercure*, 1659, etc.—he was admitted a member of the French Academy in 1662. That learned body had long promised to the world a complete dictionary of the French tongue; and when they heard that Furetière was on the point of issuing a work of a similar nature, they interfered, alleging that he had purloined from their stores, and that they possessed the exclusive privilege of publishing such a book. After much bitter recrimination on both sides the offender was expelled in 1685; but for this act of injustice he took a severe revenge in his satire *Couches* *de l'Académie.* The reply which he made to the Academician Charpentier, entitled *Factums,* ran through four editions. His dictionary was published at Rotterdam two years after his death. It was afterwards revised and improved by Basnage, who published his edition in 1701 and again in 1725; and it continued to enjoy a high reputation till the appearance of the *Dictionnaire de Trévoux,* for which indeed it furnished the basis. Furetière's other works do not possess any great literary merit; but one of them, *Le Roman Bourgeois,* is of interest as descriptive of the every-day life of his times, and has been reprinted in 1855 under the editorship of Ed. Fournier and Ch. Asselineau. The *Fureteriana,* which appeared in Paris eight years after Furetière's death, is a collection of but little value.

FURIES (FURIÆ, also called DIRÆ) are not native to Latin mythology, but adopted and modified from the Greek *Erinyes* (see ERINYES). Originally denoting the avenging power exerted by nature against all transgressors of its regular order, and spoken of by older poets (Homer, Æschylus, etc.) either simply in the singular or in the plural as an indefinite number, the Erinyes assumed later a more rigid and methodical form. As the conception of a future life grew, they were invested with the duty of punishing sinners, and were settled in Tartarus (Virgil, *Æn.* vi.); their number was fixed down to the sacred three (a number mentioned so early as Eurip., *Orestes*), and individual names, Allecto, Tisiphone, and Megæra, occur first in the Alexandrian poets and are adopted in Latin. But besides this, Virgil, and the later poets in imitation of him, frequently employ the Furiæ in another way which is also suggested by a Greek original. The Erinyes are said to madden the transgressor and lead him into further crimes which work their own punishment (*Il.* xix. 87; *Od.* xv. 234); and Æschylus by a strong metaphor calls Helen an Erinys, as it were, a scourge of men (*Agam.* 729). Virgil develops this thought so as to make the Furiæ the agents employed by the higher gods to stir up all mischief and strife and hatred on the earth. They sit close by the throne of Jupiter, ready to execute his errands of ill (*Æn.* xii.); Allecto is sent by Juno to raise the war against Æneas (so also Ovid, *Met.* iv. 473; Statius, *Theb.* i., etc.); they are the *pronubæ* of an unhappy marriage (Lucan, viii. 90). Without regard to ethical propriety, they are employed as a convenient poetic machinery. The free, fluid conception of the Greek myth, hiding in it the deepest truth and capable of infinite growth, was in this case, as so often among the Latins, either hardened into a stiff, lifeless morality, or altered into a fanciful device to suit a capricious and arbitrary system of divine action. There are also some relics of an ancient Italian conception akin to the Erinys. Goddesses named Furinæ were powerful in the underworld; they had their own flamen Furinalis, their festival Furinalia on July 25th, their grove across the Tiber, where C. Gracchus was slain. Like Erinys the word is used both in singular and in plural; and both Furina (root bhur) and Erinys (root sar) mean "the rapidly moving" (see Kuhn in *Zeitschrift,* i.). At a very early period this genuine native idea disappeared before the Grecizing tendency, and was in the time of Varro almost forgotten (Varro, *L. L.* vi. 19).

For the artistic representation see Böttiger, *Furienmaske.*

FURNACE. Under this name are included all contrivances for the production and utilization of heat by the combustion of fuel.

The word is common to all the Romance tongues, appearing in more or less modified forms of the Latin *fornax.* But in all those languages the word has a more extended meaning than in English, as it covers every variety of heating apparatus; while here, in addition to furnaces proper, we distinguish other varieties as *ovens, stoves,* and *kilns.* The first of these, in the form *Ofen,* is used in German as a general term like the French *four;* but in English it has been restricted to those apparatus in which only a moderate temperature, usually below a red heat, is produced in a close chamber. Our bakers' ovens, hot-air ovens or stoves, annealing ovens for glass or metal, etc., would all be called *fours* in French and *Oefen* in German, in common with furnaces of all kinds. Stove, an equivalent of oven, is from the German *Stube, i.e.,* a heated room, and is commonly so understood; but it is also applied to open fireplaces, which appears to be somewhat of a departure from the original signification.

Furnaces are constructed according to many different patterns with varying degrees of complexity in arrangement; but all may be considered as combining three essential parts,—namely the fire-place in which the fuel is consumed, the heated chamber, laboratory, hearth, or working bed, as it is variously called, where the heat is applied to the special work for which the furnace is designed, and the apparatus for producing rapid combustion by the supply of air under pressure to the fire. In the simplest cases, the functions of two or more of these parts may be combined into one, as in the smith's forge, where the fire-place and heating chamber are united, the iron being placed among the coals, only the air for burning being supplied under pressure from a blowing engine by a second special contrivance, the tuyere, tuiron, twyer, or blast pipe; but in the more refined modern furnaces, where great economy of fuel is an object, the different functions are distributed over separate and distinct apparatus, the fuel being converted into gas in one, dried in another, and heated in a third, before arriving at the point of combustion in the working chamber of the furnace proper.

The most obvious distinction that can be used in the classification of furnaces is founded on the method adopted for supplying air, which may either be blown into the fire, under a pressure above that of the atmosphere sufficient to overcome the resistance presented by the packed columns of fuel and other materials to its free passage, or be drawn through it by a partial vacuum in a chimney formed by the heated gases on their way to the atmosphere. The former are known as *blast furnaces,* and the latter as *chimney draught air,* or *wind furnaces.*

Stack and Blast Furnaces.—The blast furnace in its simplest form is among the oldest, if not the oldest, of metallurgical contrivances. In the old copper smelting district of Arabia Petræa, clay blast pipes dating back to the earlier dynasties of the ancient empire of Egypt have been found in great numbers, buried in slag heaps; and in India the native smiths and iron workers continue to the present day the use of furnaces of similar primitive types. These, when reduced to their most simple expression, are mere basin-shaped hollows in the ground, containing ignited charcoal and the substances to be heated, the fire being urged by a blast of air blown in through one or more nozzles from a bellows at or near the top. This class of furnace is usually known as an open fire or hearth, and is represented in a more advanced stage of development by the Catalan, German, and Walloon forges formerly used in the production of malleable iron, and still current to some extent in Sweden, Corsica, and a few places in central Europe. Figs. 1 and 2 represent a Catalan forge in use a few years since at Montgaillard, in Ariége, then one of the few localities in which the process survived. It is now probably completely abandoned. In all of these the parts are essentially the same: the cavity in the ground is represented by a pit of square or rectangular section lined with brick or stone of a kind not readily acted on by heat, about 1½ or 2 feet deep, usually somewhat larger above than below, with a tuyere or blast pipe of copper penetrating one of the walls near the top, with a considerable downward inclination, so that the air meets the fuel some way down. In the work of iron-smelting, the ore is laid in a heap upon the fuel (charcoal) filling up the hearth, and is gradually brought to the metallic state by the reducing action of the carbonic oxide formed at the tuyere. The metal sinks through the ignited fuel, forming, in the hearth, a spongy mass or ball which is lifted out by the smelters at the end of each operation, and carried to the forge hammer. The earthy matters form a fusible glass or slag melt, and collect at the lowest point of the hearth, whence they are removed by opening a hole pierced through the front wall at the bottom. The active portion of such a furnace is essentially that above the blast pipe, the function of the lower part being merely the collection of the reduced metal; the fire

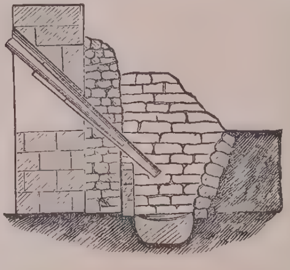

FIG. 1.—Elevation of Catalan Forge.

may therefore be regarded as burning in an unconfined space, with the waste of a large amount of its heating power. By continuing the walls of the hearth above the tuyere, into a shaft or stack either of the same or some other section, we obtain a furnace of increased capacity, but with no greater power of consuming fuel, in which the material to be treated can be heated up gradually by loading it into the stack, alternately with layers of fuel, the charge descending regularly to the point of combustion, and absorbing a proportion of the heat of the flame that went to waste in the open fire. This principle is capable of very wide extension, the blast furnace being mainly limited in height by the strength the column of materials or "burden" has to resist crushing under the weight due to the head adopted, and the power of the blowing engine to supply blast of sufficient density to overcome the resistance of the closely packed materials to the free passage of the spent gases. The consuming power of the furnace, or the rate at which it can burn the fuel supplied, is measured by the number of tuyeres and their section. In the largest modern blast furnaces used for smelting iron ores, they may be as many as six or eight, but as a rule the smaller number of from three to five of larger area is adopted, and with these there is no difficulty experienced in burning from 80 to 100 tons of coke per day in hearths of 5 to 7 feet in diameter.

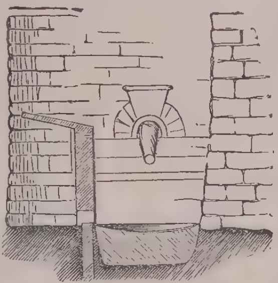

Fig. 2.—Elevation of Catalan Forge.

The profile adopted for blast furnaces has been very much varied at different times. The earliest examples were invariably square or rectangular in horizontal section, and the same class of form has been retained in many instances up to the present time; but the general tendency of modern practice is to substitute round sections, their construction being facilitated by the use of specially moulded bricks which have entirely superseded the sandstone blocks formerly used. The vertical section, on the other hand, is subject to considerable variation according to the work to which the furnace is applied. Where the operation is simply one of fusion, as in the iron-founder's so-called cupola, in which there is no very great change in volume in the materials on their descent to the tuyeres, the stack is nearly or quite straight-sided, but when, as is the case with the smelting of iron-ores with limestone flux, a large proportion of volatile matter has to be removed in the process, a wall of varying inclination is used, so that the body of the furnace is formed of two dissimilar truncated cones, joined by their bases as in fig. 3, the lower one passing downwards into a short, nearly cylindrical, position. The upper cone DC is known as the stack proper, the lower one, from the broadest part C to the tuyeres B, as the boshes, and the lower cylindrical part AB as the hearth. The further consideration of this subject belongs, however, more particularly to the article Iron. It may be sufficient to say that all blast furnaces of large size are more or less reducible to this pattern.

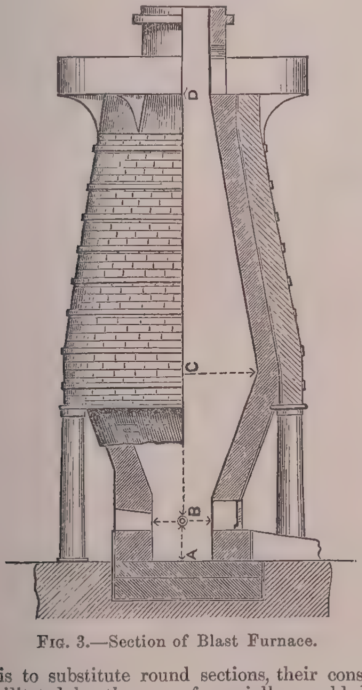

Fig. 3.—Section of Blast Furnace.

The use of bellows or of analogous contrivances is not essential to the working of stack furnaces; as the supply of air may, in furnaces of small size, be equally well obtained by the draught of a chimney, or a steam jet aspirator. The former plan is adopted in the so-called economic furnace (*hornoeconomico*) of the Cartagena lead district in Spain, used in resmelting old slags and waste products of the Roman mines, and the latter in Woodward's and Ireland's cupolas for iron foundries. In either case numerous holes representing tuyeres are provided round the lower part of the furnace, often in two rows at different heights. These furnaces have not, however, been very generally adopted; and even in Spain the chimney draught has in many instances been replaced by a fan blower.

A more primitive form of the same contrivance is still in use in Burmah,—the furnace, about 5 or 6 feet high, being placed on the side of a bank facing the prevailing wind, which enters through a series of small round tuyere holes. Similar contrivances were used by the ancient Celtic inhabitants of the Rhine valley,—the ruins of furnaces and slag heaps being found in the Nassau and Eifel hill countries, in high exposed situations far away from streams, where water power for bellows could have been obtained.

Reverberatory Furnaces.—Blast furnaces are, from the intimate contact between the burden to be smelted and the fuel, the least wasteful of heat; but their use supposes the possibility of obtaining fuel of good quality and free from sulphur or other substances likely to deteriorate the metal produced. In all cases, therefore, where it is desired to do the work out of contact with the solid fuel, the operation of burning or heat-producing must be performed in a special fire-place or combustion chamber, the body of flame and heated gas being afterwards made to act upon the surface of the material exposed in a broad thin layer in the working bed or laboratory of the furnace by reverberation from the low vaulted roof covering the bed. Such furnaces are known by the general name of reverberatory or reverbatory furnaces, also as air or wind furnaces, to distinguish them from those worked with compressed air or blast.

Originally the term cupola was used for the reverberatory furnace, but in the course of time it has changed its meaning, and is now given to a small blast furnace such as that used by iron-founders,—reverberatory smelting furnaces in the same trade being called air furnaces.

Figs. 4, 5, and 6 represent a reverberatory furnace such as is used for the fusion of copper ores for regulus, and may be taken as generally representing its class. The fire-place A is divided from the working bed B by a low wall C known as the fire bridge, and at the opposite end there is sometimes, though not invariably, a second bridge of less height called the flue bridge D. A short diagonal flue or up-take E conveys the current of spent flame to the chimney F, which is of square section diminishing by steps at two or three different heights, and provided at the top with a covering plate or damper G, which may be raised or lowered by a chain reaching to the ground, and serves for regulating the speed of the exhaust gases, and thereby the draught of air through the fire. Where several furnaces are connected with the same chimney stack, the damper takes the form of a sliding plate in the mouth of the connecting flue, so that the draught in one may be modified without affecting the others. The fire bridge is partially protected against the intense heat of the body of flame issuing through the fire arch by a passage to which the air has free access. The material to be melted is introduced into the furnace from the hoppers HH through the charging holes in the roof. When melted the products

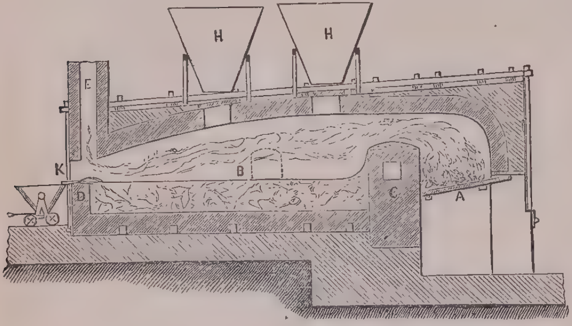

Fig. 4.—Longitudinal section of Reverberatory Furnace.

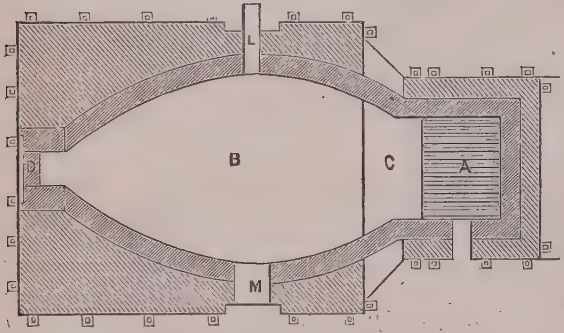

Fig. 5.—Reverberatory Furnace (horizontal section.)

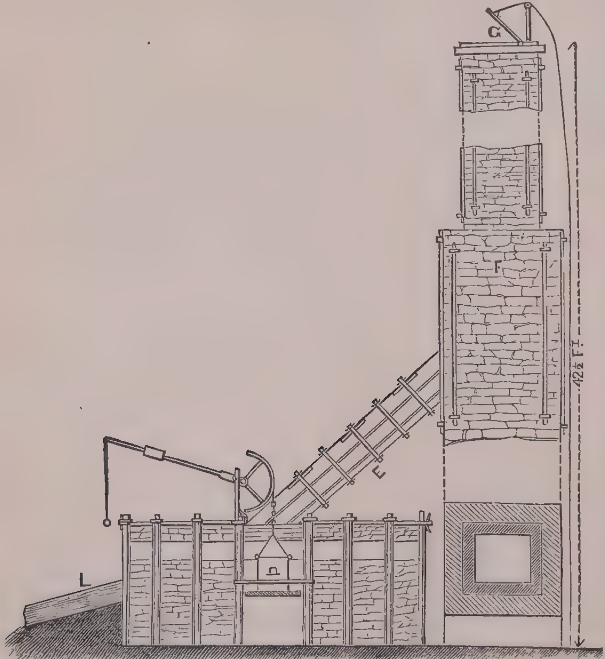

Fig. 6.—Reverberatory Furnace (elevation at flue end).

separate on the bed (which is made of closely packed sand or other infusible substances), according to their density; the lighter earthy matters forming an upper layer of slag are drawn out by the slag hole K at the flue end into an iron wagon or bogie, while the metal subsides to the bottom of the bed, and at the termination of the operation is run out by the tap hole L into moulds or granulated into water. The opposite opening M is the working door, through which the tool for stirring the charge is introduced. It is covered by a plate suspended to a lever, similar to that seen in the end elevation (fig. 6) in front of the slag hole.

According to the purposes to which they are applied, reverberatory furnaces may be classed into two groups, namely, fusion or melting furnaces, and calcining or wasting furnaces, also called calciners. The former have a very extended application in many branches of industry, being used by both founders and smelters in the fusion of metals; in the concentration of poor metallic compounds by fusion into regulus; in the reduction of lead and tin ores; for refining copper and silver; for making malleable iron by the puddling processes and welding; and for the manufacture of carbonate from sulphate of sodium in chemical works, etc. Calcining furnaces have a less extended application, being chiefly employed in the conversion of metallic sulphides into oxides by continued exposure to the action of air at a temperature far below that of fusion, or into chlorides by roasting with chloride of sodium. As some of these substances (for example, sulphide of lead and copper pyrites) are readily fusible when first heated, but become more refractory as part of the sulphur is dissipated and oxygen takes its place, it is important that the heat should be very carefully regulated at first, otherwise the mass may become clotted or fritted together, and the oxidizing effect of the air soon ceases unless the fritted masses be broken small again. This is generally done by making the bed of the furnace very long in proportion to its breadth and to the fire grate area, which may be the more easily done as a not inconsiderable amount of heat is given out during the oxidation of the ore,—such increased length being often obtained by placing two or even three working beds one above the other, and allowing the flame to pass over them in order from below upwards. Such calciners are used especially in roasting zinc blende into oxide of zinc, and in the conversion of sulphides of copper into chlorides in the wet extraction process. In some processes of lead smelting, where the minerals treated contain sand, the long calciner is provided with a melting bottom close to the fire-place, so that the desulphurized ore leaves the furnace as a glassy slag or silicate, which is subsequently reduced to the metallic state by fusion with fluxes in blast furnaces.

Muffle Furnaces.—A third class of furnaces are so arranged that the work is done by indirect heating; that is, the material under treatment, whether subjected to calcination, fusion, or any other process, is not brought in contact either with fuel or flame, but is raised to the proper temperature by exposure in a chamber heated externally by the products of combustion. These are known as muffle or chamber furnaces; and by supposing the crucibles or retorts to represent similar chambers of only temporary duration, the ordinary pot melting air furnaces, and those for the reduction of zinc ores or the manufacture of coal gas, may be included in the same category. These are almost invariably air furnaces, though sometimes air under pressure is used; as for example in the combustion of small anthracite coal, where a current of air from a fan-blower is sometimes blown under the gate to promote combustion.

Crucible Melting Furnaces.—Figs. 7 and 8 represent a series of one of the simplest furnaces of this class, the ordinary crucible air furnace, or *pot melting hole*, according to the Sheffield term used in cast-steel works. It is a chamber of brickwork *a*, either straight in the sides or more generally somewhat barrel-shaped, with a grate at the bottom, and of sufficient capacity to hold one or two crucibles *b*, containing from 50 to 70 ℔ weight of steel each, enough room being left around them for coke to bring the contents up to the melting point in five or six hours. The crucibles are supported upon disks, or "cheeses" of fire-brick placed upon the grate; the draught is maintained by a chimney *c* about 30 feet high, communicating with the furnace by a short flue near the top of the latter. The furnace is placed nearly or quite level with the floor of the casting shop *f*, and covered with a square fire tile or quarry *g*, set in an iron frame with a projecting handle, the fire grate being accessible from the cellar below.

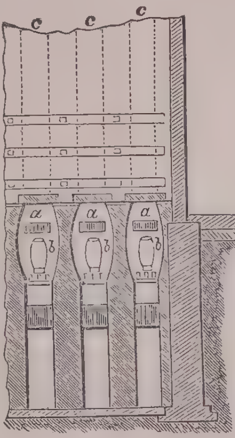

Fig. 7.—Crucible Melting Furnace (longitudinal section).

Assayers' Muffle Furnace.—The construction of a muffle furnace as used by assayers has already been described in the article ASSAYING, vol. ii. p. 635. It is simply a square air furnace with a D-shaped chamber of fire-clay fixed in the middle, so as to be surrounded with incandescent fuel, a current of air being drawn through it by a series of draught holes or slits in the roof or sides. Larger-sized muffles are used by enamellers and painters, and in the production of enamelled iron goods, as well as for calcining minerals containing arsenic where it is to be collected for sale, and in the production of metallic colors where the material has to be kept free from the influence of flame and smoke.

Furnace Materials.—The materials used in the construction of furnaces are divisible into two classes, namely, ordinary, and refractory or fire-resisting. The former are used principally as casing, walls, pillars, or other supporting parts of the structure, and include ordinary red or yellow bricks, clay-slate, granite, and most building stones; while the latter are reserved for the parts immediately in contact with the fuel and flame, such as the lining of the fire place, the arches, roof, and flues, the lower part if not the whole of the chimney lining in reverberatory furnaces, and the whole of the internal walls of blast furnaces.[1] Among such substances are fire-clay and fire-bricks, certain sand-stones, silica in the form of ganister, and Dinas stone and bricks, ferric oxide and alumina, carbon (as coke and graphite), magnesia, lime and oxide of chromium—their relative importance being indicated by their order, the last two or three indeed being only of limited use.

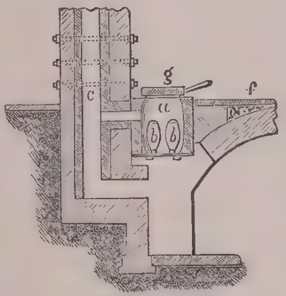

Fig. 8.—Crucible Melting Furnace (transverse section).

The most essential point in good fire-clays, or in the bricks or other objects made from them, is the power of resisting fusion at the highest heat to which they may be exposed. This supposes them to be free from metallic oxides, forming easily fusible compounds with silica, such as lime or iron, the presence of the former even in comparatively small proportion being very detrimental. As clays they must be sufficiently plastic to be readily moulded, but at the same time possess sufficient stiffness not to contract too strongly in drying, whereby the objects produced would be liable to be warped or cracked before firing. In most cases, however, the latter tendency is guarded against, in making up the paste for moulding, by adding to the fresh clay a certain proportion of burnt material of the same kind, such as old bricks or potsherds, ground to a coarse powder. Coke dust or graphite is used for the same purpose in crucible making.

The most highly valued fire-clays are derived from the Coal Measures. Among the chief localities are the neighborhood of Stourbridge in Worcestershire and Stannington near Sheffield, which supply most of the materials for crucibles used in steel and brass melting, and the pots for glass houses; Newcastle-on-Tyne, and Glenboig near Glasgow, where heavy blast furnace and other fire-bricks, gas retorts, etc., are made in large quantities. Coarse-grained but very strong fire-bricks are also made of the waste of the china clay works at Lee Moor, Devon. See FIRE-CLAY.

In Belgium, the clay raised at Andenne is very largely used for making retorts for zinc furnaces, not for local use alone, as it is exported for the same purpose to England and other countries. The principal French fire-clays are derived from the Tertiary strata in the south, and more nearly resemble porcelain clays than those of the Coal Measures. They give wares of remarkably fine texture and surface, combined with high refractory character. The principal centre of manufacture is in Paris, where small crucibles, tubes, furnaces, and other articles for the use of assaying and chemical laboratories, as well as for gold and silver refining, are produced in large quantities.

In Germany, Ips and Passau on the Danube, and Gross Almerode in Hesse, are the best known localities producing fire-clay goods, the crucibles from the last-mentioned place, known as Hessian crucibles, going all over the world. These, though not showing a great resistance to extreme heat, are very slightly affected by sudden alternations in heating, as they may be plunged cold into a strongly heated furnace without cracking, a treatment to which French and Stourbridge pots cannot be subjected with safety. The Cornish crucibles used in copper assaying, made at Redruth, are generally similar in quality and behavior to the Hessian, but are not quite so rapidly perforated by corrosive fluxes.

Plumbago or graphite is largely used in the production of crucibles, not in the pure state but in admixture with fire-clay; the proportion of the former varies with the quality from 25 to nearly 50 per cent. These are the most enduring of all crucibles, the best lasting out 70 or 80 meltings in brass foundries, about 50 with bronze, and 8 to 10 in steel melting. The most important manufactory is that of the Patent Plumbago Crucible Company, Battersea, on the Thames, where the best Ceylon graphite is the basis of the composition employed. They are also made in all the principal crucible works of the continent of Europe and in the graphite-producing localities of Canada and the United States.

Silica is used in furnace-building in the forms of sand, ganister, a finely-ground sandstone from the Coal Measures of Yorkshire, and the analogous substance known as Dinas clay, which is really nearly pure silica, containing at most about 2½ per cent. of bases. Dinas clay is found at various places in the Vale of Neath in South Wales, in the form of a loose disintegrated sandstone, which is crushed between rollers, mixed with about 1 per cent. of lime, and moulded into bricks that are fired in kilns at a very high temperature. These bricks are specially used for the roof, fire arches, and other parts subjected to intense heat in reverberatory steel melting furnaces, and although infusible under ordinary conditions, are often fairly melted by the heat without fluxing or corrosion after a certain amount of exposure. Ganister, a slightly plastic siliceous sand, is similarly used for the lining of Bessemer steel converters; it is found in the neighborhood of Sheffield.

Alumina as a refractory material is chiefly used in the form of an hydrated aluminous iron ore known as bauxete, found in the south of France, in Carniola, and in Antrim; but its applications are somewhat special. It has been found to stand well for the linings of rotatory puddling furnaces, where, under long-continued heating, it changes into a substance as hard and infusible as natural emery. In the Paris Exhibition of 1878 bricks very hard and dense in character, said to be of pure alumina, were exhibited by Muller & Co. of Paris, as well as bricks of magnesia, the latter being specially remarkable for their great weight. They are intended for use at the extreme temperatures obtainable in steel furnaces, or for the melting of platinum before the oxy-hydrogen blowpipe. For the latter purpose, however, lime is generally used; but as this substance has only small stability, it is usually bedded in a casing of fire-brick. Fig. 9 is a section of a lime furnace as used for platinum melting. The flame of the gas jet is introduced through

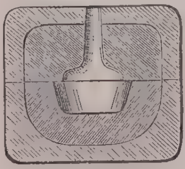

Fig. 9.—Section of Lime Furnace.

---

[1] In the figures fire-brick work is represented by closer, and casing walls in ordinary bricks by more open shading.

the hole at the top, and plays over the surface of the metal in the hollow below. Oxide of chromium and chromic iron ore have been proposed as refractory crucible materials by Andouin of Paris. The former may be used as a bed for melting platinum in the same way as lime or magnesia, without affecting the quality of the metal.

Ferric oxide, though not strictly infusible, is largely used as a protecting lining for furnaces in which malleable iron is made, a portion of the ore being reduced and recovered in the process. In an oxidizing atmosphere it is indifferent to silica, and therefore siliceous bricks containing a considerable proportion of ferric oxide, when used in flues of boilers, brewers' coppers, etc., and similar situations, are perfectly fire-resisting so long as the heated gas contains a large proportion of unconsumed air. The red fire-bricks known as Windsor bricks, which are practically similar in composition to soft red sandstone, are of this character.

Furnace Construction.—In the construction of furnaces provision has to be made for the unequal expansion of the different parts under the effect of heat. This is especially necessary in the case of reverberatory furnaces, which are essentially weak structures, and therefore require to be bound together by complicated systems of tie rods and uprights or buck staves. The latter are very commonly made of old flat bottom rails, laid with the flat of the flange against the wall. Puddling furnaces are usually entirely cased with iron plates, and blast furnaces with hoops round each course of the stack, or in those of thinner constructions the fire-brick work is entirely enclosed in a wrought iron casing or jacket. Such parts as may be subjected to extreme heat and the fretting action of molten material, as the tuyere and slag breasts of blast furnaces, and the fire bridges and bed plates of reverberatory furnaces, are often made in cast iron with double walls, a current of water or air being kept circulating through the intermediate space. In this way the metal, owing to its high conductivity and low specific heat as compared to that of water, is kept at a temperature far below its melting point if the water is renewed quickly enough. It is of course necessary in such cases that the circulation shall be perfectly free, in order to prevent the accumulation of steam under pressure in the interior of the casting. This method has received considerable extension of late years, notably in furnace-smelting of iron ores containing manganese, where the entire hearth is often completely water-cased, and in some lead furnaces where no fire-brick lining is used, the lower part of the furnace stack being a mere double iron box cooled by water sufficiently to keep a coating of slag adhering to the inner shell, which prevents the metal from being acted upon.

Furnaces with special Methods of Firing.—In the examples hitherto noticed, the use of solid fuel has alone been considered, whether in admixture with the charge in blast furnaces or burnt upon a grate in reverberatory furnaces. In either case the useful heating effect realized is considerably below that indicated as possible by theory, and for the same reason, namely, that the carbon factor of the fuel is to a considerable extent only partially oxidized, producing carbonic oxide CO, instead of carbonic acid CO_2, as it should do if the combustion were complete. This is attended with great loss of heat, unless steps be taken to ensure the subsequent combustion of the carbonic oxide, by bringing it into contact with more air at an appropriate temperature. The production of carbonic oxide is a necessary consequence where coal is used in large masses, the carbonic acid in the gases resulting from complete combustion at any spot being reduced more or less completely to carbonic oxide by contact with the ignited carbon immediately adjacent. To obtain the most perfect combustion it is, therefore, essential that the layer of fuel upon the bars in a grate fire should be as thin as is consistent with preventing the passage of an undue amount of air, which is attended with a strong cooling effect. This condition is, however, only possible in such furnaces as require an oxidizing atmosphere, as, for example, boiler fires and the different forms of calciners.

Coal-Dust Furnace.—A special method of providing more intimate contact between air and fuel has been adopted in a furnace designed by Mr. T. R. Crampton, who grinds the whole of the coal to a fine powder in a flour mill, and propels a current of coal dust and air, mixed in the right proportion for burning, into the combustion chamber representing the fire place of an ordinary furnace, either by a fan blower or by chimney draught. In the special application of welding iron considerable economy has been obtained with this furnace over ordinary coal-firing, but its use has up to the present time been exceedingly limited.

Gas Furnaces.—A more general remedy has been found in what is known as gas-firing, where the whole of the fuel is of design first imperfectly burned, *i.e.*, converted into carbonic oxide or rather into a mixture of carbonic oxide and nitrogen, by reducing the supply of air through the grate to a minimum and completing the combustion on the fire bridge by a further supply of air introduced through special channels either at ordinary atmospheric temperature or artificially heated. In this case, the fire place proper is replaced by a *gas-producer* or *gazogene*, which may either form one construction with the other parts of the furnace or be separated from them. Fig. 10 represents a gas-producer intended for heating retort furnaces in gas works. The coal is charged into a deep barrel-shaped stack *a*, terminated below by a small inclined grate *b*, with flat bars placed edgewise like the steps of a ladder or the laths of a Venetian blind, allowing sufficient air to pass between for a smothered combustion, the gases produced passing out by the large flue *c*. The charging hole *d* is covered by a closely fitting valve making a gas-tight joint, the escape of gas being prevented by the great thickness of coal above the flue and the strong draught in the latter. From the exceedingly poisonous nature of carbonic oxide it is of the utmost importance to prevent the issue of unburnt gas; and if this cannot be prevented, the escape must be fired when the charging hole is opened. This is regularly done in blast furnaces working with gas-collecting flues, and even the native iron-smelters of India, in starting their small furnaces with stacks only a few feet high, observe the same precaution. Another point of equal importance is to prevent the access of air to the gas anywhere except at the point of ignition. Any leakage of air into the gas flues must as a rule produce explosion. An ingenious and efficacious method of establishing the draught in gas-producers is adopted by Dr. C. W. Siemens. The gas delivery tube rises to a certain height, is then laid horizontal for a short distance, and finally descends vertically to the original level. The gas in passing along the horizontal tube loses heat by radiation, and on arriving at the downward tube is sensibly denser than when it started, so that the second vertical tube acts as siphon and maintains constant exhaust on the producer. In some cases the gases from the fuel are modified in composition by an injection of steam from a pipe below the grate *e* (fig. 10), which, impinging upon ignited coal, is decomposed into hydrocarbon and carbonic oxide gases. This transformation is necessarily attended with considerable cooling effect, from the

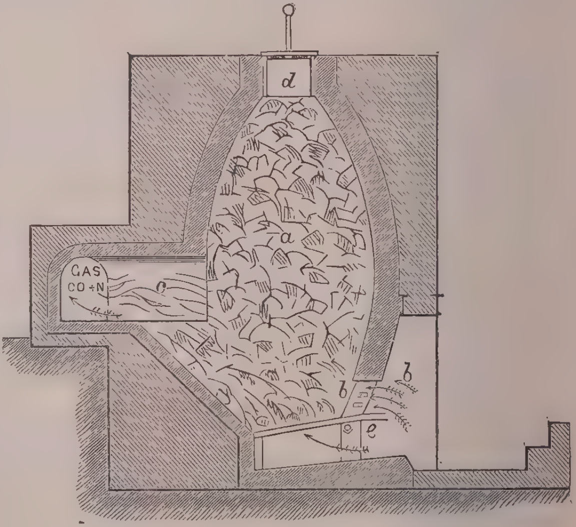

Fig. 10.—Gas-producer (transverse section).

large amount of heat expended in the decomposition of water, so that the method is only of limited application; but the "richness" or fuel value of the gases is very considerably increased by its use. It is more particularly of value with dry or anthracite coals. The gas-producer is used with advantage with very inferior fuels, such as peat, lignite, sawdust, etc., containing much ash and water, and if the latter be removed by passing the crude gas through a condenser, according to the method adopted by Lundin in Sweden, the poorest material, such as wet sawdust, may be employed for puddling and steel melting, operations that require the highest attainable temperatures.

Mechanical Furnaces.—The introduction and withdrawal of the charges in fusion furnaces is effected by gravitation, the solid masses of raw ore, fuel, and flux being thrown in at the top, and flowing out of the furnace at the taphole or slag run at the bottom. Vertical kilns, such as those used for burning limestone and iron ores, are worked in a similar manner,—the raw stone going in at the top, and the burnt product falling through holes in the bottom when allowed to do so. With reverberatory calciners, however, where the work is done upon a horizontal bed, a considerable amount of hand labor is expended in raking out the charge when finished, and in drawing slags from fusion furnaces; and more particularly in the puddling process of refining iron the amount of manual exertion required is very much greater. To diminish the item of expenditure on this head, various kinds of mechanical furnaces have been adopted, all of which can be classified under three heads of gravitating furnaces, mechanical stirrers, and revolving furnaces.

1. In *gravitating furnaces* the bed is laid at a slope just within the angle of repose of the charge, which is introduced at the upper end, and is pushed down the slope by fresh material, when necessary, in the contrary direction to the flame which enters at the lower end. This method is used in Styria for burning the dust of spathic iron ore which cannot be put into the kilns with the large lumps. The fuel used is blast furnace gas, the calciners being directly over the furnace top. Gerstenhofer's pyrites burner, another furnace of this class, has a tall vertical chamber heated from below, and traversed by numerous narrow horizontal cross bars at different heights. The ore in fine powder is fed in at the top, through a hopper, in a regular thin stream, by a pair of rollers, and in falling lodges on the flats of the bars, forming a talus upon each of the height corresponding to the angle of rest of the material, which is, however, at short intervals removed to lower levels by the arrival of fresh ore from above. In this way a very large surface is exposed to the heat, and the ore, if containing sufficient sulphur to maintain the combustion, is perfectly burned when it arrives at the bottom; if, however, it is imperfectly sized or damp, or if it contains much earthy matter, the result is not very satisfactory. Stetefeld's furnace, used for the conversion of sulphuretted silver ores into chlorides, is of a somewhat similar character. It is now largely used in the silver mines of the western States of America.

2. *Mechanical stirrers* constitute a second division of mechanical furnaces, in which the labor of rabbling or stirring the charges is performed by combinations of levers and wheel-work taking motion from a rotating shaft, and more or less perfectly imitating the action of hand labor. They are almost entirely confined to puddling furnaces, and have not been very generally adopted for these.

3. *Revolving furnaces*, the third and most important division of mechanical furnaces, are of two kinds. The first of these resemble an ordinary reverberatory furnace by having a flat bed which, however, has the form of a circular disk mounted on a central shaft, and receives a slow movement of rotation from a water-wheel or other motor, so that every part of the surface is brought successively under the action of the fire, the charge being stirred and ultimately removed by passing under a series of fixed scraper arms placed above the surface at various points. Brunton's calciner, used in the "burning" of the pyritic minerals associated with tin ore, is the most familiar example of this type. The revolving hearth is also represented in Pernot and Pousard's steel-melting furnaces. In these, however, the hearth rotates on an inclined axis, so that the path of its surface is oblique to that of the flame. In the second class of revolving furnaces the working part is a hollow cylinder, between the fire place and flue, with its axis horizontal or nearly so, whose inner surface represents the working bed. It is mounted upon friction rollers, and receives motion from a special steam engine by means of a central belt of spur gearing. Furnaces of this kind were first used in alkali works for the conversion of sulphate into carbonate of sodium in the process known as black ash fusion, but have since been applied to puddling in America and elsewhere by Danks and others; but for the latter purpose they are still to some extent in the experimental stage. As calciners they are used in tin mines and for the chlorination of silver ores.

Use of Heated Air.—The calorific intensity of fuel is found to be very considerably enhanced, if the combustion be effected with air previously heated to any temperature between that of boiling water and a dull red heat, the same effect being observed both with solid and gaseous fuel. The latter, especially when brought to the burning point at a high temperature, produces a heat that can be resisted by the most refractory substances only, such as silica, alumina, and magnesia. This is attained in the regenerative furnace of Siemens, detailed consideration of which belongs more properly to the subject of iron.

Economy of Waste Heat and Gas.—In every system of artificial heating, the amount of heat usefully applied is but a small proportion of that developed by combustion. Even under the most advantageous application, that of evaporation of water in a steam boiler, where the gases of the fire have to travel through a great length of flues bounded by thin iron surfaces of great heat-absorbing capacity, the temperature of the current at the chimney is generally much above that required to maintain an active draught in the fire place; and other tubes containing water, often in considerable numbers, forming the so-called fuel economizers, may often be interposed between the boiler and the chimney with marked advantage as regards saving of fuel. In reverberatory and air furnaces used in the different operations of iron manufacture, where an extremely high temperature has to be maintained in spaces of comparatively small extent, such as the beds of puddling, welding, and steel-melting furnaces, the temperature of the exhaust gases is exceedingly high, and if allowed to pass directly into the chimney they appear as a great body of flame at the top. It is now general to save a portion of this heat by passing the flame through flues of steam boilers, air-heating apparatus, or both—so that the steam required for the necessary operations of the forge and heated blast for the furnace itself may be obtained without further expenditure of fuel. The most perfect method of utilizing the waste heat hitherto applied is that of the Siemens regenerator, in which the spent gases are made to travel through chambers, known as regenerators or recuperators of heat, containing a quantity of thin fire-bricks piled into a cellular mass so as to offer a very large heat-absorbing surface, whereby their temperature is very considerably reduced, and they arrive at the chimney at a heat not exceeding 300 or 400 degrees. As soon as the bricks have become red hot, the current is diverted to an adjacent chamber or pair of chambers, and the acquired heat is removed by a current of cool gas or air passing towards the furnace, where it arrives at a temperature sufficiently high to ensure the greatest possible heating effect in combustion. This system being alternative, four regenerators, two for air and two for gas, are required for each furnace; but in some of the newer French patterns of so-called recuperative furnaces, a system of tubular bricks is adopted in the chambers and only the air is heated, the gas being brought hot from the producer to the furnace instead of cooling it first by atmospheric exposure in a long tube in the manner adopted by Siemens. This allows a considerable simplification in the apparatus; only a single regenerator is required working continuously, the flame travelling outwards through one set of passages in the bricks and the air inwards through another; and as the former consists only of burnt gases, no explosion can take place if a communication be established between the two currents through a leaking joint or broken brick.

In iron-smelting blast furnaces the waste gases, though not escaping at as high sensible temperatures as those of the furnaces previously considered, are of considerable fuel value, and may render important services if properly applied. Owing to the conditions of the work, which require the maintenance of a sensibly reducing atmosphere, they contain a very notable proportion of carbonic oxide, and are drawn off by large wrought-iron tubes near the top of the furnace and conveyed by branch pipes to the different boilers and air-heating apparatus, which are now as a rule

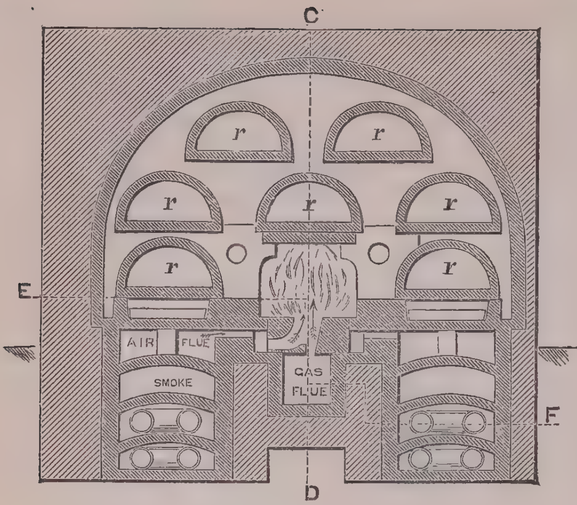

Fig. 11.—Gas-heated Retort Furnace (transverse section on A B fig. 13).

entirely heated by the combustion of such gases. Formerly they were allowed to burn to waste at the mouth of a short chimney place above the furnace top, forming a huge body of flame, which was one of the most striking features of the Black Country landscape at night, but is now less commonly seen than formerly. Perhaps the greatest number of flaming furnaces to be seen at present are those of the Scotch founding iron district about Gartsherrie, Coatbridge, etc.

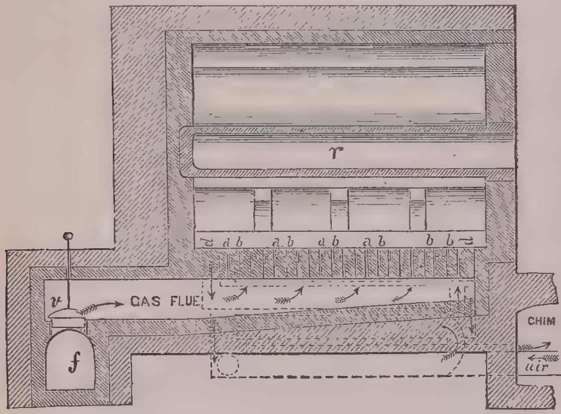

Fig. 12.—Gas-heated Retort Furnace (longitudinal section on C D fig. 11).

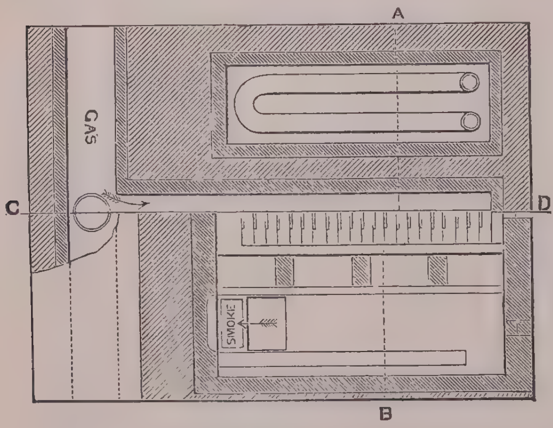

Fig. 13.—Gas-heated Retort Furnace (horizontal section on E F fig. 11).

Figs. 11, 12, and 13 represent a modern furnace heated by gas burnt with hot air as applied to heating gas retorts. The retorts of fire clay *r r r*, seven in number, are mounted upon supports at both ends in an arched chamber having a long flue running along the centre line at the bottom, covered with bricks pierced at intervals by narrow slits *a a a*, which form the gas admission passages from the gas-producer flue *f*, the supply being regulated by a valve *v*. These alternate with similar slits *b b* of less depth, communicating with a lateral flue, supplying heated air; the mixture being effected at a great number of points ensures uniformity of combustion along the whole length of the furnace. The flame, after heating the retorts, descends by passages under the ends of the side retorts in the lower series to a number of arched divisions in the substructure containing the air-heating-pipes, which are of cast iron in horseshoe coils. By this means the temperature of the gases is considerably reduced by the time they reach the chimney flue, the heat intercepted being returned by the air to the combustion chamber.

Laboratory and Portable Furnaces.—Small air-furnaces with hot plates or sand bath flues were formerly much employed in chemical laboratories, as well as small blast furnaces for crucibles heated with charcoal or coke. The use of such furnaces has very considerably diminished, owing to the general introduction of coal gas for heating purposes in laboratories, which has been rendered possible by the invention of the Bunsen burner, in which the mixture of air and gas giving the least luminous but most powerfully heating flame is effected automatically by the effluent gas. These burners, or modifications of them, have also been applied to muffle furnaces, which are convenient when only a few assays have to be made—the furnace being a mere clay shell and soon brought to a working temperature; but the fuel is too expensive to allow of their being used habitually or on a large scale. Petroleum, or rather the heavy oils obtained in tar refineries, having an equal or superior heating power to coal gas, may also be used in laboratories for producing high temperatures. The oil is introduced in a thin stream upon a series of inclined and channelled bars, where it is almost immediately volatilized and burnt by air flowing in through parallel orifices. Furnaces of this kind may be used for melting cast-iron or bronze in small quantities, and were employed by M. St. Claire Deville in experiments in the metallurgy of the platinum group of metals.

Sefstrom's blast furnace, used in Sweden for the assay of iron ores, is one of the most convenient forms of portable furnaces applied to melting in crucibles. It consists of a sheet-iron cylinder about 8 or 9 inches in diameter, within which is fixed one of smaller size lined with fire-clay, as shown in part section in fig. 14. The space between the two cylinders serves as a heater and distributor for the blast, which is introduced through the nozzle at the bottom, and enters the furnace through a series of several small tuyeres arranged round the inner lining. Charcoal is the fuel used, and the crucibles stand upon the bottom of the clay lining. When a large body of fuel is required, the cylinder can be lengthened by an iron hoop which fits over the top ring. Deville's portable blast furnace is very similar in principle to the above, but the body of the furnace is formed of a single cast-iron cylinder lined with fire-clay, closed below by a cast-iron plate perforated by a ring of small holes—a hemispherical basin below forming the air-heating chamber.

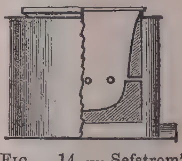

Fig. 14. — Sefstrom's Portable Blast Furnace.

The literature of furnaces is co-extensive with that of metallurgy. Most of the different patterns in use will be found described and fully illustrated in Percy's and Phillip's *Metallurgy*, Jordan's *Album du cours de Métallurgie*, etc. The atlas to Karsten's great work, and the plates in the *Encyclopédie Méthodique*, are also of much interest, but the types of apparatus represented are chiefly antiquated and out of use. (H. B.)

FURNITURE is the name, of obscure origin, used to describe the chattels and fittings required to adapt houses, churches, ships, etc., for use. The sculptures, paintings, and metal work of antiquity, of the Middle Ages, and of the Renaissance, now kept in museums and private collections, have, with few exceptions, formed part of decorations or of furniture made for temples, churches, or houses. Most of our ancient bronzes, if not images taken from ancient shrines, are pieces of mirrors, tripods, altar vessels, even the dishes and pans of the kitchen. Wood, ivory, precious stones, bronze, silver, and gold have been used from the most ancient times in the construction or for the decoration of seats, chests, tables, and other furniture, and for the shrines and altars of sacred buildings.

The kinds of objects required for furniture have varied according to the changes of manners and customs, as well as with reference to the materials at the command of the workman, in different climates and countries. Of the furniture of the ancient Egyptians there remain several examples. The British Museum contains six chairs, about the same in height as those now used. One is of ebony, turned in the lathe and inlaid with collars and dies of ivory. It is low with a back; and both back and legs are strengthened with rails of cane. The seat is of plaited cane slightly hollowed. Another is shaped out of two frames of four pieces of wood each, hinged in the centres of the longer sides, the lower ends carved into the form of the heads of animals; the seat has been made of skin or other flexible material so as to fold flat. Some Egyptian couches and seats had the legs carved like those of panthers; some had the arms or seat supported by figures representing slaves or captives taken in war. They were upholstered with rich stuffs and are accurately represented in wall paintings (see the great French work, *Description de l'Égypte*). Workmen's tables, massive blocks of wood with four plain legs, and head rests hollowed out, standing 9 or 10 inches high, are preserved in the British Museum,—some being of alabaster, probably for the sake of coolness. Painted wooden chests, with convex lids (not hinged), and mummy cases can be seen both in the British Museum and in the Louvre in Paris.

The excavations of Nineveh have brought to light sculptured representations of Assyrian seats. They were massive, the ends of the seat frame projected in the shape of rams' heads; in some instances figures of captives support the arms; in one described by Sir A. H. Layard, two horses resting on the lower bars from front to back support the seat. The seats were cushioned or upholstered with rich materials. An elaborate piece of carved ivory, with depressions to hold colored glass, agate, etc., from Nineveh, now in the British Museum, has been inlaid into a throne, —showing that such objects were sometimes richly decorated. The carving is apparently of Egyptian origin. The furniture of the Assyrians was more massive, and less varied and elegant in execution, than that of the Egyptians.

Greek seats (*thronoi*) are sculptured in the Parthenon frieze now in the British Museum. They resemble turned wood structures, though perhaps representing bronze. The arms are low and straight, and the backs upright. A curious chair of this kind is represented on one of the bas-reliefs from Xanthus (British Museum). In the same collection will be seen statues seated in chairs framed in square bars, the horizontal pieces mortised into the upright, and these details are carefully represented in marble. Certain far-famed gold and ivory statues of colossal size, at Olympia and other places, were represented seated. The bars and frames of the chairs, and of the footstools and pedestals, were constructed of cedar wood, colored and inlaid with plates of sculptured ivory, and of gold and other precious materials. A sacred chest with carved lid, a table covered with ivory carvings, and other objects in these shrines are described by Pausanias. Unfortunately we have but his verbal accounts of them (see Q. de Quincy, *Jupiter Olympien*, in which careful engravings are given of their probable shapes). Chairs of the shape in general use forty or fifty years ago (the front and back legs curved outwards, with a plain piece of wood curved to fit the shoulders for the top rail of the back) are not uncommon in paintings on vases. The vase rooms of the British Museum and the Louvre give frequent illustrations of chairs, couches, etc., as well as of the stuffs used in upholstering them. Sumptuous Greek furniture, during the last two centuries B. C., was made of bronze, damascened with gold and silver.

The Romans employed Greek artists and workmen. Their chairs, couches, and seats were of similar shape to those of the Greeks. During meals men reclined on couches each made to hold three persons; a low rail protected the back; three of these couches surrounded the table at entertainments, leaving the fourth side open for service. The decoration consisted of rich coverings, constantly changed to suit the season, or in honor of the guests. Women sat during meals. The *sella curulis*, a folding cross-shaped seat, was carried in the chariot, and used in the forums, baths, lecture halls, etc. It was often inlaid with ivory. *Sellæ*, square seats of bronze, were also often carried about, as well as footstools, the former raising the sitter above the heads of humbler persons. Couches, covered with tilts and curtains, could be carried by slaves, and used as litters. Four silver figures of the 4th century, representing the capital cities of the empire, now in the British Museum, are considered to have ornamented the ends of the poles or shafts of a litter. Tables were of marble, resting on sphinxes or other animals. Dining tables were of wood, curiously veneered, to which a high value was often attached. They rested on tripods or frames of four or of six legs, ornamented with figures, busts, animals, etc., in bronze. Tables were changed with each course. Tables were sometimes protected by rims or borders, sometimes rested on feet of carved ivory. Books and other property were kept in *scrinia*, round chests that could be fastened. Clothes and provisions had special rooms to hold them. In the later ages of the empire, in Rome, and afterwards in Constantinople, gold and silver were plentiful for furniture; even cooking and common house vessels were occasionally made in those metals.

The chair of St. Peter in Rome, a solid square seat, with pedimental back and panelled with carved ivory, that of St. Maximian in the cathedral of Ravenna, round backed, with arms also panelled with carved ivory, and many representations on carved ivory diptychs or tablets, will give the student a correct notion of the furniture of the divided empire. The character of the curule chair survived and may be recognized in the Bayeaux tapestry (St. Edward's seat), and in many mediæval paintings. The architectural features so prominent in much of the mediæval furniture begins in these Byzantine and late Roman thrones. These features became paramount as Pointed architecture became general in Europe, and scarcely less so during the Renaissance. Most of the mediæval furniture, chests, seats, trays, etc., of Italian make were richly gilt and painted. In northern Europe carved oak was more generally used. The coronation chair in Westminster Abbey, made for Edward I. in the 13th century, has a gabled and crocketed back, is panelled with tracery work, and rests on carved lions,—the whole gilt and painted. State seats in feudal halls were benches with ends carved in tracery, backs panelled or hung with cloths (called cloths of estate), and canopies projecting above. Bedsteads were square frames, the testers of panelled wood, and resting on carved posts. Chests of oak carved with panels of tracery, or of Italian cypress (when they could be imported), were used to hold and to carry clothes, tapestries, etc., to distant castles and manor houses; for house furniture had to be moved from place to place. A chest of the reign of John is kept in the castle of Rockingham. Many can be seen in old parish churches, and in the South Kensington Museum, the Louvre, and many other Continental galleries. Carved stalls covered by elaborate tabernacle work remain in many cathedrals and churches The Hôtel de Cluny in Paris contains numerous examples of this kind of wood work. Altars were backed by paintings in canopied frames, closed by shutters, which were also painted inside and outside. In some German churches, *e. g.*, the cathedrals of Hildesheim and of Münster in Westphalia, the entire picture (as well as the shutters) was made to open out, showing ingenious receptacles for reliquaries within. Copes and other vestments were kept in semicircular chests with ornamental lock plates and iron hinges; an example is preserved in Wells cathedral. The splendor of most feudal houses depended on pictorial tapestries which could be packed and carried from place to place. Wardrobes were rooms fitted for the reception of dresses, as well as for spices and other valuable stores. Excellent carving in relief was executed on caskets, which were of wood or of ivory, with painting and gilding, and decorated with delicate hinge and lock metal work. The general subjects of sculpture were taken from legends of the saints or from metrical romances.

Renaissance art made a great change in architecture, and this change was exemplified in furniture. Cabinets and panelling took the outlines of palaces and temples; sometimes they were actually constructed in perspective, *e. g.*, a small theatre front at Vicenza, the work of the younger Palladio. Curious internal fittings were arranged in cabinets, still following the details of architectural interiors. In Florence, Rome, Venice, Milan, and other capitals of Italy, sumptuous cabinets, tables, chairs, chests, etc., were made to the orders of the native princes. Vasari (*Lives of Painters*) speaks of scientific diagrams and mathematical problems illustrated in costly materials, by the best artists of the day, on furniture made for the Medici family. The great extent of the rule of Charles V. helped to give a uniform training to artists from various countries resorting to Italy, so that cabinets, etc., which were made in vast numbers in Spain, Flanders, and Germany, can hardly be distinguished from those executed in Italy. Francis I. and Henry VIII. encouraged the revived arts in their respective dominions. Examples of 16th century chests, cabinets, tables, seats, sideboards, etc., can be seen in museums, and in many private houses. *Pietra dura*, or inlay of hard pebbles, agate, lapis lazuli, and other stones, ivory carved and inlaid, carved and gilt wood, marquetry or veneering with thin woods, tortoiseshell, brass, etc., were used in making sumptuous furniture during the first period of the Renaissance. A folding chair of wrought iron (made at Augsburg), with numerous groups of figures in complete relief, is preserved at Longford Castle, Wiltshire. Mirrors, caskets and other objects in damascened iron (Milan) are shown in the South Kensington Museum. Subjects of carving or relief were generally drawn from the theological and cardinal virtues, from classical mythology, from the seasons, months, etc. Carved altarpieces and woodwork in churches partook of the change in style. The stalls of the cathedral of Amiens, of the Certosa of Pavia, the cathedral of Siena, and a great number of churches in Venice, Florence, Rome, Perugia, and other Italian cities, illustrate first the transition, then the full change from Gothic to classic detail in ecclesiastical furniture.

The elegance of form and perfection of detail, which are noticeable in the furniture of the 16th century, declined during the 17th all over Europe. The framework became bulky and heavy, and the details coarse. Silver furniture was made in considerable quantities by the Spaniards in Spain and Italy, and it was used in the courts of the French and English kings. A few examples of silver tables, mirrors, etc., now in Windsor Castle and at Knole, in Kent, are reproduced in electrotype in the South Kensington Museum. To this period belongs the name of André Charles Boule, who furnished the palace of Versailles. He invented or perfected a beautiful system of veneering with brass and tortoiseshell, brass and ebony, occasionally using white metal besides. Examples of this buhl or boule are shown in the Apollo gallery of the Louvre.

The system of veneering, or coating common wood with slices of rare and costly woods, fastened down with glue by screw presses made to fit the surface to be covered, came into general use in the 18th century. Marquetry is veneer of different woods, forming a mosaic of pictorial or ornamental designs. In Italy, in Spain, and throughout the dominions of Charles V. and his successors, figure subjects, architectural views, and quaint interiors were represented in these materials. Usually two or three woods were employed; they were tinted by means of heated sand in iron frames, and the tints graduated to the utmost nicety. Sometimes these effects were produced by splitting and laying slices of the same wood with the grain running in different directions. The fine marquetry of the last century was made of tulip wood or mahogany, with lime, pear, holly, beech, and other light-colored woods; sometimes in ebony and ivory in Italy particularly; or ebony and mother-of-pearl, the latter in Holland. Woods were occasionally stained green, blue, and other colors, but these tints were sparingly employed by the more famous makers. Curiously grained specimens of mahogany, known as letter wood and by other names, were used for veneering late in the century by the *ciseleurs* or makers of rich brass and gilt metal edgings, which that wood shows off to perfection. The golden-colored satin wood, which was imported towards the end of the last century, was much used as a ground in English marquetry.

Looking-glasses in large sheets began to be exported from Venice at the end of the 17th century; some were engraved with figures on the backs. The manufacture was established at Tourlaville, then in Paris, and about the same time at Battersea on the Thames—under Government protection in both countries. The light fantastic frames which came into fashion in France were called *rococo* (from *roquaille*, *coquaille*, rock and shell work). Carved and gilt furniture was made in Italy, where it was best designed, and all over Europe till late in the 18th century. Robert Martin, who used fine lac polish, gave the name of "Vernis Martin" to painted and polished furniture of all kinds, from carriages and wardrobes to fans and snuff-boxes. He died in 1763. The discovery of Herculaneum and Pompeii about the middle of the last century turned attention to the elegant designs of the Greco-Roman period. Riesener, David Roentgen (known as David), and the *ciseleur* Gouthière are well known names of French cabinet-makers; Chippendale, Lock, Sheraton, and Heppelwhite were Englishmen of the same period—the last half of the 18th century. James and Robert Adam designed beautiful satin wood and other furniture at that date. Medallions of porcelain were sometimes inlaid in cabinet fronts. Most of these manufactures came to an end during the French Revolution and the long war. The "empire" style, a stiff affected classicalism, prevailed in France during the reign of Napoleon. It is shown in the metal mounts of veneered mahogany furniture, and in the carvings of chair legs and backs.

A return has been made during recent years to mediæval designs. In England there is a going back to the fashions prevalent during the first fifty years of the last century. The elegant Louis XVI. style is more popular in France.

As regards furniture of the day, and the proprieties which ought to be observed in form and decoration, it is a matter of regret that no definite style is recognized in Europe; there cannot but be some consequent waste of power and uncertainty of aim. A few general principles, however, are held to be applicable to the shape and arrangements of furniture of whatever style.

Bedsteads are now very generally made of iron in most countries of Europe. They are plain; the portions not covered with hangings are made in brass, or coated with enamelled paint. In most cases no attempt is made to decorate them. They are clean, and easily taken to pieces and moved. They need no criticism. Bedroom furniture is no longer as rich or costly as when it was the fashion to include state bed-chambers among suites of rooms thrown open for the entertainment of guests. Wardrobes, chests of drawers, toilet tables, are only required to be of suitable size, and as conveniently arranged inside as possible, in order that light and heavy objects may be put away so as to be got at with the least possible exertion. Such pieces of furniture should have no projections of cornices or ornaments which do but take up space. Light-colored woods, with the simplest decorations, are preferred, on account of their freshness and cheerfulness. Common timber, such as pine, ash, oak, maple, etc., French polished, with colored lines sparingly employed, are much used by London makers for bedroom furniture; but they are less durable than mahogany. Imitations of graining are general—indeed the practice was common even in ancient Rome. But the Japanese methods of staining, powdering with gold dust, and polishing common timber without hiding the grain, deserve adoption; and efforts have latterly been made in London to bring them into use.

Chairs.—The good construction of chairs is a test of workmanship. If the wood is well seasoned, the tenons and mortises cut with exactness, the glue hot and good, and proper pressure used in putting them together, the various parts of chairs should be as perfectly united as if the wood had grown in the form required. Sir G. Wilkinson speaks of the admirable skill of the makers of Egyptian chairs, which required no cross bars to the legs. Lightness is another requisite. Very light chairs made of white wood with plaited grass seats are made at Chiavari in Italy. Large manufactories of chairs are carried on at High Wycombe, and other places where beech timber is easily obtained. If chairs are carved, the carving should be so subordinate to the outline and the comfort of the sitter as not to interfere with the dress, or be liable to breakage from having salient points, masses, or ornaments. The mahogany carved chairs of Chippendale and Sheraton are often copied, but the repetitions have not the spirit of the originals. The slight irregularities and variations made by carvers, who never absolutely repeat themselves in a series or set of such pieces, save them from the monotony so often seen in copies.

Couches.—In ancient times couches were used as actual beds. A cast of an antique bronze couch can be seen in the South Kensington Museum. The general shape has not changed in modern times. It is the chair without arms elongated or the arm chair widened. The proprieties observed in such furniture are such as are applicable to chairs. If parts of the furniture of state rooms, they are generally framed in wood, carved and gilt or painted. The seats, backs, and ends are stuffed and upholstered with rich materials, like the chairs,—the most costly material being tapestry, formerly woven in fanciful designs after Boucher, Fragonard, and other "genre" painters, in the looms of Beauvais, or, in England, of Mortlake and Soho. Such tapestries can seldom be procured now. Inferior imitations of these designs are still produced. Couches or sofas of this kind are made for conversation rather than repose, and admit of the backs being shaped in curves or carved at the top, provided that the inequalities are but slight (a rule often violated in cheap modern furniture), and the carvings so arranged as not to interfere with the comfort of sitters, or of those who may occasionally lean on them. The ends should generally be square. In rooms not intended for receptions shallow couches, with rounded ends, and awkward showy carvings on the backs, are out of place. Another kind of couch, thickly stuffed on the back, ends, and seat, may be considered as the Oriental divan raised on legs. It is practically a framework of fixed cushions, intended for repose. Its excellence depends on the upholstery, as does that of the modern stuffed arm chair.

Tables.—Good workmanship and careful regard for comfort and use are absolutely necessary in making tables. They are to be firm, and easily moved, and the legs or supports out of the way of persons sitting at them; their proper ornamentation is veneer of fine grained wood, split and arranged in patterns or buhl and other marquetry. Carved and gilt tables with marble tops, made as ornaments to galleries and halls, should have the carvings so arranged as not to interfere with the general look of support, or be too liable to breakage. The same may be said of sideboards. Much skilful carving on such pieces is either too close an imitation of nature, and looks as if it were hung on, not part of, the structure, or is crowded and not arranged in parts in which it would be subordinate to leading lines of division, panels, borders, etc.

Cabinets.—Cabinet fronts are flat, with metal edgings, or shallow and delicate carvings; or they are subdivided by architectonic members, columns, deep mouldings, etc. In divisions protected by these salient features carvings of regular figure compositions are in place. The interiors may be subdivided into any varieties of quaint and ingenious drawers and receptacles. It is to cabinets that the greatest skill is devoted. The perfect fitting of small interior drawers, etc., is a test of excellence in workmanship. On cornices, brackets, and other projections, busts, figures, and carving of the finest kind can be placed effectively,—great care being taken not to break up running mouldings, cornices, and other members that mark the structure, or form lines of division. The French, and after them the Italians, are the first masters of this kind of carving. London cabinetmakers rarely attempt the figure. A cabinet by Fourdinois (No. 721·69) in the South Kensington Museum, purchased from the Exhibition of 1867, may be referred to for careful observation of these proprieties; even the mouldings of the panelling are covered with carving, but so delicate as not to interfere with their general outlines or surfaces. An example of flat carving may also be seen in a Flemish 17th century ebony cabinet in the same collection (No. 1651·56). As to the proper arrangements and colors of marquetry decoration, there also the masses of the design should be symmetrical, or balanced by compensating parts where absolute symmetrical arrangement is not suitable. In marquetry, as in carving, there ought to be agreeable dispositions of lines and masses of ornament, such as will look in proportion at distances at which details are not distinguishable. The colors should be few and harmonious, even when the materials are contrasted as decidedly as ebony with ivory, or satin wood with mahogany. We may compare the crowded patterns and the garish contrasts of color of much modern marquetry with the work of Riesener. His marquetry is laid out with diapers of two woods, or with medallions and pattern work—much space being left plain. A good example is in the large secrétaire now in the Louvre, signed and dated 1769. The same may be said of Chippendale's furniture, and of that in satin wood designed by the brothers Adam in the last century.

The manufacture of furniture is, to a great extent, in the hands of large factories both in England and on the Continent. Owing to the necessary subdivision of labor in these establishments, each piece of furniture passes through numerous distinct workshops. The master and a few workmen formerly superintended each piece of work, which, therefore, was never far removed from the designer's eye. Though accomplished artists are retained by the manufacturers of London, Paris, and other capitals, there can no longer be the same relation between the designer and his work. Many operations in these modern factories are carried on by steam. Even the carving of copies and repetitions of busts, figures, and ornaments is done in some instances by a special machine. This, though an economy of labor, entails loss of artistic effect. The chisel and the knife are no longer in such cases guided and controlled by the sensitive touch of a human hand.

Collections of Furniture.—1. *Antique.*—British Museum; Louvre; Vatican; Royal Museum, Naples. 2. *Mediæval and 16th century.*—Musée de Cluny, Paris; S. Kensington Museum; Sauvageot Collection, Louvre; National Museum, Nuremberg; Museum of Madrid. 3. *18th century.*—Louvre Galleries; collection of Sir R. Wallace, Manchester Square, London. Fine examples have been exhibited from Windsor Castle. Carriages, in the royal palaces at Lisbon and Vienna.

Books.—*Description de l'Égypte*; Wilkinson, *Ancient Egyptians*; Layard, *Nineveh*, etc.; Hamilton's *Vases*; Wright's *Homes of our Forefathers*; Agincourt, *Histoire de l'Art*; Du Sommerard, *Arts Somptuaires*; Viollet-le-Duc, *Dictionnaire du Mobilier*; Jacquemart, *History of Furniture*; Pollen, *Furniture and Woodwork*, where references to books will be found, and notes on materials and construction. (J. H. P.)

FURRUCKABAD. See FARRAKHÁBÁD.

FÜRST, JULIUS (1805–1873), Orientalist, was born of Jewish parents at Zerkowo in Posen, 12th May, 1805. His friends designed him for the rabbinical profession, and at a very early age he had gained an extensive acquaintance both with Biblical and with Talmudical Hebrew. In his fifteenth year he entered the Berlin gymnasium, whence he passed to the university in 1825; but straitened circumstances compelled his return to Posen, long before the completion of his studies. He then taught for some time in the Jewish school at his native place, with the result that he experienced a growing feeling of repugnance to what was then regarded as rabbinical orthodoxy. In 1827 he was able to resume a university career at Breslau, where he studied theology and Oriental philology; and in 1831 he removed to Halle, where he heard the lectures of Gesenius, Wegscheider, and Tholuck. He ultimately fixed his residence in Leipsic, where, after having taught privately for some years, he obtained an appointment as lecturer in the university in 1839. From the year 1864 till his death, which occurred on the 9th of February, 1873, he held the rank of professor. In 1835 he published the first part of the *Lehrgebäude der aramäischen Idiome*, a work which he did not live to complete; and from 1837 to 1840 he was engaged upon his *Concordantiæ*, an admirable edition of Buxtorf's Hebrew and Chaldee Concordance, with valuable appendices, in the preparation of which he was largely assisted by Delitzsch. In 1851 appeared the *Hebräisches u. Chaldäisches Handwörterbuch*, which reached a third edition in 1876, and which has been translated into English by Dr. Samuel Davidson (4th edition, 1871). Though a work of considerable merit, this cannot on the whole be said to have superseded that of Gesenius. In particular its philological theories, and its method of reducing triliteral to biliteral roots, are not likely to meet with general acceptance among scholars. His *Geschichte des Karäerthums* appeared in 1865; and the *Geschichte der Biblischen Literatur und des jüdisch-hellenischen Schriftthums*, begun in 1867, was completed in 1870. Fürst also edited a valuable *Bibliotheca Judaica* (1849–1863), and was the author of some other works of minor importance. From 1840 to 1851 he was also editor of *Der Orient*, a journal devoted to the language, literature, history, and antiquities of the Jews.

FÜRSTENBERG, the name of two noble houses of Germany.

I. The more important is in possession of a mediatized principality in the district of the Black Forest and the Upper Danube, which comprises the countship of Heiligenberg, about 7 miles to the N. of the lake of Constance, the landgravates of Stühlingen and Baar, and the lordships of Jungnau, Trochtelfingen, Hausen, and Möskirch or Messkirch. The territory is discontinuous; and as it lies partly in Baden, partly in Würtemberg, and partly in the Prussian province of Sigmaringen, the head of the family is an hereditary member of the first chamber of Baden and of the chamber of peers in Würtemberg and in Prussia. The relations of the principality with Baden are defined by the treaty of May, 1825, and its relations with Würtemberg by the royal declaration of 1839. The *Stammort* or ancestral seat of the family is Fürstenberg in the Black Forest, about 13 miles N. of Schaffhausen, but the principal residence of the present representatives of the main line is at Donaueschingen. The Fürstenbergs are descended from the counts of Urach, in the valley of the Ems, to the east of Tübingen,—Henry I., the youngest son of Egon VI. of Urach, ranking as the founder of the family. He was born about 1215, signalized himself as a supporter of the house of Hapsburg (which in the person of Rudolf, a relative of his own, ascended the throne in 1273), and died in 1284. On the death of Frederick III. in 1559, the family broke up into two lines, the Heiligenberg and the Kinzigerthal. To the former, which became extinct in 1716, belonged the well-known William Egon of Fürstenberg, who, in spite of his elevation to the rank of elector by the emperor Leopold, played into the hands of the French, had to leave Germany, and as a reward for his services was made archbishop of Strasburg in 1682. The latter furnished a large number of military and diplomatic servants to the German states. The various possessions of the family were united in 1744 under Joseph William Ernest, who was born in 1699 and died in 1762; and to him his descendants were indebted for the right that they all possess of taking the title of prince. On the failure of the male issue of his elder son in 1804, the inheritance passed to the representative of a younger Bohemian branch, Charles Egon, a prince memorable for the liberal spirit by which he was actuated, and for the number of his benevolent and scientific foundations, such as the infirmary at Donaueschingen and the blind asylum at Neidingen. The family is at present (1879) represented by his son Charles Egon. There are two subordinate branches, the Pürglitz with its chief residence at Lana in Bohemia, and the Königshof with its chief residence at Königshof in Bohemia.

II. The second Fürstenberg family has its possessions in Westphalia and the country of the Rhine, and takes its name from the castle of Fürstenberg on the Ruhr, which is said to have been built by count Dietrich or Theodoric of Oldenberg, in the 11th century. The two most remarkable men whom it has produced are Francis Frederick William and Francis Egon. The former (1729–1811) became ultimately minister of the prince-bishop of Münster, and effected a great number of important reforms in the administration of the country; the latter (1797–1859) was an enthusiastic patron of art, zealously advocating the completion of the Cologne cathedral, and erecting the beautiful church of Apollinaris, near Remagen on the Rhine.

See (for the first family) Münch's *Geschichte des Hauses und Landes Fürstenberg*, Aix-la-Chapelle, 1830–1832, and Riezler, *Fürstenbergisches Urkundenbuch, hrsggbn. von dem fürstlichen Hauptarchiv in Donaueschingen*, 1877, 1878.

FÜRSTENWALDE, a town in the Prussian province of Brandenberg, government of Frankfort, on the right bank of the Spree, and on the railway between Berlin and Frankfort-on-the-Oder, 28 miles E. of the former city. Its beautiful cathedral church contains a good many old monuments. The town possesses manufactures of linen and woollen goods, breweries, meal-mills, tile-works, and a chemical work. Fürstenwalde is one of the oldest towns of Brandenburg. Since 1385 it was the seat of the bishop of Lebus, whose bishopric was incorporated with the duchy of Brunswick in 1595. The town was taken by the Swedes in 1631, and burned by the imperialists in 1633. The population in 1875 was 9688.

FÜRTH, an important manufacturing town of Bavaria, circle of Middle Franconia, at the confluence of the Pegnitz with the Rednitz, 5 miles N.W. of Nuremberg, with which it is connected by railway. It is largely indebted for its importance to the industry and perseverance of the Jews, who at the beginning of the present century composed nearly one-half of the whole population, and now amount to about 3600. They have a college, a separate court of justice, several schools and synagogues, and two Hebrew printing establishments. The principal building of the town is the new town-house, with a tower 215 feet high. The manufactures include mirrors, jewelry, lacquered wares, chandeliers, spectacles, machines of various kinds, turnery wares, surgical instruments, lead pencils, artificial flowers, liqueurs, tobacco, leather, and woollen and cotton goods. There are also several breweries. A large annual fair is held at Michaelmas, which lasts for fourteen days. The population in 1875 was 27,360.

In 1632 Gustavus Adolphus was defeated near Fürth, in attempting to carry the intrenchments of Wallenstein; and in 1634 the town was burned down by the Croats. It was originally under the protection of the burggrafs of Nuremberg, but in 1806 it came into the possession of Bavaria. In the latter half of the 18th century it rose rapidly in importance through its manufactures, but it was not raised to the rank of a town till 1818.

FURZE, GORSE, or WHIN, *Ulex*, Linn. (German, *Stechginster;* French, *Ajonc*), a genus of thorny papilionaceous shrubs, of few species, confined to west and central Europe and north-west Africa. The leaves, except those of seedling plants, which are trifoliate, are exstipulate, and have the form of prickles; the flowers are axillary, yellow, and sweet-scented, and have a colored calyx deeply divided into two concave segments, the upper bi-serrate and the lower tri-serrate at the apex, the carina and alæ obtuse, stamens united into a sheath, style smooth, and stigma capitale. The pods are few-seeded; their crackling as they burst may often be heard in hot weather. Common furze, *U. europæus*, Linn., is found on heaths and commons in western Europe from Denmark to Italy, and in the Canaries and Azores, and is abundant in nearly all parts of the British Isles. It grows to a height of 2–6 feet; it has hairy stems, and the smaller branches end each in a spine; the leaves, sometimes lanceolate on the lowermost branches, are mostly represented by spines from 2 to 6 lines long, and branching at their base; and the flowers, about ¾ inch in length, have a shaggy, yellowish-olive calyx, with two small ovate bracts at its base, and appear in early spring and late autumn. This species comprises the varieties *U. vulgaris*, or *U. europæus* proper, which has spreading branches, and strong, many-ridged spines, and *U. strictus* (Irish furze), with erect branches, and slender 4-edged spines. Its seeds, according to Babington (*Man. Brit. Bot.*, p. 80, 6th ed., 1867), produce either *U. europæus* or *U. strictus*. The other British species of furze is *U. nanus*, Forst., an inmate of Belgium, Spain, and the west of France; it is a procumbent plant, less hairy than *U. europæus*, with smaller and more orange-colored flowers, which spring from the primary spines, and have a nearly smooth calyx, with minute basal bracts. From *U. nanus* have been formed the subspecies *U. eunanus* (Dwarf Furze), common in the south of England, and *U. Galli*, of Planchon, confined in Britain to the western counties, with the exception of Northumberland. During the winter of 1837–38 the furze perished wholly above ground, not only around London, but even in South Wales, Cornwall, and Devonshire; the double *U. europæus* was observed to be more hardy than the wild species, and *U. strictus* suffered more than either. (See *Trans. Hort. Soc. Lond.*, 2d ser., ii. p. 225.) Furze, or gorse, is sometimes employed for fences. On its use as a forage-plant see AGRICULTURE, vol. i. p. 336. In various parts of England it is cut for fuel. The ashes contain a large proportion of alkali, and are a good manure, especially for peaty land.

See Morton, *Cyclopædia of Agriculture*, 1855; J. T. Boswell Syme, *Sowerby's English Botany*, vol. iii. pp. 3–7, 1864; Bentham, *Handbook of British Flora*, vol. i., 1865; J. D. Hooker, *The Student's Flora*.

FUSELI, Henry (1741–1825), an eminent painter and writer on art, was born at Zurich in Switzerland on the 7th February, 1741; he himself asserted, in 1745, but this appears to have been a mere whim. He was the second child in a family of eighteen. His father was John Caspar Füssli, of some note as a painter of portraits and landscapes, and author of *Lives of the Helvetic Painters*. This parent destined his son for the church, and with this view sent him to the Caroline college of his native town, where he received an excellent classical education. One of his schoolmates there was Lavater, with whom he formed an intimate friendship. After taking orders in 1761, Fuseli was obliged to leave his country for a while in consequence of having aided Lavater to expose an unjust magistrate, whose family was still powerful enough to make its vengeance felt. He first travelled through Germany, and then, in 1763, visited England, where he supported himself for some time by miscellaneous writing; there was a sort of project of promoting through his means a regular literary communication between England and Germany. He became in course of time acquainted with Sir Joshua Reynolds, to whom he showed his drawings. By Sir Joshua's advice he then devoted himself wholly to art. In 1770 he made an art-pilgrimage to Italy, where he remained till 1778, changing his name from Füssli to Fuseli, as more Italian-sounding. Early in 1779 he returned to England, taking Zurich on his way. He found a commission awaiting him from Alderman Boydell, who was then organizing his celebrated Shakespeare gallery. Fuseli painted a number of pieces for this patron, and about this time published an English edition of Lavater's work on physiognomy. He likewise gave Cowper some valuable assistance in preparing the translation of Homer. In 1788 Fuseli married Miss Sophia Rawlins (who it appears was originally one of his models, and who proved an affectionate wife), and he soon after became an Associate of the Royal Academy. Two years later he was promoted to the grade of Academician. In 1799 he exhibited a series of paintings from subjects furnished by the works of Milton, with a view to forming a Milton gallery corresponding to Boydell's Shakespeare gallery. The number of the Milton paintings was forty-seven, many of them very large; they were executed at intervals within nine years. This exhibition, which closed in 1800, proved a failure as regards profit. In 1799 also he was appointed professor of painting to the Academy. Four years afterwards he was chosen keeper, and resigned his professorship; but he resumed it in 1810, and continued to hold both offices till his death. In 1805 he brought out an edition of Pilkington's *Lives of the Painters*, which however, did not add much to his reputation. Canova, when on his visit to England, was much taken with Fuseli's works, and on returning to Rome in 1817 caused him to be elected a member of the first class in the Academy of St. Luke. Fuseli, after a life of uninterrupted good health, died at Putney Hill, 16th April, 1825, at the advanced age of eighty-four, and was buried in the crypt of St. Paul's Cathedral. He was comparatively rich at his death, though his professional gains had always appeared to be meagre.

As a painter, Fuseli had a daring invention, was original, fertile in resource, and ever aspiring after the highest forms of excellence. His mind was capable of grasping and realizing the loftiest conceptions, which, however, he often spoiled on the canvas by exaggerating the due proportions of the parts, and throwing his figures into attitudes of fantastic and over-strained contortion. He delighted to select from the region of the supernatural, and pitched everything upon an ideal scale, believing a certain amount of exaggeration necessary in the higher branches of historical painting. "Damn Nature! she always puts me out," was his characteristic exclamation. In this theory he was confirmed by the study of Michelangelo's works and the marble statues of the Monte Cavallo, which, when at Rome, he used often to contemplate in the evening, relieved against a murky sky or illuminated by lightning. But this idea was by him carried out to an excess, not only in the forms, but also in the attitudes of his figures; and the violent and intemperate action which he often displays destroys the grand effect which many of his pieces would otherwise produce. A striking illustration of this occurs in his famous picture of Hamlet breaking from his Attendants to follow the Ghost: Hamlet, it has been said, looks as though he would burst his clothes with convulsive cramps in all his muscles. This intemperance is the grand defect of nearly all Fuseli's compositions. On the other hand, his paintings are never either languid or cold. His figures are full of life and earnestness, and seem to have an object in view which they follow with rigid intensity. Like Rubens he excelled in the art of setting his figures in motion. Though the lofty and terrible was his proper sphere, Fuseli had a fine perception of the ludicrous. The grotesque humor of his fairy scenes, especially those taken from the *Midsummer Night's Dream*, is in its way not less remarkable than the poetic power of his more ambitious works. As a colorist Fuseli has but small claims to distinction. He scorned to set a palette as most artists do; he merely dashed his tints recklessly over it. Not unfrequently he used his paints in the form of a dry powder, which he rubbed up with his pencil with oil, or turpentine, or gold size, regardless of the quantity, and depending for accident on the general effect. This recklessness may perhaps be explained by the fact that he did not paint in oil till he was twenty-five years of age. Despite these drawbacks, he possessed the elements of a great painter.

Fuseli painted more than 200 pictures, but he exhibited only a minority of them. His earliest painting represented Joseph interpreting the Dreams of the Baker and Butler; the first to excite particular attention was the Nightmare, exhibited in 1781. He produced only two portraits. His sketches or designs numbered about 800; they have admirable qualities of invention and design, and are frequently superior to his paintings.

His general powers of mind were large. He was a thorough master of French, Italian, English, and German, and could write in all these tongues with equal facility and vigor, though he preferred German as the vehicle of his thoughts. His writings contain passages of the best art-criticism that English literature can show. The principal work is his series of *Lectures* in the Royal Academy, twelve in number, commenced in 1801.

Many interesting anecdotes of Fuseli, and his relations to contemporary artists, are given in his *Life* by John Knowles, who also edited his works in 3 vols. 8vo, London, 1831. He was a man of abrupt temper, sharp of tongue, energetic in all his ways, in stature short, but robust, with a head full of fire and character.

FUSEL OIL, the name applied to the volatile oily liquids, of a nauseous fiery taste and smell, which are obtained in the rectification of spirituous liquors made by the fermentation of grain, potatoes, the marc of grapes, and other material, and which, as they are of higher boiling-point than ethylic alcohol, occur in largest quantity in the last portions of the distillate. Besides ethylic or ordinary alcohol, and amylic or pentylic alcohol, which are present in them all, there have been found in fusel oils several other bodies of the $C_nH_{2n+1}.OH$ series, also certain ethers, and members of the $C_nH_{2n}O_2$ series of fatty acids. Normal propylic alcohol, $C_3H_7.OH$ is contained in the fusel oil or the marc brandy of the south of France, and isoprimary butylic alcohol, $CH\ (CH_3)_2.CH_2.OH$, in that of beet-root molasses. The chief constituent of the fusel oil procured in the manufacture of alcohol from potatoes and grain, usually known as fusel oil and potato-spirit, is isoprimary amylic alcohol, or isobutylcarbinol, $CH\ (CH_3)_2.CH_2.CH_2.OH$, boiling at 129°–130° C., and inactive as regards polarized light. Ordinary fusel oil yields besides another isomeric amylic alcohol, boiling at about 128°, and lævorotatory. The formation of amylic alcohol is stated by Liebig (*Familiar Letters on Chemistry*, p. 217, 4th ed., 1859) never to take place in fermenting fluids in the presence of tartar, of racemic, tartaric, or citric acid, or of certain bitter substances as hops. It is produced principally in alkaline or neutral liquids, and in such as contain lactic or acetic acid. Schorlemmer (*Proc. Roy. Soc.*, xv., 1866, p. 131) has shown that amyl-compounds prepared from fusel oil and from American petroleum agree in specific gravity and boiling point, and are therefore to be regarded as identical. Variable quantities of fusel oil, less or greater according to the stage of ripening, exist in commercial spirits. Administered in small amount, it exercises a poisonous action, causing thirst and headache, with furred tongue (*Brit. and For. Med.-Chir. Rev.*, xxviii., 1861, p. 101). In crude spirit made from potatoes, after its purification in the cold from noxious gases by means of charcoal, M. Rabuteau found 50 per cent. of ethylic, and 1·5 per cent. of isopropylic alcohol, and traces of propylic, and of ordinary and a more complex amylic alcohol. He discovered that in $\frac{1}{50}$ aqueous solution ethylic alcohol was not injurious to frogs, isopropylic alcohol killed after some hours, and propylic alcohol in a single hour, whilst the vapors of a similar solution of amylic alcohol were instantaneously fatal to them, and even diluted to as much as 500 times its bulk that body exercised on them a poisonous influence. The widely different actions of common alcohol and of such compounds as the potato-oils in intoxicating drinks, he points out, render it necessary to distinguish between the excitable *ethylism* produced by the former, and the dull and heavy *amylism*, or more properly *polyalcoholism*, of the latter. (See *Le Progrès Médical*, 1878, p. 979, "Société de Biologie.") To remove fusel oil from spirits, a matter of prime importance to the distiller, a great number of methods have been resorted to. A practically pure spirit can be obtained by rectification several times after dilution with water, or by the use of specially constructed stills, as Coffey's (see DISTILLATION, vol. vii. p. 231). Among the materials which have been employed for the complete defuselation of spirit are the powder of freshly burnt charcoal, which acts best when the vapor of the liquid is passed through it, and charcoal with manganese peroxide, with slaked lime, and with soap-boilers' lye; also saturated solution of chloride of lime, alone or with zinc chloride; and calcium chloride, olive oil, soda-soap, and milk. The presence of fusel oil in spirit may be suspected when the addition of four parts of water causes milkiness. It is detected by its odor when the spirit is diluted with warm water, or when its ethylic alcohol has been allowed to evaporate. To remove the last-named body and water from fusel oil calcium chloride has been employed. The estimation of the alcohols of fusel oil may be effected by Dupré's process, in which their corresponding acids are obtained by oxidizing with sulphuric acid and potassium dichromate, and eventually the quantity of barium in the barium salts of the purified acids is determined (see *Analyst*, Mar. 31, 1871). Fusel oil is employed in the arts as a source of amylic alcohol.

FUST, JOHANN (? . . . .–1466), often considered as the inventor or one of the inventors of printing, belonged to a rich and respectable burgher family of Mainz, which is known to have flourished from 1423, and to have held many civil and religious offices, but was not related to the patrician family Fuss. The name was always written Fust, until in 1506 Johann Schöffer, in dedicating the German translation of Livy to the emperor Maximilian, called his grandfather Faust. After that the family called themselves Faust, and the Fausts of Aschaffenburg, an old and quite distinct family, placed John Fust in their pedigree as one of their most distinguished ancestors. John's brother Jacob, a goldsmith, was appointed baumeister of the town in 1445, and was first burgomaster in 1462, when Mainz was stormed and sacked by the troops of Count Adolf of Nassau. There is no evidence that, as is commonly asserted, John Fust was himself a goldsmith. He appears to have been a money-lender or banker and speculator, better known for prudence than for uprightness and disinterestedness. His connection with Gutenberg, who is now generally, though not universally, admitted to be the real inventor of printing, has been very variously represented, and Fust has been put forward by some as the inventor of typography, and the instructor as well as the partner of Gutenberg, by others as his patron and benefactor, who saw the value of his discovery and had the courage to supply him with means to carry it out. This view has been the most popular; but during the present century Fust has been frequently painted as a greedy and crafty speculator, who took advantage of Gutenberg's necessity and robbed him of the fruits of his invention. Gutenberg, many years resident in Strasburg, where he was long engaged in the experiments and attempts which resulted in his discovery of typography, is not known to have been there after 1444. His uncle Henne (or Johann) Gutenberg, senior, on 28th October, 1443, took the house in Mainz called Zum Jungen, where Gutenberg afterwards carried on printing. Having already exhausted his own resources in his long-continued and costly experiments, Gutenberg, through his cousin Albrecht Gelthuss zum Echtzeller, borrowed 150 florins in Mainz, 6th October, 1448. This sum was quite insufficient for his purposes, and on 22d August, 1459, as appears from the amount of interest afterwards claimed, he made an agreement with Fust, who was to advance him 800 gold florins to make and procure his tools and materials, which were to be security for the loan. Fust was also to give him 300 florins a year for expenses, wages, house rent, parchment, paper, ink, etc. They were to divide the profits equally, and if they wished to separate, Gutenberg was to return the 800 florins, and the materials were to cease to be security. Fust was to have half the profits, being both holder of a mortgage and partner in the firm. Gutenberg carried on the business at Zum Jungen, where he lived. It is difficult to ascertain precisely what books were printed while the partnership lasted. They first printed, says Trithemius, a vocabulary called *Catholicon*. This was not the *Catholicon* of Johannes de Janua, a folio of 748 pages, 66 lines to a full page, printed in 1460, and now considered to be the work of Gutenberg alone, but was probably a small glossary for children, now lost; they also printed *Donatus de octo partibus orationis*, 27 lines to a page, of which two leaves were discovered in Mainz in the original binding of an account book of 1451. Their greatest work was the Latin Bible known as the *Bible of 42 lines*, because a page contains 42 lines, and also as the Mazarin Bible, because the first copy described was found in the library of Cardinal Mazarin. It was finished at latest in 1455, and is a folio of 1282 printed pages, with spaces left for the illumination of initials, and is in much smaller type than the famous and much-disputed *Bible of 36 lines*, also called the *Bamberg Bible*, because nearly all the known copies were found in the neighborhood of Bamberg. It is also called *Schelhorn's Bible*, because Schelhorn described it in 1760 as the oldest printed Latin Bible, and *Pfister's Bible*, because ascribed to Albert Pfister, a printer of Bamberg, who used the same type for printing many small German books, the chief of which is Boner's *Edelstein*, 1461, 4to, 88 leaves, 85 woodcuts, a book of fables in German rhyme. But many eminent bibliographers believe this Bible to have been printed by Gutenberg, who used the same type in the Letters of Indulgence of 1454, and in the 27-line Donatus of 1451. The types used by Pfister are evidently old and worn, except those of the additional letters required for German, *k*, *w*, *z*, which are clear and sharp like the types used in the Bible. Ulric Zell states, in the Cologne Chronicle of 1499, that Gutenberg and Fust printed the Bible in large type like that used in missals. It has been said that this description applies to the 42-line Bible, as its type is as large as that of most missals earlier than 1500, and that the size now called missal type (double pica) was not used in missals until late in the 16th century. This is no doubt true of the smaller missals printed before 1500, some of which are in even much smaller type than the 42-line Bible. But many of the large folio missals, as that printed at Mainz by Peter Schöffer in 1483, the Carthusian missal printed at Spires by Peter Drach about 1490, and the Dominican missal printed by Andrea de Torresanis at Venice in 1496 are in as large type as the 36-line Bible. It required scarcely less than such a work, says Madden, to induce Fust to advance such large sums of money. Some other smaller works were printed by the partners, as the Papal Letters of Indulgence of 1454–5, granted 12th April, 1451, by Nicolas V., in aid of John II., king of Cyprus, against the Turks, and probably many now lost. Peter Schöffer of Gernsheim, between Mainz and Mannheim, who was a copyist in Paris in 1449, and who is called by Fust his servant (famulus), is said by Trithemius to have discovered an easier way of founding characters. Lambinet and others have concluded from this that Schöffer invented the punch. Schöffer himself, in the colophon of the Psalter of 1457, a work which probably was planned and partly printed by Gutenberg, claims only the mode of printing rubrics and colored capitals. Didot believes that Schöffer discovered the *movable* mould, and that Gutenberg alludes to this discovery and to Schöffer's youth when he says in the colophon of the *Catholicon* of 1460 that God reveals to babes what He hides from the wise. Fust, quite unexpectedly as it seems, and before the profits of the undertaking could be realized, brought a suit against Gutenberg to recover the money he had lent, claiming 2026 florins for principal and interest. He had made a second loan of 800 florins in 1452, but had not paid the 300 florins a year, and, according to Gutenberg, had said that he had no intention of accepting interest. The suit was decided in Fust's favor, 6th November, 1455, in the great refectory of the Barefooted Friars of Mainz, when Fust made oath by all the saints that he had borrowed 1550 florins and given them to Gutenberg. Fust removed the portion of the printing materials covered by his mortgage, which did not include the types of the 36-line Bible, to a house belonging to him called Zum Humbreicht, where he carried on printing with the aid of Peter Schöffer, to whom he gave his only daughter Dyna or Christina in marriage about 1465. Their first publication was the Psalter, 14th August, 1457, a folio of 350 pages, the first printed book with a complete date, and remarkable for the beauty of the large initials printed each in two colors, red and blue, from types made in two pieces, a method patented in England by Solomon Henry in 1780, and by Sir William Congreve in 1819. The Psalter was reprinted with the same types, 1459 (August 29), 1490, 1502 (Schöffer's last publication), and 1516. Fust and Schöffer's other works are given below.[1] In 1464 Adolf of Nassau appointed for the church of St. Quintin three baumeisters, who were to choose twelve chief parishioners as assistants for life. The first of these "Vorvaren," who were named on May-day, 1464, was Johês Fust, and in 1467 Adam Von Hochheim was chosen instead of Johannes Fust. Fust is said to have gone to Paris in 1466, and to have died of the plague, which raged there in August and September. He certainly was in Paris on 4th July, when he gave Louis de Lavernade, a distinguished gentleman of the province of Forez, then chancellor of the Duc de Bourbon and first president of the parliament of Toulouse, a copy of his second edition of Cicero, as appears from a note in Lavernade's own hand at the end of the book, which is now in the library of Geneva. But Fust probably did not die until 30th October, on which day, probably in 1471, an annual mass was instituted for him by Peter Schöffer and Conrad Henlif in the church of St. Victor of Paris, where he was buried.

Fust has been often confounded with the famous magician Dr. Johann Faust, no doubt a real person, though the fables gradually gathered round his name have formed a regular mythical saga. Trithemius speaks in 1507 of Magister Georgius Sabellicus, who called himself Faustus Junior. Conradus Metianus Rufus (Conrad Mudt) in 1513 calls him "quidam chiromanticus Georgius Faustus." But Melanchthon (Manlius, *Collectanea communium Locorum*, 1568, p. 39), and the author of the oldest popular history of Faust, call the magician John, which name has been adopted in the popular books and generally accepted. This change of name, which has been variously explained, allowed the confused traditional remembrance of the printer to be worked into the Faust saga, perhaps the more readily as in his colophons Fust said that his books were not made with pen or pencil, "sed arte quædam perpulchra." The confusion has been much assisted by the story of Fust's supposed prosecution for magic, which, widely credited, and frequently repeated as an authentic anecdote, seems to have been first mentioned by Johannes Walchius in his *Decas fabularum humani generis*, Argentorati, 1610, fol. 181. He states on the authority of Hendrik van Schore or Schorus, a Flemish author, then an old man and provost of Surburg, that when Fust sold his Bibles in Paris, the purchasers, surprised to find all the copies agree exactly in every letter, complained of deception ("a Fausto falsos ac deceptos se clamabant"), and bringing back their books demanded their money, and pursued him even in Mainz, so that to escape he removed to Strasburg. Johann Conrad Dürr, professor of theology at Altdorf, wrote an *Epistola de Johanne Fausto*, dated 18th July, 1676, which Schelhorn printed in 1726, in his *Amœnitates Literariæ*, vol. v. pp. 50–80. Dürr (after relating from Emmanuel van Meteren the tale of Koster's types being stolen on Christmas eve by John Fust his workman, who fled to Amsterdam, then to Cologne, and lastly to Mainz) says that, on showing his books, Fust was suspected of magic, as he could print in one day as much as several men could write in a year, and as the monks and nuns, who had long made great profits by copying, found their kitchens grow cold, and their bright fires extinguished, Fust incurred their hatred and calumny, and was transformed into a magician; and this opinion was confirmed by his printing the *Doctrinale Alexandri* (*i. e., Doctrinale Alexandri Galli*, a most popular mediæval Latin grammar), which gave rise to the story that Faust had caused Alexander the Great to appear to Charles V. Lacaille (*Histoire de l'Imprimerie*, Paris, 1689, p. 12) repeats the story of Fust selling his Bibles in Paris, and adds, as Marchand (*Hist. de l'Imprimerie*, La Haye, 1740, p. 27) says, out of his own head ("avance de son chef"), that the purchasers brought a suit against Fust accusing him of magic, so that he had to escape to Mainz, but the parliament of Paris made a decree discharging Fust of all prosecutions as to the sale of his Bibles. The whole story, as Bernard says, is very improbable and scarcely deserves a serious refutation. There is no proof that the monks were hostile to printing, or that it interfered with the profits of the copyists. On the contrary many books were printed by monks, the early printers often set up their presses in monasteries, and Gutenberg, Fust, and Schöffer were on friendly terms with many conventual houses. Dürr himself quotes from the *Chronicle* of Aventinus a statement that, if printing had not been discovered, the old books would have been lost, as they would no longer write in the monasteries. Printing did the mechanical work, and multiplied the material for calligraphy and illumination, and therefore did not at first interfere with the profits of the scribes or excite their hostility. The learned men who bought books in 1463 cannot have been ignorant of the invention of printing, which the colophon of the Bible of 1462 expressly mentions. No trace of a suit against Fust has been found in the registers of the parliament of Paris. Shortly before his death Fust was known in Paris to Louis de Lavernade, a magistrate of the highest rank, who could have had no intercourse with a man accused of magic. The confusion is especially seen in the German puppet plays even now placing Dr. Faust in Mainz, while the popular histories make him dwell in Wittenberg, the birthplace of Protestantism, where Marlowe's *Tragical History of Dr. Faustus*, founded on the prose history, places him. Many writers have accepted Dürr's error (see Ristelhuber, *Faust dans l'histoire et la legende*, Paris, 1863, p. 173); thus Chasles (*Études sur le moyen âge*, p. 398) calls Fust "magicien à barbe blanche," and Victor Hugo's introduction to Marlowe's play is based on this error, which, says Heine (*Ueber Deutschland*), "is widely spread among the people. They identify the two Fausts because they perceived indistinctly that the mode of thought represented by the magicians found its most formidable means of diffusion in the discovery of printing. This mode, however, is thought itself as opposed to the blind Credo of the Middle Ages."

Galli, 1690, fol., 2 vols.; *Cronica van der Hilliger Stat. van Coellen*, Cologne, 1499, fol.; Joannis, *Rerum Moguntiacarum*, Francofurti ad Mœnum, 1722–27, fol., 3 vols. (P. A. L.)

FUSTIAN, a term which includes a variety of heavy woven cotton fabrics, chiefly prepared for men's wear. It embraces plain twilled cloth called jean, and cut fabrics similar to velvet, known as velveteen, moleskin, corduroy, etc. The operations connected with the finishing of cut fustian (cutting, brushing, and singeing, etc.) are conducted under unhealthy conditions. The name is said to be derived from El-Fustat, a suburb of Cairo (see vol. vii. p. 667), where it was first made; and certainly a kind of cloth has been long known under that name. In a petition to parliament, *temp.* Philip and Mary, "fustian of Naples" is mentioned, and in books of a later time this term was abridged to fustiananapes, whence arose an obvious corruption, fustian and apes.

Durandus, *Rationale divinorum officiorum*, 1459, folio, 160 leaves; 4. the *Clementine Constitutions*, with the gloss of Johannes Andreæ, 1460, 51 leaves; 5. *Biblia Sacra Latina*, 1462, fol., 2 vols., 242 and 239 leaves, 48 lines to a full page; 6. the Sixth Book of Decretals, with Andreæ's gloss, 17th December, 1465, fol., 141 leaves; 7. Cicero *De Officiis*, 1465, 4to, 88 leaves, the first edition of a Latin classic, the first book containing Greek characters, while in the colophon Fust first calls Schöffer "puerum suum"; 8. the same, 4th February, 1466; 9. *Grammatica rhytmica*, 1466, fol., 11 leaves. They also printed in 1461–2 several papal bulls, proclamations of Adolf of Nassau, etc. Nothing is known to have appeared for three years after the storming of Mainz, 8th October, 1465.

FUSTIC, or YELLOW WOOD, also known as old fustic (Germ. *Gelbholz*, Fr. *Bois jaune*), is a dye-stuff consisting of the wood of *Maclura tinctoria*, Don, a large tree of the natural order *Moraceæ*, growing in the West Indies and tropical America, and having oblong, taper-pointed leaves, and an edible fruit. Fustic occurs in commerce in blocks, which are brown without, and of a brownish-yellow within. It is sometimes employed for inlaid work. For its use in the dyeing of yellow and other colors, see vol. vii. pp. 499, 501. The dye-stuff termed young fustic or Zante fustic, and also Venetian sumach, is the wood of *Rhus Cotinus*, Linn., a southern European and Asiatic shrub of the natural order *Anacardiaceæ*, called by Gerarde "red sumach," and apparently the "coccygia" and "cotinus" of Pliny (*Nat. Hist.*, xiii. 41, xvi. 30). Its leaves are deciduous, stiff, smooth, obovate, simple, and rounded at the apex, with long petioles; the blossoms are small, pale-purplish or flesh-colored, and in loose panicles, and their pedicels, after the flowering is over, become long and hairy, forming together, as Gerarde remarks, "a most fine woollie or stockie tuft, crisped and curled like a curious wrought silken fleece" (*The Herball*, p. 1293, 1597). The plant in its native habitat is used both for dyeing and tanning, and by Loudon (*Arboretum*, vol. ii. p. 550) it is recommended for ornamental purposes.

FUTTEHPOOR. See FATHIPUR.

FUX, JOHANN JOSEPH (1661–1741), the composer of more than 400 works of various kinds and dimensions, but chiefly remembered as the author of a theoretical work on music. He was born in 1660 at Marein in Styria, probably of poor parents. Of his youth and early training nothing is known. All we can ascertain is that in 1696 he was organist at one of the principal churches of Vienna, and in 1698 was appointed by the emperor Leopold I. as his "imperial court composer," with the by no means inconsiderable salary of about £6 a month. At the court of Leopold and of his successors Joseph I. and Charles VI., Fux remained for the rest of his life. To his various court dignities that of organist at St. Stephen's cathedral was added in 1704. As a proof of the high favor in which he was held by the art-loving Charles VI., it is told that at the coronation of that emperor as king of Bohemia in 1723, an opera, *La Constanza e la Fortezza*, especially composed by Fux for the occasion, was given at Prague. The performance took place in an open-air theatre, and the *mise-en-scène* is said to have been of great splendor. Fux at the time was suffering from gout, but in order to enable him to be present at the performance, the emperor had him carried in a litter all the way from Vienna, and a seat in the imperial box was reserved for the composer. Fux died at Vienna in 1741. His life, although passed in the great world, was eventless, and his only troubles arose from the intrigues of his Italian rivals at court. Of the numerous operas which Fux wrote for the amusement of his imperial patrons it is unnecessary to speak. They do not essentially differ from the style of the Italian *opera seria* of the time. Of greater importance are his sacred compositions, psalms, motets, oratorios, and masses, the celebrated *Missa Canonica* amongst the latter. It is an all but unparalleled *tour de force* of learned musicianship, being written entirely in that most difficult of contrapuntal devices—the canon. As a contrapuntist and musical scholar generally, Fux was unsurpassed by any of his contemporaries, and it is owing to these qualities that his great theoretical work, the *Gradus ad Parnassum*, has preserved its importance to the present day. For a long time it remained by far the most thorough treatment of counterpoint and its various developments. The title of the original Latin edition may be given:—*Gradus ad Parnassum sive manuductio ad compositionem musicæ regularem, methoda nova ac certa nondum ante tam exacta ordine in lucem edita, elaborata a Joanne Josepho Fux* (Vienna, 1725). It was translated into most European languages during the 18th century, and is still studied by musicians interested in the history of their art. The expenses of the publication were defrayed by the emperor Charles VI., to whom the musical world most probably owes the survival of the important work. Fux's biography, a book full of minutest original research, and trustworthy in every respect, has recently been published by Ludwig von Köchel (Vienna, 1871). It contains, amongst other valuable materials, a complete catalogue of the composer's numerous works. (F. H.)

FYT, JOHANNES (1609–1661), the best painter of animals and game after Franz Snyders, was born at Antwerp and christened August 19, 1609. He was registered apprentice to Hans van den Berghe in 1621. That he should have been placed thus early under the tuition of a man who held but a humble station amongst his artist contemporaries can only be explained by stating that Van den Berghe was the friend of Fyt's father and had already taught Jacques Fyt, Johannes's brother. Professionally Van den Berghe was a restorer of old pictures rather than a painter of new ones. At twenty Johannes Fyt entered the guild of St. Luke as a master, and from that time till his death in 1661, he produced a vast number of pictures in which the bold facility of Snyders is united to the powerful effects of Rembrandt, and harmonies of gorgeous tone are not less conspicuous than freedom of touch and a true semblance of nature. There never was such a master of technical processes as Fyt in the rendering of animal life in its most varied forms. He may have been less correct in outline, less bold in action than Snyders, but he was much more skilful and more true in the reproduction of the coat of deer, dogs, greyhounds, hares, and monkeys, whilst in realizing the plumage of peacocks, woodcocks, ducks, hawks, and cocks and hens, he had not his equal, nor was any artist even of the Dutch school more effective in relieving his compositions with accessories of tinted cloth, porcelain ware, vases, and fruit. He was not clever at figures, and he sometimes trusted for these to the co-operation of Cornelius Schut or Willeborts, whilst his architectural backgrounds were sometimes executed by Quellyn. Silenus amongst Fruit and Flowers, in the Harrach collection at Vienna, Diana and her Nymphs with the Produce of the Chase, in the Belvedere at Vienna, and Dead Game and Fruit in front of a Triumphal Arch, belonging to Baron Anselm von Rothschild at Vienna, are specimens of the co-operation respectively of Schut, Willeborts, and Quellyn. They are also Fyt's masterpieces. The earliest dated work of the master is a cat grabbing at a piece of dead poultry near a hare and birds, belonging to Baron Cetto at Munich, and executed in 1644. The latest is a Dead Snipe with Ducks, of 1660, sold with the Jäger collection at Cologne in 1871. Great power is shown in the bear and boar hunts at Munich and Ravensworth castle. A Hunted Roedeer with Dogs in the Water, in the Berlin Museum, has some of the life and more of the roughness of Snyders, but lacks variety of tint and finish. A splendid specimen is the Page and Parrot near a table covered with game, guarded by a dog staring at a monkey, in the collection of Sir Richard Wallace. It is curious that Antwerp should possess only two examples of Fyt. The Madrid Museum contains 11, the Lichtenstein Gallery at Vienna 8, the Berlin, Vienna, and Dresden Museums 5 each, the Louvre 3, and the London National Gallery 1. With the needle and the brush Fyt was equally clever. He etched 16 plates, and those representing dogs are of their kind unique. (J. A. C.)

FYZABAD, another name for FAIZABAD (*q.v.*).
